The global economy is constantly evolving and corporate technology and business are an important factor in this development and because of the accompanying negative impact on the environment and society, the role of sustainability and sustainable development highlights. This actually is the place the sustainability idea is needed, with the purpose to make a balanced interplay between economic investments, useful resource utilization, and social advancement for modern wishes and future potentials[1], [2]. In this connection, there is a have to combine sustainability and information technology allow organizations to behave in a manner to going greener [3]. The green or Greenness has become an important topic that goes into all aspects of life around the world including information technology and business. In general, Merriam-Webster (An American Dictionary of the English Language) defined a green is "tending to preserve environmental quality (as by being recyclable, biodegradable, or non-polluting)" [4].

In 2018, Hayri ACAR consider sustainable software at the outside of the green software. Therefore, that mean the green must respect sustainable criteria. In this regard, UN cited the sustainability criteria only have three main dimensions, which are economic growth, environmental protection, and social equality[5].

Because the globalization changing very speedily in business, competition increased, and information technology rapidly growths, companies have to undertake enterprise resource planning (ERP) systems furnished with software program and hardware amenities[6][7] to typically meet the technical data necessities of companies along with the desire of owner to strengthen corporate competitiveness[8].

Comprehending that the Enterprise Resource Planning (ERP) system is one of the very effective commercial enterprise solutions for organizations, In doing so, it have now been an important contributor to environmental degradation brought on by resource consumption, greenhouse (carbon) emissions, and wastage[9]. As a consequence, it's essential to align its use with sustainability elements through the utilization of green information technology (IT) [3], So every company must look into the impact of the utilization of Information and communications technology (ICT) on our natural environment and take care to adopt methods to decrease the effects negative on its [3][9][10].

2. Related work

The development of information and communication technologies has an impact on the development of all types of software and applications in the organization. At the same time, the phenomenon of globalization and the external environment were more complex with the new need and conditions for institutions in terms of reducing the negative effects on the environment[11]. For this reason, a high-quality information system is now a necessity for every enterprise to be capable to make bigger competitiveness with the aid of decreasing fees via higher logistics. Previous reviews of the literature need more research in the scope of the green software development process, as well as little research on the topic of green software development process with ERP system, so we focused on this as shown in (Figure 1) where we note that the ERP system and the software development process and knowledge management are all within the environment of the green software development process, and this leads to a high quality of data and software in the enterprise. In these circumstances, companies have two challenges: to generate and put in force an infrastructure for information technologies with purposes for storing and sharing information and to successfully use this information for the decision-making process[11].

Because of the negative effects on the environment resulting from its software, systems, and applications in organizations[3], the objective of this study is to the possibility of enhancing the implementation of the ERP system in Green SDP by using green IT practices and knowledge management as a facilitation tools. Moreover, knowledge can also being a significant intangible asset to attain success in the situation of green sustainable development [12]. The organization can take advantage of the benefits of ERP systems and knowledge management and achieve success in the competition globally[11]. In this regard, In 2003 Darshana Sedera et al. propose a model to empirically assessing the impact of KM on the success of ERP systems.

In 2007 Rosemary and Sukunesan show there is an opportunity that may be explored, are the many companies that undertake IT implementation towards sustainable development and many of those companies have a basis in KM[13]. Currently, organizations have assigned very significance to the knowledge, which is generated internal and external the company, think about it an priceless asset to acquire sustainable benefits and due to the have an effect on enhancing their processes, rendering it fundamental to generate techniques focused at knowledge management[14].

In this regard, Pattarin and Vichita in 2019 developed a framework by means of integrating the essential concepts from sustainability and knowledge management [1]. In 2019, Minodora, et al. proposed a framework to explore the connection between green IT practices and ERP to check how green IT provides a chance for organizations to enhance ERP in greater environmentally answerable initiatives [3]. However, they published that the connection between ERP and green IT practices is now not relevant, specifically due to the fact of the low stage of environmentally friendly lifestyle inside companies. So they advised that organizations should start to provoke an massive layout now not simply addressing the

operational stage of these systems, however moreover the integration of sustainability factors in software program quality, administration elements of ERP implementation, or enterprise attitudes to going green[3].

In this regard, the objective of this study is to possibility of enhance the implementation of ERP system in Green SDP by using green IT practices and knowledge management as a facilitation tools. This leads to new knowledge in this field that combines ERP, Green SDP, SDP and KM, as well as focusing on the quality factor of data and software.

3. Methodology

The objective of this research study is to provide a design model to enhance ERP system in green software development process by using green IT practices and knowledge management as a facilitation tools , to achieve this objective, we conducted are:

1. Reconnoitering of previous studies on the subject of the research study based on keywords such as Green Process Software Development (GSDP), Software Development (SDP) or it is also called Software Development Lifecycle (SDLC), Project Planning (ERP) and Knowledge Management (KM).
2. Analysis (filtering and summarizing) the existing researches, provide a systematic review.
3. Propose and design a model to enhance the ERP system in the green software development process.

4. Propose model

Based on the literature review and to achieve the goal of this paper, we propose a design model to enhance ERP system in GSDP. This model consists of five components: ERP, software development process, green software development process, green IT practices, and knowledge management. The importance of this model comes from the green software development process, which is about producing nature-friendly software products with the aim of reducing the terrible environmental impacts on our environment, using green IT practices in SDLC that can be successfully implemented. (Figure 1) shows the model proposed.

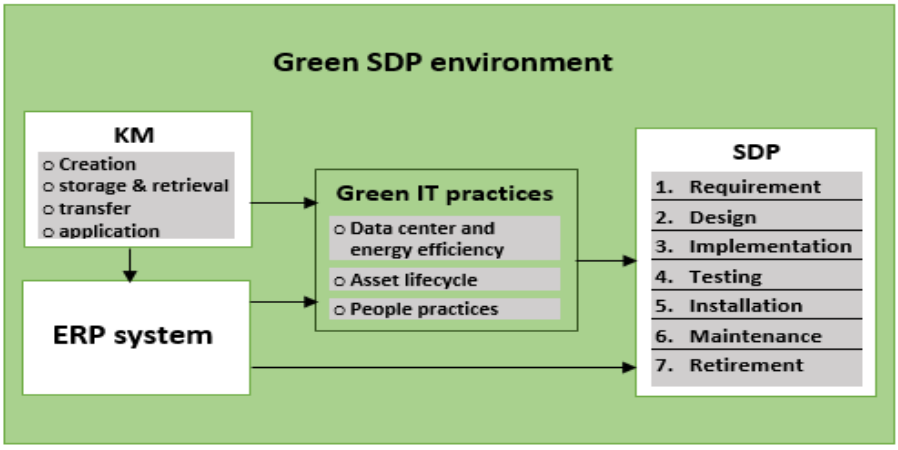

Figure1. ERPs in Green SDP model

4.1. ERP system

ERP system is one of the integrated information systems, which continues to evolve as information technologies evolve and business requirements continue to diversify [8], [15]. The opinions about ERP evolution are different; Rashid et al. (2002) described that evolution as follows: in the 1960s the

organizations were used inventory control packages to automating systems, were using programming languages to writing like COBOL and FORTRAN. In the 1970s, Material requirement and planning (MRP) structures had been used to sketch the requirements of product and components inside a process of production[16]. After that, at 1980s, manufacturing resource planning (MRPII) was evolved to enhance the process of production; it added modules to include business planning, production planning, finance, engineering, human resources, distribution, and shop floor in one computer system (Wallace, 1990). Then these concepts expanded, were appeared ERP systems in the 1990s, which have the ability to integrate the business processes throughout a company[8][17].

Irwan et al. 2018, defined ERP "is a software for business management system which integrates all business functions, processes, and information between different departments inside the company. This business software system will allow companies to automate and integrate the majority of their business processes, share common data and practices across the entire enterprise, and produce and access information in a real-time environment"[18].

