Chapter One

Sequence:-

A sequence is a function whose domain is the set of positive integer 1,2,3,... . We denote the sequence by $\langle f(n) \rangle$. Where $f(n)$ is the function at valued n .

The sequence f is the set $\{(n, f(n)); n \in N\}$. That is ,the set of all pairs $(n, f(n))$, with n appositive integer. We also write a_n to denote the sequence whose ordinate at $y = a_n$.

Examples:-

- $\langle \frac{1}{2n} \rangle = \frac{1}{2}, \frac{1}{4}, \frac{1}{6}, \dots \dots$

The set $\{ (n, \frac{1}{2n}), n = 1, 2, 3, \dots \dots \}$ is a sequence whose value at n is $\frac{1}{2n}$.

- $\langle \frac{1}{n+1} \rangle = \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \dots \dots$

The set $\{ (n, \frac{1}{n+1}), n = 1, 2, 3, \dots \dots \}$ is a sequence whose value at n is $\frac{1}{n+1}$.

- $\langle 1 \rangle = 1, 1, 1, \dots \dots$

The set $\{ (n, 1), n = 1, 2, 3, \dots \dots \}$ is a sequence whose value at n is 1.

Finite sequence :-

The sequence $\langle f(n) \rangle$ is said to be finite if there exist two numbers a and b such that $a \leq f(n) \leq b$ or $a < f(n) \leq b$ or $a \leq f(n) < b$ or $a < f(n) < b$.

Note:- every finite sequence is bounded.

Infinite sequence:-

The sequence $\langle f(n) \rangle$ is said to be infinite if both a and b or one of them equal to $\pm\infty$.

Note:- every infinite sequence is unbounded.

Convergent Sequence:-

A sequence is said to be convergent if it approaches some limit.

Formally, a sequence S_n converges to the limit L . A divergent sequence doesn't have a limit. $\lim_{n \rightarrow \infty} S_n = L$

Discuss the following sequences:-

- $\langle \frac{1}{2n} \rangle = \left\{ \frac{1}{2}, \frac{1}{4}, \frac{1}{6}, \dots \right\} . n \in N$

The set $\{ (1, \frac{1}{2}), (2, \frac{1}{4}), (3, \frac{1}{6}), \dots \}$ is a finite and bounded sequence when $n \rightarrow \infty$,

$$\lim_{n \rightarrow \infty} \frac{1}{2n} = 0$$

$\langle \frac{1}{2n} \rangle \rightarrow 0$ the sequence converge to zero.

$$0 < \frac{1}{2n} \leq \frac{1}{2}$$

- $\langle \frac{1}{n+1} \rangle = \left\{ \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \dots \right\} . n \in N$

The set $\{ (1, \frac{1}{2}), (2, \frac{1}{3}), (3, \frac{1}{4}), \dots \}$ is a finite and bounded sequence when $n \rightarrow \infty$,

$$\lim_{n \rightarrow \infty} \frac{1}{n+1} = \lim_{n \rightarrow \infty} \frac{\frac{1}{n}}{\frac{n}{n} + \frac{1}{n}} = \frac{0}{1+0} = 0$$

$\left\langle \frac{1}{n+1} \right\rangle \rightarrow 0$ the sequence is converge to zero.

$$0 < \frac{1}{n+1} \leq \frac{1}{2}$$

- $\left\langle 1 \right\rangle = \{1, 1, 1, \dots \dots \}$.

The set $\{ (1,1), (2,1), (3,1), \dots \dots \}$ is a finite and bounded sequence when $n \rightarrow \infty$,

$$\lim_{n \rightarrow \infty} 1 = 1$$

$\left\langle 1 \right\rangle \rightarrow 1$ the sequence is converge to 1.

- $\left\langle \frac{2n+1}{2n} \right\rangle = \left\{ \frac{3}{2}, \frac{5}{4}, \frac{7}{6}, \dots \dots \right\} . n \in N$

The set $\{ (1, \frac{3}{2}), (2, \frac{5}{4}), (3, \frac{7}{6}), \dots \dots \}$ is a finite and bounded sequence since when $n \rightarrow \infty$, there are two Solutions for this sequence:-

First solution:-

$$\lim_{n \rightarrow \infty} \frac{2n+1}{2n} = \lim_{n \rightarrow \infty} \frac{\frac{2n}{n} + \frac{1}{n}}{\frac{2n}{n}} = \lim_{n \rightarrow \infty} \frac{2 + \frac{1}{n}}{2} = \frac{2+0}{2} = 1$$

$$\therefore \left\langle \frac{2n+1}{2n} \right\rangle \rightarrow 1$$

Second solution:-

$$\lim_{n \rightarrow \infty} \frac{2n+1}{2n} = \lim_{n \rightarrow \infty} \frac{2n}{2n} + \frac{1}{2n} = \lim_{n \rightarrow \infty} 1 + \frac{1}{2n} = 1 + 0 = 1$$

$$\therefore \left\langle \frac{2n+1}{2n} \right\rangle \rightarrow 1$$

The sequence is converge to 1.

$$1 < \frac{2n+1}{2n} \leq \frac{3}{2}$$

- $\langle n \rangle = \{1, 2, 3, \dots\}, n \in N$

The set $\{(1,1), (2,2), (3,3), \dots\}$ is a infinite and unbounded sequence when $n \rightarrow \infty$, $\langle n \rangle \rightarrow \infty$. The sequence is diverged.

Note:- Those sequences are also infinite, unbounded and diverge

$\langle \sqrt{n} \rangle, \langle 5n^2 \rangle, \langle \frac{n^3}{6} \rangle, \langle \frac{n^6}{n^3} \rangle$ And so on. Have a same solve like

$\langle n \rangle$.

Example:- Find the Domains for the following sequences

- $\langle \frac{1}{n-1} \rangle$

$$n - 1 = 0$$

$$n = 1$$

$$n \in N / \{1\}$$

$$\text{Or } n = \{2, 3, 4, \dots\}.$$

- $\langle \sqrt{n-4} \rangle$

$$n - 4 \geq 0$$

$$n \geq 4$$

$$n \in N / \{1, 2, 3\}$$

Or $n = \{4, 5, 6, \dots\}$.

$$\bullet \quad <\frac{1}{\sqrt{n+4}}>$$

$$n \in N \text{ since } n + 4 > 0 \quad \rightarrow \quad n > -4$$

$$\bullet \quad <\frac{1}{\sqrt{n-3}}>$$

$$n - 3 > 0$$

$$n > 3$$

$$n \in N / \{1, 2, 3\}$$

Or $n = \{4, 5, 6, \dots\}$.

$$\bullet \quad <\frac{1}{\sqrt{3-n}}>$$

$$3 - n > 0$$

$$3 > n$$

$$n = \{1, 2\}.$$

$\therefore <\frac{1}{\sqrt{3-n}}>$ Is finite sequence having two limits.

$$\bullet \quad <\sqrt{7-n}>$$
 How ?

Are the sequences converging or diverge?

$$1. \quad <\frac{n-2}{n^2+1}>$$

Solution:-

$$\lim_{n \rightarrow \infty} \frac{n-2}{n^2+1} = \lim_{n \rightarrow \infty} \frac{\frac{n}{n^2} - \frac{2}{n^2}}{\frac{n^2}{n^2} + \frac{1}{n^2}} = \lim_{n \rightarrow \infty} \frac{\frac{1}{n} - \frac{2}{n^2}}{1 + \frac{1}{n^2}} = \frac{0-0}{1+0} = 0$$

$$\therefore \left\langle \frac{n-2}{n^2+1} \right\rangle \rightarrow 0$$

2. $\left\langle \frac{n^3+1}{n-2} \right\rangle$

$$\text{Sol.: } \lim_{n \rightarrow \infty} \frac{n^3+1}{n-2} = \lim_{n \rightarrow \infty} \frac{\frac{n^3}{n^3} + \frac{1}{n^3}}{\frac{n}{n^3} - \frac{2}{n^3}} = \lim_{n \rightarrow \infty} \frac{1 + \frac{1}{n^3}}{\frac{1}{n^2} - \frac{2}{n^3}} = \frac{1+0}{0-0} = \frac{1}{0} = \infty$$

$\therefore \left\langle \frac{n^3+1}{n-2} \right\rangle$ The sequence is diverge.

3. $\left\langle (-1)^n \right\rangle, n \in N$

$$\text{Sol.: } \left\langle (-1)^n \right\rangle = \{-1, 1, -1, 1, \dots\}$$

$$\left\langle (-1)^n \right\rangle = \begin{cases} -1 & n \text{ odd} \\ 1 & n \text{ even} \end{cases}$$

$$\left\langle (-1)^n \right\rangle = \begin{cases} (1, -1), (3, -1), (5, -1), \dots & n \text{ odd} \\ (2, 1), (4, 1), (6, 1), \dots & n \text{ even} \end{cases}$$

$$-1 \leq (-1)^n \leq 1$$

$\therefore \left\langle (-1)^n \right\rangle$ Is bounded.

$$\text{But } \lim_{n \rightarrow \infty} (-1)^n = \begin{cases} -1 & n \rightarrow \infty \text{ odd} \\ 1 & n \rightarrow \infty \text{ even} \end{cases}$$

$\therefore \left\langle (-1)^n \right\rangle$ Is diverge because it has two limits.

Discuss the following sequences? (Homework)

4. $\left\langle (-1)^{n+1} \right\rangle$

5. $\left\langle (-1)^{n-1} \right\rangle$

6. $\left\langle 1 - (-1)^n \right\rangle$

$$7. <\frac{1}{(-1)^n}>$$

$$8. <n - (-1)^n>$$

$$9. <\frac{n}{(-1)^n}>$$

$$10. <\frac{(-1)^n}{n}>$$

$$11. <<5n + 4>>$$

$$12. <\frac{4}{3n}>$$

$$13. <\sqrt[5]{n}>$$

$$14. <\frac{n^2}{n^3+3}>$$

Find the values of a_1 , a_2 , a_3 and a_4 for the following sequence

$<a_n>$, were given a_n term ?

$$1. \ a_n = \frac{1-n}{n^2}$$

$$a_1 = \frac{1-1}{1^2} = \frac{0}{1} = 0$$

$$a_2 = \frac{1-2}{2^2} = \frac{-1}{4}$$

$$a_3 = \frac{1-3}{3^2} = \frac{-2}{9}$$

$$a_4 = \frac{1-4}{4^2} = \frac{-3}{16}$$

$$2. \ a_n = \frac{(-1)^{n+1}}{2^{n-1}}$$

$$a_1 = \frac{(-1)^{1+1}}{2^{1-1}} = \frac{(-1)^2}{2^0} = \frac{1}{1} = 1$$

$$a_2 = \frac{(-1)^{2+1}}{2^{2-1}} = \frac{(-1)^3}{2} = \frac{-1}{2}$$

$$a_2 = \frac{(-1)^{3+1}}{2^{3-1}} = \frac{(-1)^4}{2^2} = \frac{1}{4}$$

$$a_4 = \frac{(-1)^{4+1}}{2^{4-1}} = \frac{(-1)^5}{2^3} = \frac{-1}{8}$$

3. $a_n = \frac{(-1)^{n+1}}{2n-1}$ Homework?

4. $a_n = \left(\frac{n+1}{2n}\right)\left(1 - \frac{1}{n}\right)$ Homework?

Are the following sequence converge or diverge find the limited of each convergent sequence?

1. $a_n = 2 + (0.1)^n$

$$n = 1, 2, 3, \dots$$

$$a_1 = 2.1, a_2 = 2.01, a_3 = 2.001, \dots$$

$$n \rightarrow \infty, \lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} (2 + (0.1)^n)$$

$$= \lim_{n \rightarrow \infty} \left(2 + \frac{1}{10^n} \right)$$

$$= 2 + \lim_{n \rightarrow \infty} \frac{1}{10^n} = 2 + 0 = 2$$

$$\therefore a_n \rightarrow 2$$

$$2 \leq a_n \leq 2.1$$

$\langle a_n \rangle$ is bounded.

2. $a_n = 1 + (0.1)^n$? Homework

Not :- All of these sequence are diverge:- $\langle a_n \rangle = \frac{n}{10}$, $\langle a_n \rangle = (n-1)^2$ and $\langle a_n \rangle = (n+(-1)^n)$.

when $n \rightarrow \infty$ the limit sequences $\lim_{n \rightarrow \infty} a_n = \infty$

$$3. \langle a_n \rangle = \frac{\cos n}{n}$$

$$-1 \leq \cos n \leq 1$$

$$\frac{-1}{n} \leq \frac{\cos n}{n} \leq \frac{1}{n}$$

$$\text{But } \langle \frac{-1}{n} \rangle \rightarrow 0 \text{ and } \langle \frac{1}{n} \rangle \rightarrow 0$$

$$\therefore \langle \frac{\cos n}{n} \rangle \rightarrow 0$$

By theorem if $a_n \leq b_n \leq c_n \forall n$ and $\langle a_n \rangle \rightarrow L$ and $\langle c_n \rangle \rightarrow L$ then $\langle b_n \rangle \rightarrow L$.

But this sequence is diverge show that $\langle a_n \rangle = n + \cos n$?
(Homework).

Mathematical Convergent for Sequence:-

A sequence S_n is said to be converge Mathematically for a real number L if and only if for every positive real number ($\epsilon > 0$), there exist corresponding number ($K \in N$), such that :

$$\langle S_n \rangle \rightarrow L \Leftrightarrow |S_n - L| < \epsilon \quad \forall n > K.$$

Example:- prove that

$$1. \langle \frac{1}{n} \rangle \rightarrow 0$$

$$\text{Proof:- } \left| \frac{1}{n} - 0 \right| < \epsilon \quad \forall n > K$$

$$\left| \frac{1}{n} \right| < \epsilon \quad \forall n > K$$

$$\frac{1}{n} < \epsilon \quad \forall n > K$$

$$n > \frac{1}{\epsilon} \quad \forall n > K$$

$$\therefore K = \frac{1}{\epsilon}.$$

$$2. \quad <\frac{1}{2^n}> \rightarrow \mathbf{0}$$

$$\text{Proof:- } \left| \frac{1}{2^n} - 0 \right| < \epsilon \quad \forall n > K$$

$$\left| \frac{1}{2^n} \right| < \epsilon \quad \forall n > K$$

$$\frac{1}{2^n} < \epsilon \quad \forall n > K$$

$$2^n > \frac{1}{\epsilon} \quad \forall n > K$$

$$\ln 2^n > \ln \frac{1}{\epsilon}$$

$$n \ln 2 > \ln 1 - \ln \epsilon$$

$$n > \frac{0 - \ln \epsilon}{\ln 2}$$

$$\therefore K = \frac{-\ln \epsilon}{\ln 2}.$$

$$3. \quad <\frac{n+1}{n}> \rightarrow \mathbf{1}$$

$$\text{Proof:- } \left| \frac{n+1}{n} - 1 \right| < \epsilon \quad \forall n > K$$

$$\left| \frac{n+1-n}{n} \right| < \epsilon \quad \forall n > K$$

$$\left| \frac{1}{n} \right| < \epsilon \quad \forall n > K$$

$$\frac{1}{n} < \epsilon \quad \forall n > K$$

$$n > \frac{1}{\epsilon} \quad \forall n > K$$

$$\therefore K = \frac{1}{\epsilon}$$

4. $\left\langle \frac{n}{n+1} \right\rangle \rightarrow 1$ prove that ?(Homework)

5. $\left\langle \frac{2}{n} \right\rangle \rightarrow 0$ prove that ?(Homework)

Converge of sequence by theorem of continuous

If $s_n \rightarrow L$ and f is a continuous function on L ; f is defined on all terms of sequence , then $f(s_n) \rightarrow f(L)$.

Example:- prove that

$$1. \left\langle \sqrt{\frac{n+1}{n}} \right\rangle \rightarrow 1$$

Proof:- Let $x = \frac{n+1}{n}$

$$\lim_{n \rightarrow \infty} \frac{n+1}{n} = \lim_{n \rightarrow \infty} \frac{n}{n} + \frac{1}{n} = \lim_{n \rightarrow \infty} 1 + \frac{1}{n} = 1 + 0 = 1$$

$$\therefore \left\langle \sqrt{\frac{n+1}{n}} \right\rangle \rightarrow 1$$

Let $f(x) = \sqrt{x}$

f is continuous at 1.

Since $f(1) = \lim_{n \rightarrow \infty} f(x) = 1$

$$\lim_{n \rightarrow +1} f(x) = \lim_{n \rightarrow -1} f(x) = 1$$

The limit from left equal the limit from right equal to 1.

Here , by theorem of converge $f\left(\frac{n+1}{n}\right) \rightarrow f(1), \left\langle \frac{n+1}{n} \right\rangle \rightarrow 1$.

2. $\left\langle 2^{\frac{1}{n}} \right\rangle \rightarrow 1$

Let $x = \frac{1}{n}$, $\lim_{n \rightarrow \infty} x = \lim_{n \rightarrow \infty} \frac{1}{n} = 0$

Let $f(x) = 2^x$ continuous at 0

\therefore By theorem of converge (if $s_n \rightarrow L$ and f is a continuous function on L then $f(s_n) \rightarrow f(L)$).

$$f\left(\frac{1}{n}\right) \rightarrow f(0)$$

$$\rightarrow 2^{\frac{1}{n}} \rightarrow 2^0 = 1$$

$$\therefore \left\langle 2^{\frac{1}{n}} \right\rangle \rightarrow 1$$

3. $\left\langle \sqrt{\frac{9n+1}{n-2}} \right\rangle \rightarrow 3$

Let $x = \frac{9n+1}{n-2}$, $\lim_{n \rightarrow \infty} x =$ H.W.

Let $f(x) = \sqrt{x}$

f is continuous at 1. H.W.

$$4. \left\langle \frac{1}{2^n} \right\rangle \rightarrow 1$$

Let $x = \frac{1}{n}$, $\lim_{n \rightarrow \infty} x = \lim_{n \rightarrow \infty} \frac{1}{n} = 0$

Let $f(x) = \frac{1}{2^x}$ continuous at 0 H.W.

$$5. \left\langle \sqrt{\frac{1}{n}} \right\rangle \not\rightarrow 0$$

Diverge to zero and the function not continuous at zero because the limit from the right doesn't exist.

The series

Definition:-

If $\langle a_n \rangle = \{a_1, a_2, a_3, \dots\}$ is infinite sequence, then $a_1 + a_2 + a_3 + \dots$ is called an infinite series and it is written as $\sum_{n=1}^{\infty} a_n$.

If series of the form $a_1 + a_2 + a_3 + \dots + a_n$. Then is called a finite series and it is written as $\sum_{k=1}^n a_k = S_n$, which S_n is finite series. The sequence $\langle S_n \rangle$ is called the sequence of partial sums of $\sum_{k=1}^n a_k$, where:-

$$S_1 = a_1$$

$$S_2 = a_1 + a_2$$

$$S_3 = a_1 + a_2 + a_3$$

\vdots

$$S_n = a_1 + a_2 + a_3 + \dots + a_n$$

Example :-

$$* \sum_{n=1}^{\infty} 2n = 2(1) + 2(2) + 2(3) + \dots$$

$$\begin{aligned} ** \sum_{n=1}^{\infty} \frac{(n+1)^2}{n} &= \frac{(1+1)^2}{1} + \frac{(2+1)^2}{2} + \frac{(3+1)^2}{3} + \dots \\ &= 4 + \frac{9}{2} + \frac{16}{3} + \dots \end{aligned}$$

$$\begin{aligned} *** \sum_{n=1}^{\infty} \left(\frac{1}{n} + n \right) &= \sum_{n=1}^{\infty} \frac{1}{n} + \sum_{n=1}^{\infty} n = \left(1 + \frac{1}{2} + \frac{1}{3} + \dots \right) + (1 + 2 + 3 \\ &\quad + \dots) \end{aligned}$$

Theorem:-

If $\sum_{n=1}^{\infty} a_n$ and $\sum_{n=1}^{\infty} b_n$ are series, and $c \in R$, then:-

1. $\sum_{n=1}^{\infty} c \cdot a_n = c \sum_{n=1}^{\infty} a_n$
2. $\sum_{n=1}^{\infty} (a_n \pm b_n) = \sum_{n=1}^{\infty} a_n \pm \sum_{n=1}^{\infty} b_n.$

Definition:-

The infinite series $\sum_{n=1}^{\infty} a_n$ is said to be converging to L i.e.
 $\sum_{n=1}^{\infty} a_n = L$, if the sequence of partial sums $\langle S_n \rangle$ converge to L .

$$\lim_{n \rightarrow \infty} S_n = L, L \in R ; \sum_{k=1}^{\infty} a_k = S_n.$$

Example:- Is the series $\sum_{n=1}^{\infty} a_n = \sum_{n=1}^{\infty} \frac{1}{n(n+1)}$ converge ? find it's sum if exist?

Sol.:-

$$\frac{1}{n(n+1)} = \frac{A}{n} + \frac{B}{(n+1)}$$

$$= \frac{A(n+1) + Bn}{n(n+1)}$$

$$= \frac{An + A + Bn}{n(n+1)}$$

$$\frac{1}{n(n+1)} = \frac{A + n(A+B)}{n(n+1)}$$

$$A = 1, A + B = 0 \rightarrow 1 + B = 0 \rightarrow B = -1$$

$$\frac{1}{n(n+1)} = \frac{1}{n} - \frac{1}{(n+1)}$$

$$\sum_{n=1}^{\infty} \frac{1}{n(n+1)} = \sum_{n=1}^{\infty} \frac{1}{n} - \sum_{n=1}^{\infty} \frac{1}{(n+1)}$$

$$S_1 = 1 - \frac{1}{2}$$

$$S_2 = \left(1 - \frac{1}{2}\right) + \left(\frac{1}{2} - \frac{1}{3}\right) = 1 - \frac{1}{3}$$

$$S_3 = \left(1 - \frac{1}{2}\right) + \left(\frac{1}{2} - \frac{1}{3}\right) + \left(\frac{1}{3} - \frac{1}{4}\right) = 1 - \frac{1}{4}$$

⋮

$$S_n = \left(1 - \frac{1}{2}\right) + \left(\frac{1}{2} - \frac{1}{3}\right) + \left(\frac{1}{3} - \frac{1}{4}\right) + \cdots + \left(\frac{1}{n} - \frac{1}{(n+1)}\right) = 1 - \frac{1}{(n+1)}$$

$$\lim_{n \rightarrow \infty} S_n = \lim_{n \rightarrow \infty} \left(1 - \frac{1}{(n+1)}\right) = 1 - 0 = 1$$

$$\therefore \sum_{n=1}^{\infty} \frac{1}{n(n+1)} = \sum_{n=1}^{\infty} \frac{1}{n} - \sum_{n=1}^{\infty} \frac{1}{(n+1)} = 1$$

Are the series $\sum_{n=1}^{\infty} a_n = \sum_{n=1}^{\infty} \frac{1}{n(n+1)}$ converge ? find it's sum if exist?

$$1. \sum_{n=2}^{\infty} \frac{1}{n(n-1)}$$

$$2. \sum_{n=3}^{\infty} \frac{1}{(n-1)(n-2)} \text{ Homework`}$$

$$3. \sum_{n=1}^{\infty} \frac{1}{(n+1)(n+2)}$$

$$4. \sum_{n=0}^{\infty} \left(\frac{1}{n+3} - \frac{1}{n+4} \right)$$

Geometric Series:-

$$\sum_{n=1}^{\infty} ar^n, \sum_{n=0}^{\infty} ar^n, \sum_{n=1}^{\infty} ar^{n+1}, \sum_{n=0}^{\infty} ar^{n+1} \text{ and } \sum_{n=1}^{\infty} ar^{n-1} \dots \text{etc.}$$

Those are Geometric Series and a is positive constant , r is the base of series .

The sequence of partial some for the series $\sum_{n=1}^{\infty} ar^{n-1}$ is:-

$$S_n = \frac{a}{\text{first term}} + ar + ar^2 + \dots + ar^{n-1}$$

1. If $|r| = 1$

$$S_n = a + a + a + \dots + a = na$$

$< S_n > = < na >$ diverge $\rightarrow \sum_{n=1}^{\infty} ar^{n-1}$ diverge

2. If $|r| > 1$

$\sum_{n=1}^{\infty} ar^{n-1}$ diverge

3. If $|r| < 1$

The series $\sum_{n=1}^{\infty} ar^{n-1}$ is converge and the sum is:-

$$\sum_{n=1}^{\infty} ar^{n-1} = \frac{\text{first term}}{1 - \text{base}} = \frac{a}{1 - r}$$

Not:-If the series $\sum_{n=1}^{\infty} ar^n$ and $|r| < 1$ the sum is

$$\sum_{n=1}^{\infty} ar^n = \frac{ar}{1-r}$$

That mean the first term is ar and the partial sequence of the series is

$$S_n = ar + ar^2 + ar^3 + \cdots + ar^n$$

Example:- which series are converge and diverge .if it converge find the sum of series?

$$1. \sum_{n=1}^{\infty} \left(\frac{7}{4^n}\right)$$

$$\text{sol. } \sum_{n=1}^{\infty} \left(\frac{7}{4^n}\right) = \frac{7}{4} + \frac{7}{4^2} + \frac{7}{4^3} + \cdots$$

$$\sum_{n=1}^{\infty} \left(\frac{7}{4^n}\right) = \sum_{n=1}^{\infty} 7 \cdot \left(\frac{1}{4^n}\right) = \sum_{n=1}^{\infty} ar^n$$

$$a = 7, r = \frac{1}{4} \text{ and } F.T. = \frac{7}{4}$$

$$|r| < 1 \implies \sum_{n=1}^{\infty} \left(\frac{7}{4^n}\right) \text{ converge and the sum is } = \frac{\frac{7}{4}}{1 - \frac{1}{4}} = \frac{\frac{7}{4}}{\frac{3}{4}} = \frac{7}{3}$$

$$\sum_{n=1}^{\infty} \left(\frac{7}{4^n}\right) \rightarrow \frac{7}{3}$$

$$2. \sum_{n=1}^{\infty} \left(\frac{7}{3}\right)^n$$

$$\text{sol. } \sum_{n=1}^{\infty} \left(\frac{7}{3}\right)^n = \frac{7}{3} + \left(\frac{7}{3}\right)^2 + \left(\frac{7}{3}\right)^3 + \cdots$$

$$\sum_{n=1}^{\infty} \left(\frac{7}{3}\right)^n = \sum_{n=1}^{\infty} 1 \cdot \left(\frac{7}{3}\right)^n = \sum_{n=1}^{\infty} ar^n$$

$$a = 1, r = \frac{7}{3} \text{ and } F.T. = \frac{7}{3}$$

$|r| > 1 \rightarrow \sum_{n=1}^{\infty} \left(\frac{7}{3}\right)^n$ and have no summation.

diverge

$$3. \sum_{n=1}^{\infty} \frac{1}{2} (-1)^n = \sum_{n=1}^{\infty} ar^n$$

$$\text{sol.} \sum_{n=1}^{\infty} \frac{1}{2} (-1)^n = -\frac{1}{2} + \frac{1}{2} \cdot (1)^2 + \frac{1}{2} \cdot (-1)^3 + \dots$$

$$a = \frac{1}{2}, |r| = 1 \therefore \sum_{n=1}^{\infty} \frac{1}{2} (-1)^n \text{ diverge.}$$

$$4. \sum_{n=1}^{\infty} \left(\frac{5}{2^n} + \frac{1}{3^n} \right) = \sum_{n=1}^{\infty} \frac{5}{2^n} + \sum_{n=1}^{\infty} \frac{1}{3^n}$$

$$\sum_{n=1}^{\infty} \frac{5}{2^n} = \sum_{n=1}^{\infty} 5 \cdot \frac{1}{2^n} = \sum_{n=1}^{\infty} ar^n, \quad a = 5, |r| = \frac{1}{2}, \quad F.T. = \frac{5}{2}$$

The series is converge and the sum is:-

$$\sum_{n=1}^{\infty} \frac{5}{2^n} = \frac{\frac{5}{2}}{1 - \frac{1}{2}} = \frac{\frac{5}{2}}{\frac{1}{2}} = 5 \quad , \therefore \sum_{n=1}^{\infty} \frac{5}{2^n} \rightarrow 5$$

$$\sum_{n=1}^{\infty} \frac{1}{3^n} = \sum_{n=1}^{\infty} 1 \cdot \frac{1}{3^n} = \sum_{n=1}^{\infty} ar^n, \quad a = 1, |r| = \frac{1}{3}, \quad F.T. = \frac{1}{3}$$

The series is converge and the sum is:-

$$\sum_{n=1}^{\infty} \frac{1}{3^n} = \frac{\frac{1}{3}}{1 - \frac{1}{3}} = \frac{\frac{1}{3}}{\frac{2}{3}} = \frac{1}{2} \quad , \therefore \sum_{n=1}^{\infty} \frac{1}{3^n} \rightarrow \frac{1}{2}$$

$$\begin{aligned} \sum_{n=1}^{\infty} \left(\frac{5}{2^n} + \frac{1}{3^n} \right) &= \sum_{n=1}^{\infty} \frac{5}{2^n} + \sum_{n=1}^{\infty} \frac{1}{3^n} = 5 + \frac{1}{2} = \frac{11}{2}, \therefore \sum_{n=1}^{\infty} \left(\frac{5}{2^n} + \frac{1}{3^n} \right) \\ &\rightarrow \frac{11}{2} \end{aligned}$$

Discuss the following series?

$$1. \quad 2 + \frac{2}{3} + \frac{2}{9} + \frac{2}{27} + \cdots + \frac{2}{3^{n-1}} + \cdots$$

$$= \sum_{n=1}^{\infty} 2 \cdot \frac{1}{3^{n-1}} = \sum_{n=1}^{\infty} ar^n, a = 2, r = \frac{1}{3}, F.T. = 2$$

$$|r| < 1 \longrightarrow \sum_{n=1}^{\infty} \left(\frac{2}{3^{n-1}} \right) \text{ converge and the sum is } = \frac{2}{1-\frac{1}{3}} = \frac{2}{\frac{2}{3}} = 3$$

$$\therefore \sum_{n=1}^{\infty} \left(\frac{2}{3^{n-1}} \right) \rightarrow 3$$

$$2. \quad 1 + \frac{4}{3} + \left(\frac{4}{3} \right)^2 + \cdots$$

$$\begin{aligned} \sum_{n=0}^{\infty} \left(\frac{4}{3} \right)^n &= \sum_{n=0}^{\infty} 1 \cdot \left(\frac{4}{3} \right)^n = \sum_{n=0}^{\infty} ar^n \\ a = 1, r = \frac{4}{3} \text{ and } F.T. &= 1 \end{aligned}$$

$$|r| > 1 \longrightarrow \sum_{n=1}^{\infty} \left(\frac{4}{3} \right)^n \text{ diverge.}$$

$$3. \quad 2 - 3 + 8 + 7^2 + 7^3 + 7^4 + \cdots$$

$$= -1 + 1 + 7 + 7^2 + 7^3 + 7^4 + \cdots$$

$$= -1 + \sum_{n=0}^{\infty} (7)^n = \sum_{n=0}^{\infty} ar^n, a = 1, |r| = 7 > 1$$

$$4. \quad 1 - 2 + 4 - 8 + \cdots$$

$$= (-2)^0 + (-2)^1 + (-2)^2 + (-2)^3 + \cdots$$

$$= \sum_{n=0}^{\infty} (-2)^n, , a = 1, |r| = 2 > 1$$

The series is diverge.

$$\begin{aligned} 5. \quad & 3 + 6 + \frac{1}{3} + \frac{1}{3^2} + \frac{1}{3^3} + \cdots \\ & = 8 + 1 + \frac{1}{3} + \frac{1}{3^2} + \frac{1}{3^3} + \cdots \\ & = 8 + \sum_{n=0}^{\infty} \frac{1}{3^n} = \sum_{n=0}^{\infty} 1 \cdot \frac{1}{3^n} = \sum_{n=0}^{\infty} ar^n, \quad a = 1, |r| = \frac{1}{3}, \quad F.T. = 1 \end{aligned}$$

The series is converge and the sum is:-

$$\sum_{n=1}^{\infty} \frac{1}{3^n} = \frac{1}{1 - \frac{1}{3}} = \frac{1}{\frac{2}{3}} = \frac{3}{2}, \quad \therefore 8 + \sum_{n=1}^{\infty} \frac{1}{3^n} \rightarrow 8 + \frac{3}{2} = \frac{19}{2}$$

$$6. \quad 1 + 2(7) + 2(7)^2 + 2(7)^3 + \cdots \text{ H.W.}$$

7. $\sum_{n=1}^{\infty} c = c + c + c + \cdots$ is constant series and geometric series with

$a = c, |r| = 1$ where c is constant and The series is diverge.

Write the geometric series with (Homework).

$$1. a = \frac{1}{5}, r = \frac{2}{3}$$

$$2. a = 3, r = \frac{1}{2}$$

Method of convergence

1. The P-Series Test

$$\sum_{n=1}^{\infty} \frac{1}{n^p}, \quad p > 0 \quad \text{is P - Series}$$

a) If $P > 1 \longrightarrow \sum_{n=1}^{\infty} \frac{1}{n^p}$ is converge.

- b) If $P < 1 \implies \sum_{n=1}^{\infty} \frac{1}{n^p}$ is diverge.
- c) If $P = 1 \implies \sum_{n=1}^{\infty} \frac{1}{n^p}$ is diverge and it's called **Harmonic Series**.

Example:-

- 1) $\sum_{n=1}^{\infty} \frac{1}{n}$, Harmonic Series and P-Series diverge because $p=1$.
- 2) $\sum_{n=1}^{\infty} \frac{3}{n} = 3 \sum_{n=1}^{\infty} \frac{1}{n}$, Harmonic Series and P-Series diverge because $p=1$.
- 3) $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n}}$, P-Series diverge because $p = \frac{1}{2} < 1$.
- 4) $\sum_{n=1}^{\infty} \frac{1}{n^2}$, P-Series converge because $p = 2 > 1$.
- 5) $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n^2}} = \sum_{n=1}^{\infty} \frac{1}{n}$, Harmonic Series and P-Series diverge because $p=1$.
- 6) $\sum_{n=1}^{\infty} \frac{1}{\sqrt[3]{n^3}}$, P-Series converge because $p = \frac{3}{2} > 1$.

2. The n-Ratio n-terms Test:-

Let $\sum_{n=1}^{\infty} a_n$ be a series ; $a_n > 0$, then:-

If $\lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} = L \in R$,

- a) If $L < 1 \implies \sum_{n=1}^{\infty} a_n$ is converge.
- b) If $L > 1 \implies \sum_{n=1}^{\infty} a_n$ is diverge.
- c) If $L = 1 \implies \sum_{n=1}^{\infty} a_n$ the series may by converge or diverge.

Examples :- Are the following series converge ?

i. $\sum_{n=1}^{\infty} \frac{n}{3^n}$

$$\text{Sol. } \lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} = \lim_{n \rightarrow \infty} \frac{\frac{n+1}{3^{n+1}}}{\frac{n}{3^n}} = \lim_{n \rightarrow \infty} \frac{n+1}{3^{n+1}} \cdot \frac{3^n}{n} = \lim_{n \rightarrow \infty} \frac{n+1}{3n}$$

$$= \frac{1}{3} \lim_{n \rightarrow \infty} \left(\frac{n}{n} + \frac{1}{n} \right) = \frac{1}{3} (1 + 0) = \frac{1}{3} < 1$$

$$\therefore \sum_{n=1}^{\infty} \frac{n}{3^n} \rightarrow \frac{1}{3}$$

$$\text{ii. } \sum_{n=1}^{\infty} \frac{2^n + 5}{3^n}$$

$$\begin{aligned} \text{Sol. } \lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} &= \lim_{n \rightarrow \infty} \frac{\frac{2^{n+1} + 5}{3^{n+1}}}{\frac{2^n + 5}{3^n}} = \lim_{n \rightarrow \infty} \frac{2^{n+1} + 5}{3^{n+1}} \cdot \frac{3^n}{2^n + 5} = \\ &\lim_{n \rightarrow \infty} \frac{2^{n+1} + 5}{3(2^n + 5)} \\ &= \frac{1}{3} \lim_{n \rightarrow \infty} \frac{2^n \cdot 2 + 5}{2^n + 5} = \frac{1}{3} \lim_{n \rightarrow \infty} \frac{\frac{2^n \cdot 2 + 5}{2^n}}{\frac{2^n + 5}{2^n}} = \frac{1}{3} \lim_{n \rightarrow \infty} \frac{2 + \frac{5}{2^n}}{1 + \frac{5}{2^n}} = \frac{1}{3} \left(\frac{2+0}{1+0} \right) = \frac{2}{3} < 1 \end{aligned}$$

$$\therefore \sum_{n=1}^{\infty} \frac{2^n + 5}{3^n} \rightarrow \frac{2}{3}$$

$$\text{iii. } \sum_{n=1}^{\infty} \frac{4^n \sqrt{n}}{3^n}$$

$$\begin{aligned} \text{Sol. } \lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} &= \lim_{n \rightarrow \infty} \frac{\frac{4^{n+1} \sqrt{n+1}}{3^{n+1}}}{\frac{4^n \sqrt{n}}{3^n}} = \lim_{n \rightarrow \infty} \frac{4^{n+1} \sqrt{n+1}}{3^{n+1}} \cdot \frac{3^n}{4^n \sqrt{n}} = \\ &\lim_{n \rightarrow \infty} \frac{4 \sqrt{n+1}}{3 \sqrt{n}} \\ &= \frac{4}{3} \lim_{n \rightarrow \infty} \sqrt{\frac{n+1}{n}} = \frac{4}{3} \lim_{n \rightarrow \infty} \sqrt{\frac{\frac{n+1}{n}}{\frac{n}{n}}} = \frac{4}{3} \sqrt{\frac{1+0}{1}} = \frac{4}{3} > 1 \end{aligned}$$

$$\therefore \sum_{n=1}^{\infty} \frac{2^n + 5}{3^n} \text{ diverge.}$$

$$\text{iv. } \sum_{n=1}^{\infty} (-1)^n \frac{n^3}{3^n}$$

$$\text{Sol. } \lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} = \lim_{n \rightarrow \infty} \frac{\frac{(-1)^{n+1} (n+1)^3}{3^{n+1}}}{\frac{(-1)^n n^3}{3^n}} = \lim_{n \rightarrow \infty} \frac{(-1)^{n+1} (n+1)^3}{3^{n+1}} \cdot \frac{3^n}{(-1)^n n^3}$$

$$\begin{aligned}
&= \frac{1}{3} \lim_{n \rightarrow \infty} \left(\frac{n+1}{n} \right)^3 \cdot \frac{(-1)^n \cdot (-1)}{3^n \cdot 3} \cdot \frac{3^n}{(-1)^n} = \frac{-1}{3} \lim_{n \rightarrow \infty} \left(\frac{n}{n} + \frac{1}{n} \right)^3 \\
&= \frac{-1}{3} (1 + 0) = \frac{-1}{3} < 1
\end{aligned}$$

$$\therefore \sum_{n=1}^{\infty} (-1)^n \frac{n^3}{3^n} \rightarrow \frac{-1}{3}$$

3. The Comparison Ratio Test:-

If $\sum_{n=1}^{\infty} a_n$ and $\sum_{n=1}^{\infty} b_n$ are two infinite series such that:

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = L \neq 0$$

Then:

- 1) $\sum_{n=1}^{\infty} a_n$ is converge if and only if $\sum_{n=1}^{\infty} b_n$ is converge.
- 2) $\sum_{n=1}^{\infty} a_n$ is diverge if and only if $\sum_{n=1}^{\infty} b_n$ is diverge.

Examples :- Are the following series converge ?

i. $\sum_{n=1}^{\infty} \frac{1}{2^n - 1}$

Sol. $a_n = \frac{1}{2^n - 1}, \quad b_n = \frac{1}{2^n}$

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{1}{2^n - 1}}{\frac{1}{2^n}} = \lim_{n \rightarrow \infty} \frac{2^n}{2^n - 1} = \lim_{n \rightarrow \infty} \frac{\frac{2^n}{2^n}}{\frac{2^n - 1}{2^n}} = \frac{1}{1 - 0} = 1 \neq 0$$

$$\sum_{n=1}^{\infty} b_n = \sum_{n=1}^{\infty} \frac{1}{2^n} \quad \text{geo. Ser.} \quad |r| = \frac{1}{2} < 1$$

$\therefore \sum_{n=1}^{\infty} \frac{1}{2^n}$ is converge and

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} \neq 0$$

$$\therefore \sum_{n=1}^{\infty} a_n = \sum_{n=1}^{\infty} \frac{1}{2^n - 1} \quad \text{is converge}$$

ii. $\sum_{n=1}^{\infty} \frac{2n}{3n^2 - 4n + 1}$

$$\text{Sol. } a_n = \frac{\frac{2}{n}}{3 - \frac{4}{n} + \frac{1}{n^2}}, \quad b_n = \frac{2}{n}$$

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{2}{n}}{\frac{3 - \frac{4}{n} + \frac{1}{n^2}}{\frac{2}{n}}} = \lim_{n \rightarrow \infty} \frac{1}{3 - \frac{4}{n} + \frac{1}{n^2}} = \frac{1}{3 - 0 + 0} = \frac{1}{3} \neq 0$$

$$\sum_{n=1}^{\infty} b_n = \sum_{n=1}^{\infty} \frac{2}{n} \quad \text{P-Ser.} \quad p = 1$$

$\therefore \sum_{n=1}^{\infty} \frac{2}{n}$ is diverge and

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} \neq 0$$

$\therefore \sum_{n=1}^{\infty} a_n = \sum_{n=1}^{\infty} \frac{2n}{3n^2 - 4n + 1}$ is diverge.

$$\text{iii. } \sum_{n=1}^{\infty} \frac{2n^3 + 100n^2 + 1000}{8n^6 - n + 2} \quad \text{Hint let } b_n = \frac{2}{n^3}$$

$$\text{Sol. } a_n = \frac{\frac{2}{n^3} + \frac{100}{n^4} + \frac{1000}{n^6}}{8 - \frac{1}{n^5} + \frac{2}{n^6}}, \quad b_n = \frac{2}{n^3}$$

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = \lim_{n \rightarrow \infty} \frac{\frac{2}{n^3} + \frac{100}{n^4} + \frac{1000}{n^6}}{\frac{8 - \frac{1}{n^5} + \frac{2}{n^6}}{\frac{2}{n^3}}} = \lim_{n \rightarrow \infty} \frac{1 + \frac{50}{n} + \frac{500}{n^3}}{8 - \frac{1}{n^5} + \frac{2}{n^6}} = \frac{1 + 0 + 0}{8 - 0 + 0} = \frac{1}{8} \neq 0$$

$$\sum_{n=1}^{\infty} b_n = \sum_{n=1}^{\infty} \frac{2}{n^3} \quad \text{P-Ser.} \quad p > 1$$

$\therefore \sum_{n=1}^{\infty} \frac{2}{n^3}$ is converge and

$$\lim_{n \rightarrow \infty} \frac{a_n}{b_n} \neq 0$$

$\therefore \sum_{n=1}^{\infty} a_n = \sum_{n=1}^{\infty} \frac{2n^3 + 100n^2 + 1000}{8n^6 - n + 2}$ is converge.

iv. $\sum_{n=1}^{\infty} \frac{1}{n+1}$ is diverge because $\sum_{n=1}^{\infty} b_n = \sum_{n=1}^{\infty} \frac{1}{n}$ (Homework)

4. The n-th Root Test

Let $\sum_{n=1}^{\infty} a_n$ be infinite series , such that :-

$\lim_{n \rightarrow \infty} \sqrt[n]{a_n} = L \in R$, then :-

- a) If $L < 1 \implies \sum_{n=1}^{\infty} a_n$ is converge.
- b) If $L > 1 \implies \sum_{n=1}^{\infty} a_n$ is diverge.
- c) If $L = 1 \implies \sum_{n=1}^{\infty} a_n$ has no information.

Ex. Discuss the convergence for the following series?

i) $\sum_{n=1}^{\infty} \frac{2^n}{3^n}$

Sol.

$$\lim_{n \rightarrow \infty} \sqrt[n]{a_n} = \lim_{n \rightarrow \infty} \sqrt[n]{\frac{2^n}{3^n}} = \lim_{n \rightarrow \infty} \sqrt[n]{\left(\frac{2}{3}\right)^n} = \frac{2}{3} < 1$$

$$\therefore \sum_{n=1}^{\infty} \frac{2^n}{3^n} \rightarrow \frac{2}{3}$$

ii) $\sum_{n=1}^{\infty} \frac{1}{n^n}$

Sol.

$$\lim_{n \rightarrow \infty} \sqrt[n]{a_n} = \lim_{n \rightarrow \infty} \sqrt[n]{\frac{1}{n^n}} = \lim_{n \rightarrow \infty} \frac{1}{\sqrt[n]{n^n}} = \lim_{n \rightarrow \infty} \frac{1}{n} = 0 < 1$$

$$\therefore \sum_{n=1}^{\infty} \frac{1}{n^n} \rightarrow 0$$

iii) $\sum_{n=1}^{\infty} \frac{2^n}{n^2}$

Sol.

$$\lim_{n \rightarrow \infty} \sqrt[n]{a_n} = \lim_{n \rightarrow \infty} \sqrt[n]{\frac{2^n}{n^2}} = \lim_{n \rightarrow \infty} \frac{\frac{n}{2}}{n^{\frac{2}{n}}} = 2 \lim_{n \rightarrow \infty} \frac{1}{n^{\frac{2}{n}}} = 2 \cdot \frac{1}{\infty^{\frac{2}{n}}} = 2 \cdot \frac{1}{\infty^0} = 2 > 1$$

$\therefore \sum_{n=1}^{\infty} \frac{2^n}{n^2}$ the series is diverge.

iv) $\sum_{n=1}^{\infty} \frac{5^n}{2(3)^n}$

Sol.

$$\lim_{n \rightarrow \infty} \sqrt[n]{a_n} = \lim_{n \rightarrow \infty} \sqrt[n]{\frac{5^n}{2(3)^n}} = \lim_{n \rightarrow \infty} \left(\frac{5}{2}\right)^{\frac{1}{n}} \cdot \frac{n^{\frac{1}{n}}}{3^{\frac{n}{n}}} = \left(\frac{5}{2}\right)^{\frac{1}{\infty}} \cdot \frac{\infty^{\frac{1}{\infty}}}{3} = \left(\frac{5}{2}\right)^0 \cdot \frac{\infty^0}{3}$$

$$= \frac{1}{3} < 1$$

$\therefore \sum_{n=1}^{\infty} \frac{5^n}{2(3)^n}$ the series is convergent .

v) $\sum_{n=1}^{\infty} \frac{5^n}{2(3)^n}$

Sol.

$$\lim_{n \rightarrow \infty} \sqrt[n]{a_n} = \lim_{n \rightarrow \infty} \sqrt[n]{\frac{5^n}{2(3)^n}}$$

$$= \lim_{n \rightarrow \infty} \left(\frac{1}{2}\right)^{\frac{1}{n}} \cdot \left(\frac{5}{3}\right)^{\frac{n}{n}} = \left(\frac{1}{2}\right)^{\frac{1}{\infty}} \cdot \left(\frac{5}{3}\right) = \left(\frac{1}{2}\right)^0 \cdot \left(\frac{5}{3}\right) = \frac{5}{3} > 1$$

$\therefore \sum_{n=1}^{\infty} \frac{5^n}{2(3)^n}$ the series is diverge.

5. The Comparison inequality Test

If $0 \leq a_n \leq b_n \forall n \in N$, then:

- If $\sum_{n=1}^{\infty} a_n$ diverge, then $\sum_{n=1}^{\infty} b_n$ diverge.
- If $\sum_{n=1}^{\infty} b_n$ converge, then $\sum_{n=1}^{\infty} a_n$ converge.

Ex. Are the following series converge?

$$1. \sum_{n=1}^{\infty} \frac{1}{(n+1)^2}$$

Sol.

Is converge since $\sum_{n=1}^{\infty} b_n = \sum_{n=1}^{\infty} \frac{1}{n^2}$ is converge

$$0 \leq \frac{1}{(n+1)^2} \leq \frac{1}{n^2}$$

$$2. \sum_{n=1}^{\infty} \frac{1}{n!}$$

Sol.

$$\sum_{n=1}^{\infty} a_n = \sum_{n=1}^{\infty} \frac{1}{n!}, \sum_{n=1}^{\infty} b_n = \sum_{n=0}^{\infty} \frac{1}{2^n}$$

$$\sum_{n=1}^{\infty} \frac{1}{n!} = \frac{1}{1} + \frac{1}{(2)1} + \frac{1}{(3)(2)1} + \frac{1}{(4)(3)(2)1} + \dots$$

$$\sum_{n=0}^{\infty} \frac{1}{2^n} = \frac{1}{1} + \frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \dots$$

$$0 \leq \frac{1}{n!} \leq \frac{1}{2^n}$$

$\sum_{n=1}^{\infty} a_n$ converge since $\sum_{n=1}^{\infty} b_n$ is converge .

6. The Absolutely Converge Test:-

- If $\sum_{n=1}^{\infty} a_n$ is Absolutely converge if $\sum_{n=1}^{\infty} |a_n|$ is converge.
- If $\sum_{n=1}^{\infty} |a_n|$ is not converge, then $\sum_{n=1}^{\infty} a_n$ is not Absolutely converge.

Ex.