ERP systems may provide a company with multiple benefits. However, it is very important these benefits outweigh the expenses of the system and they need to provided that the proper system for the company is chosen and the system is implemented properly[7]. According to Deloitte 1998, the ERP system is a software system package for business[19] that lets in the enterprise to: automate and combine the majority of its enterprise processes, share common practices and data throughout the whole enterprise produce, and get admission to information in real-time.

There are many vendors, which provide an ERP system like SAP, Oracle, Microsoft et al.; they have relied on various ERP software programs according to customer needs. Most ERP solutions run along with Unix and Linux operating systems or Windows platform[20] [21]. We will take SAP ERP system as a case study. SAP word abbreviation means "Systems Applications and Products" in Data Processing. (SAP AG) by using definition, can be the title of the ERP software program alongside the title of the organization. SAP AG Software is absolutely a European multinational, established in 1972 by five engineers were worked at the IBM company are Plattner, Wellenreuther, Hector, Tschira, and Hopp. They improve software program solutions for client relationships and managing enterprise operations[22]. In practice, this business enterprise software program is known as (SAP), and the professional name is SAP ERP. (SAP AG) is the world's greatest provider of business enterprise software program that, in 2017, served extra than 345,000 clients in over a hundred ninety nations (SAP AG, 2017b). The Enterprise Software section of the organization has developed industry-specific features in the software product for over twenty-five industries to client relations and manage commercial enterprise operations for organizations [23].

SAP provides ERP solutions, to all enterprise areas, inclusive of midsize and small businesses. Where SAP launched its first ERP software program in 1979 as R/2, then redesigned the software program in 1992 the usage of a client-server architecture. R/3 used to be the ensuing software; it grew to be an immediately hit. With the assertion of it a client-server SAP R/3 system, SAP AG, which already the greatest issuer in the ERP market, brought a system that used to be attractive to small-sized and medium organizations in addition to the large organizations that already make use of SAP software program [24]. The key features of SAP R/3 software are:

1. SAP R/3 software runs on truly any software/hardware platform and may use numerous database management systems.
2. The programing code of SAP R/3 is wrote in an interpretive language known as ABAP. (ABAP is a German abbreviation that, translate as loosely, mean "Advanced Business Application Programming"). ABAP is very comparable in its syntax to COBOL. Use of the ABAP language permits SAP clients to increasing the functions of the software product.

SAP presents a massive array of widespread reports and a report writer, "Advanced Business Application Programming" (ABAP). ABAP programming language is an object-oriented environment that generates reports or transactions. The ABAP surroundings limited in offers some automatic report generation and query tools. To obtain the total advantage of the ABAP surroundings, one should be a proficient programmer [20].

Generally SAP ERP is primarily based on a database that treats with numerous commercial enterprise features interior exclusive modules like finance, sales, purchase, human resources, inventory, and manufacturing [23]. However, SAP ERP is a commercial enterprise system designed to assist the optimization of business processes within an enterprise and associated process management activities[25][26].

4.2. Software development process

SDP is also called SDLC "Software development life cycle" is a procedure that produces a software program with the very best high-quality and lowest price in a short time. SDLC consists of a detailed sketch for how to develop, maintain, replace, and alter a software system[27]. However, SDP is a systematic technique for developing software program applications. Introducing any idea early in the SDLC can make sure that the idea is propagated via a number of phases [28].
Below are the software development lifecycle stages:

1. Requirement: gather all the information and requirements to conceive a concrete expectation to the software product.
2. Design: is a phase do a clear and expert design of the system and software to obtain all the requirements of the preceding phase with the aid of the developers and architects of the system.
3. Implementation: The software design will now be translated into code.
4. Testing: each module will be tested to make sure that the software product is completely free of any defects.
5. Installation: install the product up to be ready for customer use.
6. Maintenance: fine-tuning and enhancements of the system and begin planning to the feasible features and functionalities that should be inserted into the software.
7. Retirement: is the removal of a software release from production, it is also known as system decommissioning.

4.3. Green software development process

Green or Greenness has become an important topic that goes into all aspects of life around the world including information technology and business. In general, Merriam-Webster (An American Dictionary of the English Language) defined a green is tending to reserve environmental qualities (such as by being biodegradable, recyclable , or non- contaminating)[4]. In 2018, Hayri ACAR consider sustainable software at the outside of the green software. Therefore, that mean the green must respect sustainable criteria. In this regard, UN cited the sustainability criteria only have three main dimensions, which are economic growth, environmental protection, and social equality[5].
GSD is a methodical processes which allow a disciplined, systematic and well-organized development of green software products[12]. Green SD is concerning to use green finest practices during SDLC process. The Key idea of Green SD is regarding manufacturing of nature-friendly software products with the aim of minimizing negative ecological impacts to our natural environment[29][30]. The main goal of GSD is about using green practices in SDLC for making greener software products, including any kinds of application software and system software products[31][32][28].

GSD includes seven phases: 1) Requirement, 2) Design, 3) Implementation, 4) Testing, 5) Installation, 6) Maintenance, and 7) Retirement [33]. Consciousness of environmental concerns and green practices must certainly be promoted at the starting of the software development [31][34]. Alike, building a secure software, security concepts should be presented in the initial SDLC phases. Likewise, presenting energy awareness early confirms that the energy-related expenditures could be minimized in later SDLC phases[28]. McXin Tee, Rusli Abdullah, J. Din, S. Abdullah, and L. Wu (2017) proposed a framework to explore relations between five independent variables (ethical motivation, competitive motivation, managerial motivation, financial motivation, and regulatory motivation) and Green SD adoption through using KM acts as simplification tools[29]; But the result of the empirical analysis showed the only motivating factor that expressively contributes to motivate software practitioners in adopting Green SD is the ethical motivation.

4.4. Green IT practices

Green practices are expressed as collections of knowledge about green policies and activities that gather the most common environmental issues[35][31]. To do make work environment harmful and decreasing the overall expense of ownership, green IT proposes some of the main pros that can be done if green policies and frameworks based on green IT should be implemented correctly. Some of these benefits are[36]:

1. Green IT reduces total energy costs of the organizations.
2. It extends or elongate the life of existing data center kit by cleverly revitalizing equipment, taking benefit of energy efficiencies.
3. It lowers IT maintenance actions and costs and improves over- all impression of the organization.
4. It reduces environmental stewardship and saves money and by appropriate disposal of discarded and toxic hardware, by suggesting new hardware's which are environment friendly, consume less energy and easy to get rid of.
5. It reduce global warming effects by reducing overall carbon footprints.
6. It reduces smog, Acid rains and global climate change effects.
7. It reduces the emanation of CO2, thereby reducing the respirational problems faced by different types.
8. It reduces the straining on the electricity grid.
9. Free up spaces on data center floors.

Thus, based on the green IT maturity model suggested by Foogooa et al. [37], the next three focal points are contained in the model in our research: energy efficiency and data centers, asset lifecycle, and people practices[3].

4.5. Knowledge management

KM is defined as a cyclical process concerning to phases of collecting knowledge from varied sources, then storing the knowledge in an appropriate format and place, and finally upgrading the present knowledge with the goal of making new values to organizations[29], [38], [39]. Knowledge is really a melted mixture of experience, related information, and expert insight that provides a construction for evaluating and combining new experiences and information. It initiates and is applied in the awareness of a knower[40][14].

Knowledge could be split into two kinds: explicit knowledge and tacit knowledge. The tacit knowledge is the better practices, intuitions, heuristic, special know-how, practical skills, and so on. Its individual

knowledge that's difficult to formalize or expressive. The explicit knowledge could be transmitted and codified in recognized and systematic language[40].

The utilization of KM can upraise sustainability through its essential processes and activities[1]. KM processes are composed of four groups of activities working with the management of explicit and tacit knowledge within the organization[41] .