1. $\sum_{n=1}^{\infty} \frac{(-1)^n}{2^n}$ Absolutely converge since $\sum_{n=1}^{\infty} \left| \frac{(-1)^n}{2^n} \right| = \sum_{n=1}^{\infty} \frac{1}{2^n}$

$\sum_{n=1}^{\infty} \frac{1}{2^n}$ geometric series $|r| = \left| \frac{1}{2} \right| < 1$ converge.

The series $\sum_{n=1}^{\infty} \frac{(-1)^n}{2^n}$ is Absolutely converge.

2. $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n^2}$ Absolutely converge since $\sum_{n=1}^{\infty} \left| \frac{(-1)^{n+1}}{n^2} \right| = \sum_{n=1}^{\infty} \frac{1}{n^2}$

$\sum_{n=1}^{\infty} \frac{1}{n^2}$ P-series $p = 2 > 1$ converge.

The series $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n^2}$ is Absolutely converge.

3. $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n}$ is not Absolutely converge since

$\sum_{n=1}^{\infty} \left| \frac{(-1)^{n+1}}{n} \right| = \sum_{n=1}^{\infty} \frac{1}{n}$ the series is diverge.

4. $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{\sqrt{n}}$ is not Absolutely converge since $\sum_{n=1}^{\infty} \left| \frac{(-1)^{n+1}}{\sqrt{n}} \right| = \sum_{n=1}^{\infty} \frac{1}{\sqrt{n}}$

$\sum_{n=1}^{\infty} \frac{1}{\sqrt{n}}$ P-series $p = \frac{1}{2} < 1$ diverge.

Conditional Converge :-

If $\sum_{n=1}^{\infty} (-1)^n a_n$ is converge, but $\sum_{n=1}^{\infty} |a_n|$ is not converge.

$\sum_{n=1}^{\infty} (-1)^n a_n$ Is converge if it satisfies the following condition:-

- $a_n > 0 \quad \forall n \in N.$
- $a_n \geq a_{n+1} \quad \forall n \in N.$
- $\lim_{n \rightarrow \infty} a_n = 0 \quad \forall n \in N.$

We said that the series was Conditional Converge not absolutely converge.

Ex. Do the following series absolutely converge or conditional converge?

1. $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n}$ is not Absolutely converge since

$$\sum_{n=1}^{\infty} \left| \frac{(-1)^{n+1}}{n} \right| = \sum_{n=1}^{\infty} \frac{1}{n} \text{ the series is diverge.}$$

$$a_n > 0 \quad \forall n \in N \rightarrow \frac{1}{n} > 0$$

$$a_n \geq a_{n+1} \rightarrow \frac{1}{n} \geq \frac{1}{n+1}$$

$$\lim_{n \rightarrow \infty} a_n = 0 \rightarrow \lim_{n \rightarrow \infty} \frac{1}{n} = 0$$

$\therefore \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n}$ conditional converge not absolutely converge .

2. $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{\sqrt{n}}$ Is not Absolutely converge, but conditional converge.

(Homework)

3. $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n+1}$ Is not Absolutely converge, but conditional converge.

(Homework)

Theorem:-

If $\sum_{n=1}^{\infty} a_n$ is converge, then $\lim_{n \rightarrow \infty} a_n = 0$.

That means if $\lim_{n \rightarrow \infty} a_n \neq 0$, then $\sum_{n=1}^{\infty} a_n$ is diverge.

4. $\sum_{n=1}^{\infty} (-1)^{n+1} \frac{n}{5n+1}$ Is not Absolutely converge

$$\sum_{n=1}^{\infty} \left| (-1)^{n+1} \frac{n}{5n+1} \right| = \sum_{n=1}^{\infty} \frac{n}{5n+1}$$

$$\lim_{n \rightarrow \infty} a_n = 0 \rightarrow \lim_{n \rightarrow \infty} \frac{n}{5n+1} = \lim_{n \rightarrow \infty} \frac{1}{5 + \frac{1}{n}} = \frac{1}{5} \neq 0$$

By theorem above $\sum_{n=1}^{\infty} \frac{n}{5n+1}$ is diverge.

i.e. $\sum_{n=1}^{\infty} (-1)^{n+1} \frac{n}{5n+1}$ Is not Absolutely converge.

Note: - The converse of the theorem above is not true

If $\lim_{n \rightarrow \infty} a_n = 0 \rightarrow$ this not necessary to be $\sum_{n=1}^{\infty} a_n$ converge.

Ex. Are the series converging or diverging?

1. $\sum_{n=1}^{\infty} \frac{1}{n}$ is diverge

Although $\lim_{n \rightarrow \infty} \frac{1}{n} = 0$.

2. $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n}}$ is diverge

Although $\lim_{n \rightarrow \infty} \frac{1}{\sqrt{n}} = 0$.

3. $\sum_{n=1}^{\infty} \frac{1}{n^3}$ is converge

And $\lim_{n \rightarrow \infty} \frac{1}{n^3} = 0$.

4. $\sum_{n=1}^{\infty} \frac{n}{n+1}$ Is diverge because

$\lim_{n \rightarrow \infty} \frac{n}{n+1} = 1 \neq 0$. By theorem $\therefore \sum_{n=1}^{\infty} a_n$ is diverge.

5. $\sum_{n=1}^{\infty} n^2$

$\because \lim_{n \rightarrow \infty} n^2 = \infty \neq 0 \rightarrow$ By theorem $\therefore \sum_{n=1}^{\infty} a_n$ is diverge.

6. $\sum_{n=1}^{\infty} \sqrt{n}$

$\because \lim_{n \rightarrow \infty} \sqrt{n} = \infty \neq 0 \rightarrow$ By theorem $\therefore \sum_{n=1}^{\infty} a_n$ is diverge.

7. $\sum_{n=1}^{\infty} \frac{n^3}{n\sqrt{n}}$ (Homework)

8. $\sum_{n=1}^{\infty} \frac{n^2+1}{n}$

9. $\sum_{n=1}^{\infty} n$

$$10. \sum_{n=1}^{\infty} \frac{n^2 \sqrt{n}}{n^2 + 1}$$

Ex. Determine whether the given series converge or diverge ?

$$1. \sum_{n=1}^{\infty} \frac{\sqrt{n}}{n^2 + 1}$$

$$2. 1 + \sum_{n=1}^{\infty} \frac{1}{2^n}$$

$$3. \sum_{n=1}^{\infty} \left(\frac{5}{2^n} + \frac{1}{3^n} \right)$$

$$4. \sum_{n=1}^{\infty} \frac{(-1)^n}{3}$$

$$5. \sum_{n=1}^{\infty} \frac{1}{n^2 + 1}$$

$$6. \sum_{n=1}^{\infty} \frac{(n+1)!}{3! n! 3^n}$$

Chapter Two

The power series :- are the series of the form:

$$\sum_{n=0}^{\infty} C_n(x-a)^n = C_0 + C_1(x-a) + C_2(x-a)^2 + \cdots + C_n(x-a)^n + \cdots$$

In which the center a and the coefficients C_0, C_1, \dots are constants.

Ex.: - Taking the coefficients to be 1 in the equation of the power series, we get the geometric power series :

$$\sum_{n=0}^{\infty} 1 \cdot x^n = 1 + x + x^2 + \cdots + x^n + \cdots, \text{ where } a = 1, r = x$$

when $|x| < 1$,

Ex.: - Find the interval of the convergence of the series $\sum_{n=0}^{\infty} x^n$ and the sum of it ?

$$\sum_{n=0}^{\infty} 1 \cdot x^n = \sum_{n=0}^{\infty} a \cdot r^n \quad \text{geometric series}$$

$a = 1, r = x$, is converge when $|r| = |x| < 1 \rightarrow -1 < x < 1 \rightarrow x \in (-1,1)$.

$$\sum_{n=0}^{\infty} x^n = \frac{F.T.}{1-r} = \frac{1}{1-x}, \quad \forall x \in (-1,1)$$

Ex. For the following power series: find the interval of convergene and the sum of it?

$$1 - \frac{1}{2}(x-2) + \frac{1}{4}(x-2)^2 + \cdots + \left(-\frac{1}{2}\right)^n (x-2)^n + \cdots$$

$a = 1, r = -\frac{1}{2}(x-2)$, the series is converge when

$$|r| = \left| -\frac{1}{2}(x-2) \right| < 1 \rightarrow \left| \frac{x-2}{2} \right| < 1 \rightarrow -1 < \frac{x-2}{2} < 1$$

$$-2 < x-2 < 2 \rightarrow 0 < x < 4 \quad x \in (0,4).$$

$$\begin{aligned} \sum_{n=0}^{\infty} \left(-\frac{1}{2}\right)^n (x-2)^n &= \frac{F.T.}{1-r} = \frac{1}{1 - (-\frac{1}{2}(x-2))} \\ &= \frac{1}{1 + \frac{x-2}{2}} = \frac{1}{\frac{2+x-2}{2}} = \frac{2}{x}, \quad \forall x \in (0,4) \end{aligned}$$

Ex. Find the power series if $C_n = 3$ and $a = 2$? And find the interval of convergence and the sum of it? Homework

Sol.

$$\sum_{n=0}^{\infty} 3(x-2)^n$$

The Taylor Series Expansion of $f(x)$ about a or near $x = a$

Let f be a function with derivatives of all orders throughout some interval containing a as an interior point. Then Taylor series generated by f at a is:

$$\begin{aligned} \sum_{k=0}^{\infty} \frac{f^{(k)}(a)}{k!} (x-a)^k \\ = f(a) + f'(a)(x-a) + \frac{f''(a)}{2!} (x-a)^2 + \dots \\ + \frac{f^{(n)}(a)}{n!} (x-a)^n + \dots \end{aligned}$$

Remark:-

When $a=0$, then the series said Maclaurin Series.

$$\sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k = f(0) + f'(0)x + \frac{f''(0)}{2!} x^2 + \dots + \frac{f^{(n)}(0)}{n!} x^n + \dots$$

Ex. : - Find Taylor Series

**Expansion of $f(x) = \frac{1}{x}$ at $a = 2$, and find the convergence sum? or
Find Taylor Series Expansion generated by $f(x) = \frac{1}{x}$ near $a = 2$,
and find the convergence sum?**

Sol.

$$\begin{aligned}
& \sum_{k=0}^{\infty} \frac{f^{(k)}(a)}{k!} (x-a)^k \\
& = f(a) + f'(a)(x-a) + \frac{f''(a)}{2!} (x-a)^2 + \dots \\
& \quad + \frac{f^{(n)}(a)}{n!} (x-a)^n + \dots \\
& = f(2) + f'(2)(x-2) + \frac{f''(2)}{2!} (x-2)^2 + \dots + \frac{f^{(n)}(2)}{n!} (x-2)^n + \dots (*)
\end{aligned}$$

Now we found the derivatives of the function

$$\begin{aligned}
f(x) &= \frac{1}{x} = x^{-1}, f'(x) = -x^{-2}, f''(x) = 2x^{-3}, \\
f'''(x) &= -6x^{-4}, f^{(4)}(x) = 24x^{-5}, \dots, f^{(n)}(x) = (-1)^n \cdot n! \cdot x^{-(n+1)}, \dots
\end{aligned}$$

Now we put a=2

$$\begin{aligned}
f(2) &= \frac{1}{2} = 2^{-1}, f'(2) = -2^{-2}, f''(2) = 2 \cdot 2^{-3}, f'''(2) = -6 \cdot 2^{-4} \\
f^{(4)}(2) &= 24(2)^{-5}, \dots, f^{(n)}(2) = (-1)^n \cdot n! \cdot 2^{-(n+1)}, \dots \\
\frac{f^{(n)}(2)}{n!} &= (-1)^n \cdot 2^{-(n+1)} = \frac{(-1)^n}{2^{(n+1)}}
\end{aligned}$$

Now we put those values in series * and we get

$$\begin{aligned}
f(x) &= f(2) + f'(2)(x-2) + \frac{f''(2)}{2!} (x-2)^2 + \dots + \frac{f^{(n)}(2)}{n!} (x-2)^n \\
&\quad + \dots \\
f(x) &= \frac{1}{2} + -2^{-2}(x-2) + \frac{2 \cdot 2^{-3}}{2!} (x-2)^2 + \dots + \frac{(-1)^n}{2^{(n+1)}} (x-2)^n + \dots \\
f(x) &= \frac{1}{2} - \frac{1}{2^2} (x-2) + \frac{1}{2^3} (x-2)^2 - \dots + \frac{(-1)^n}{2^{(n+1)}} (x-2)^n + \dots \\
f(x) &= \sum_{n=0}^{\infty} \frac{(-1)^n}{2^{(n+1)}} (x-2)^n
\end{aligned}$$

$$f(x) = \sum_{n=0}^{\infty} \frac{1}{2} (-1)^n \left(\frac{1}{2}\right)^n (x-2)^n$$

$$f(x) = \sum_{n=0}^{\infty} \frac{1}{2} \left(-\frac{1}{2}(x-2)\right)^n$$

This is a geometric series $a = \frac{1}{2}$, $r = -\frac{1}{2}(x-2)$ and it's converge at the intervals: $|r| < 1 \rightarrow \left|-\frac{1}{2}(x-2)\right| < 1 \rightarrow \left|\frac{1}{2}(x-2)\right| < 1$

$$-1 < \frac{1}{2}(x-2) < 1 \rightarrow -2 < (x-2) < 2 \rightarrow 0 < x < 4 \quad x \in (0,4)$$

$$\sum_{n=0}^{\infty} ar^n = \frac{F.T.}{1-r} = \frac{\frac{1}{2}}{1 + \frac{x-2}{2}} = \frac{\frac{1}{2}}{\frac{2+x-2}{2}} = \frac{1}{x}$$

Ex. Find the Taylor Series for $f(x) = \frac{1}{x}$ near $a = 1$?(Homework)

Ex. Find the converge interval and the sum if exist?

$$1. \sum_{n=1}^{\infty} \frac{x^n}{n}$$

Sol. We solve this series by using The n-Ratio n-terms test

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{x^{n+1}}{n+1}}{\frac{x^n}{n}} \right| = \lim_{n \rightarrow \infty} \frac{|x|^{n+1}}{n+1} \cdot \frac{n}{|x|^n} = \lim_{n \rightarrow \infty} \frac{|x| \cdot n}{n+1}$$

$$= |x| \cdot 1 < 1 \rightarrow -1 < x < 1 \rightarrow x \in (-1,1).$$

$$2. \sum_{n=0}^{\infty} 2x^n$$

Sol.

$$\sum_{n=0}^{\infty} 2x^n = \sum_{n=0}^{\infty} ar^n = \frac{F.T.}{1-r} = \frac{2}{1-x}$$

$$|r| = |x| < 1 \rightarrow -1 < x < 1, x \in (-1,1).$$

$$3. \sum_{n=0}^{\infty} \frac{(x+2)^n}{3^n}$$

Sol.

$$\sum_{n=0}^{\infty} \mathbf{1} \cdot \frac{(x+2)^n}{3^n} = \sum_{n=0}^{\infty} ar^n = \frac{F.T.}{1-r} = \frac{1}{1 - \frac{x+2}{3}} = \frac{1}{\frac{3-x-2}{3}} = \frac{3}{1-x}$$

$$|r| = \left| \frac{x+2}{3} \right| < 1 \rightarrow -1 < \frac{x+2}{3} < 1 \rightarrow -3 < x+2 < 3$$

$-5 < x < 1$, converge interval $x \in (-5,1)$.

4. $\sum_{n=0}^{\infty} \frac{(x+2)^n}{3^{n+1}}$

Sol.

$$\sum_{n=0}^{\infty} \frac{1}{3} \cdot \frac{(x+2)^n}{3^n} = \sum_{n=0}^{\infty} ar^n = \frac{F.T.}{1-r} = \frac{\frac{1}{3}}{1 - \frac{x+2}{3}} = \frac{\frac{1}{3}}{\frac{3-x-2}{3}} = \frac{1}{1-x}$$

$$|r| = \left| \frac{x+2}{3} \right| < 1 \rightarrow -1 < \frac{x+2}{3} < 1 \rightarrow -3 < x+2 < 3$$

$-5 < x < 1$, converge interval $x \in (-5,1)$.

5. $\sum_{n=0}^{\infty} \frac{(2x-5)^n}{n^2}$

Sol.

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{(2x-5)^n}{n^2} \right|} = \lim_{n \rightarrow \infty} \sqrt[n]{\frac{|(2x-5)^n|}{n^2}}$$

$$= |2x-5| \lim_{n \rightarrow \infty} \frac{1}{\sqrt[n]{n^2}}$$

$$= |2x-5| < 1 \rightarrow -1 < 2x-5 < 1$$

$4 < 2x < 6 \rightarrow 2 < x < 3$, $x \in (2,3)$ converge interval

6. $\sum_{n=0}^{\infty} nx^n$ (Homework)

7. $\sum_{n=0}^{\infty} \frac{x^n}{n+1}$

8. $\sum_{n=1}^{\infty} \frac{(x+5)^n}{n(n+1)}$

9. $\sum_{n=1}^{\infty} (-1)^{n-1} \frac{x^n}{n}$

Ex. Find the Taylor polynomial generated by $f(x) = e^x$ near $x = 0$?

Sol.

$$f(x) = e^x, a = 0$$

$$\sum_{k=0}^n \frac{f^{(k)}(0)}{k!} (x-0)^k = f(0) + f'(0)x + \frac{f''(0)}{2!}x^2 + \cdots + \frac{f^{(n)}(0)}{n!}x^n$$

$$f(x) = e^x \rightarrow f(0) = e^0 = 1.$$

$$f'(x) = e^x \rightarrow f'(0) = e^0 = 1.$$

$$f''(x) = e^x \rightarrow f''(0) = e^0 = 1$$

⋮

$$f^{(n)}(x) = e^x \rightarrow f^{(n)}(0) = e^0 = 1$$

$$\sum_{k=0}^n \frac{f^{(k)}(0)}{k!} x^k = e^0 + e^0 x + \frac{e^0}{2!} x^2 + \cdots + \frac{e^0}{n!} x^n$$

$$e^x = 1 + x + \frac{x^2}{2!} + \cdots + \frac{x^n}{n!} = \sum_{k=0}^n \frac{x^k}{k!}$$

Ex. Find the Taylor polynomial generated by

$$f(x) = e^{-x} \text{ near } x = 0? \text{(Homework).}$$

Ex. Find the Maclaurin Series generated by $f(x) = \cos x$?

Sol.

$$\sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k = f(0) + f'(0)x + \frac{f''(0)}{2!}x^2 + \cdots + \frac{f^{(n)}(0)}{n!}x^n + \cdots$$

$$f(x) = \cos x \rightarrow f(0) = \cos 0 = 1$$

$$f'(x) = -\sin x \rightarrow f'(0) = -\sin 0 = 0$$

$$f''(x) = -\cos x \rightarrow f''(0) = -\cos 0 = -1$$

$$f'''(x) = \sin x \rightarrow f'''(0) = \sin 0 = 0$$

:

$$f^{(2n)}(x) = (-1)^n \cos x \quad n \text{ even} \rightarrow f^{(2n)}(0) = (-1)^n$$

$$f^{(2n+1)}(x) = (-1)^n \sin x \quad n \text{ odd} \rightarrow f^{(2n+1)}(0) = 0$$

$$f(x) = \cos x = f(0) + f'(0)x + \frac{f''(0)}{2!}x^2 + \cdots + \frac{f^{(n)}(0)}{n!}x^n + \cdots$$

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} \cdots + \frac{(-1)^n}{(2n)!}x^{2n} + \cdots$$

$$\cos x = \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k)!} x^{2k}$$

Ex. Find the Maclaurin polynomial for $f(x) = \sin x$?

Sol.

$$f(x) = \sum_{k=0}^n \frac{f^{(k)}(0)}{k!} x^k$$

$$f(x) = \sin x = f(0) + f'(0)x + \frac{f''(0)}{2!}x^2 + \cdots + \frac{f^{(n)}(0)}{n!}x^n$$

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} \cdots + \frac{(-1)^{2n-1}}{(2n-1)!}x^{2n-1}$$

$$\sin x = \sum_{k=0}^n \frac{(-1)^{2k-1}}{(2k-1)!} x^{2k-1}$$

Computation of Logarithms:-

From Taylor series expansion, we get

$$\ln(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \cdots + (-1)^n \frac{x^n}{n} + \cdots$$

And

$$\ln(1-x) = -x - \frac{x^2}{2} - \frac{x^3}{3} - \cdots - \frac{x^n}{n} + \cdots$$

$$\ln \frac{1+x}{1-x} = \ln(1+x) - \ln(1-x)$$

$$\ln \frac{1+x}{1-x} = 2\left(x + \frac{x^3}{3} + \frac{x^5}{5} + \dots + \frac{x^{2n-1}}{2n-1} + \dots\right)$$

$$\text{Now put } \frac{N+1}{N} = \frac{(1+x)}{(1-x)}$$

$$N(1+x) = (N+1)(1-x)$$

$$N + Nx = N - Nx + 1 - x$$

$$2Nx + x = 1 \rightarrow x(2N+1) = 1 \rightarrow x = \frac{1}{(2N+1)}$$

$$\ln \frac{N+1}{N} = 2\left(\frac{1}{(2N+1)} + \frac{1}{3(2N+1)^3} + \frac{1}{5(2N+1)^5} + \dots\right)$$

Ex. By approximate find $\ln 2$?

$$\text{Sol. } \ln 2 = \ln \frac{1+1}{1} = 2\left(\frac{1}{(2(1)+1)} + \frac{1}{3(2(1)+1)^3} + \frac{1}{5(2(1)+1)^5} + \dots\right)$$

$$\ln 2 = 2\left(\frac{1}{3} + \frac{1}{3^4} + \frac{1}{5(3)^5} + \dots\right)$$

$$= 2(0.333 + 0.0123 + 0.0008 + \dots)$$

$$\cong 2(0.3464) \cong 0.69314$$

$$\ln 2 \cong 0.69314$$

The logarithms of the number $\frac{2}{1}, \frac{3}{2}, \frac{4}{3}, \frac{5}{4}, \dots, \frac{N+1}{N}$ are ordinarily computed first informing a table of natural logarithms of the integers.

Then it is a matter of simple arithmetic to compute:-

$$\ln 3 = \ln \frac{2}{1} + \ln \frac{3}{2}$$

$$\ln 4 = \ln 3 + \ln \frac{4}{3}$$

$$\ln 5 = \ln 4 + \ln \frac{5}{4}$$

⋮

$$\ln(N+1) = \ln N + \ln \frac{N+1}{N}$$

Ex. Construct a table of natural logarithms in N for $N = 1, 2, 3, \dots, 10$ by the method discussed in connection with equation

$$\ln \frac{N+1}{N} = 2\left(\frac{1}{(2N+1)} + \frac{1}{3(2N+1)^3} + \frac{1}{5(2N+1)^5} + \dots\right)$$

But taking advantage of the relationships:-

$$\ln 4 = 2\ln 2, \quad \ln 6 = \ln 2 + \ln 3, \quad \ln 8 = 3\ln 2$$

$$\ln 9 = 2\ln 3, \quad \ln 10 = \ln 2 + \ln 5$$

Properties :-

$$\ln(a.b) = \ln a + \ln b$$

$$\ln \frac{a}{b} = \ln a - \ln b$$

$$\ln a^k = k \ln a$$

Fourier Series

A Fourier series is an infinite series expansion in terms of trigonometric functions of $f(x)$ on the interval $(0, 2\pi)$ is

$$f(x) = a_o + \sum_{k=1}^{\infty} [a_k \cos kx + b_k \sin kx]$$

Where

$$a_o = \frac{1}{2\pi} \int_0^{2\pi} f(x) dx$$

and

$$a_k = \frac{1}{\pi} \int_0^{2\pi} f(x) \cos kx dx \quad \text{for } k = 0, 1, 2, 3, \dots, n$$

$$b_k = \frac{1}{\pi} \int_0^{2\pi} f(x) \sin kx dx$$

Ex. Find the Fourier series for

$$f(x) = \begin{cases} 1 & 0 \leq x \leq \pi \\ 2 & \pi < x \leq 2\pi \end{cases}$$

Sol.

$$f(x) = a_o + \sum_{k=1}^{\infty} [a_k \cos kx + b_k \sin kx] \quad (1)$$

$$a_o = \frac{1}{2\pi} \int_0^{2\pi} f(x) dx$$

$$a_o = \frac{1}{2\pi} \left(\int_0^{\pi} 1 dx + \int_{\pi}^{2\pi} 2 dx \right)$$

$$= \frac{1}{2\pi} [x|_0^{\pi} + 2x|_{\pi}^{2\pi}]$$

$$= \frac{1}{2\pi} [\pi - 0 + 2(2\pi - \pi)]$$

$$= \frac{1}{2\pi} [\pi + 2\pi] = \frac{3\pi}{2\pi}$$

$$\therefore a_o = \frac{3}{2}$$

$$a_k = \frac{1}{\pi} \int_0^{2\pi} f(x) \cos kx \ dx$$

$$\begin{aligned} a_k &= \frac{1}{\pi} \left(\int_0^{\pi} \cos kx \ dx + \int_{\pi}^{2\pi} 2 \cos kx \ dx \right) \\ &= \frac{1}{\pi} \left[\frac{\sin kx}{k} \Big|_0^{\pi} + 2 \frac{\sin kx}{k} \Big|_{\pi}^{2\pi} \right] \quad ; k = 1, 2, 3, \dots, n \\ &= \frac{1}{\pi} \left[\frac{1}{k} (\sin k\pi - \sin 0) + \frac{2}{k} (\sin k2\pi - \sin k\pi) \right] \\ &= \frac{1}{\pi} \left[\frac{1}{k} (0 - 0) + \frac{2}{k} (0 - 0) \right] = \frac{1}{\pi} (0) = 0 \end{aligned}$$

$$b_k = \frac{1}{\pi} \int_0^{2\pi} f(x) \sin kx \ dx$$

$$\begin{aligned} b_k &= \frac{1}{\pi} \left(\int_0^{\pi} \sin kx \ dx + \int_{\pi}^{2\pi} 2 \sin kx \ dx \right) \\ &= \frac{1}{\pi} \left[-\frac{\cos kx}{k} \Big|_0^{\pi} - 2 \frac{\cos kx}{k} \Big|_{\pi}^{2\pi} \right] \quad ; k = 1, 2, 3, \dots, n \\ &= \frac{1}{\pi} \left[\frac{1}{k} (-\cos k\pi + \cos 0) + \frac{2}{k} (-\cos k2\pi + \cos k\pi) \right] \\ &= \frac{1}{\pi k} [(-\cos k\pi + 1) + 2(-1 + \cos k\pi)] \\ &= \frac{1}{\pi k} (\cos k\pi - 1) \quad ; k = 1, 2, 3, \dots, n \end{aligned}$$

$$\therefore b_k = \frac{(-1)^k - 1}{k\pi}, \quad b_k = \begin{cases} \frac{-2}{k\pi} & \text{if } k \text{ odd} \\ 0 & \text{if } k \text{ even} \end{cases}$$

$$b_1 = \frac{-2}{\pi}, \quad b_2 = 0, \quad b_3 = \frac{-2}{3\pi}, \quad b_4 = 0, \quad b_5 = \frac{-2}{5\pi}$$

Now we put the a_0, a_k, b_k in the series (1), we get:-

$$f(x) = \frac{3}{2} + \sum_{k=1}^{\infty} [0(\cos kx) + b_k \sin kx]$$

$$\begin{aligned} f(x) &= \frac{3}{2} + \sum_{k=1}^{\infty} [b_k \sin kx] \\ &= \frac{3}{2} + [b_1 \sin x + b_3 \sin 3x + b_5 \sin 5x + \dots] \end{aligned}$$

$$\therefore f(x) = \frac{3}{2} - \frac{2}{\pi} \left[\sin x + \frac{\sin 3x}{3} + \frac{\sin 5x}{5} + \dots \right]$$

Ex2. $F(x) = 3, \quad 0 \leq x \leq 2\pi$ find the Fourier series?

Sol.

$$f(x) = a_0 + \sum_{k=1}^{\infty} [a_k \cos kx + b_k \sin kx] \quad (*)$$

$$a_0 = \frac{1}{2\pi} \int_0^{2\pi} f(x) dx = \frac{1}{2\pi} \int_0^{2\pi} 3 dx$$

$$= \frac{1}{2\pi} [3x|_0^{2\pi}]$$

$$= \frac{1}{2\pi} 3(2\pi - 0)$$

$$= \frac{6\pi}{2\pi}$$

$$\therefore a_0 = 3$$

$$a_k = \frac{1}{\pi} \int_0^{2\pi} f(x) \cos kx \, dx$$

$$a_k = \frac{1}{\pi} \left(\int_0^{2\pi} 3 \cos kx \, dx \right)$$

$$= \frac{1}{\pi} \left[3 \frac{\sin kx}{k} \Big|_0^{2\pi} \right] ; k = 1, 2, 3, \dots, n$$

$$= \frac{1}{\pi} \left[\frac{3}{k} (\sin k 2\pi - \sin k 0) \right]$$

$$= \frac{1}{\pi} \left[\frac{3}{k} (0 - 0) \right] = \frac{1}{\pi} (0) = 0$$

$$b_k = \frac{1}{\pi} \int_0^{2\pi} f(x) \sin kx \, dx$$

$$b_k = \frac{1}{\pi} \left(\int_0^{2\pi} 3 \sin kx \, dx \right)$$

$$= \frac{1}{\pi} \left[-3 \frac{\cos kx}{k} \Big|_0^{2\pi} \right] ; k = 1, 2, 3, \dots, n$$

$$= \frac{3}{\pi k} (-\cos k 2\pi + \cos k 0)$$

$$= \frac{3}{\pi k} (-1 + 1) = \frac{3}{\pi k} (0)$$

Now we put the a_0, a_k, b_k in the series (*), we get:-

$$f(x) = 3 + \sum_{k=1}^{\infty} [0(\cos kx) + 0(\sin kx)]$$

$$\therefore f(x) = 3$$

Ex.3:- $f(x) = x, \forall 0 \leq x \leq 2\pi$ find the Fourier series?

Sol.

$$f(x) = a_o + \sum_{k=1}^{\infty} [a_k \cos kx + b_k \sin kx] \quad (*)$$

$$a_o = \frac{1}{2\pi} \int_0^{2\pi} f(x) dx = \frac{1}{2\pi} \int_0^{2\pi} x dx$$

$$= \frac{1}{2\pi} \left[\frac{x^2}{2} \right]_0^{2\pi}$$

$$= \frac{1}{4\pi} (x^2|_0^{2\pi})$$

$$= \frac{4\pi^2}{4\pi}$$

$$\therefore a_o = \pi$$

$$a_k = \frac{1}{\pi} \int_0^{2\pi} f(x) \cos kx dx$$

$$a_k = \frac{1}{\pi} \left(\int_0^{2\pi} x \cos kx dx \right)$$

By using $udv = v \cdot u - \int vdu$

$$u = x, \quad du = dx, \quad dv = \cos kx dx, \quad v = \frac{\sin kx}{k}$$

$$= \frac{1}{\pi} \left[x \cdot \frac{\sin kx}{k} \Big|_0^{2\pi} - \int_0^{2\pi} \frac{\sin kx}{k} dx \right]$$

$$= \frac{1}{\pi} \left[\left(2\pi \cdot \frac{\sin k2\pi}{k} - 0 \right) + \frac{\cos kx|_0^{2\pi}}{k^2} \right]$$

$$= \frac{1}{\pi} \left[\left(2\pi \cdot \frac{0}{k} - 0 \right) + \frac{\cos k2\pi - \cos k0}{k^2} \right]$$

$$a_k = 0$$

$$b_k = \frac{1}{\pi} \left(\int_0^{2\pi} x \sin kx \, dx \right)$$

By using $udv = v \cdot u - \int vdu$

$$\begin{aligned} u &= x, & du &= dx, & dv &= \sin kx \, dx, & v &= \frac{-\cos kx}{k} \\ &= \frac{1}{\pi} \left[-x \cdot \frac{\cos kx}{k} \Big|_0^{2\pi} + \int_0^{2\pi} \frac{\cos kx}{k} \, dx \right] \\ &= \frac{1}{\pi} \left[\left(-2\pi \cdot \frac{\cos k2\pi}{k} + 0 \right) + \frac{\sin kx}{k^2} \Big|_0^{2\pi} \right] \\ &= \frac{1}{\pi} \left[\left(-2\pi \cdot \frac{1}{k} \right) + \frac{\sin k2\pi - \sin k0}{k^2} \right] = \frac{1}{\pi} \left(-2\pi \cdot \frac{1}{k} \right) + \frac{0 - 0}{k^2} \\ \therefore b_k &= \frac{-2}{k} \end{aligned}$$

Now we put the a_0, a_k, b_k in the series (*), we get:-

$$f(x) = \pi + \sum_{k=1}^{\infty} \left[0(\cos kx) - \frac{2}{k} (\sin kx) \right]$$

$$\therefore f(x) = \pi - \frac{2}{k} \sum_{k=1}^{\infty} (\sin kx)$$

Ex. Find the Fourier series associated with the following functions. Sketch each functions?

$$1- f(x) = \begin{cases} 0 & 0 \leq x \leq \pi \\ 1 & \pi < x \leq 2\pi \end{cases}$$

$$2- f(x) = \begin{cases} -1 & 0 \leq x \leq \pi \\ 1 & \pi < x \leq 2\pi \end{cases}$$

$$3- f(x) = 3x, \quad 0 \leq x \leq 2\pi$$

$$4- f(x) = \begin{cases} 2 & 0 \leq x \leq \pi \\ x & \pi < x \leq 2\pi \end{cases}$$

$$5- f(x) = \begin{cases} x & 0 \leq x \leq \pi \\ -x & \pi < x \leq 2\pi \end{cases}$$

Chapter Three

The vectors

The vectors

Let $P_1 = (x_1, y_1)$ and $P_2 = (x_2, y_2)$ be two points in RXR, then $\overrightarrow{P_1 P_2}$ or $\overrightarrow{P_2 P_1}$ are vectors where :-

$$\overrightarrow{P_1 P_2} = (x_2 - x_1, y_2 - y_1)$$

$$\overrightarrow{P_2 P_1} = (x_1 - x_2, y_1 - y_2)$$

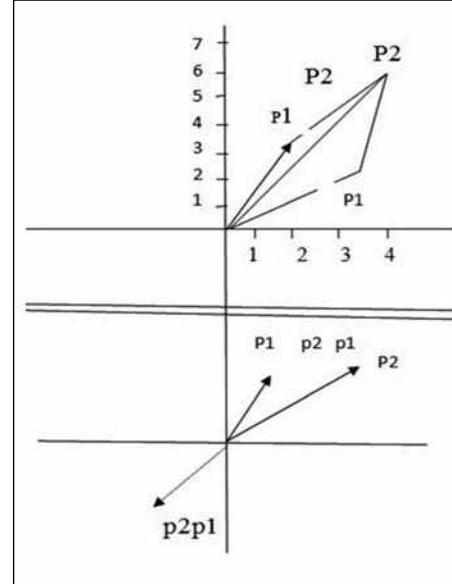

Ex. $P_1 = (2, 3)$, $P_2 = (4, 7)$

$$\overrightarrow{P_1 P_2} = (4 - 2, 7 - 3)$$

$$= (2, 4)$$

$$\overrightarrow{P_2 P_1} = (2 - 4, 2 - 7)$$

$$= (-2, -4)$$

Ex. $P_1 = (4, 2)$, $P_2 = (-3, 5)$ find $\overrightarrow{P_1 P_2}$ and

$\overrightarrow{P_2 P_1}$? (Homework)

- If $P = (x, y)$, $O = (0, 0)$, then

$$\overrightarrow{OP} = (x - 0, y - 0) = (x, y)$$

$$\overrightarrow{PO} = (0 - x, 0 - y) = (-x, -y)$$

$$\vec{V} = (a, b) = (a, 0) + (0, b)$$

$$= a(1,0) + b(0,1)$$

$$\therefore \vec{V} = ai + bj$$

$$\text{slop } m = \frac{b}{a} = \tan \theta$$

$$(3,4) = 3i + 4j$$

The Length of \vec{V} :-

We denote for The Length of \vec{V} by $|\vec{V}|$ for the vector

$\vec{V} = xi + yj$ which equal :-

$$|\vec{V}| = \sqrt{x^2 + y^2}$$

Ex. Find The Length of

1- $\vec{V} = 5i + 7j$

2- $\vec{V} = 4j$

3- $\vec{V} = -3i$ (Homework)

4- $\vec{V} = -i - j$ (Homework)

Sol. 1-

$$|\vec{V}| = \sqrt{5^2 + 7^2} = \sqrt{25 + 49} = \sqrt{74}$$

Sol. 2-

$$|\vec{V}| = \sqrt{0^2 + 4^2} = \sqrt{0 + 16} = \sqrt{16} = 4$$

The Zero Vector:-

$$\vec{0} = 0i + 0j = (0, 0)$$

$$|\vec{0}| = \sqrt{0^2 + 0^2} = 0$$

The Unit Vector:-

$u = xi + yj$ when $|u| = 1$, then u is said to be a unit vector.

- $i(1, 0) \Rightarrow |i| = \sqrt{1^2 + 0^2} = 1, i$ is a unit vector.

- $j(0, 1) \Rightarrow |j| = \sqrt{0^2 + 1^2} = 1, j$ is a unit vector.

- $u = \cos \theta i + \sin \theta j$

$$\Rightarrow |u| = \sqrt{(\cos \theta)^2 + (\sin \theta)^2} = 1, u$$
 is a unit vector.

To find a unit vector for any vector

We must find the direction of vector V is $\frac{V}{|V|}$ which is the unit vector such that $\left| \frac{V}{|V|} \right| = 1$.

Ex. $\vec{V} = 3i - 4j$ find a unit vector for \vec{V} ?

Sol.

$$u = \frac{V}{|V|} ; |u| = 1$$

$$|V| = \sqrt{3^2 + (-4)^2} = \sqrt{9 + 16} = \sqrt{25} = 5$$

$$u = \frac{V}{|V|} = \frac{3i - 4j}{5} = \frac{3}{5}i - \frac{4}{5}j$$

$\therefore u$ is the unit vector such that:

$$|u| = \left| \frac{V}{|V|} \right| = \sqrt{\left(\frac{3}{5}\right)^2 + \left(\frac{4}{5}\right)^2} = \sqrt{\frac{9}{25} + \frac{16}{25}} = \sqrt{\frac{25}{25}} = 1$$

Propositions:-

If $V_1 = a_1\mathbf{i} + b_1\mathbf{j}$ & $V_2 = a_2\mathbf{i} + b_2\mathbf{j}$ are two vectors :

$$1- V_1 + V_2 = (a_1 + a_2)\mathbf{i} + (b_1 + b_2)\mathbf{j}$$

$$V_2 + V_1 = (a_2 + a_1)\mathbf{i} + (b_2 + b_1)\mathbf{j}$$

$$\text{Where } V_1 + V_2 = V_2 + V_1$$

$$2- V_1 - V_2 = (a_1 - a_2)\mathbf{i} + (b_1 - b_2)\mathbf{j}$$

$$V_2 - V_1 = (a_2 - a_1)\mathbf{i} + (b_2 - b_1)\mathbf{j}$$

$$V_1 - V_2 = -(V_2 - V_1)$$

$$3- cV_1 = ca_1\mathbf{i} + cb_1\mathbf{j} = c(a_1\mathbf{i} + b_1\mathbf{j})$$

$$4- c(V_1 \pm V_2) = cV_1 \pm cV_2$$

Ex. If $V_1 = 3\mathbf{i} + 5\mathbf{j}$ & $V_2 = 3\mathbf{i} - 2\mathbf{j}$, find ?

$$V_1 + V_2 = 6\mathbf{i} + 3\mathbf{j}$$

$$V_2 + V_1 =$$

$$V_1 + V_1 =$$

$$V_1 - V_2 =$$

$$3V_1 =$$

$$2(5V_1 - V_2) - V_1 =$$

Def.: Two vectors $V_1 = a_1\mathbf{i} + b_1\mathbf{j}$ & $V_2 = a_2\mathbf{i} + b_2\mathbf{j}$ are

equal iff $V_1 = V_2 \Rightarrow a_1\mathbf{i} + b_1\mathbf{j} = a_2\mathbf{i} + b_2\mathbf{j}$

$$a_1 = a_2 \text{ and } b_1 = b_2$$

Ex. Show that $V_1 = 3\mathbf{i} + 7\mathbf{j}$ & $V_2 = \frac{15}{5}\mathbf{i} + \left(\frac{12}{2} + 1\right)\mathbf{j}$ are equal ?

Sol.

$$3 = \frac{15}{5} \quad \& \quad 7 = \frac{12}{2} + 1$$

$$\therefore V_1 = V_2$$

Ex. If P_1 is the point (1,3) and $P_2(2,-1)$ find $\overrightarrow{P_1P_2}$, $\overrightarrow{P_2P_1}$,

$$5\overrightarrow{P_1P_2} - 3\overrightarrow{P_2P_1} \quad ?(\text{Homework}).$$

Ex. Find $\overrightarrow{OP_3}$ if O is the origin point and P_3 is the mid point

of the vector $\overrightarrow{P_1P_2}$ joining $P_1(2,-1)$ and $P_2(-4,3)$?

Sol.

$$P_3 = \frac{P_1 + P_2}{2}$$

$$P_1(2,-1), P_2(-4,3)$$

$$P_3 = \left(\frac{2-4}{2}, \frac{-1+3}{2} \right)$$

$$P_3 = (-1, 1) \text{ & } O = (0, 0)$$

$$\overrightarrow{OP_3} = (-1 - 0, 1 - 0) = (-1, 1)$$

Ex. Find the vector from the point A (2,3) to the origin point?

Sol.

$$\overrightarrow{AO} = (0 - 2, 0 - 3) = (-2, -3)$$

Ex. Find the sum of the vector \overrightarrow{AB} and \overrightarrow{CD} , from the four

given points A(1,-1) , B(2,0) , C(-1,3) , D(-2,2)?

Sol.

$$\overrightarrow{AB} = (2 - 1, 0 + 1) = (1, 1)$$

$$\overrightarrow{CD} = (-2 + 1, 2 - 3) = (-1, -1)$$

$$\overrightarrow{AB} + \overrightarrow{CD} = (1, 1) + (-1, -1) = (0, 0)$$

Ex. Find the length and direction of the following vectors:-

$$1- i + j \Rightarrow |i + j| = \sqrt{1^2 + 1^2} = \sqrt{2}$$

$$2- \sqrt{3}i + j \Rightarrow$$

$$3- 2i - 3j \Rightarrow$$

$$4- 5i + 12j \Rightarrow$$

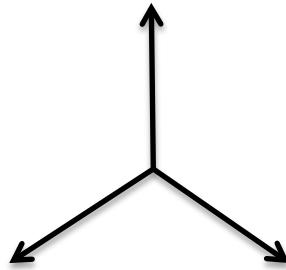

$$5- -2i + 3j \Rightarrow$$

Space Co-ordinates Vectors In Space

The vector in the 3D is $V = (a, b, c)$ or $V = (x, y, z)$

Let \mathbf{V} be a vector from the origin point to the point $P(x, y, z)$.

$$\overrightarrow{OP} = \vec{V} = (x, y, z)$$

Ex. Locate (plot) the following points:-

$$P_1(1, 2, 3), P_2(1, 2, -3), P_3(1, -2, 3), P_4(-1, 2, 3), P_5(1, -2, -3)$$

$$, P_6(-1, 2, -3), P_7(-1, -2, 3), P_8(-1, -2, -3).$$

The vector between two points in space

Let $P_1(x_1, y_1, z_1)$ & $P_2(x_2, y_2, z_2)$ be two points

$$\overrightarrow{P_1P_2} = (x_2 - x_1, y_2 - y_1, z_2 - z_1)$$

$$\overrightarrow{P_2P_1} = (x_1 - x_2, y_1 - y_2, z_1 - z_2)$$

$$\overrightarrow{OP} = (x - 0, y - 0, z - 0) = (x, y, z)$$

$$\vec{V} = (a, b, c) \leftrightarrow V = ai + bj + ck$$

$$|V| = \sqrt{a^2 + b^2 + c^2}, \quad |\overrightarrow{OP}| = \sqrt{x^2 + y^2 + z^2}$$

The Direct of Vector in Space

$$dir(V) = \frac{V}{|V|}$$

The Distant Between Two Point in Space

$$|\overrightarrow{P_1P_2}| = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}$$

$$V_1 = (x_1, y_1, z_1), \quad V_2 = (x_2, y_2, z_2),$$

Prove that $V_1 + V_2 = V_2 + V_1$

Sol.

$$1) \quad V_1 + V_2 = (x_1 + x_2, y_1 + y_2, z_1 + z_2)$$

$$= (x_2 + x_1, y_2 + y_1, z_2 + z_1)$$

$$= (x_2, y_2, z_2) + (x_1, y_1, z_1)$$

$$= V_2 + V_1$$

$$\therefore V_1 + V_2 = V_2 + V_1$$

$$2) \quad V_1 + V_2 = (x_1 - x_2, y_1 - y_2, z_1 - z_2)$$

$$V_2 - V_1 = (x_2 - x_1, y_2 - y_1, z_2 - z_1)$$

$$3) \quad CV = (cx, cy, cz)$$

$$4) \quad \overrightarrow{V_1} \parallel \overrightarrow{V_2} \rightarrow \exists \ C \in \mathbf{R} \text{ s.t. } \overrightarrow{V_1} = C \overrightarrow{V_2}$$

$$\mathbf{V}_1 = \mathbf{C}\mathbf{V}_2 \quad \text{OR} \quad \mathbf{V}_2 = \mathbf{C}\mathbf{V}_1$$

Such that $c = \frac{x_1}{x_2} = \frac{y_1}{y_2} = \frac{z_1}{z_2}$

5) If $\mathbf{V} = (a, b, c) = \mathbf{O} (0, 0, 0) = o\mathbf{i} + o\mathbf{j} + o\mathbf{k}$

$$\rightarrow a = b = c = 0$$

6) $\vec{\mathbf{V}}_1 \perp \vec{\mathbf{V}}_2, \theta = \frac{\pi}{2} \& \vec{\mathbf{V}}_1 \cdot \vec{\mathbf{V}}_2 = 0$ تعاون متجهين

$$\vec{A} \times \vec{B} = \begin{vmatrix} i & j & k \\ a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \end{vmatrix} \quad \left\{ \begin{array}{l} \vec{A} = a_1 i + b_1 j + c_1 k \\ \vec{B} = a_2 i + b_2 j + c_2 k \end{array} \right.$$

$$= i \begin{vmatrix} b_1 & c_1 \\ b_2 & c_2 \end{vmatrix} - j \begin{vmatrix} a_1 & c_1 \\ a_2 & c_2 \end{vmatrix} + k \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}$$

$$= i(b_1c_2 - c_1b_2) - j(a_2c_2 - a_1c_1) + k(a_1b_2 - a_2b_1)$$

(Ex.) : $\vec{A} = 3i + 7j - k$, $\vec{B} = i + j + 3k$

$$\vec{A} \times \vec{B} = \begin{vmatrix} i & j & k \\ 3 & 7 & -1 \\ 1 & 1 & 3 \end{vmatrix}$$

$$= i(7(3) - (-1)(1)) - j(3(3) - 1)(+1) + k(3(1) - 7(+1))$$

$$= 22i - 10j - 4k$$

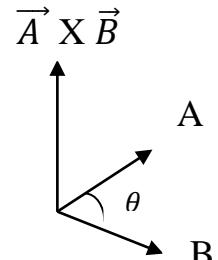

تعريف آخر للضرب الاتجاهي

A nother Diffenition for $\vec{A} \times \vec{B}$:-

$$\vec{A} \times \vec{B} = \vec{n} |A| |B| \sin \theta$$

$$\vec{n} = \frac{\vec{A} \times \vec{B}}{|A||B|\sin \theta}$$

متجه وحدة

(Ex) Find the unit vector \vec{n} If $\vec{A} = i + j$ & $\vec{B} = j - k$??

Sol. $\vec{A} \times \vec{B} = \begin{vmatrix} i & j & k \\ 1 & 1 & 0 \\ 0 & 1 & -1 \end{vmatrix}$

$$= i \begin{vmatrix} 1 & 0 \\ 1 & -1 \end{vmatrix} - j \begin{vmatrix} 1 & 0 \\ 0 & -1 \end{vmatrix} + k \begin{vmatrix} 1 & 1 \\ 0 & 1 \end{vmatrix}$$

$$= i(1(-1) - 0(1)) - j(1(-1) - 0(0)) + k(1(1) - 1(0))$$

$$\vec{A} \times \vec{B} = -\mathbf{i} + \mathbf{j} + \mathbf{k}$$

$$\mathbf{A} \cdot \mathbf{B} = 1(0) + 1(+1) 0(-1) = 1$$

$$\cos \theta = \frac{\mathbf{A} \cdot \mathbf{B}}{|\mathbf{A}| |\mathbf{B}|} = \frac{1}{\sqrt{2} \sqrt{2}} = \frac{1}{2}$$

$$|\mathbf{A}| = \sqrt{1^2 + 1^2 + 0^2} = \sqrt{2}$$

$$|\mathbf{B}| = \sqrt{0^2 + 1^2 + (-1)^2} = \sqrt{2}$$

$$\therefore \theta = \cos^{-1} \left(\frac{1}{2} \right) \rightarrow \theta = \frac{\pi}{3} \text{ } {}^\circ \quad \sin \theta = \frac{\sqrt{3}}{2}$$

$$\vec{n} = \frac{\vec{A} \times \vec{B}}{|\mathbf{A}| |\mathbf{B}| \sin \theta}$$

$$= \frac{(-i+j+k)}{\sqrt{2} \sqrt{2} \frac{\sqrt{3}}{2}} = \frac{-1}{\sqrt{3}} \mathbf{i} + \frac{1}{\sqrt{3}} \mathbf{j} + \frac{1}{\sqrt{3}} \mathbf{k}$$

$$|\vec{n}| = \sqrt{\left(\frac{-1}{\sqrt{3}}\right)^2 + \left(\frac{1}{\sqrt{3}}\right)^2 + \left(\frac{1}{\sqrt{3}}\right)^2}$$

$$= \sqrt{\frac{1}{3} + \frac{1}{3} + \frac{1}{3}} = \sqrt{\frac{3}{3}} = 1$$

$\therefore \vec{n}$ is unit vector

(Ex.) If $\vec{A} = \mathbf{i} + 4\mathbf{j} + \mathbf{k}$, $\mathbf{B} = -2\mathbf{i} + \mathbf{j} - 2\mathbf{k}$? Is $\mathbf{A} \perp \mathbf{B}$?