1. Knowledge creation: could be the improvement of new knowledge or replacement of the existing one, where inventions and solutions are generated.
2. Knowledge retrieval and storage: are described the memory that preserves, keep and share knowledge across time and space, which supports reduce replication of work and wastefulness of resources.
3. Knowledge transfer: could be the exchange of knowledge at different levels between individuals, groups, or organizations using various communication methods.
4. Knowledge application: is the process that knowledge is utilized in practice to be able to bring competitive advantage to life.

And the knowledge evolution cycle consists of five phases [42]:

1. Originate/create knowledge: members of an organization develop knowledge through learning, problem solving, innovation, creativity, and importation from outside sources.
2. Capture/acquire knowledge: members acquire and capture information about knowledge in the explicit forms.
3. Transform/organize knowledge: in written material and knowledge bases.
4. Deploy/access knowledge: organizations distribute through education, training program, and automated knowledge base system or expert networks.
5. Apply knowledge: KM aims to make knowledge available whenever it is needed.

5. Discussion

In this paper, We got to know the ERP system (definition, stages of development, importance and suppliers... etc.) of many research papers, as well as identifying the most important practices applied in the software development lifecycle to get a practical environment for the development of green software, which must be without or less an impact on the environment. In addition, we got know the importance of knowledge management in the organization and its relationship with the project planning system and the green software development environment.

The proposed model for improving the implementation of ERP system in the green software development process environment is important in improving software quality as well as knowledge quality because it requires the implementation of ERP in a pure, environmentally friendly environment, with less of (energy consumption, carbon emissions and waste of resources).

6. Conclusion

The adoption of ERP system is important for companies around the world, and the implementation of ERP continues to face many problems. There are many studies in this regard, but there is no framework that demonstrates the possibility of improving the implementation of the ERP system in a green software development process environment as it is pure and environmentally friendly.

In this paper we propose a model to improve the implementation of the ERP system in a green software development process environment based on knowledge management and IT practices as support tools. The result model shows how knowledge management has been used as a management to enhance the green software development process environment.

In the future, we will provide a questionnaire for specialists in this field to verify the validity of the model, and we suggest that there should be a field study of some companies that use ERP system in Iraq/Basra and urge them to implement the system in a friendly environment. One of the limitations of this study is that it is a theoretical study, not an application, as well as the ability to develop an algorithm for the model.

7. Acknowledgments

We would like to express our thanks to everyone who helped us complete this research.

The Prediction of COVID 19 Disease Using Feature Selection Techniques

The Prediction of COVID 19 Disease Using Feature Selection Techniques

Rasha H. Ali[1] and Wisal Hashim Abdulsalam[2]

Abstract. COVID 19 has spread rapidly around the world due to the lack of a suitable vaccine; therefore the early prediction of those infected with this virus is extremely important attempting to control it by quarantining the infected people and giving them possible medical attention to limit its spread. This work suggests a model for predicting the COVID 19 virus using feature selection techniques. The proposed model consists of three stages which include the preprocessing stage, the features selection stage, and the classification stage. This work uses a data set consists of 8571 records, with forty features for patients from different countries. Two feature selection techniques are used in order to select the best features that affect the prediction of the proposed model. These are the Recursive Feature Elimination (RFE) as wrapper feature selection and the Extra Tree Classifier (ETC) as embedded feature selection. Two classification methods are applied for classifying the features vectors which include the Naïve Bayesian method and Restricted Boltzmann Machine (RBM) method. The results were 56.181%, 97.906% respectively when classifying all features and 66.329%, 99.924% respectively when classifying the best ten features using features selection techniques.

Keywords: Feature selection, COVID 19, Recursive Feature Elimination, Extra Tree Classifier, Restricted Boltzmann Machine, Naïve Bayesian.

1. Introduction

COVID 19 is an infectious disease that spreads through the air. Besides, it can live on rooftops for about two days, and it was initially called the Wuhan virus because of its origin from Wuhan, China, where the first human case was recorded [3]. Then the disease spreads rapidly and within a month turned into a pandemic affecting people all over the world in a negatively way. This prompted the World Health Organization (WHO) to declare a general global health emergency by the end of January 2020. Symptoms may appear on the infected person or not, but in either cases, the infected person can spread the virus. The incubation period ranges from two days to two weeks. The symptoms are different, such as fever,

shortness of breath, cough, chest pain, loss of sense of smell and taste, vomiting, headache, nausea, laziness, and others [4, 5].
In general, there is no vaccine available for **COVID 19** and information about it remains limited. There are several clinical trials to understand how the virus could be redeveloped in an attempt to produce a vaccine [6].
To limit the virus spread, governments around the world have taken various measures such as closing borders and commercial complexes, suspending education in universities and schools and converting them to e-learning, and suspending gatherings, etc., which affected various aspects of life, especially the economic aspect. People have been made aware of the importance of practicing simple steps such as staying home, regularly washing and sterilizing hands, social distancing, and wearing masks. Figure (1) gives **COVID 19** cases distribution worldwide, in November 2020 [2].

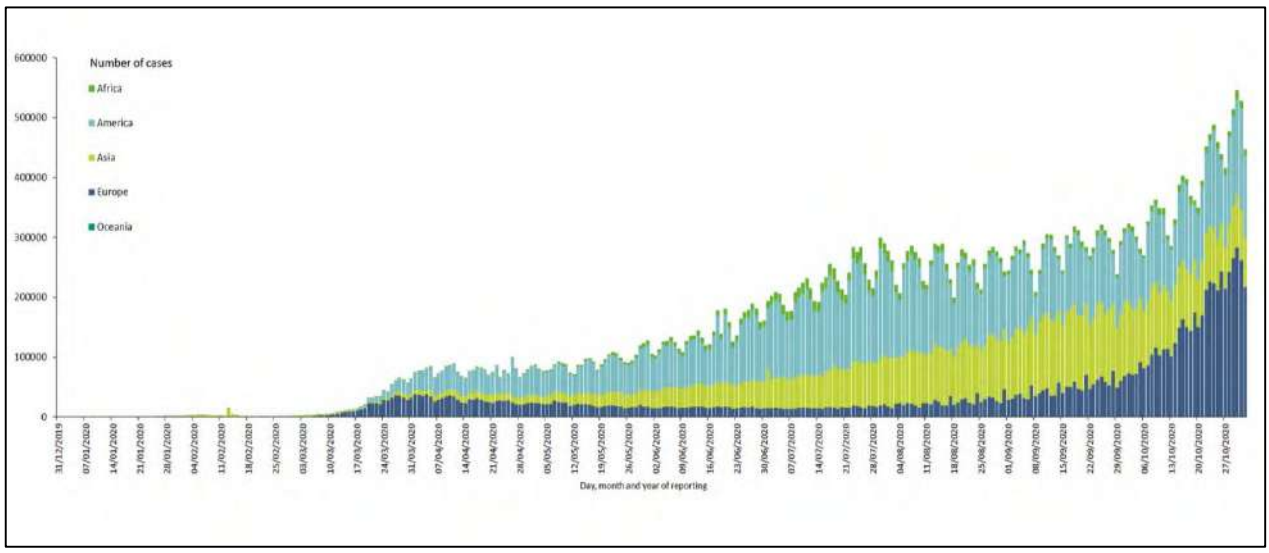

Fig. (1) **COVID 19** cases distribution worldwide, in November 2020 [2].

The goal of this work is to suggest a model for predicting the disease of **COVID 19** using feature selection techniques. The feature selection techniques are used for selecting the important features which affect the accuracy of the classification for the model.
The main contribution of this work is the prediction of the COVID 19 disease using two types of feature selection techniques, which are REF as wrapper feature selection method and ETC as embedded feature selection method and comparing between them by the results in order to select the most important features, then extracted the optimal number of features in the dataset contained different information, different types of data (text, number, and date), missing value, and large numbers. Two types of classification techniques are used including the Naïve Bayesian and RBM which are applied on different number of features for comparing the results.
This paper is ordered as follows: Section 2 presents the literature review. Section 3 describes the proposed work including the dataset used, basic preprocessing operations, feature selection, and classification. Section 4 presents the results and discussion while section 5 gives the conclusions.

2. Literature Review

This section presents the work related to **COVID 19** prediction based on feature selection techniques.

Warda M. Shaban et al. [5] suggested a strategy to diagnosis **COVID 19** using a hybrid feature selection that used filter method as a rapid feature selection and then used genetic algorithm as a wrapper method to select the most important features from those extracted from chest Computed Tomography (CT) images and then an Enhanced K-Nearest Neighbour (EKNN) classifier was used. This method achieved 96% of accuracy.

Liang Sun et al. [7] proposed an Adaptive Feature Selection guided Deep Forest (AFS-DF) for **COVID 19** classification based on chest CT images. AFS-DF was evaluated on a dataset with 1495 patients of **COVID 19** and 1027 patients of community and gained an accuracy of 91.79%.

Bejoy Abraham, and Madhu S. Nair [8] investigated the effectiveness of a combination of several pre-trained Convolutional Neural Networks (CNNs) for **COVID 19** detection from X-ray images. The method used a combination of features extracted from multi-CNN with correlation based feature selection technique in combination with subset size forward selection, and a linear forward selection based search technique to determine the optimal feature subset and Bayesnet classifier. They achieved an accuracy of 91.16% when tested on a dataset with 453 **COVID 19** images and 497 non-COVID images, and 97.44% on a dataset consisting of 71 **COVID 19** images and 7 non-COVID images.

Mohammad Pourhomayoun, and Mahdi Shakibi [9] applied different filter and wrapper methods for feature selection to select 42 features out of 112 features. Then they used several machine-learning algorithms to predict mortality in patients with **COVID 19**. They used a dataset of more than 117,000 laboratory-confirmed **COVID 19** patients from76 countries. The Neural Network algorithm achieved the best performance and accuracy of 93%.

3. The Proposed Work The proposed work consists of three stages. These are pre-processing stage, features selection stage, and finally the classification stage. In each stage, more than one step and techniques are used for achieving the goal of each stage. Figure (2) shows the structure of the proposed model.

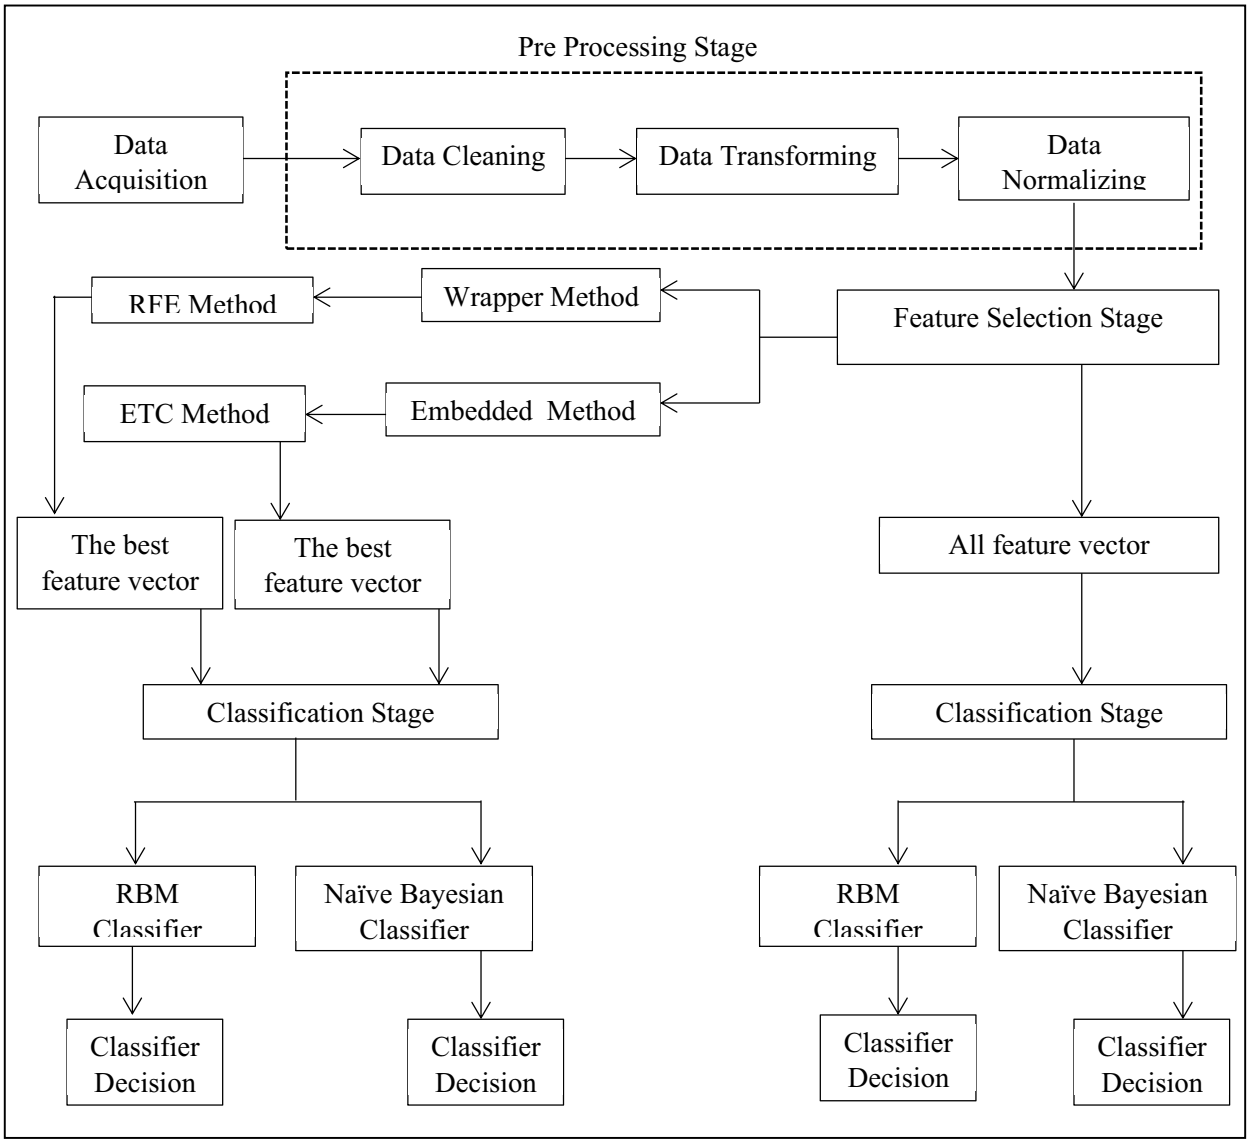

Fig. (2) The structure of the proposed model.

3.1 The Pre-processing Stage

This stage is also known as data preparation. It is a very important stage to build a good model and enhance the accuracy [10]. The dataset used in this work had been collecting by the WHO, which contained 8571 records from thirty-eight countries.