Sol. $\mathbf{A} \cdot \mathbf{B} ?$ ($\text{If } \mathbf{A} \cdot \mathbf{B} = 0 \text{ Then } \mathbf{A} \perp \mathbf{B}$)

$$= 1(-2) + 4(1) + 1(-2)$$

$$= -2 + 4 - 2 = 0$$

$$\therefore \mathbf{A} \cdot \mathbf{B} = 0 \rightarrow \text{i.e } \mathbf{A} \perp \mathbf{B}$$

Remark : If $\vec{A} \parallel \vec{B} \rightarrow \theta = \text{Zero} = 0^\circ$

$$\sin 0 = 0 \rightarrow \therefore \vec{A} \times \vec{B} = \text{Zero} \rightarrow \vec{A} \times \vec{B} = \vec{n} |\mathbf{A}| |\mathbf{B}| \sin \theta = 0$$

Propositions :-

$$1) \vec{A} \times \vec{B} = \vec{B} \times \vec{A}$$

$$2) \mathbf{A} \times (\mathbf{C} + \mathbf{C}) = (\mathbf{A} \times \mathbf{B}) + (\mathbf{A} \times \mathbf{C})$$

$$3) \mathbf{A} \times \mathbf{A} = 0 \quad \text{Since } \theta = 0 \quad \theta = 0 \nearrow \mathbf{A}$$

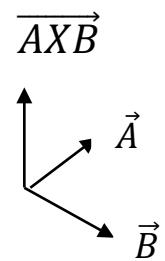

$$4) \mathbf{i} \times \mathbf{i} = \mathbf{j} \times \mathbf{j} = \mathbf{k} \times \mathbf{k} = 0$$

$$5) \mathbf{A} \cdot (\vec{A} \times \vec{B}) = \mathbf{B} \cdot (\vec{B} \times \vec{A})$$

$$= \text{Zero}$$

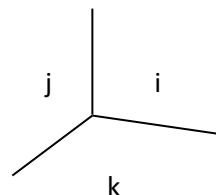

عمودي

Since $\vec{A} \times \vec{B}$ are $\begin{cases} \text{Normal} \\ \text{Vertical} \\ \text{perpendicular} \end{cases}$ on \vec{A} and on \vec{B}

$$6) \mathbf{i} \times \mathbf{j} = \mathbf{k} \quad & \mathbf{j} \times \mathbf{k} = \mathbf{i} \quad & \mathbf{k} \times \mathbf{i} = \mathbf{j}$$

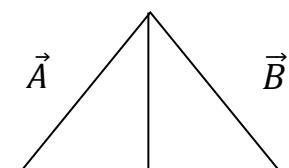

because $\mathbf{i} \perp \mathbf{j} \perp \mathbf{k}$

7) Area of triangle ABC is

$$= \frac{1}{2} |\vec{A} \times \vec{B}|$$

ضلاع $\vec{C}, \vec{B}, \vec{A}$

\vec{c}

(Ex.) Let $\vec{A} = i + j$ & $\vec{B} = i + k$ Find the Area of triangle ABC

Where \vec{A}, \vec{B} are two sides of it ??

Sol. Area = $\frac{1}{2} |\vec{A} \times \vec{B}|$

$$\vec{A} \times \vec{B} = \begin{vmatrix} i & j & k \\ 1 & 1 & 0 \\ 1 & 0 & 1 \end{vmatrix} = i \begin{vmatrix} 1 & 0 \\ 0 & 1 \end{vmatrix} - j \begin{vmatrix} 1 & 0 \\ 1 & 1 \end{vmatrix} + k \begin{vmatrix} 1 & 1 \\ 1 & 0 \end{vmatrix}$$

$$= i - j - k$$

$$|\vec{A} \times \vec{B}| = \sqrt{1^2 + (-1)^2 + (-1)^2} = \sqrt{3}$$

$$\therefore \text{Area} = \frac{1}{2} \sqrt{3} = \frac{\sqrt{3}}{2}$$

(Ex.) : Find the Area of triangle ABC where are vertices

$$A(1, -1, 0), B(2, 1, -1), C(-1, 1, 2)$$

ملاحظه :- يفضل للرؤوس احرف كبيرة والتجهيز احرف صغيرة كذلك الرؤوس
نأخذها بشكل احداثيات والتجهيز نأخذها بشكل مجموع ضرب

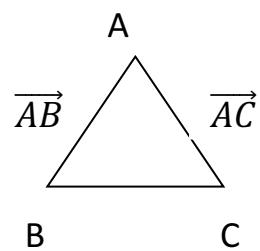

$$A(a, b, c) \quad \& \quad \vec{V} = ai + bj + ck$$

نقطة

تجهيز

(لكي تمييز بينهما)

Sol: $\overrightarrow{AB} = (2-1, 1-(-1), (-1)-0)$

$$= (1, 2, -1)$$

$$\overrightarrow{AB} = i + 2j + k$$

$$\overrightarrow{AC} = (-1-1, 1-(-1), 2-0)$$

$$= (-2, 2, 2)$$

$$\overrightarrow{AC} = -2i + 2j + 2k$$

$$\overrightarrow{AB} \times \overrightarrow{AC} = \begin{vmatrix} i & j & k \\ 1 & 2 & -1 \\ -2 & 2 & 2 \end{vmatrix}$$

$$= i \begin{vmatrix} 2 & -1 \\ 2 & 2 \end{vmatrix} - j \begin{vmatrix} 1 & -1 \\ -2 & 2 \end{vmatrix} + k \begin{vmatrix} 1 & 2 \\ -2 & 2 \end{vmatrix}$$

$$= i(4+2) - j(2-2) + k(2+4)$$

$$= 6i + 6k$$

$$|\overrightarrow{AB} \times \overrightarrow{AC}| = \sqrt{6^2 + 0^2 + 6^2}$$

$$= \sqrt{36 + 36} = \sqrt{72}$$

$$\begin{array}{c|c} 2 & 72 \\ 6 & 36 \\ 6 & 6 \\ \hline & 1 \end{array}$$

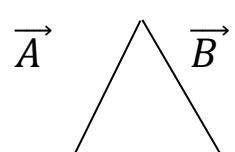

$$\therefore \text{Area} = \frac{1}{2} |\overrightarrow{AB} \times \overrightarrow{AC}|$$

$$= \frac{1}{2} \sqrt{72} = \frac{6\sqrt{2}}{2} = 3\sqrt{2}$$

(Ex.) Find Area of triangle where $\overrightarrow{A} = i + j$ & $\overrightarrow{B} = i + k$

are two sides of it ? (Homework)

$$\underline{\text{Sol}}. \overrightarrow{A} \times \overrightarrow{B} = \begin{vmatrix} i & j & k \\ 1 & 1 & 0 \\ 1 & 0 & 1 \end{vmatrix}$$

$$\therefore \vec{A} \times \vec{B} =$$

$$|\vec{A} \times \vec{B}| = \sqrt{\quad}$$

$$\text{Area} = \frac{1}{2} |\vec{A} \times \vec{B}| = \frac{1}{2} (\quad)$$

Orthogonal = vertical = Normal = Perpendicular

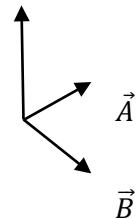

تعني هذه الكلمات مرادفات كلمة عمودي

(Ex .) Find the normal Vector from $\vec{N} = \vec{A} \times \vec{B} = ?$ Where

$$\vec{A} = (2, 1, -1) \quad \& \quad \vec{B} = (-2, 4, -1) \quad \vec{N} = \vec{A} \times \vec{B}$$

$$\vec{A} = 2\mathbf{i} + \mathbf{j} - \mathbf{k} \quad \vec{B} = -2\mathbf{i} + 4\mathbf{j} - \mathbf{k}$$

Sol. $N = \vec{A} \times \vec{B} = \begin{vmatrix} i & j & k \\ 2 & 1 & -1 \\ -2 & 4 & -1 \end{vmatrix} =$

Direction (Homework)

(Ex) find the direction of \vec{A} and \vec{B} , $\vec{A} = i$, $\vec{B} = j$?

هنا كلمة نفس المعنى اي الاتجاه Dir هو متجه الوحدة unit vector, Dir المطلوب.

$$\underline{\text{Sol.}} \quad \text{Dir} = \frac{\vec{A} \times \vec{B}}{|\vec{A} \times \vec{B}|} ; \quad \vec{N} = \vec{A} \times \vec{B}$$

$$\text{Dir} = \vec{u} = \frac{\vec{N}}{|\vec{N}|}$$

$$\text{Dir} = \frac{\vec{A} \times \vec{B}}{|\vec{A} \times \vec{B}|}$$

$$\begin{aligned}\vec{A} \times \vec{B} &= \begin{vmatrix} i & j & k \\ 1 & 0 & 0 \\ 0 & 1 & 0 \end{vmatrix} = i(0) + j(0) + k(1) \\ &= \vec{K}\end{aligned}$$

$$|\vec{A} \times \vec{B}| = \sqrt{0^2 + 0^2 + 1^2} = (1)$$

$$\therefore \vec{u} = \text{Dir} = \frac{\vec{k}}{1} = \vec{K}$$

Where $|\vec{K}| = 1$

هنا متجهة الوحدة الناتج او (Dir) الاتجاه بين المتجهتين نتج المتجه \vec{K} والذي هو متجه وحده وطول (1) وهذا تطبيق للخاصية

(Ex) : Find the Dir (direction) between $\vec{A} = 2i - 2j + k$ &

$$\vec{B} = i + j + k$$

Sol. (Homework)

(Ex) : If $\vec{V} = 2i - j$ & $\vec{w} = i + 3j - 2k$, $\vec{u} = 3i - 4j + 2k$??

Compute حسب

$$(1) \quad (\vec{V} \times \vec{W}) \cdot \vec{U} = ? ? \text{ (Homework)}$$

Sol(1) $\vec{V} \times \vec{W} = ?$

$$(\vec{V} \times \vec{W}) \cdot \vec{U} = ?$$

$$(2) \quad (\vec{W} \times \vec{U}) \cdot \vec{V}$$

Sol(2) $\vec{W} \times \vec{U} = ?$

$$(\vec{W} \times \vec{U}) \cdot \vec{V} = ?$$

$$(3) \quad (\vec{U} \times \vec{V}) \cdot \vec{W}$$

Sol(2) $\vec{U} \times \vec{V} = ?$

$$(\vec{U} \times \vec{V}) \cdot \vec{W} = ?$$

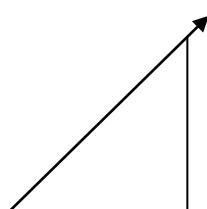

Ex.: If $\vec{A} = 4\mathbf{i} - 8\mathbf{j} + \mathbf{k}$ & $\vec{B} = 2\mathbf{i} + \mathbf{j} - 2\mathbf{k}$

هل تتحقق المساواة ?? $(\vec{A} \times \vec{B}) \cdot \vec{A} = \vec{B} \cdot (\vec{A} \times \vec{B})$

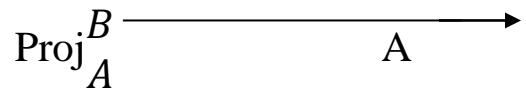

Vector projection

الاسقاط الاتجاهي

وهو يعرف حسب القيمة التالية

$$\text{Proj}_{\vec{A}} \frac{\vec{B}}{\vec{A} \cdot \vec{A}} = \frac{\vec{B} \cdot \vec{A}}{\vec{A} \cdot \vec{A}} \cdot \vec{A}$$

Praposition:

$$[\vec{A}]^2 = \vec{A} \cdot \vec{A}; \vec{A} = ai + bj + ck$$

$$\text{Proof: } \vec{A} \cdot \vec{A} = a(a) + b(b) + c(c)$$

$$= a^2 + b^2 + c^2 \dots \dots \dots *$$

$$|\vec{A}| = \sqrt{a^2 + b^2 + c^2}$$

$$|\vec{A}|^2 = a^2 + b^2 + c^2 \dots \dots \dots *$$

$$\therefore \vec{A} \cdot \vec{A} = |\vec{A}|^2$$

$$\therefore \text{Proj}_{\vec{A}} \frac{\vec{B}}{|\vec{A}|^2} = \frac{\vec{B} \cdot \vec{A}}{|\vec{A}|^2} \cdot \vec{A}$$

Scalar projection

الاسقاط الدورى

هو يمثل طول الاسقاط الاتجاه اي:-

$$\left[\begin{array}{c} \text{sc. pro.} \\ \text{for } \vec{B} \text{ on } \vec{A} \end{array} \right] = |\text{Proj}_{\vec{A}}^{\vec{B}}|$$

Ex:- a) Find vertor projection for \vec{B} on \vec{A} and scalar projection of it ?

b) Find vector projection for \vec{B} on \vec{A} and scalar projection
 $|Proj_{\vec{A}} \vec{B}| = ?$

Where $\vec{A} = 10i + 11j - 2k$

$$\vec{B} = 2i + 3j + 4k$$

Sol :- a)- $|Proj_{\vec{A}} \vec{B}| = ?$ & $Proj_{\vec{A}} \vec{B} = \frac{\vec{B} \cdot \vec{A}}{|\vec{A}|^2} \vec{A} = ?$

b)- $Proj_{\vec{B}} \vec{A} = \frac{\vec{A} \cdot \vec{B}}{|\vec{B}|^2} \vec{B} =$ & $|Proj_{\vec{B}} \vec{A}| = ?$

Equation of sphere

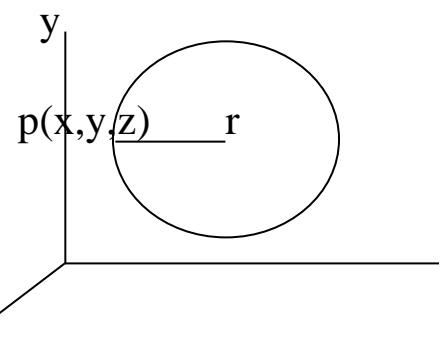

معادلة الكرة

$$(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2 = r^2$$

حيث ان (z_0, y_0, x_0) نقطة مركز الكرة و r نصف القطر حيث p اي نقطة على محيط الكرة $p(x, y, z)$

$$r = |p_o p|$$

$$r = \sqrt{(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2}$$

Ex.: find the center c and the radius r for the following sphere

$$(x - 3)^2 + (y + 7)^2 + (z - 5)^2 = 4 ?$$

Sol. :- c (3, -7 , 5) , r = 2

Ex:- find c = 2 and r = 2 where $x^2 + (y-2)^2 + (z+2) = 36$

Sol.:- (Homework)

Ex.:- find the center and radius from the following sphere equation $x^2 + y^2 + z^2 + 4x - 3z = 4$?

Sol.:-

$$x^2 + y^2 + z^2 + 4x - 3z = 4$$

لأكمال المربع نضيف (٢١ / معامل x)

$$x^2 + 4x + 4 + y^2 + z^2 - 3z + (1/2(3))^2 = 4 + 4 + \frac{9}{4}$$

$$(x + 2)^2 + y^2 + (z - \frac{3}{2})^2 = \frac{16 + 16 + 4}{4}$$

$$\therefore C(-2 , 0 , \frac{3}{2}) , r = \frac{\sqrt{41}}{2}$$

Ex.:- find the center and radius from sphere eq.

$$x^2 + y^2 + 4x + z^2 + 3z = 4 ? \text{ (Homework)}$$

Ex.:- find the center and radius from sphere eq.

$$x^2 + y^2 + z^2 - 2az = 0 ?$$

$$\text{Sol} : - (x - 0)^2 + (y - 0)^2 + z^2 - 2az + (\frac{-2a}{2})^2 = a^2$$

$$(x - 0)^2 + (y - 0)^2 + (z - a)^2 = a^2$$

$$C(0,0,a) \quad r = a$$

Ex.: - find the center and radius from $x^2 - 4x + y^2 + 2ay = z^2$?

(Homework).

معادلة المستقيم

Equation of the line

$$V(a,b,c), P_0(x_0, y_0, z_0)$$

$$x = x_0 + ta$$

$$y = y_0 + tb$$

$$z = z_0 + tc$$

$$P_0(x_0, y_0, z_0)$$

$$V(a,b,c),$$

هذه المعادلات لوسطية للمستقيم

$$t = \frac{x - x_0}{a} = \frac{y - y_0}{b} = \frac{z - z_0}{c}$$

هذه معادلة المستقيم

اشتقاق القانون اعلاه حسب :-

هنا $L = P_0P$ حيث P اي نقطة على L

$$P(x, y, z), P_0(x_0, y_0, z_0)$$

ويكون L موازي للتجهيز $V(a, b, c)$

$$V // PP_0 \rightarrow PP_0 = tV$$

$$(x - x_0)i + (y - y_0)j + (z - z_0)k = t(ai + bj + ck)$$

ومنها وجدنا المعادلات اعلاه

$$\rightarrow at = x - x_0, bt = y - y_0, ct = z - z_0$$

EX:- Find the equation of line L , which pass through $P_0(1,2,3)$
 And Parallel to the line $\vec{V} (4,7,-1) = v = 4i + 7j - k ??$

$$\text{Sol:- } L = t = \frac{x - x_0}{a} = \frac{y - y_0}{b} = \frac{z - z_0}{c}$$

$$x = x_0 + at \quad P_0(x_0, y_0, z_0)$$

$$y = y_0 + bt \quad V(a, b, c)$$

$$z = z_0 + ct$$

$$L = \frac{x-1}{4} = \frac{y-2}{7} = \frac{z-4}{-1}$$

$$x = 1 + t(4) \quad x = 1 + 4t$$

$$y = 2 + t(7) \quad y = 2 + 7t$$

$$z = 4 + t(-1) \quad z = 4 - t$$

Ex.: find line equation for $p_0(0, 1, -2)$ $v = (7, 6, 2)$?(Homework)

معادلات المستوي

plane equations

$$Ax + By + Cz = D$$

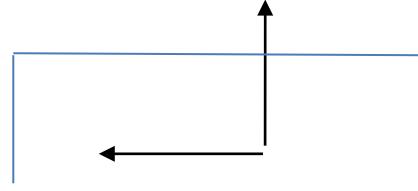

معادلة المستوي

$$D = Ax_0 + By_0 + Cz_0$$

$$\vec{N}(A,B,C)$$

$$P_O(x_0, y_0, z_0)$$

$$\vec{N}(A,B,C) \quad \&$$

$$p(x, y, z) - P_O(x_0, y_0, z_0)$$

اشتقاق القانون :- هنا لدينا نقطة $P_O(x_0, y_0, z_0)$

ومستقيم N عمودي على المستوى على P_O لذا P هي نقطة المستوى المكون منها حيث سيكون التعامد $N \perp PP_O$ هنا $N \cdot PP_O = 0$ اي التعامد يعني

$$\cos \frac{\pi}{2} = 0 \quad \emptyset = \frac{\pi}{2}$$

$$\overrightarrow{P_O P} = (x - x_0) \mathbf{i} + (y - y_0) \mathbf{j} + (z - z_0) \mathbf{k}$$

$$0 = \vec{N} \cdot \overrightarrow{P_O P} = A(x - x_0) + B(y - y_0) + C(z - z_0)$$

$$Ax + By + Cz = Ax_0 + By_0 + Cz_0$$

$$\therefore Ax + By + Cz = D$$

Ex :- find plan equation for $p_o(1,4,0)$ and $\vec{N} = 4\mathbf{i} + 7\mathbf{j} - 2\mathbf{k}$?

$$p_o(x_0, y_0, z_0) \text{ and } \vec{N} = A\mathbf{i} + B\mathbf{j} + C\mathbf{k} ??$$

$$Ax + By + Cz = Ax_0 + By_0 + Cz_0 = D$$

$$4X + 7Y - 2Z = 4(1) + 7(4) + (-2)(0)$$

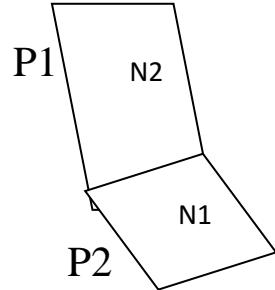

$$\underline{4X + 7Y + 2Z = 32}$$

EXE : find plane eqution for $\vec{N} (3,5,7)$ and $p_o(-3,4,5)??$

تعامد مستويات

$$P_1 \perp p_2 \quad \text{-----} \quad N_2 \perp N_1$$

$$N_2 \cdot N_1 = 0$$

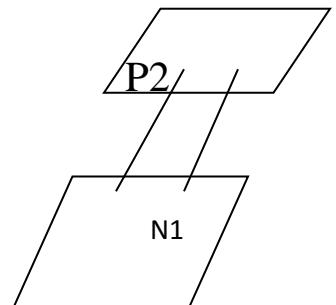

حيث N_2 و N_1 المستقيمات العموديات عليها على التوالي مستويات P_1 & P_2

$$\vec{N_1} (A_1, B_1, C_1) \text{ & } \vec{N_2} (A_2, B_2, C_2)$$

توازى المستويات :-

$$P_1 // P_2 \rightarrow \vec{N_2} // \vec{N_1} \rightarrow \frac{A_1}{A_2} = \frac{B_1}{B_2} = \frac{C_1}{C_2}$$

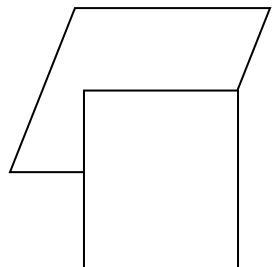

$$\vec{N_1} (A_1, B_1, C_1) \text{ & } \vec{N_2} (A_2, B_2, C_2)$$

تقاطع المستويات

$$P_1 \cap P_2 \rightarrow \vec{N_2} \cap \vec{N_1} = \theta$$

$$\cos\theta = \frac{\vec{N_1} \cdot \vec{N_2}}{|\vec{N_1}| |\vec{N_2}|}$$

المسافة من نقطة الى مستوى حيث P مستوى Q نقطة

$$|PQ| = \sqrt{(X_1 - X_0)^2 + (Y_1 - Y_0)^2 + (Z_1 - Z_0)^2}$$

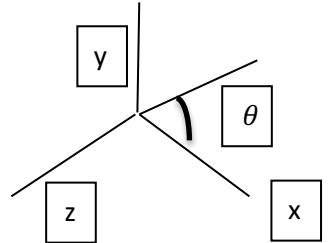

Q (X_0, Y_0, Z_0)	$P(X_1, Y_1, Z_1)$
-----------------------	--------------------

حيث P مستوى و Q نقطة خارج المستوى و P_1 ايّة نقطة داخل المستوى فتكون المسافة من المستوى P الى النقطة Q هي نفسها المسافة من النقطة P_1 الى ايّة نقطة داخل المستوى.