Figure (3) shows the number of records for each country in the dataset. The dataset included forty features with different types (time, text, and number), with type (CSV) file. The proposed model undergoes pre-processing in three steps, namely data cleaning, transforming and normalization

- **Data cleaning processing.** The data set may have insufficient data, missing data, too much data in rows or in columns, duplicate data and outlier values. In this work, the data has been cleaned through processing the missing value by fill each missing value with the nearest value.
- **Data transforming process** has been applied through transforming data into numeric forms.
- **Data normalizing** has been performed by applying min max scalar using the following equation

$$z = (x - \min) / (\max - \min) \quad \ldots(1)$$

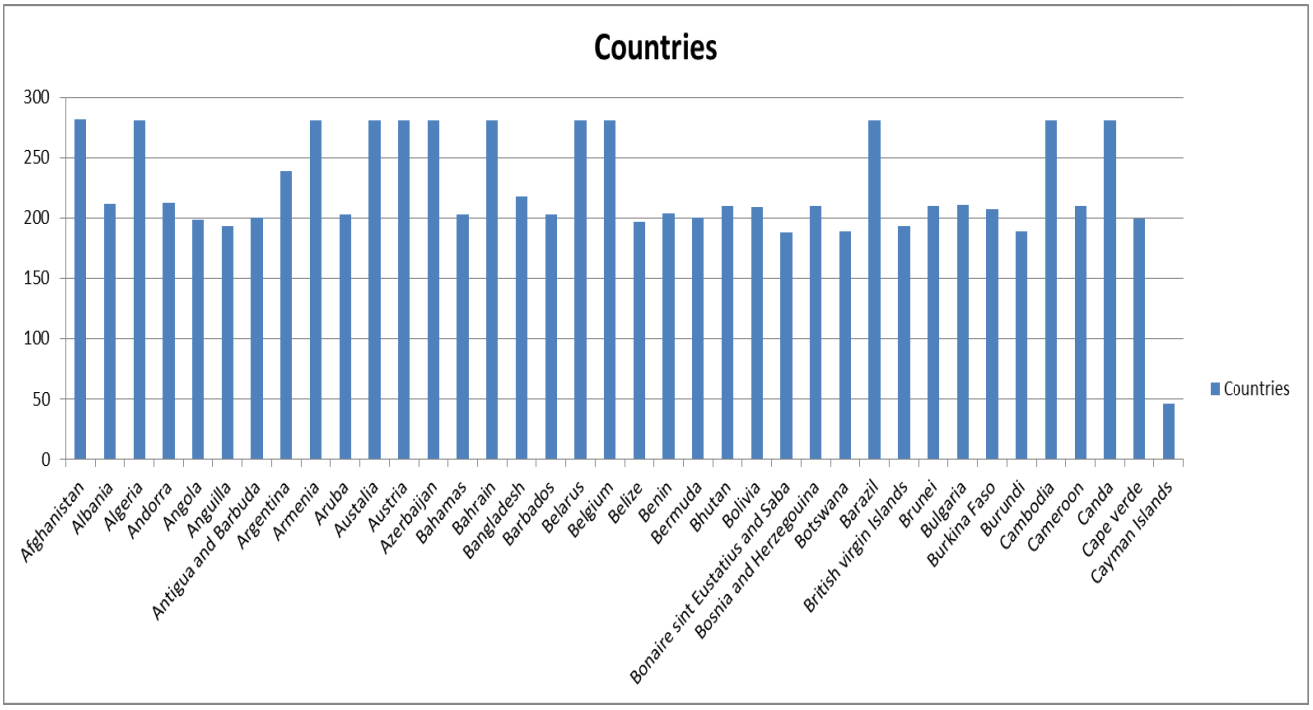

Fig. (3) The number of records and countries in the dataset.

3.2 The Feature Selection Stage

To improve learning performance, dimensionality reduction was used when there are a large number of input features, which divided into feature extraction and feature selection techniques. Feature extraction extracts a new set of features that is smaller than that resulting from feature selection, so the discriminative power is better. Because of that, it is more useful for signal processing, information retrieval, and image analysis, but a combination of features may have no physical meaning, so feature extraction is not a good approach in respect of transparency, interpretability, and readability. Feature

selection builds a subset of the original features. This is useful when interpretability knowledge extraction is crucial, as in medicine, and since this work is based on a medical problem, we will concentrate on feature selection. There are three types of feature selection: filters, wrappers, and embedded. Filters concentrate on the general characteristics of the data. So they are independent of any learning method, not computationally costly and have a good generalization capacity. Wrappers and embedded methods both are required for selecting features. For wrappers, an induction method evaluates candidate subsets of features. They are more computationally costly than filters but perform better. Embedded methods lie between filters and wrappers because the selection is part of the training process for the induction method. The search for the best subset of features is performed during the training of the classifier and, because of that; embedded methods are less computationally costly than wrappers. There is also a hybrid method, which combines different feature selection algorithms in a sequential manner [11].
In this work, the number of features in the dataset is forty. Table (1) presents the features of the dataset. The goal of this stage is selecting the important features which affect the prediction of the model. Two methods are used for selecting features: Recursive Feature Elimination (RFE) method and the Extra Tree Classifier (ETC) method. The RFE is one of the wrapper feature selection method. It works by recursively removing attributes and building a model on those attributes that remain. It uses accuracy metric to rank the feature according to their importance. It takes the model to be used and the number of required features as input and gives the ranking of all the variables, the value (one) being most important. It also gives its support, the value (True) being a relevant feature and (False) value being an irrelevant feature. Algorithm (1) shows the steps of the RFE.

Algorithm (1) The steps of the RFE method.

Step1:- Train the logistic regression model using training set.

Step2:- Calculate the performance of the model.

Step3:- Calculate the variable ranking.

Step4:- For each subset size S_i do

1. keep the S_i most important variable
2. preprocessing the data
3. train the model using S_i predictors
4. calculate the performance of the model.
5. recalculate the ranking for each predictors.

End

Step5:- Calculate the performance for all S_i

Step6:- Determine the number of the predictors.

Step7:- END.

The (ETC) method is an embedded feature selection method. It depends on decision trees where each decision tree is created from the unusual training sample. Then, at each test node, each tree is provided with a random sample of N features from the feature set from which each decision tree must select the best feature to split the data based on the Gini Index using equation (2) as a mathematical criterion [12]. This random sample of features leads to the creation of multiple de-correlated decision trees.

$$I_G = 1 - \sum_{j=1}^{c} p_j^2 \quad \ldots(2)$$

Table (1) The features of the dataset [1].

3.3 The Classification Stage

Also, it is known as decision making. The goal of this stage is to classify the feature vector [13]. In this stage, the feature vector is classified using two methods: the Naïve Bayesian (NB) method and Restricted Boltzmann Machine (RBM) method. NB is a simple classifier based on the Bayes theorem which assumes that the features are independent. This classifier has worked well in many real-world situations. It is a very fast and has a good performance. The main advantages of this classifier are the conditional independence assumption, which helps to obtain a quick classification, and the probabilistic hypotheses. Parameters of probability distributions are obtained from the training material [14].

RBM is an algorithm useful for dimensionality reduction, feature learning, regression, classification, and collaborative filtering. RBM is a two-layered stochastic recurrent neural network capable of unsupervised learning and feature extraction [15]. It is an energy based model that can be viewed as a single layer undirected neural network which consists of two binary layers, the visible layer, and hidden layers. There are no effects between nodes in a single layer of RBM[16].

4 The Results and Discussion

This paper suggests a model for predicting the **COVID 19** disease using features selection techniques and two methods for classifying the features vector. The implementation of the proposed work was achieved using Python (V.3.5) as programming language, Jet Brains Pycharm (V.2018.2) as framework. As described earlier, the suggested method consists of three main stages. Firstly, the data pre-processing which was contained more than one process because of the nature of the collected dataset which has missing values, extra data, and different types of data. Secondly, the features selection was achieved by using two models for selecting features (the wrapper method and the embedded method). In this stage, the number of features selected was: ten features and twenty features. The RFE is one of the wrapper methods which was applied for selecting the 10 features and 20 features. Figure (4) presents the sorting of ten important features using RFE. The true value means the relevant feature while the false value means the irrelevant feature. Also, it can be viewed as ranking; the value (one) is the most important feature while the remainder values mean the rank of each feature depending on its importance.