CYLINDRICAL COORDINATES \leftrightarrow CARTESIAN COORDINATES

$$(r, \theta, z) \rightarrow (x, y, z)$$

$$\tan \theta = \frac{y}{x}$$

$$r = \sqrt{x^2 + y^2}$$

$$x = r \cos \theta$$

$$y = r \sin \theta$$

$$\text{Ex.} : (r, \theta, z) = (1, \frac{\pi}{2}, 1) \rightarrow (x, y, z) \rightarrow x = \cos \frac{\pi}{2} = 0$$

$$y = 1 \sin \frac{\pi}{2} = 2$$

$$z = 1$$

$$\therefore (x, y, z) = (0, 1, 1)$$

$$\text{Ex.} : (x, y, z) = (1, 0, 1) \text{ find } (r, \theta, z)?$$

$$\text{Sol.: } r = \sqrt{x^2 + y^2} = 1$$

$$\tan \theta = \frac{0}{1} = 0$$

$$\theta = 0$$

$$\therefore (r, \theta, z) = (1, 0, 1)$$

Chapter four

Partial Differential

Partial Differential

1- Functions of two and more variables

- $y = f(x)$ Two variables x and y.

$$\text{Ex1. } y = 3x^2$$

$$y = f(x) = 3x^2$$

$$\frac{dy}{dx} = 3(2x) = 6x$$

- $Z = F(x, y)$ Three variables x, y and z

$$\text{Ex2. } z = 3x^2 + y^2$$

$$\frac{\partial z}{\partial x} = 3(2x) + 0$$

$$\frac{\partial z}{\partial x} = 6x$$

$$\frac{\partial z}{\partial y} = 2y$$

- $W = f(x, y, z)$ Four variables x, y, z and w

⋮

- $W = f(x_1, x_2, x_3, \dots, x_n)$

$$\text{Ex3. } W = \frac{x^2 - z^2}{y^2}$$

There are two ways to solve that example:-

First way

$$\frac{\partial w}{\partial x} = \frac{(2x - 0) \cdot y^2 - (x^2 - z^2) \cdot (0)}{(y^2)^2}$$

$$\frac{\partial w}{\partial x} = \frac{2xy^2}{y^4} = \frac{2x}{y^2}$$

Second way

$$W = \frac{1}{y^2} (x^2 - z^2)$$

$$W = \frac{x^2}{y^2} - \frac{z^2}{y^2}$$

$$\frac{\partial w}{\partial x} = \frac{1}{y^2} (2x) - 0 = \frac{2x}{y^2}$$

$$\frac{\partial w}{\partial y} = \frac{(0) \cdot y^2 - 2y \cdot (x^2 - z^2)}{(y^2)^2}$$

$$= \frac{-2y(x^2 - z^2)}{y^4} = \frac{-2(x^2 - z^2)}{y^3}$$

$$\frac{\partial w}{\partial z} = \frac{(-2z) \cdot y^2 - 0}{y^4} = \frac{-2z}{y^2}$$

$$\text{Ex4. } W = e^x \ln(x^2 + y^2 + 1)$$

$$\frac{\partial w}{\partial x} = e^x \cdot \frac{1}{x^2 + y^2 + 1} \cdot (2x) + e^x \ln(x^2 + y^2 + 1)$$

$$\frac{\partial w}{\partial y} = e^x \cdot \frac{1}{x^2 + y^2 + 1} \cdot (2y)$$

$$\text{Ex5. } z = f(x, y) = \ln \sqrt{x^2 + y^2}$$

$$\frac{\partial w}{\partial x} = \frac{1}{\sqrt{x^2 + y^2}} \cdot \frac{1}{2} (x^2 + y^2)^{-\frac{1}{2}} \cdot 2x$$

$$\frac{\partial w}{\partial x} = \frac{1}{\sqrt{x^2 + y^2}} \cdot \frac{1}{2\sqrt{x^2 + y^2}} \cdot 2x = \frac{x}{x^2 + y^2}$$

$$\frac{\partial w}{\partial y} = \frac{1}{\sqrt{x^2 + y^2}} \cdot \frac{1}{2\sqrt{x^2 + y^2}} \cdot 2y = \frac{y}{x^2 + y^2}$$

$$\text{Ex6. } W = \frac{(x^2 + y^2)}{(u^2 + v^2)}$$

$$\frac{\partial w}{\partial x} = \frac{2x(u^2 + v^2) - (0)(x^2 + y^2)}{(u^2 + v^2)^2} = \frac{2x(u^2 + v^2)}{(u^2 + v^2)^2}$$

$$= \frac{2x}{(u^2 + v^2)}$$

$$\frac{\partial w}{\partial y} = \frac{2y(u^2 + v^2) - (0)(x^2 + y^2)}{(u^2 + v^2)^2} = \frac{2y}{(u^2 + v^2)}$$

$$\frac{\partial w}{\partial u} = \frac{(0)(u^2 + v^2) - 2u(x^2 + y^2)}{(u^2 + v^2)^2} = -\frac{2u(x^2 + y^2)}{(u^2 + v^2)^2}$$

$$\frac{\partial w}{\partial v} = \frac{(0)(u^2 + v^2) - 2v(x^2 + y^2)}{(u^2 + v^2)^2} = -\frac{2v(x^2 + y^2)}{(u^2 + v^2)^2}$$

Ex7. Find all Partial Differential of the following blow :-

$$1. Z = \frac{(u^2+v^2)}{2x}$$

$$2. f(x, y) = x^2 - y$$

$$3. f(x, y) \frac{3y}{x}$$

$$4. W = \frac{z+x}{y}$$

Differential by definition

$Z = f(x, y)$ and the partial differential of this function are:

Z_x , Z_y , f_x and f_y .

$$f_x = \frac{\partial f}{\partial x} = \lim_{Dx \rightarrow 0} \frac{f(x_0 + Dx, y_0) - f(x_0, y_0)}{Dx}$$

$$f_y = \frac{\partial f}{\partial y} = \lim_{Dy \rightarrow 0} \frac{f(x_0, y_0 + Dy) - f(x_0, y_0)}{Dy}$$

Ex. Find f_x and f_y for the following function:-

$$f(x, y) = 100 - x^2 - y^2$$

Sol.

$$f_x = \frac{\partial f}{\partial x} = \lim_{Dx \rightarrow 0} \frac{f(x_0 + Dx, y_0) - f(x_0, y_0)}{Dx}$$

$$f(x_0, y_0) = 100 - x_0^2 - y_0^2$$

$$f(x_0 + Dx, y_0) = 100 - (x_0 + Dx)^2 - y_0^2$$

$$\begin{aligned} f_x &= \frac{\partial f}{\partial x} = \lim_{Dx \rightarrow 0} \frac{100 - (x_0 + Dx)^2 - y_0^2 - (100 - x_0^2 - y_0^2)}{Dx} \\ &= \lim_{Dx \rightarrow 0} \frac{100 - x_0^2 - 2x_0Dx - Dx^2 - y_0^2 - 100 + x_0^2 + y_0^2}{Dx} \end{aligned}$$

$$= \lim_{Dx \rightarrow 0} \frac{-2x_0Dx - Dx^2}{Dx} = \lim_{Dx \rightarrow 0} \frac{(-2x_0 - Dx)Dx}{Dx}$$

$$= \lim_{Dx \rightarrow 0} (-2x_0 - Dx) = -2x_0 - 0 = -2x_0$$

$$f_x = \frac{\partial f}{\partial x} = -2x_0$$

$$f_y = \frac{\partial f}{\partial y} = \lim_{Dy \rightarrow 0} \frac{f(x_0, y_0 + Dy) - f(x_0, y_0)}{Dy}$$

$$f(x_0, y_0 + Dy) = 100 - x_0^2 - (y_0 + Dx)^2$$

$$\begin{aligned}
f_y &= \frac{\partial f}{\partial y} = \lim_{Dy \rightarrow 0} \frac{100 - x^2 - (y + Dy)^2 - (100 - x^2 - y^2)}{Dy} \\
&= \lim_{Dy \rightarrow 0} \frac{100 - x^2 - y^2 - 2yDy - Dy^2 - 100 + x^2 + y^2}{Dy} \\
&= \lim_{Dy \rightarrow 0} \frac{-2yDy - Dy^2}{Dy} = \lim_{Dy \rightarrow 0} \frac{(-2y - Dy)Dy}{Dy} \\
&= \lim_{Dy \rightarrow 0} (-2y - Dy) = -2y - 0 = -2y
\end{aligned}$$

$$f_y = \frac{\partial f}{\partial y} = -2y$$

Ex. Find f_x and f_y for the function $f(x, y) = x + 3y$ by using definition?(Homework).

The Chair Rule

1. $w = f(x, y)$, $x = x(t)$ & $y = y(t)$

$$\frac{\partial w}{\partial x}, \frac{\partial w}{\partial y}, \frac{dx}{dt}, \frac{dy}{dt}$$

$$\therefore \frac{dw}{dt} = \frac{\partial w}{\partial x} \cdot \frac{dx}{dt} + \frac{\partial w}{\partial y} \cdot \frac{dy}{dt}$$

Ex. Find $\frac{dw}{dt}$ for the function:-

$$w = x^2 + 2y^2, x = \sin t \text{ and } y = \cos t$$

$$\frac{\partial w}{\partial x} = 2x + 0, \quad \frac{dx}{dt} = \cos t$$

$$\frac{\partial w}{\partial y} = 0 + 4y, \quad \frac{dy}{dt} = -\sin t$$

$$\begin{aligned}
\frac{dw}{dt} &= \frac{\partial w}{\partial x} \cdot \frac{dx}{dt} + \frac{\partial w}{\partial y} \cdot \frac{dy}{dt} \\
&= 2x \cos t - 4y \sin t \\
&= 2 \sin t \cos t - 4 \cos t \sin t \\
\frac{dw}{dt} &= -2 \sin t \cos t
\end{aligned}$$

2. $w = f(x, y)$, $x = x(t, z)$ & $y = y(t, z)$

$$\begin{aligned}
\frac{\partial w}{\partial t} &= \frac{\partial w}{\partial x} \cdot \frac{\partial x}{\partial t} + \frac{\partial w}{\partial y} \cdot \frac{\partial y}{\partial t} \\
\frac{\partial w}{\partial z} &= \frac{\partial w}{\partial x} \cdot \frac{\partial x}{\partial z} + \frac{\partial w}{\partial y} \cdot \frac{\partial y}{\partial z}
\end{aligned}$$

Ex.

$$z = f(v, w), \quad v = v(n, u) \text{ & } w = w(n, u)$$

$$z = vw, \quad v = un, \quad w = n^2 + u^2$$

$$\begin{aligned}
\frac{\partial z}{\partial n} &= \frac{\partial z}{\partial v} \cdot \frac{\partial v}{\partial n} + \frac{\partial z}{\partial w} \cdot \frac{\partial w}{\partial n} \\
&= vu + 2vn
\end{aligned}$$

$$\frac{\partial z}{\partial n} = (n^2 + u^2)u + 2un^2$$

$$\frac{\partial z}{\partial u} = \frac{\partial z}{\partial v} \cdot \frac{\partial v}{\partial u} + \frac{\partial z}{\partial w} \cdot \frac{\partial w}{\partial u}$$

$$= wn + 2vu$$

$$\frac{\partial z}{\partial u} = (n^2 + u^2)u + 2nu^2$$

Ex. Find $\frac{dz}{dt}$ for the functions:- (Homework)

1. $z = f(x, y)$, $x = x(t)$ and $y = y(t)$
2. $z = \sin(x \cdot y)$, $x = \frac{1}{t}$ and $y = 3t$

Ex. Find $\frac{\partial z}{\partial u}$ and $\frac{\partial z}{\partial w}$ for the functions:- (Homework)

$$z = f(x, y) = y \sin x, x = w - u^2 \text{ and } y = \frac{w}{u}$$

The gradate & vector differential

We denoted for gradate function $f(x, y, z)$ at the point $p^\circ(x^\circ, y^\circ, z^\circ)$ by:-

$$\Delta f|_{p^\circ} = \frac{\partial f}{\partial x}|_{p^\circ} \cdot i + \frac{\partial f}{\partial y}|_{p^\circ} \cdot j + \frac{\partial f}{\partial z}|_{p^\circ} \cdot k$$

Ex. Find the gradate for $f(x, y, z)$ where

$$f(x, y, z) = x^3 - xy^2 - z \text{ at } p^\circ(1, 1, 0)?$$

Sol.

$$\Delta f|_{p^\circ} = \frac{\partial f}{\partial x}|_{p^\circ} \cdot i + \frac{\partial f}{\partial y}|_{p^\circ} \cdot j + \frac{\partial f}{\partial z}|_{p^\circ} \cdot k$$

$$\frac{\partial f}{\partial x} = 3x^2 - y^2, \quad \frac{\partial f}{\partial y} = -2xy, \quad \frac{\partial f}{\partial z} = -1$$

$$\frac{\partial f}{\partial x}|_{p^\circ(1,1,0)} = 3 \cdot (1)^2 - (1)^2 = 2$$

$$\frac{\partial f}{\partial y}|_{p^\circ(1,1,0)} = -2 \cdot (1) \cdot (1) = -2$$

$$\frac{\partial f}{\partial z}|_{p^\circ(1,1,0)} = -1$$

$$\Delta f|_{p^\circ} = 2i - 2j - k$$

Ex. Find the gradate for $f(x, y, z)$ where

$$f(x, y, z) = \sin xyz \text{ at } p_0(0,0,0) \text{ ? (Homework)}$$

Vector differential

We denote for vector differential by $Du\Delta f|_{p_0}$ which equals the gradate multiplying by unit vector.

$$Du\Delta f|_{p_0} = \Delta f|_{p_0} \cdot \vec{u}$$

$$\vec{u} = \frac{\vec{A}}{|\vec{A}|}$$

Ex. Find vector differential for the previous example

$$f(x, y, z) = x^3 - xy^2 - z \text{ at } p_0(1,1,0) \text{ in the direction of}$$

$$\vec{A} = 2i - 3j + 6k$$

Sol.

$$\because \Delta f|_{p_0} = 2i - 2j - k, \quad \vec{A} = 2i - 3j + 6k$$

$$|\vec{A}| = \sqrt{4 + 9 + 36} = \sqrt{49} = 7$$

$$\vec{u} = \frac{\vec{A}}{|\vec{A}|} = \frac{2}{7}i - \frac{3}{7}j + \frac{6}{7}k$$

$$Du\Delta f|_{p_0} = \Delta f|_{p_0} \cdot \vec{u}$$

$$= (2i - 2j - k) \cdot \left(\frac{2}{7}i - \frac{3}{7}j + \frac{6}{7}k \right)$$

$$= (2) \cdot \left(\frac{2}{7} \right) + (-2) \cdot \left(-\frac{3}{7} \right) + (-1) \cdot \left(\frac{6}{7} \right)$$

$$\therefore Du\Delta f|_{p_0} = \frac{4}{7} + \frac{6}{7} - \frac{6}{7} = \frac{4}{7}$$

Higher order differentials

$$z = f(x, y)$$

$$f_x = \frac{\partial f}{\partial x} = \frac{\partial z}{\partial x} = f_x = z_x$$

$$f_{xx} = \frac{\partial}{\partial x} \left(\frac{\partial f}{\partial x} \right) = \frac{\partial^2 f}{\partial x^2}$$

$$f_{xxx} = \frac{\partial}{\partial x} \left(\frac{\partial^2 f}{\partial x^2} \right) = \frac{\partial^3 f}{\partial x^3}$$

⋮

$$f_{\underset{n \text{ times}}{x \dots x}} = \frac{\partial}{\partial x} \left(\frac{\partial}{\partial x} \left(\frac{\partial}{\partial x} \left(\dots \frac{\partial f}{\partial x} \right) \right) \right) = \frac{\partial^n f}{\partial x^n}$$

$$f_y = \frac{\partial f}{\partial y} = z_y$$

$$f_{yy} = \frac{\partial}{\partial y} \left(\frac{\partial f}{\partial y} \right) = \frac{\partial^2 f}{\partial y^2}$$

$$f_{yyy} = \frac{\partial}{\partial y} \left(\frac{\partial^2 f}{\partial y^2} \right) = \frac{\partial^3 f}{\partial y^3}$$

⋮

$$f_{\underset{n - \text{ times}}{y \dots y}} = \frac{\partial}{\partial y} \left(\frac{\partial}{\partial y} \left(\frac{\partial}{\partial y} \left(\dots \frac{\partial f}{\partial y} \right) \right) \right) = \frac{\partial^n f}{\partial y^n}$$

Now, if we have

$$f_x = \frac{\partial f}{\partial x}$$

$$f_{xy} = \frac{\partial}{\partial y} \left(\frac{\partial f}{\partial x} \right) = \frac{\partial^2 f}{\partial y \partial x}$$

$$f_{xyx} = \frac{\partial}{\partial x} \left(\frac{\partial}{\partial y} \left(\frac{\partial f}{\partial x} \right) \right) = \frac{\partial^3 f}{\partial x \partial y \partial x}$$

⋮

And so on .

$$\text{Ex. } f(x, y) = x^5 - 7x + y^2 \text{ Find } \frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial}{\partial y} \left(\frac{\partial f}{\partial x} \right), \frac{\partial}{\partial x} \left(\frac{\partial f}{\partial y} \right)$$

$$\frac{\partial f}{\partial x} = 5x^4 - 7 = f_x$$

$$\frac{\partial f}{\partial y} = 2y = f_y$$

$$\frac{\partial}{\partial y} \left(\frac{\partial f}{\partial x} \right) = 0 = f_{xy}$$

$$\frac{\partial}{\partial x} \left(\frac{\partial f}{\partial y} \right) = 0 = f_{yx}$$

$$f_{xy} = f_{yx}$$

Ex. Prove that $f_{xy} = f_{yx}$ for ? (Homework)

$$1. f(x, y) = \sin(xy)$$

$$2. f(x, y) = \frac{x}{y}$$

$$3. z = x^2 + 2y^2$$

Ex. Prove that $f_{xxy} = f_{xyx} = f_{yxx}$ for $f(x, y) = x \cos y + ye^x$

$$\frac{\partial f}{\partial x} = \cos y + ye^x = f_x$$

$$\frac{\partial}{\partial x} \left(\frac{\partial f}{\partial x} \right) = ye^x = f_{xx}$$

$$\frac{\partial}{\partial y} \left(\frac{\partial}{\partial x} \left(\frac{\partial f}{\partial x} \right) \right) = e^x = f_{xxy}$$

$$\frac{\partial}{\partial y} \left(\frac{\partial f}{\partial x} \right) = -\sin y + e^x = f_{xy}$$

$$\frac{\partial}{\partial x} \left(\frac{\partial}{\partial y} \left(\frac{\partial f}{\partial x} \right) \right) = e^x = f_{xyx}$$

$$\frac{\partial f}{\partial y} = -x \sin y + e^x = f_y$$

$$\frac{\partial}{\partial x} \left(\frac{\partial f}{\partial y} \right) = -\sin y + e^x = f_{yx}$$

$$\frac{\partial}{\partial x} \left(\frac{\partial}{\partial x} \left(\frac{\partial f}{\partial y} \right) \right) = e^x = f_{yxx}$$

$$\therefore f_{xxy} = f_{xyx} = f_{yxx} = e^x$$

Ex. Prove that $f_{xxy} = f_{xyx} = f_{yxx}$ for $f(x, y) = \sin xy - \frac{y}{x}$?

(Homework).

Definition: Local Extrema

We call $f(a, b)$ a **local maximum** of f if there is an open disk R centered at point (a, b) for which $f(a, b) \geq f(x, y)$ for all $(x, y) \in R$. Similarly, we call $f(a, b)$ a **local minimum** of f if there is an open disk R centered at point (a, b) for which $f(a, b) \leq f(x, y)$ for all $(x, y) \in R$.

Definition: Critical Point

The point (a, b) is a critical point of the function $f(x, y)$ if (a, b) is

in the domain of f and either $\frac{\partial f}{\partial x}(a, b) = \frac{\partial f}{\partial y}(a, b) = 0$ or one or both of $\frac{\partial f}{\partial x}$ and $\frac{\partial f}{\partial y}$ do not exist at (a, b) .

Saddle Point

The point $P(a, b, f(a, b))$ is a saddle point of $z = f(x, y)$ if (a, b) is a critical point of f and if every open disk centered at (a, b) contains points (x, y) in the domain of f for which $f(x, y) < f(a, b)$ and points (x, y) in the domain of f for which $f(x, y) > f(a, b)$.

Maximum and Local Minimum Points

To find the function if it has a Local Maximum or Local Minimum Points by using some steps which are :-

1. We find the differential $f_x = ?, f_y = ?$
2. $f_x = 0, f_y = 0$ and solve it to find the critical points.
3. We find the differential $f_{xx} = ?, f_{xy} = ?, f_{yy} = ?$ And put the critical points in it .
4. We put it into the relation

$$D = f_{xx}|_c \cdot f_{yy}|_c - f_{xy}|_c^2$$

5. $D > 0$ or $D < 0$ or $D = 0$.

Here compared with zero .

- a. If $D > 0, f_{xx} > 0 \Rightarrow$ Local Min.
- b. If $D > 0, f_{xx} < 0 \Rightarrow$ Local Max.
- c. If $D < 0 \Rightarrow$ Saddle Points.
- d. If $D = 0 \Rightarrow$ No Conclusion.

Ex. Find Local max or min if exist for

$$1- f(x, y) = 6xy - x^2 - 3y^2$$

Sol. $f_x = \cancel{6y} - 2x = 0$

$$f_y = 6x - \cancel{6y} = 0$$

$$\underline{4x = 0 \Rightarrow x = 0}$$

$$6y = 0 \Rightarrow y = 0$$

$$\therefore c(0,0)$$

$$f_{xx} = -2 \Rightarrow f_{xx}|_{(0,0)} = -2$$

$$f_{yy} = -6 \Rightarrow f_{yy}|_{(0,0)} = -6$$

$$f_{xy} = 6 \Rightarrow f_{xy}|_{(0,0)} = 6$$

$$D = f_{xx}|_{(0,0)} \cdot f_{yy}|_{(0,0)} - f_{xy}|_{(0,0)}^2$$

$$= (-2) \cdot (-6) - 36 = -24$$

$$\therefore D = -24 < 0$$

$\therefore c(0,0)$ is Saddle point.

$$2- f(x, y) = 3 - 6x - 6y + x^2 + y^2$$

Sol. $f_x = -6 + 2x = 0 \Rightarrow x = 3$

$$f_y = -6 + 2y = 0 \Rightarrow y = 3$$

$\therefore c(3,3)$ is critical point.

$$f_{xx} = 2 \Rightarrow f_{xx}|_{(3,3)} = 2$$

$$f_{yy} = 2 \Rightarrow f_{yy}|_{(3,3)} = 2$$

$$f_{xy} = 0 \Rightarrow f_{xy}|_{(3,3)} = 0$$

$$\begin{aligned} D &= f_{xx}|_{(3,3)} \cdot f_{yy}|_{(3,3)} - f_{xy}|_{(3,3)}^2 \\ &= (2) \cdot (2) - 0 = 4 \\ \therefore D &= 4 > 0, f_{xx} = 2 > 0 \\ \therefore c(3,3) &\text{ is Local Min. Point.} \\ \mathbf{3-} f(x,y) &= 6x + 3y - x^2 - y^3 \quad (\text{Homework}). \end{aligned}$$

Chapter Five

The Differential Equation

الفصل الخامس

chapter five

المعادلات التفاضلية

the Differential Equation

المعادلة التفاضلية :- هي أي علاقة بين متغيرات وتفاضلاتها او مشتقاتها (Differential Equation) هناك نوعان منها :-

١- **المعادلة التفاضلية الاعتيادية** Ordinary Differential Equation

هي المعادلة التي تحتوي على متغير مستقل واحد فقط مع تفاضله ومشتقه.

٢- **المعادلة التفاضلية الجزئية** Partial Differential Equation

هي المعادلة التي تحتوي على متغيرين مستقلين أو أكثر .

رتبة المعادلة التفاضلية The Order of Differential Equation

هي أعلى مشتقه (تفاضل) يظهر في المعادلة .

درجة المعادلة التفاضلية The Degree of Differential Equation

هي اس (قوة) أعلى مشتقه تظهر في المعادلة وترمز ب ∂ لتفاضل او المشتقه الجزئية وترمز ب d لتفاضل او المشتقه الاعتيادية .

Examples:-

$$\text{Ex1 :- } Qy'' + 3y = x^2$$

- معادلة تفاضلية اعтикаدية من الرتبة الثانية والدرجة الأولى

$$\text{Ex2 :- } (3x + 2y)^2 \cdot y^{2=1}$$

- معادلة تفاضلية اعтикаدية من الرتبة الاولى والدرجة الاولى

$$\text{Ex3 :- } \left(\frac{\partial^2 P}{\partial X^2}\right)^4 + \left(\frac{\partial^2 P}{\partial y^2}\right)^3 + \frac{\partial^2 P}{\partial z^2} = 0$$

- معادلة تفاضلية جزئية من الرتبة الثانية والدرجة الرابعة

$$\text{Ex4:- } x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y} = 2z$$

- معادلة تفاضلية جزئية من الرتبة الاولى والدرجة الاولى

$$\text{Ex 5 : } \left(\frac{dy}{dx} \right)^4 - x^5 = 0$$

- معادلة تفاضلية اعتيادية من الرتبة الاولى والدرجة الرابعة

Ex 6 :- $y'' - y^2 = 0$

- معادلة تفاضلية اعتيادية من الرتبة الثانية والدرجة الاولى

Ex 7 :- y ' + y =2

- معادلة تفاضلية اعتيادية من الرتبة الاولى والدرجة الاولى

The Solution of The Differential Equation حل المعادلة التفاضلية

هي أي علاقة بين متغيرات المعادلة التفاضلية وتكون خالية من المشتقات او التفاضلات وتحقق المعادلة التفاضلية .