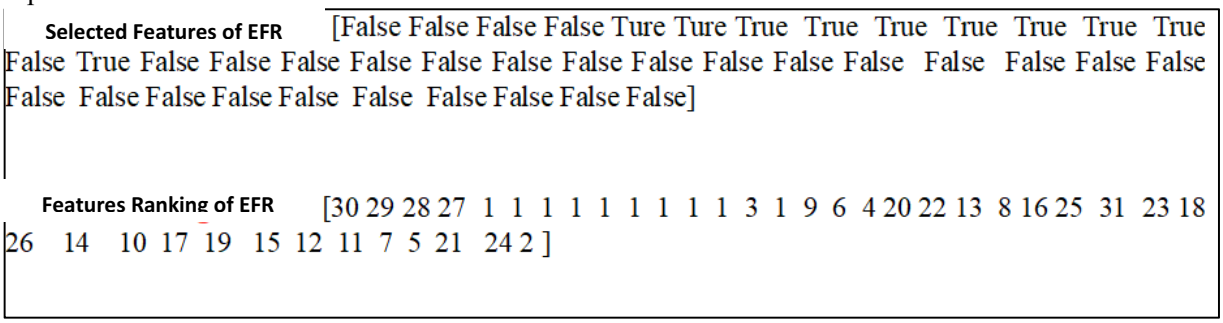

Fig. (4) The results of RFE method.

The second method applied for selecting features was ETC. Table (2) shows the values of features depend on their importance. While Figure (5) and (6) show the sorting of features depends on the importance of features for (10 most important features and 20 most important features respectively).

Table (2) The values of importance for features

Feature's Name	The value	Feature's Name	The value
iso_code	0.0000	new_tests_smoothed_per_thousand	0.017507
Continent	0.0000	tests_per_case	0.017407
Location	0.0000	positive_rate	0.015329
Date	0.0000	tests_units	0.0000
total_cases	0.075913	stringency_index	0.037782
New_deaths	0.040493	population	0.004229
new_cases_smoothed	0.075071	population_density	0.002263

new_cases_smoothed_per_million	0.076830	extreme_poverty	0.004050
total_deaths_per_million	0.047108	cardiovasc_death_rate	0.004266
new_deaths_per_million	0.036282	diabetes_prevalence	0.008391
new_deaths_smoothed_per_million	0.040993	female_smokers	0.002974
new_tests	0.016462	male_smokers	0.004460
total_tests	0.016644	handwashing_facilities	0.005238
total_tests_per_thousand	0.016404	hospital_beds_per_thousand	0.005043
new_tests_per_thousand	0.014537	life_expectancy	0.005591
new_tests_smoothed	0.019729	human_development_index	0.009421

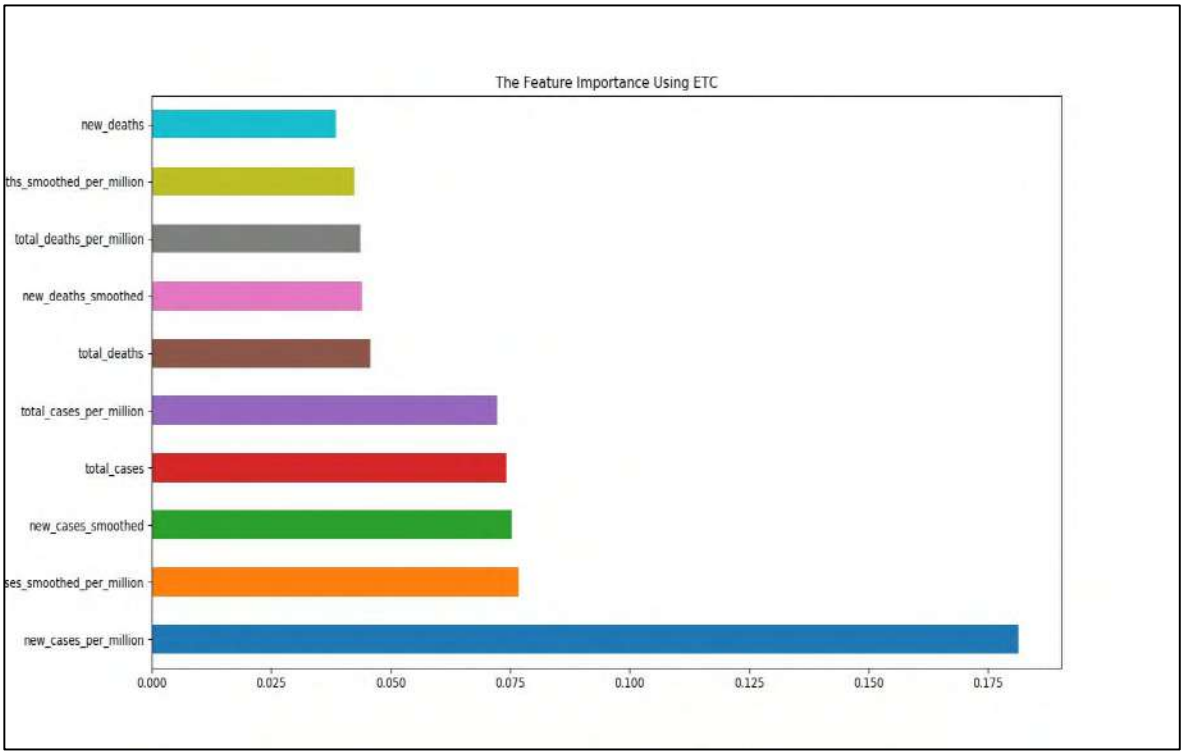

Fig. (5) The sorting of important ten features using ETC.

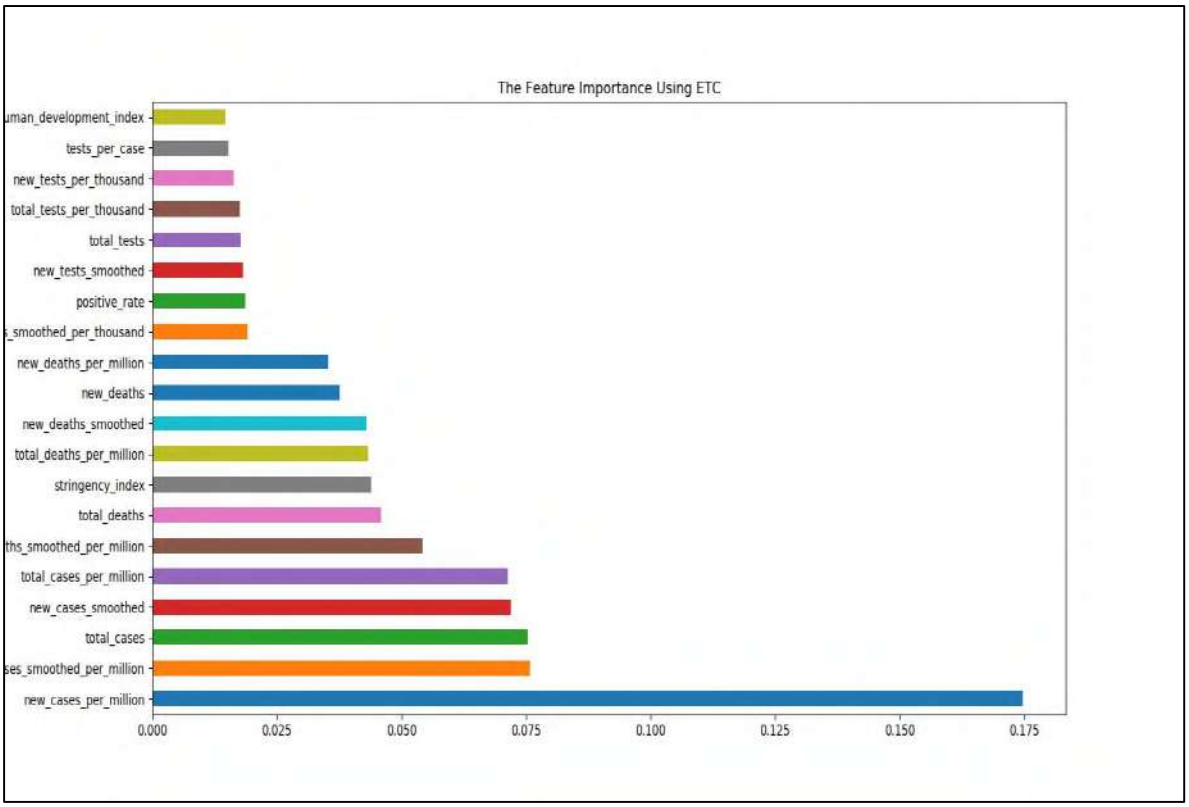

Fig. (6) The sorting of important twenty features using ETC.