Ex:- show that $y = x \ln x - x$

Is a solution for the following diff . eq. $xy' = x+y$ ***

Sol. :- y = x Lux- x *

$$y' = 1 \cdot \ln x + x \frac{1}{x} - 1$$

Put (*) and (**) in (***)

$$xy' = x + y$$

$$x(\ln x) = x + (x \ln x - x)$$

$$\therefore x \ln x = x \ln x$$

The general solution

الحل العام

هو مجموعه كل الحلول للمعادلة حيث ان عدد الثوابت الاختيارية تكون بقدر رتبة المعادلة .

Ex :- prove that $y = x^4 + c_1 x + c_2 \dots \ast$ Is a general solution for the following differentail equation $y'' = 12 x^2 \dots \dots \dots \ast \ast \ast$

$$\text{Sol.} \therefore y' = 4x^3 + c_1 \dots \ast \ast$$

$$y'' = 12 x^2 \dots \ast \ast \ast$$

$\therefore \ast$ is a general sol. For $\ast \ast \ast$

The special solution

الحل الخاص

هو حل واحد فقط او اكثرب ينتج من فرض وتعويض قيم ثوابت الاختيارية

Ex :- show that $y = x^4 + 5x + 4$ is a special sol. for the differentail equation $y'' = 12x^2$?

$$\text{Sol. } y = x^4 + 5x + 4 \dots \ast$$

$$y' = 4x^3 + 5 \dots \ast \ast$$

$$y'' = 12 x^2 \dots \ast \ast \ast$$

$\therefore \ast$ is a sp.sol . for $\ast \ast \ast$

$$y = x^4 + c_1 x + c_2$$

هنا كان الحل عام

حيث الثوابت (هي حل للمعادلة y'') وتم فرض $c_1 = 5, c_2 = 4$ ففتح حل خاص للمعادلة y'' .

Ex1:- find the ordred and degree for the following differential equation ?

$$1. (y')^2 + x y' = y^2$$

$$2. \quad y'' = (3y' + x)2$$

$$3. \quad (y'')^2 = (1 + y')3$$

Ex2 :- prove that the following values are a general solution for the equations bested them ??

a- $y'' + 4y = 0$, $y = c_1 \sin 2x + c_2 \cos 2x$

b- $y'' + 3y' + 2y = 0$, $y = c^1 e^{-x} + c^2 e^{-2x}$

حلول المعادلات التفاضلية الرتبة الاولى والدرجة الاولى first order and first degree diff. eq.

تكون المعادلة التفاضلية من الرتبة الاولى والدرجة الاولى بالشكل $\frac{dy}{dx} = f(x,y)$

او بالشكل $m(x,y)dx + n(x,y)dy = 0$

وتكون على عدة انواع :-

1 - المعادلة التفاضلية القابلة للفصل Seperable Differential Equation

وهي المعادلة التفاضلية التي نستطيع فصل متغيراتها مع تفاضلها ونجد التكامل لها فنحصل على حلها اى اولا نضغطها بالشكل $A(x)dx + B(y)dy = 0$ ثم نتكامل الاطراف فنحصل على $f(x,y) = c$ وهي مجموعه الحل للمعادلة.

Ex:- solve the following diff. eq. ?

$$x^2(1-y^2)dx + y(1-x^2)dy = 0$$

$$\text{Sol. :- } \frac{x^2}{1+x^2}dx + \frac{y}{1-y^2}dy = 0$$

$$\int \left(1 - \frac{1}{1-x^2}\right) dx + \left(\frac{1}{-2}\right) \int \frac{-2dy}{1-y^2} = c$$

$$\int dx - \int \frac{dx}{1+x^2} - \frac{1}{2} \ln|1-y^2| = c$$

بالطرح $\frac{x^2+1}{-1} \sqrt{x^2} |$

$$\int dx - \int \frac{dx}{1+x^2} - \frac{1}{2} \ln|1-y^2| = c$$

$$x - \tan^{-1} x - \frac{1}{2} \ln|1-y^2| = c$$

$\therefore f(x,y) = c$ general sol.

Ex : solve the following diff.eq. $xy dy + (2yx^2 + 4x^2 - y - 2) dx = 0$

$$\text{Sol. :- } xy dy + 2x^2(y+2) - (y+2) dx = 0$$

$$xy dy + (2x^2 - 1)(y+2) dx = 0$$

$$\frac{2x^2 - 1}{x} dx + \frac{y}{y+2} dy = 0$$

$$(2x - \frac{1}{x}) dx + (1 - \frac{2}{y+2}) dy = 0$$

$$\int 2x dx - \int \frac{dx}{x} + \int dy - 2 \int \frac{dy}{y+2} = c$$

$$\boxed{\begin{array}{c} \sqrt[y+2]{y} \\ \frac{y+2}{-2} \end{array}} \text{ بالطريقة}$$

$$x^2 - \ln|x| + y - 2\ln|y+2| = c$$

$\therefore f(x,y) = c$ g . sol . for the diff. eq.

Ex : Homework solve the following diff. eq. ??

$$xy dy + (cx^2 - 2yx^2 + 4 - 8y) dx = 0$$

٢ - المعادلات التفاضلية المتجانسة

Homogeneous diff. eq.

الدالة المتجانسة هي الدالة التي تحقق الشرط التالي

$$\text{Ex} : - f(x,y) = x^3 - 2xy^2 + x^2y + y^3$$

$$\begin{aligned} f(tx, ty) &= (tx)^3 - 2(tx)(ty)^2 + (tx)^2(ty) + (ty)^3 \\ &= t^3x^3 - 2t^3xy^2 + t^3x^2y + t^3y^3 \\ &= t^3(x^3 - 2xy^2 + x^2y + y^3) \\ &= t^3 f(x,y) \end{aligned}$$

\therefore متجانسة من الدرجة الثالثة

$$\text{Ex} : - f\left(\frac{y}{x}\right) = e^{\frac{y}{x}} + \sin\frac{y}{x} - \frac{1}{\left(\frac{y}{x}\right)} + \left(\frac{y}{x}\right)^2$$

$$\begin{aligned} f\left(\frac{ty}{tx}\right) &= e^{\frac{ty}{tx}} + \sin\frac{ty}{tx} - \frac{1}{\left(\frac{ty}{tx}\right)} + \left(\frac{ty}{tx}\right)^2 \\ &= e^{\frac{y}{x}} + \sin\frac{y}{x} - \frac{1}{\frac{y}{x}} + \left(\frac{y}{x}\right)^2 \\ &= t^0(f\left(\frac{y}{x}\right)) \end{aligned}$$

Ex. Is $f(x, y) = \frac{x^3+y^3}{xy^2}$ Homo. Function?(Homework)

Homogeneous differential equation

المعادلة التفاضلية المتجانسة

هي المعادلة التي تحقق فيها كون كل من M & N دالة متجانسة من نفس الدرجة وطريقة حلها كالاتي:-

$$M(x,y)dx + N(x,y)dy = 0$$

$$M(tx,ty) = t^n M(x,y)$$

$$N(tx,ty) = t^n N(x,y)$$

وكل من M و N دالة متجانسة من نفس الدرجة.

خطوات حل هذا النوع من المعادلات:-

١. نضع المعادلة بالشكل $\frac{dy}{dx} = f(x, y)$
٢. ونضعها بالشكل $\frac{dy}{dx} = f\left(\frac{y}{x}\right)$
٣. نفرض $v = \frac{x}{y} \rightarrow \frac{dy}{dx} = f(v)$
٤. أصبحت لدينا معادلة تفاضلية قابلة للفصل بالنسبة ل x, v
٥. نحل الصيغة اعلاه ونعرض بـ $\frac{x}{y}$ بدل v .

Ex. Solve the following differential equation

$$xdy - ydx = \sqrt{x^2 + y^2} dx?$$

Sol.

$$(y + \sqrt{x^2 + y^2})dx - xdy = 0$$

$$M(x, y) = (y + \sqrt{x^2 + y^2})$$

$$M(tx, ty) = (ty + \sqrt{(tx)^2 + (ty)^2})$$

$$M(tx, ty) = (ty + \sqrt{t^2(x^2 + y^2)})$$

$$M(tx, ty) = (ty + t\sqrt{(x^2 + y^2)})$$

$$M(tx, ty) = t(y + \sqrt{(x^2 + y^2)})$$

$\therefore M(tx, ty) = t M(x, y)$ دالة متجانسة من الدرجة الأولى

$$N(x, y) = -x$$

$$N(tx, ty) = -(tx)$$

$$= t(-x)$$

$$= t N(x,y)$$

$\therefore N$ is homo . function of degree one

1- we put $\frac{dy}{dx} = f(x,y)$

$$\frac{dy}{dx} = \frac{\frac{y}{x} + \sqrt{\frac{x^2+y^2}{x^2}}}{\frac{x}{x}} = \frac{y}{x} + \sqrt{\frac{x^2+y^2}{x^2}}$$

$$= \frac{y}{x} + \sqrt{\frac{x^2}{x^2} + \frac{y^2}{x^2}}$$

$$= \frac{y}{x} + \sqrt{1 + \left(\frac{y}{x}\right)^2}$$

$$\therefore \frac{dy}{dx} = f\left(\frac{y}{x}\right)$$

$$\frac{dy}{dx} = \frac{y}{x} + \sqrt{1 + \left(\frac{y}{x}\right)^2} = f\left(\frac{y}{x}\right)$$

$$\text{Put } v = \frac{y}{x} \rightarrow f(v) = v + \sqrt{1 + v^2} \quad -$$

$$\text{Solve } \frac{dx}{x} + \frac{dv}{v-f(v)} = 0 \quad -$$

$$\frac{dx}{x} + \frac{dv}{v-(v+\sqrt{1+v^2})} = 0$$

$$\frac{dx}{x} + \frac{dv}{-\sqrt{1+v^2}} = 0$$

اصبحت لدينا معادلة تفاضلية قابلة للفصل بالنسبة ل y ، x نكامل للطرفين فنحصل على

$$\int \frac{dx}{x} - \int \frac{dv}{\sqrt{1+v^2}} = \int o$$

$$\ln|x| - \int \frac{dv}{\sqrt{1+v^2}} = c \quad *$$

$$\int \frac{dv}{\sqrt{1+v^2}} \quad ??$$

هذا نحل التكامل التالي بطريقة التعويضات المثلثية

$$\int \frac{dv}{\sqrt{1+v^2}}$$

Let $v = \tan\theta$

$$dv = \sec \theta \ d\theta$$

$$\sin^2 \theta + \cos^2 \theta = 1 \quad \int \frac{dv}{\sqrt{1+v^2}} = \int \frac{\sec \theta \ d\theta}{\sqrt{\tan \theta + 1}}$$

$$= \int \frac{\sec \theta \ d\theta}{\sin \theta} \qquad \qquad \tan^2 \theta + 1 = \sec^2 \theta$$

$$= \int \sec \theta \, d\theta$$

$$= \ln |\sec \theta + \tan \theta|$$

$$= \ln \left| \sqrt{1 + \tan^2 \theta} + \tan \theta \right|$$

$$= \ln \left| \sqrt{1 + v^2} + v \right|$$

$$\ln|x| - \ln \left| \sqrt{1 + \left(\frac{y}{x}\right)^2} + \frac{y}{x} \right| = c \quad \text{نوع فی}$$

$$F(x,y)=c$$

Ex :- Homework :- Solve $xy \frac{dx}{dy} + (cx^2 - 2y^2) = 0$

المعادلات التفاضلية الغير المتجانسة non – homogeneous differential eq.

المعادلة التفاضلية من الرتبة الاولى والدرجة الاولى تكون غير متجانسة اذا لم تتحقق شرط التجانس $M(tx, ty) & N(tx, ty)$

هذا ستكون بالشكل التالي

$$(ax + by + c) dx + (\alpha x + \beta y + \gamma) dy = 0$$

$$\frac{dy}{dx} = \frac{ax + by + c}{\alpha x + \beta y + \gamma}$$

نصفها بالشكل التالي

الآن نأخذ الحالتان

الحالة الاولى :- في حالة المشتقات متقطعتات حلها انيا ونجد نقطة التقاطع

$$ax + by + c = 0$$

$$ax + \beta y + \gamma = 0$$

$$\frac{a}{\alpha} \neq \frac{d}{\beta}$$

ولتكن

$$x = x_1 + h \quad \& \quad y = y_1 + k \quad \text{نفرض الفرضية التالية}$$

$$\& \frac{dy}{dx} = \frac{dy_1}{dx_1} \quad \text{ونعرض في المعادلة اعلاه}$$

فنحصل على معادلة متجانسة بدلالة x_1, y_1 ونحلها حسب الطريقة في الحالة الثانية

(من نوع الثاني) بعدها نعرض بدلالة x, y ونحصل على الحل العام

Ex :- solve

$$(2x - 3y + 4) dx + (3x - 2y + 1) dy = 0$$

$$\text{Sol:-} \quad \frac{dy}{dx} = \frac{-2x + 3y - 4}{3x - 2y + 1}$$

$$\frac{a}{\alpha} = \frac{-2}{3} + \frac{d}{\beta} = \frac{3}{-2}$$

المستقيمان متوازيان حلها أنيا

$$-2x + 3y - 4 = 0$$

$$3x - 2y + 1 = 0$$

$$-6x + 9y - 12 = 0$$

$$6x - 4y + 2 = 0$$

$$(h, k) = ?(1, 2)$$

$$5y = -10$$

$$Y = -2$$

$$3x - 2(-2) + 1 = 0$$

$$3x - 3 = 0 \rightarrow x = 1$$

Let $x = x_1 + h$ & $y = y_1 + k$

$$x = x_1 + 1 \quad \& \quad y = y_1 + 2$$

$$\frac{dy_1}{dx_1} = \frac{-2(x_1+1)3(y_1+2)-4}{3(x_1+1)-2(y_1+2)+1}$$

$$\frac{dy_1}{dx_1} = \frac{-2x_1-2+3y_1+6-4}{3x_1+3-2y_1-4+1}$$

$$\frac{dy_1}{dx_1} = \frac{-2x_1+3y_1}{3x_1-2y_1}$$

$$\frac{dy_1}{dx_1} = \frac{-\frac{2x_1+3y_1}{x_1}}{\frac{3x_1-2y_1}{x_1}}$$

$$\frac{dy_1}{dx_1} = \frac{-2+3(\frac{y_1}{x_1})}{3-2(\frac{y_1}{x_1})}$$

$$\text{Let } v = \frac{y_1}{x_1} \rightarrow \frac{dy_1}{dx_1} = \frac{-2+3v}{3-2v} = f(v)$$

$$\frac{dx_1}{x_1} + \frac{dv}{v-f(v)} = 0$$

$$\frac{dx_1}{x_1} + \frac{dv}{v - \frac{-2+3v}{3-2v}} = 0$$

$$\frac{dx_1}{x_1} + \frac{dv}{\frac{3v-2v^2+2-3v}{3-2v}}$$

$$\frac{dx_1}{x_1} + \frac{dv}{\frac{-2(v^2-1)}{(3-2v)}}$$

$$\frac{dx_1}{x_1} - \frac{(3-2v)dv}{2(v^2-1)} = 0$$

$$\frac{dx_1}{x_1} - \frac{3}{2} \frac{dv}{v^2-1} + \frac{2v dv}{2(v^2-1)} = 0$$

$$\int \frac{dx_1}{x_1} - \frac{3}{2} \int \frac{dv}{v^2-1} + \frac{1}{2} \int \frac{2vdv}{v^2-1} = \int 0$$

$$\ln |x_1| - \frac{3}{2} \int \frac{dv}{(v-1)(v+1)} + \frac{1}{2} \ln |v^2 - 1| = c$$

هنا تجزئةكسور

$$\int \frac{dv}{(v-1)(v+1)} \stackrel{?}{=} \int \frac{\frac{1}{2}}{v-1} - \frac{\frac{1}{2}}{v+1} dv$$

$$= \frac{1}{2} \int \frac{dv}{v-1} - \frac{1}{2} \int \frac{dv}{v+1}$$

$$= \frac{1}{2} \ln |v-1| - \frac{1}{2} \ln |v+1|$$

$$\ln |x_1| - \frac{3}{2} (\frac{1}{2} \ln |v-1| - \frac{1}{2} \ln |v+1|) + \frac{1}{2} \ln |v^2 - 1| = c$$

$$\ln |x_1| - \frac{3}{4} \ln \left| \frac{y_1}{x_1} - 1 \right| + \frac{3}{4} \ln \left| \frac{y_1}{x_1} + 1 \right| + 1 + \frac{1}{2} \ln \left| \left(\frac{y_1}{x_1} \right)^2 - 1 \right|$$

$$\ln |x-1| - \frac{3}{4} \ln \left| \frac{y-2}{x-1} - 1 \right| + \frac{3}{4} \ln \left| \frac{y-2}{x-1} + 1 \right| + \frac{1}{2} \ln \left| \frac{(y-2)^2}{(x-1)^2} - 1 \right| = c$$

$$x = x_1 + 1 \rightarrow x_1 = x - 1, y = y_1 + 2 \rightarrow y_1 = y - 2 \therefore f(x, y) = c$$

الحالة الثانية :- في حالة المستقيمان متوازيان

$$\frac{dy}{dx} = \frac{ax + by + c}{\alpha x + \beta y + \gamma}$$

هنا نختبر $\frac{a}{\alpha} \stackrel{?}{=} \frac{b}{\beta}$ في حالة التساوي نستنتج ن مستقيمان متوازيان.

ونحلها باستخدام الفرضية التالية الطريقة
حيث تصبح قابلة للفصل بعدها نعرض بدلالة z , فنحصل على معادلة متجانسة
بدلالة z

Ex :- solve

$$(2x + y)dx - (4x + 2y - 1)dy = 0$$

Sol:- $\frac{dy}{dx} = \frac{2x+y}{4x+2y-1}$

$$\frac{a}{\alpha} = \frac{2}{4} + \frac{b}{\beta} = \frac{1}{2}$$

المستقيمان متوازيان

$$z = 2x + y$$

$$dz = 2dx + dy$$

$$dy = dz - 2dx$$

$$\frac{dy}{dx} = \frac{dz}{dx} - 2$$

$$\frac{dy}{dx} = \frac{2x+y}{4x+2y-1}$$

$$\frac{dz}{dx} - 2 = \frac{2x+y}{2(2x+y)-1}$$

$$\frac{dz}{dx} = \frac{z}{2z-1} + 2$$

$$\frac{dz}{dx} = \frac{z+4z-2}{2z-1}$$

$$\frac{dz}{dx} = \frac{5z-2}{2z-1}$$

$$\int \frac{2z-1}{5z-2} dz - \int dx = \int 0$$

$$2 \int \frac{z}{5z-2} dz - \int \frac{1}{5z-2} dz - \int dx = \int 0$$

$$2 \int \frac{z}{5z-2} dz - \frac{1}{5} \ln|5z-2| - x = c \dots \dots \dots \quad 1)$$

$$2 \int \frac{z}{5z-2} dz = 2 \left(\frac{1}{5} \int dz + \frac{2}{5} \int \frac{1}{5z-2} dz \right)$$

$$= 2 \left(\frac{1}{5}z + \frac{2}{25} \ln|5z - 2| \right) \dots \dots \dots *$$

Put * in equation 1 we get:-

$$\frac{2}{5}z + \frac{4}{25} \ln|5z - 2| - \frac{1}{5} \operatorname{Ln}|5z - 2| - x = c$$

$$\frac{2}{5}z + \frac{4}{25} \ln|5z - 2| - \frac{1}{5} \operatorname{Ln}|5z - 2| - x = c$$

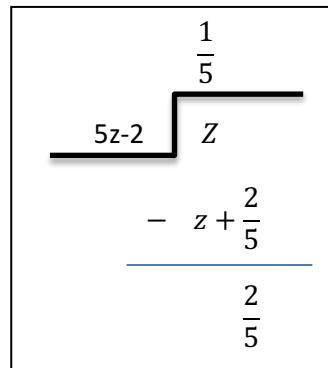

$$\frac{2}{5}z + \frac{4-5}{25} \ln|5z-2| - x = c$$

$$\frac{2}{5}z - \frac{1}{25} \ln|5z - 2| - x = c$$

Put $z = 2x + y$ we get

$$\frac{2}{5}(2x+y) - \frac{1}{25} \ln|5(2x+y) - 2| - x = c$$

$$\therefore f(x,y) = c$$

Exact differential equation

(٤) المعادلة التفاضلية تامة

The differential equation $M(x, y)dx + N(x, y)dy = 0$

become Exact if it satisfy the condition :-

$$\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$$

and the general solution is $f(x, y) = c$

To find the function f , we used the relation

حيث $(y) \neq$ دالة اختيارية بالنسبة ل y ونجدها عن طريق اشتقاق الدالة f_y
ومساواتها بدالة $N(x, y)$

نجد $(\gamma) \emptyset$ ونعرضها في * ونجد بذلك الحل العام للمعادلة التفاضلية التامة.

$$Ex: solve (3x^2 + 3xy^2) dx + (3x^2 y - 3y^2 + 2y) dy = 0$$

Sol.

$$M(x, y) = 3x^2 + 3xy^2, \quad N(x, y) = 3x^2 y - 3y^2 + 2y$$

$$\frac{\partial M}{\partial y} = 6xy \quad = \quad \frac{\partial N}{\partial x} = 6x \ y$$

Exact diff. eq.

$$f(x, y) = \int M(x, y) dx + \phi(y)$$

$$f(x,y) = \int (3x^2 + 3xy^2) dx + \emptyset(y)$$

$$f(x, y) = x^3 + \frac{3}{2}x^2y^2 + \emptyset(y)$$

$$Now f_y = \frac{\partial f}{\partial y} = N(x, y)$$

$$0 + \frac{3}{2}x^2(2y) + \emptyset'(y) = 3x^2 y - 3y^2 + 2y$$

$$\emptyset'(y) = \frac{d\emptyset}{dy} = -3y^2 + 2y$$

$$\int d\emptyset = \int (-3y^2 + 2y) dy$$

$$\emptyset(y) = -y^3 + y^2 - c$$

$$\therefore F(x, y) = x^3 + \frac{3}{2}x^2y^2 - y^3 + y^2 = c$$

$$\therefore F(x, y) = c$$

Ex. Solve $3x(xy-2)dx + (x^3 + 2y)dy = 0$ (Homework)

Non – Exact diff. eq.

(٥) المعادلة التفاضلية الغير تامة

هنا في هذه الحالة تكون المشتقة غير متساوية أي انه

$$\frac{\partial M}{\partial y} \neq \frac{\partial N}{\partial x}$$

ولكي نجعلها تساوي تجري العمليات التالية : -

١- نجد عامل التكامل للمعادلة وذلك كالتالي :

$$\frac{1}{N} \left(\frac{\partial M}{\partial y} - \frac{\partial M}{\partial x} \right) = f(x)$$

نختبر

اذا كان الناتج دالة لـ x عامل التكامل سيكون

$$I(x, y) = e^{\int f(x) dx}$$

٢- نضرب طرفي المعادلة به فتصبح المعادلة تامة ونحلها حسب الحالة السابقة

Remark :

$$\frac{1}{M} \left(\frac{\partial M}{\partial y} - \frac{\partial M}{\partial x} \right) = g(y) \quad \text{في حالة كون الاختبار حق تساوي دالة } (y)$$

يكون عامل التكامل

$$I(x, y) = e^{-\int g(y) dy}$$

Ex. : solve $(3x y^3 + 4y) dx + (3x^2 y^2 + 2x) dy = 0$

Sol.

$$\frac{\partial M}{\partial y} = q x y^2 + 4 \neq \frac{\partial N}{\partial x} = 6 x y^2 + 2$$

Not Exact

$$\frac{1}{N} \left(\frac{\partial M}{\partial y} - \frac{\partial N}{\partial x} \right) = ? f(x)$$

$$\frac{1}{3x^2 y^2 + 2x} ((q x y^2 + 4) - (6 x y^2 + 2)) = \frac{1}{x(3y^2 + 2)} (3x y^2 + 2) = \frac{1}{x} = f(x)$$

$$I(x, y) = e^{\int f(x) dx}$$

$$I(x, y) = e^{\int \frac{dx}{x}} = e^{\ln |x|} = x$$

$$x(3x y^3 + 4y) dx + x(3x^2 y^2 + 2x) dy = 0$$

$$(3x^2 y^3 + 4xy) dx + (3x^3 y^2 + 2x^2) dy = 0$$

M

N

$$\frac{\partial M}{\partial y} = 9 x^2 y^2 + 4x = \frac{\partial N}{\partial x} = 9 x^2 y^2 + 4x$$

∴ Exact diff. eq.

The Sol. Is :

$f(x,y) = c$ where

$$f(x,y) = \int M(x,y) dx + \varphi(y)$$

$$f(x,y) = \int (3x^2y^3 + 4xy) dx + \varphi(y)$$

$$f(x,y) = x^3y^3 + 2x^2y + \varphi(y)$$

$$f_y = \frac{-\partial f}{\partial y} = N(x,y)$$

$$\frac{\partial f}{\partial y} = 3x^3y^2 + 2x^2 + \varphi'(y) = N(x,y)$$

$$\rightarrow 3x^2y^2 + 2x^2 + \frac{d\varphi}{dy} = 3x^3y^2 + 2x^2$$

$$\rightarrow \frac{d\varphi}{dy} = 0 \quad \rightarrow \int d\varphi = \int 0 dy$$

$$\rightarrow \varphi = c y^\circ \leftarrow \text{constant}$$

$$\therefore \varphi(y) = 0$$

$$\therefore F(x,y) = x^3y^3 + 2x^2y + c$$

$$\therefore F(x,y) = c \quad \text{g. s. for diff eq.}$$

Linear diff.eq

(٦) المعادلة التفاضلية الخطية

$$\frac{dy}{dx} + p(x)y = q(x)$$

تكون على الصيغة

حيث p و q دوال لـ x وقد تكون ثوابت خطوات حل هكذا معادلة :-

١- نجد عامل التكامل كالاتي

$$I(x,y) = e^{\int P(x)dx}$$

$$f(x,y) = c$$

٢- نجد الحل بالخطوة التالية

$$y \cdot I = \int q(x) \cdot I dx + c$$

Ex. Solve $(1+x^2) y' + x y = x^{-1} \sqrt{x^2 + 1}$

$$\text{Sol. } \frac{dy}{dx} + \frac{x}{x^2+1} \cdot y = \frac{\sqrt{x^2+1}}{x(x^2+1)}$$

$$\frac{dy}{dx} + \frac{x}{x^2+1} \cdot y = \frac{1}{x\sqrt{x^2+1}}$$

$$I(x, y) = e^{\int \frac{x}{x^2+1} dx}$$

$$= e^{\frac{1}{2} \ln|x^2+1|}$$

$$I = e^{\ln \sqrt{x^2 + 1}} = \sqrt{x^2 + 1}$$

$$\text{g.s. } f(x, y) = c$$

$$y. I = \int q(x) \cdot I dx + c$$

$$y. \sqrt{x^2 + 1} = \int \frac{1}{x\sqrt{x^2+1}} \sqrt{x^2 + 1} dx + c$$

$$y. \sqrt{x^2 + 1} = \int \frac{1}{x} dx + c$$

$$y \sqrt{x^2 + 1} = \ln|x| + c$$

$$f(x, y) = c$$

ملاحظه : هنا اذا كان y بالنسبة لـ x اما اذا كان بالعكس x بالنسبة لـ y

$$\frac{dx}{dy} + p(y) \cdot x = q(y)$$

$$I(x, y) = e^{\int P(y) dy}$$

$$x. I = \int q(y) \cdot I dy + c$$

$$\underline{\text{Ex. }} y \frac{dx}{dy} + 2x = y^3$$

$$\text{Sol. } y \frac{dx}{dy} + 2x = y^3$$

$$\frac{dx}{dy} + \frac{2}{y} x = y^2$$

$$\frac{dx}{dy} + p(y) \cdot x = q(y)$$

$$I(x, y) = e^{\int P(y) dy}$$

$$= e^{\int \frac{2}{y} dy} = e^{2 \ln y} = e^{\ln y^2} = y^2$$

$$x \cdot I = \int q(y) \cdot I dy + c$$

$$x \cdot y^2 = \int y^2 \cdot y^2 dy + c$$

$$x \cdot y^2 = \frac{1}{5} y^5 + c$$

$$\therefore f(x, y) = c$$

Special Types of Second order eq.

حالات خاصة من المعادلات ذات الرتبة الثانية

هنا تخفيف الرتبة الثانية للرتبة الاولى له حالتان :-

$$(1) f(x, y', y'') = 0$$

اذا كانت المعادلة بالشكل

نفرض الفرضية التالية

$$P = y' \rightarrow p' = \frac{dp}{dx} = \frac{d}{dx}(y')$$

$$\frac{d}{dx} \left(\frac{dy}{dx} \right) = \frac{d^2 y}{dx^2} = y''$$

$$\therefore P = y' \rightarrow p' = y''$$

اما اذا كانت بالشكل التالي :

$$(2) F(y, y', y'') = 0$$

فتكون الفرضية بالاشتقاق بالنسبة لـ y

$$P = y' \rightarrow \frac{dp}{dy} = \frac{d}{dy}(y')$$

$$= \frac{d}{dy} \left(\frac{dy}{dx} \right) = \frac{d^2y}{dy^2} = y''$$

$$P = y' \rightarrow p' = y''$$

Ex : $x^2 y'' - (y')^2 2x y' = 0$ معادلة تخفيف رتبة

Sol . (1) $F(x, y', y'') = 0$

$$P = y' \rightarrow p' = \frac{dp}{dx} = y''$$

$$x^2 \frac{dp}{dx} - p^2 - 2xp = 0$$

$$\frac{dp}{dx} - \frac{2x}{x^2} \cdot p = \frac{1}{x^2} p^2$$

Bernolly eq.

$$\frac{dy}{dx} + p(x) \cdot y = q(x) \cdot y^n \quad n \in R / \{0, 1\}$$

معادلة برنولي

$$\frac{dy}{dx} + p(x) y = q(x) \quad \leftarrow \text{هذه خطية عادية}$$

الآن وجود y^n مضروب في $q(x)$ تمثل حالة أخرى من المعادلات الخطية وتسمى
معادلة برنولي (Bernolly eq)

* هنا اذا كانت $n = 0$ تصبح خطية و $(1-n)$ تكون عامل مشترك مع الطرف
اليسرى ولا تصبح خطية لذا ($n = 2$ فما فوق) وهي تدعى معادلة برنولي

Berolly Equation

$$\frac{dy}{dx} + p(x) \cdot y = q(x) \cdot y^n$$

$$(1) \quad \text{Let } Z = y^{1-n} \quad (1) \text{ نفرض الفرضية التالية}$$

$$(2) \quad \frac{dz}{dx} + (1-n) p(x) \cdot Z = (1-n) q(x)$$

(2) نحل المعادلة بالنسبة ل Z و x حيث ستكون خطية

نعود الان لحل السؤال

$$\frac{dy}{dx} - \frac{2}{x} p = \frac{1}{x^2} p^2 , n=2$$

$$(1) \quad \text{Let } Z = p^{1-n} = p^{1-2} = p^{-1} = \frac{1}{p}$$

$$(2) \quad \frac{dz}{dx} + (1-n) p(x).z = (1-n)q(x)$$

$$\frac{dz}{dx} + (1-2) \left(-\frac{2}{x}\right) . Z = (1-2) \left(\frac{1}{x^2}\right)$$

$$\frac{dz}{dx} + \frac{2}{x} . Z = \frac{-1}{x^2}$$

$$I(x, z) = e^{\int \frac{2}{x} dx} = x^2$$

$$z \cdot I(x, z) = \int q(x) \cdot I(x, z) dx + c$$

$$z \cdot x^2 = \int -\frac{1}{x^2} \cdot x^2 dx + c$$

$$Z \cdot x^2 = -x + c$$

$$Z = \frac{-x+c}{x^2} , \quad Z = \frac{1}{P}$$

$$\frac{1}{P} = \frac{-X+C}{X^2}$$

$$P = \frac{x^2}{-x+c} , \quad p = \frac{dy}{dx} = y'$$

$$\frac{dy}{dx} = \frac{x^2}{-x+c}$$

$$-x -c$$

$$\int dy = \int \frac{x^2}{-x+c} dx \quad \sqrt{-x+c} \sqrt{x^2}$$

بالطريقة
 $\frac{+x^2 - c}{cx - c^2}$
 $\frac{c}{c^2}$

$$y = \int \left(-x - c + \frac{c^2}{-x+c} \right) dx$$

$$y = -x^2 - cx - c^2 \ln |-x+c|$$

$$\therefore f(x, y) = c$$

المعادلات التفاضلية الخطية من الرتبة الثانية

$$a_n y^{(n)} + a_{n-1} y^{(n-1)} + a_{n-2} y^{(n-2)} + \dots + a' y' + a_0 y = 1$$

معادلة تفاضلية خطية من الرتبة n ومعاملاتها دوال لـ x والطرف اليمين دالة

$$f(x)$$

في حالة a_n, \dots, a_0 تكون ثوابت تسمى المعادلة تفاضلية خطية من الرتبة n ذات معاملات ثابتة و اذا كان الطرف اليمين $f(x) = 0$

سميت معادلة تفاضلية خطية متGANSA

$$y' = \frac{dy}{dx}, y'' = \frac{d^2y}{dx^2}, \dots, y^{(n)} = \frac{d^n y}{dx^n}$$

$$y'' + p(x)y' + q(x)y = f(x) \quad \text{هنا في حالة } n=2 \text{ تكون بالشكل}$$

عندما $f(x) = 0$ تكون معادلة متGANSA بالشكل التالي

$$y'' + p(x)y' + q(x)y = 0$$

الآن سنأخذ المعادلة الخطية المتGANSA من الرتبة الثانية ذات المعاملات الثانية اي (p, q) تكون ثوابت وهنا تمثل a_0, a_1, a_2

$$y'' + p y' + q y = 0$$

الحل العام لها بطريقة جبرية حيث سنفرض

$$y'' = m^2 \& y' = m \& y = 1$$

$$m^2 + pm + q = 0$$

نحلها ونجد جذور المعادلة والتي ستأخذ ثلاثة حالات

1) عندما $m_1 \& m_2$ جذور حقيقة مختلفة سيكون الحل للمعادلة التفاضلية

$$y = c_1 e^{m_1 x} + c_2 e^{m_2 x}$$

٢) عندما تكون $(m_1 = m_2)$ حقيقة ومتقاربة

$$y = c_1 e^{mx} + x \cdot c_2 e^{mx}$$

٣) ثالثاً عندما تكون $m_1 \neq m_2$ جذور خالية الحل للمعادلة سيكون

$$y = e^{ax} (c_1 \cos bx + c_2 \sin bx)$$

Ex. solve (find the general solution)

$$\frac{d^2y}{dx^2} + \frac{dy}{dx} - 6y = 0$$

هنا نلاحظ من الرتبة الثانية وطرفها اليمين صفر تعني حالة $\lambda = m$ اي نفرض

$$y = 1, \frac{dy}{dx} = m, \frac{d^2y}{dx^2} = m^2$$

$$m^2 + m - 6 = 0$$

$$(m+3)(m-2) = 0$$

$$m_1 = -3, m_2 = 2$$

$$\text{g.s. } y = c_1 e^{-3x} + c_2 e^{2x}$$

$$y = c_1 e^{-3x} + c_2 e^{2x}$$

* هنا للتحقق من صحة الحل نستوي y' و y'' وتفوق في الطرف الأيسر سيكون الناتج = صفر اي الطرف اليمين

$$\text{Ex. } y'' - 6y' = -9y$$

$$\text{Sol. } y'' + 6y' + 9y = 0$$

$$m^2 + 6m + 9 = 0$$

$$(m+3)^2 = 0$$

$$m_1 = m_2 = m = 3$$

$$\therefore y = c_1 e^{3x} + c_2 x e^{3x}$$

Ex.: $y'' + qy = 0??$

Sol. $m^2 + q = 0$

$$m^2 = -9$$

$$m_{1,2} = \mp\sqrt{-9}$$

$$= \mp 3\sqrt{-1}$$

$$= \mp 3i$$

$$m_1, m_2 = a \mp bi \rightarrow a = 0, b = 3$$

$$y = e^{ax}(c_1 \cos bx \mp c_2 \sin bx)$$

$$y = c_1 \cos 3x \mp c_2 \sin 3x$$

$$\text{Exc. (1)} \quad y'' - 3y' + 2y = 0 \quad (3) \quad y'' + qy = 0$$

$$(2) \quad y'' = 4y' + 4y = 0 \quad (\text{Homework})$$

Laplace Trans for motions

تحويلات لاپلاس

تحويل لاپلاس : يُعرف تحويل لاپلاس للدالة $f(x)$ بـ $L(f(x))$ التكامل التالي :-

$$L\{f(x)\} = \int_0^{\infty} f(x) e^{-px} dx; \quad p \quad \text{عدد حقيقي}$$

خواص تحويل لاپلاس :-

$$(1) \quad L\{f(x) \mp g(x)\} = L\{f(x)\} \mp \{g(x)\}$$

$$(2) \quad L\{Af(x)\} = A L\{f(x)\}$$

$$(3) \quad L\{Af(x) \mp Bg(x)\} = A L\{f(x)\} \mp B L\{g(x)\}$$

هنا خاصية رقم واحد تمثل توزيع تحويل لاپلاس على الجمع والطرح لأنه يمثل متكامل لذا يتحقق هذه الخاصية للتكامل اي التوزيع على الجمع والطرح .

والخاصية الثانية تمثل الثابت يخرج خارج التحويل حيث ان التكامل بحاصل ضرب ثابت في دالة يساوي الثابت في تامل الدالة .

اما الشرط الثالث فهو جامع للشروطين السابقين ويسمى الخاصية الخطية (اي انه التكامل يحقق الخاصية الخطية) وبالتالي فإن تحويل لابلاس يحقق الخاصية الخطية .

Proof :

$$(1) \quad L\{f(x) \mp g(x)\} ?? = L\{f(x)\} \mp L\{g(x)\}$$

$$Pf: L\{ f(x) \mp g(x) \} = \int_0^{\infty} (f(x) \mp g(x)) e^{-px} dx$$

$$= \int_0^{\infty} f(x) \cdot e^{-px} dx \mp \int_0^{\infty} g(x) e^{-px} dx$$

$$= L\{f(x)\} \mp L\{g(x)\}$$

$$(2) \quad L\{Af(x)\} = AL\{f(x)\}$$

$$Df: L\{Af(x)\} = \int_0^{\infty} (Af(x)) e^{-px} dx$$

$$= \int_0^{\infty} A(f(x) e^{-px}) dx$$

$$= A \int_0^{\infty} f(x) e^{-px} dx$$

$$= A L\{f(x)\}$$

$$(3) \quad L\{A f(x) \mp B g(x)\} ??$$

$$= \int_0^{\infty} (Af(x) e^{-px}) dx \mp \int_0^{\infty} (Bg(x) e^{-px}) dx$$

$$= A \int_0^{\infty} f(x) e^{-px} dx \mp B \int_0^{\infty} g(x) e^{-px} dx$$

$$= A \{f(x)\} \mp B L\{g(x)\}$$

برهن خاصية (3) بالاعتماد على خاصية (1) و (2) &

$$L\{A f(x) \mp B g(x)\} ??$$

from propo. (1)

from propo. (2)

NOW if (1) $f(x) = 1 \rightarrow$ find $L\{f(x)\} = ?$

$$\begin{aligned}
 (1) \quad L\{1\} &= \int_0^\infty 1 \cdot e^{-px} dx = \frac{-1}{p} e^{-px} \Big|_0^\infty \\
 &= \frac{-1}{p} (e^{-p(\infty)} - e^{-p(0)}) \\
 &= -\frac{1}{p} \left(\frac{1}{e^\infty} - e^0 \right) \\
 &= -\frac{1}{p} (0-1)
 \end{aligned}$$

$$\therefore L\{1\} = +\frac{1}{p} \leftarrow \text{تحويل لابلاس للواحد هو}$$

$$(2) \quad \text{If } f(x) = e^{ax}$$

$$\begin{aligned}
 (2) \quad L\{e^{ax}\} &= \int_0^\infty e^{ax} e^{-px} dx \\
 &= \int_0^\infty e^{(a-p)x} dx = \frac{1}{(a-p)} \int_0^\infty (a-p) e^{(a-p)x} dx \\
 &= \frac{1}{a-p} e^{(a-p)x} \Big|_0^\infty = \frac{1}{a-p} (e^{(a-p)\infty} - e^0) \\
 &= \frac{1}{a-p} (e^{a\infty} (e^{-p\infty}) - 1) = \frac{1}{a-p} (\infty(0) - 1)
 \end{aligned}$$

وهكذا نجد تحويلات لابلاس لكل دالة تعطى لنا

Ex. : (Homework) Find Laplace transformation for the following function:-

$$1. f(x) = 2x^4$$

$$2. f(x) = \sin 3x e^{-x}$$

$$3. f(x) = \frac{1}{2} \sinh 5x$$

$$4. f(x) = \frac{1}{3} \cos 2x e^{3x}$$

$$5. f(x) = 4 \cosh 7x \qquad \qquad \qquad 6. f(x) = 3x^2 e^x$$

$F(t)$	$F(s) = L(f(t))$	
1		
t^n	$\frac{n!}{s^{n+1}}$	$s > 0, n = 0, 1, 2, \dots$
e^{at}	$\frac{1}{s - a}$	$s > a$
$\sinh(at)$	$\frac{a}{s^2 - a^2}$	$s > a $
$\cosh(at)$	$\frac{s}{s^2 - a^2}$	$s > a $
$\sin(at)$	$\frac{a}{s^2 + a^2}$	$s > 0$
$\cos(at)$	$\frac{s}{s^2 + a^2}$	$s > 0$
$e^{at} \sin(bt)$	$\frac{b}{(s - a)^2 + b^2}$	
$e^{at} \cos(bt)$	$\frac{s - a}{(s - a)^2 + b^2}$	
$f'(t)$	$sF(s) - f(0)$	
$\frac{1}{t} f(t)$	$\int F(u) du$	
$t^n e^{at}$	$\frac{n!}{(s - a)^{n+1}}$	$n = 1, 2, 3, \dots$

جدول تحويلات لا بلاس لبعض الدوال

ملاحظه :- الجدول ليس للحفظ حيث يعطى التحويل المطلوب استعماله في السؤال.

معكوس تحويل لا بلاس

Inverse Laplace transformation

1. $L^{-1} \left\{ \frac{1}{P} \right\} = 1$
2. $L^{-1} \left\{ \frac{1}{P-a} \right\} = e^{ax}$

اي انه معكوس تحويلات لا بلاس للمقدار هو ارجاع الدالة الاصلية التي كان تحويل لا بلاس لها هو المقدار المراد ايجاد معكوس التحويل له.

Ex. Find $L^{-1} \left\{ \frac{3}{P(P+3)} \right\} = ?$

$$\begin{aligned}
 \text{Sol. } L^{-1} \left\{ \frac{3}{P(P+3)} \right\} &= L^{-1} \left\{ \frac{1}{P} - \frac{1}{P+3} \right\} \\
 &= L^{-1} \left\{ \frac{1}{P} \right\} - L^{-1} \left\{ \frac{1}{P+3} \right\} \quad \text{by prop. 1)} \\
 &= 1 - e^{-3x} \quad \text{حسب جدول معكوس}
 \end{aligned}$$

Ex. Find Laplace inverse transformation for the following:-

1. $L^{-1} \left\{ \frac{3P+2}{P^2+4} \right\}$

$$\begin{aligned}
 \text{Sol. } &= L^{-1} \left\{ \frac{3P}{P^2+4} + \frac{2}{P^2+4} \right\} \\
 &= L^{-1} \left\{ \frac{3P}{P^2+4} \right\} + L^{-1} \left\{ \frac{2}{P^2+4} \right\} \\
 &= 3L^{-1} \left\{ \frac{P}{P^2+2^2} \right\} + 2L^{-1} \left\{ \frac{1}{P^2+2^2} \right\} \\
 &= 3 \cos 2x + 2 \sin 2x \quad \text{من الجدول}
 \end{aligned}$$

2. $L^{-1} \left\{ \frac{P+5}{(P+2)^2+9} \right\}$

$$\begin{aligned}
 \text{Sol. } &= L^{-1} \left\{ \frac{P+2}{(P+2)^2+3^2} \right\} + L^{-1} \left\{ \frac{3}{(P+2)^2+3^2} \right\} \\
 &= \cos 3x \ e^{-2x} + \sin 3x \ e^{-2x} \quad \text{من الجدول}
 \end{aligned}$$

Solution of differential Equation by using Laplace transformation and inverse

Let $a_2y'' + a_1y' + a_0y = f(x)$

معادلة تفاضلية خطية من الرتبة الثانية وتكون ذات معاملات ثابتة وغير متاجسة.

ولحل المعادلة نتبع الخطوات الآتية:-

١ - نأخذ تحويل لا بلاس لطرف في المعادلة المطلوب حلها.

٢ - بعد ترتيب المعادلة حسب التحويل $\{y\}$ نأخذ معكوس تحويل لا بلاس للطرفين فنحصل على الحل العام للمعادلة.

لحل المعادلة تحتاج إلى تحويلات لا بلاس للمشتقة الأولى والثانية وكالاتي:-

$$L\{y'(x)\} = P L\{y(x)\} - y(0)$$

$$L\{y''(x)\} = P^2 L\{y(x)\} - Py(0) - y'(0)$$

Pf.1:-

$$\begin{aligned} L\{y'(x)\} &= \int_0^\infty y'(x)e^{-px} dx \\ &= \int_0^\infty e^{-px} \cdot y'(x) dx = y(x)e^{-px} \Big|_0^\infty + \int_0^\infty y(x)pe^{-px} dx \\ &= (y(\infty)e^{-p\infty} - y(0)e^{-p0}) + p \int_0^\infty y(x)e^{-px} dx \\ &= (0 - 1 \cdot y(0)) + pL\{y(x)\} \\ &= pL\{y(x)\} - y(0) \end{aligned}$$

Pf 2:-

$$L\{y''(x)\} = P^2 L\{y(x)\} - Py(0) - y'(0)$$

$$L\{y''(x)\} = \int_0^\infty y''(x)e^{-px} dx$$

Ex:- Solve $y' - y = 1$; $y(0) = 0$, $L(1) = \frac{1}{P}$

$$L(e^{ax}) = \frac{1}{p-a}$$

Sol. $L\{y'\} - L\{y\} = L\{1\}$

$$p L\{y\} - y(0) - L\{y\} = \frac{1}{P}$$

$$(1-p)L\{y\} - 0 = \frac{1}{P}$$

$$(1-p)L\{y\} = \frac{1}{P}$$

$$L\{y\} = \frac{1}{(1-p)P} = \frac{1}{(1-p)} - \frac{1}{P}$$

$$L^{-1}\{L\{y\}\} = L^{-1}\left\{\frac{1}{(1-p)} - \frac{1}{P}\right\}$$

$$= L^{-1}\left\{\frac{1}{(1-p)}\right\} - L^{-1}\left\{\frac{1}{P}\right\}$$

$$\therefore y = e^x - 1$$

Ex. :- Solve $y'' + 2y' + 5y = 0$; $y(0) = 1$, $y'(0) = 5$

$$L\{\sin bx e^{ax}\} = \frac{b}{(P+a)^2 + b^2}$$

$$L\{\cos bx e^{ax}\} = \frac{P+a}{(P+a)^2 + b^2}$$

Sol. $L\{y'' + 2y' + 5y\} = L\{0\}$

$$L\{y''\} + 2L\{y'\} + 5L\{y\} = 0$$

$$P^2 L\{y\} - p y(0) - y'(0) + 2(p L\{y\} - y(0)) + 5 L\{y\} = 0$$

$$(P^2 + 2p + 5)L\{y\} - p - 5 - 2 = 0$$

$$(P^2 + 2p + 5)L\{y\} = p + 7$$

$$L\{y\} = \frac{p+7}{(P^2 + 2p+5)}$$

$$L^{-1}\{L\{y\}\} = L^{-1}\left\{\frac{p+7}{(P^2 + 2p+5)}\right\}$$

$$y = L^{-1}\left\{\frac{p+1}{(P^2 + 2p+1)+4} + \frac{6}{(P^2 + 2p+1)+4}\right\}$$

$$y = L^{-1}\left\{\frac{p+1}{(P^2 + 2p+1)+4}\right\} + L^{-1}\left\{\frac{6}{(P^2 + 2p+1)+4}\right\}$$

$$y = L^{-1}\left\{\frac{p+1}{(p+1)^2+4}\right\} + 3L^{-1}\left\{\frac{2}{(p+1)^2+4}\right\}$$

$$\therefore y = \cos 2x \cdot e^{-x} + 3 \sin 2x \cdot e^{-x}$$

Ex. Solve (Homework)

$$1. \quad y' + 2y = e^x; \quad y(0) = 0$$

$$2. \quad \frac{dy}{dx} + 2y = \cos x; \quad y(0) = 1$$

$$3. \quad y' - 4y = 2; \quad y(0) = 2$$

$$4. \quad y'' - 4y' + 3y = 6e^{4x}; \quad y(0) = 2, \quad y'(0) = 6$$

$$5. \quad y'' - 9y = 6 \cos 3x; \quad y(0) = 0, \quad y'(0) = 3$$