Finally, the classification stage aimed to classify the features vector. In this stage, two methods were applied including the NB method and RBM method. The dataset was split into 70% for training and 30% for testing to predicate the disease of **COVID 19**. The equation (3) was used for computing the accuracy of the proposed work.

$$Accuracy = \frac{Number\ of\ correct\ predictions}{Total\ number\ of\ predictions} \quad \ldots(3)$$

Table (3) presents the results of classification using two methods (NB and RBM) with three cases: firstly, for all features, secondly, for the best 20 features, and finally, for 10 best features which selected in features selection stage. The results show that there is an improvement in accuracy when using the techniques of selecting features. Also, the RBM classifier got a good accuracy comparing with (NB) classifiers.

Table (3) The accuracy of the methods.

The Method	The accuracy for all features	The accuracy for best 20 features	The accuracy for best 10 features
NB	56.181%	61.780%	66.329%
RBM	97.906%	98.949%	99.924%

As shown in figures (4) and (5), the results of the RFE method and ETC method in selecting the important features are approximate. As shown in table (3), the accuracy when using the best ten features is more than the accuracy of the best twenty features. This is because of the correlation between these features. So, it can eliminate the correlated features which may cause a decrease the accuracy and performance as all. By comparing the results of this work with the results of the related works, this work had more accuracy especially when using RBM method comparing with the related works in spite of increasing the size of the dataset except for the work in Reference [8], but this work got more accuracy comparing with that study. The features selection techniques had a more positive impaction on the classification of the feature vector.

5 The Conclusion

In this work, the prediction of **COVID 19** disease using the techniques of feature selection had been achieved. The dataset contained different information about the disease from different countries. The proposed system contains three stages. More than one steps has been applied for preparing the data for the next stage. In the features selection stage, two types of techniques (RFE and ETC) were used for selecting the important features from forty features. The results of the two methods for the important features were approximate. The selecting of the important features affected the accuracy of the proposed work. The accuracy was very good when used RBM technique more than the NB technique.

Abstract. This paper proposes a new approach, of Clustering Ultrasound images using the Hybrid Filter (CUHF) to determine the gender of the fetus in the early stages. The possible advantage of CUHF, a better result can be achieved when fuzzy c-mean FCM returns incorrect clusters. The proposed approach is conducted in two steps. Firstly, a preprocessing step to decrease the noise presented in ultrasound images by applying the filters: Local Binary Pattern (LBP), median, median and discrete wavelet (DWT), (median, DWT & LBP) and (median & Laplacian) ML. Secondly, implementing Fuzzy C-Mean (FCM) for clustering the resulted images from the first step. Amongst those filters, Median & Laplace has recorded a better accuracy. Our experimental evaluation on real data from the Kadhimiya teaching hospital shows that the proposed CUHF is a better method when compared to the accuracy of the other integrated filters.
Keywords: Fuzzy C-mean, Filters Integration, Noise Reduction, Fetus Gender.

1. Introduction.

Many studies have focused on the use of fuzzy logic techniques to improve medical diagnostics [1]. The fuzzy c-mean algorithm (FCM) [2] is one of the most famous algorithms which can assist in decision-making [3]. [4] Proposed a novel approach to measure the muscle thickness from ultrasound images of the lumbar area to diagnose low back pain effectively. [5] Used robust Optimal GLCM features linked to FCM segmentation algorithm which is employed to cluster the kidney cysts and tumor from the ultrasound kidney images. However, others applied filters before implementing FCM to reduce the speckle in ultrasound images to obtain better results.

Filters play a major role in the pre-processing step which could assist researchers to reduce the noise of images [6]. Other studies also used filters for enhancing ultrasound images [7]. [8]Adopted a special study on "noise reduction" by using a wiener filter and discrete wavelet transform in a homomorphic region. The use of the Weiner filter and wavelet conversion is utilized to reduce the noise of ultrasound [8]. Besides, (LBP) local binary pattern operator to provide the classification Ultrasonic Thyroid of HOG Features[9]. A median filter is used in artifact removal in radiological ultrasound images [10]. In addition, several studies reported that filters can be useful to improve the FCM algorithm. For example, [11] used LBP with fuzzy c-mean to extract features in underwater images. [12] Integrated wavelet into FCM for

reconstructing morphological grayscale of sparse regularization. Moreover, improved malignant diagnosis using FCM based on the improved median of lung images [13].

In this study, we propose CUHF a new approach for improving the performance of FCM by using such an algorithm that tries different applied filters as preprocess on Ultrasound images. The proposed approach uses single and combination filters until the CUHF records the highest accuracy. The design of our approach was to detect the gender of the fetus by extracting selected features. Many difficulties were challenged such as the complexity of uterine tissue and the similarity of the fetus features were difficult to distinguish. Kadhimiya teaching hospital was selected because pregnancies attend the sonar department to do regular checks. The test of pregnant mothers was conducted to obtain the source of medical images for educational purposes. The images include related features from the ultrasound device (UD) during the second and third trimester of pregnancy. Our initial experimental results show that the CUHF approach achieves a better accuracy when the ML filter is applied and compared to those obtained when using FCM and other used filters.

2. Pre-Processing & Filters Applied to CUHF Approach

This section describes the used filters to reduce the noise of ultrasound images. These filters are applied to reduce the noise to enhance the performance of the FCM algorithm. Ultrasound images contain a noise which may cause damage conditions because of variation of the velocity with beam frequency. Therefore the preprocess step contains a series of image enhancement stages that can be listed as follows: noise removal, segmentation, and normalization. To remove the noise associated with the ultrasound image, a suitable filter will be applied to reduce the noise and maintain the original details of the image. Images are next partitioned into multiple segments for object recognition. Ultimately, the images are normalized into the range of pixel intensity of 256 x 256. The difference between the edges and the noise will produce a frame (3*3) into the next candidate filter.

2.1 Local Binary Pattern (LBP)

LBP is a local binary pattern that works as a character revealer can be executed on ultrasound images. The basic algorithm idea can be described as two-parent surface textures. The native operator classifies pixels of the image by specifying the 3 x 3 (LBP) of each pixel with the value of the center and a result is a binary number, (LBP) as classification or fragmentation properties by applying a summation of the probability of fabric pattern in the histogram [14]. The reason for the failure of the LBP in the classification is because it is influenced by the contour, which is often a "high contrast".

First, When LBP is applied to the ultrasound images; the proposed CUHF approach converts them into greyscale. Secondly, it divides the examined frame into cells 3x3 pixels. Third, compare the pixel to each of its 8 neighbors" .Follow the pixels clockwise or counterclockwise. If the center pixel's value is greater than the neighbor's value", then the value is 1 else value is 0. "After computing this for every neighbor pixel, the values are listed in a clockwise manner and the equivalent decimal value is calculated". Finally "Once done for every pixel, the values are grouped in 256 bins and the histogram is created", the output is the enhanced filter.

2.2 Discrete Wavelet Transform (DWT)

Is an easy-to-implement conversion in which wavelets are sampled instead of separate DWT. It is important to use because the transform uses a Fourier transform instead of using a fixed-width frame, DWT as well as the time it takes to calculate a conversion very quickly compared to a Fourier transform that takes more time, the conversion depends mainly on the wavelet matrix, which can be calculated faster than the Fourier matrix. The method of hiding information can also be used as DWT [15], [16]. The process of converting wavelets is a simple idea. The original image is divided into 4 new sub-images. Each sub-image is (25%) the original image by analyzing each image in different frequency bands with varying degrees of accuracy.

Each image is decomposed by four levels using the separate wavelet conversion at each level. (HH, HL, LH) and Details (LL) Transactions, Rounding The sub picture appears in the upper right, lower left, and lower right as an approximation of the original image because it contains high-frequency components of the original image. As for the upper left sub-picture, it appears as the original image and looks smoother, with the lower frequency components of the original image [17].

2.3 Median Filtering

Median and Nonlinear digital filtering is mostly used for noise removal of "spots" from ultrasound images [18]. This method is effective and widely used in digital image processing because it maintains sharp edges when noise is removed [19]. It calculates the median by sorting all pixel values from surrounding neighborhoods in the numerical approach and then replaces corresponding pixels with the pixel value. The median is also provided the simplicity of eliminating noise when compared with other filters. Especially for ultrasound images, this filter is very important [18].

Table1 Unsorted Vectors

1	0	0
0	8	7
5	29	14

Taken the above example, unsorted vectors are (1, 0, 5, 0, 8, 29, 0, 7, 14), sorted vector are (0, 0, 0, 1, 5, 7, 8, 14, 29) Median value is 5. It is noted in Figure 1 that the images contain a higher percentage of noise than the image (B) resulting in the results as shown below:

(A) (B)

Figure 1 Applying Median Filter

(A) The original image before the implementation of the median filter
(B) Filtered image after the implementation of the median filter

When the median filter is applied to the proposed CUHF, an Input of 256*256 ultrasound images is obtained. In the first step, the entire matrix of the image pixel is padded with zeros or ones on all sides. Second, the frame will be an array, store the 3*3 neighbor value in the array, and sort the neighboring pixels into order. Finally, replace the value of a center pixel with the median value from the list, the enhanced filter is obtained.

2.4 Laplacian Filtering

Laplacian is considered as a two-dimension isotropies' measure of the second spatial derivative of an image. It highlights areas of fast intensity change and consequently often utilized for edge detection with the technique of zero-crossing edge detectors. This filter is frequently applied on images that have first been smoothed with something approximating a Gaussian filter to reduce its sensitivity to noise. Therefore the two variants will be labeled together. A single gray level image is normally taken as an input and generates another gray level of the image as output [20]. The Laplacian $L(x,y)$ of an image with pixel intensity values is, x & y are random variables, ə= an integral transform that converts a function of a real

variable, I = integral maps a function from original to function space, the equation of Laplacian is given below :

$$L(x,y) = \frac{\partial^2 I}{\partial x^2} + \frac{\partial^2 I}{\partial y^2} \quad (1)$$

Equation 1 Laplacian Intensity Metric [21]

Because the input of the image appears as a set of discrete pixels, a discrete convolution kernel can be approximated as second derivatives. Thus, in the definition of the Laplacian, small kernels could be relatively sensitive to noise. The image is preferably Gaussian smoothed before applying the Laplacian filter. This pre-processing step decreases the high-frequency noise contents before the differentiation step. The combination of filters could lead to better results. [22] Proposed hybrid filter of image processing approach which improves the Gabor function to execute the image classification. [23] Suggested a new speckle-noise reduction algorithm in medical ultrasound images by combining a wavelet transform and Laplacian filter. [24] suggested a hybrid median filter as a noise removal based non-liener filter for image enhancement. It is suggested for Gaussian noise removal from the medical image. The introduced hybrid filtering technique is for the removal of Gaussian noise from medical images. The research conducted on extracting skeleton on Kinect images [25] supported the idea of combining filters to reduce the noise and obtain better performance. This encouraged the researcher to try combining median and Laplacian filters to remove the noise and detect edges of ultrasound images.

2.5 Feature Extraction

Extracting features is the most important step in image classification. It helps to extract the attribute of the image as perfect as possible. [26] Described that the extraction of features of visual information from the image and saves properties oriented in the database features. The feature extracting is originated to extract visual information from the image and save oriented properties in the database features. Extract feature finds the image description in the form value feature for each pixel. For a given image, the GLCM (Gray-Level Co-Occurrence Matrix) works by calculating how often pairs of pixels are made in images and then extracting statistical measures from that matrix, in a given space relationship. Features can be derived from the original image to be combined with the GLCM features. The derived from an image that has been optimized and used as features to cluster the fabric of digital images [27]. The features are useful for clustering and retrieving similar images and provide information on the distribution properties of the density level of the Image. The tissue attributes are extracted from the common presence matrix and the mathematical equations are given the textile profiles as shown in the algorithm of [28].

In addition, the original selected features of the fetuses are bi-parietal diameter (BPD), femur length (FL), Liquor, Placenta, FH+ve, uterine wall contraction, congenital anomaly, longitudinal lie, single or twin, contrast, entropy, diabetes. Moreover, the age of pregnancies was taken between (15 - 40) weeks of pregnancy.

Feature Extraction Algorithm:
Input: Number of image of (mxn) gray scale image.
Output: 12 features.
Step 1: Select data set of image.
Step 2: Construct GLCM for images.
Step 3: Calculate feature from GLCM.
Step 4: Put all feature in matrix.
Step 5: Normalize feature.
Step 5.1: Calculates mean, variance, standard deviation, skewness for each feature.

2.6 Fuzzy C – Mean Algorithm

Data mining algorithms have been used for improving many fields [29]. One of the most useful algorithms is FCM. It is a method of clustering in which each data can be assigned to more than one cluster. It involves allocating data points to clusters for instance items in the same cluster are as similar as possible, while items fitting to different clusters are as dissimilar as possible. These similarity measures contain distance, connectivity, and intensity. In hard clustering, data belong to different clusters, where each point can only belong to precisely one cluster. In fuzzy clustering, data points can belong to many clusters. Membership scores are allocated to each of the dataset points (tags). These membership scores refer to the degree to which data points fit each group. Therefore, points on the edge of a cluster, with higher membership scores, could be in the cluster to higher scores than refers in the center of the cluster. FCM has been a very significant approach for image processing in clustering objects in images. In the last decades, mathematicians presented the spatial term into the FCM algorithm to develop the accuracy of clustering under noise [30].

Enhanced FCM has been utilized to distinguish between different actions using image-based features [31]. As a result, FCM is still the most spread for its practical success which can discover the basic skeletons of data that are used in many engineering and scientific fields for example medical images and search for biological data [32].

3. Proposed approach: CUHF to Enhance the Performance of Clustering.

This stage was performed through collecting images after the ethical approval is obtained of pregnancies in the maternity hospital. An experimental methodology has been utilized to obtain the best results. The used filters in the first experiments were produced unsatisfactory results because of low accuracy. All filters are applied before implementing the FCM algorithm to remove noise as shown in Figure 2. We first applied the LBP filter but undesirable results were obtained. Thus, to improve the performance of FCM, we second applied the Median filtering technique on these images as a pre-processing step of noise reduction. Afterward, Median & DWT are applied to the CUHF approach, the accuracy went slightly better. (Median, DWT & LBP) are examined to obtain good results but undesirable accuracy is gained by this integration. As shown in CUHF Algorithm, the attempt was to try one or a combination of the determined filters to obtain the best results. After the selected features are extracted the CUHF allocates the number of clusters i.e. Cn. In addition, the approach chooses the appropriate level of membership of fuzziness m > 1. After initializing the partition matrix randomly U, the Calculation of the centers of Vector (C^ ((k)) will be completed. Calculate the Euclidean distance ($\mathbf{D_{ij}}$) to update fuzzy membership matrix Uij, if the distance is less than the membership ε the approach must be stopped otherwise it should return to the step of calculating the centers of Vectors. The best results are obtained by the proposed (Median & Laplacian) ML when compared to other applied filters. The combination of filters is to enhance the performance of clustering. ML is an integration of non-linear and linear filters. The attempt was to remove the noise using the Median filter and then pass the result to the Laplacian filter to allocate the fetus's edges. ML produces better results for noise reduction, preservation of structures and key details. The Hybrid Filter is used for de-noising and smoothing images as shown in

Figure 3 (B), whereas in the same figure (A) the image is still distorted. The filter fits in with the local variation and the performance of the smoothing feature extraction.

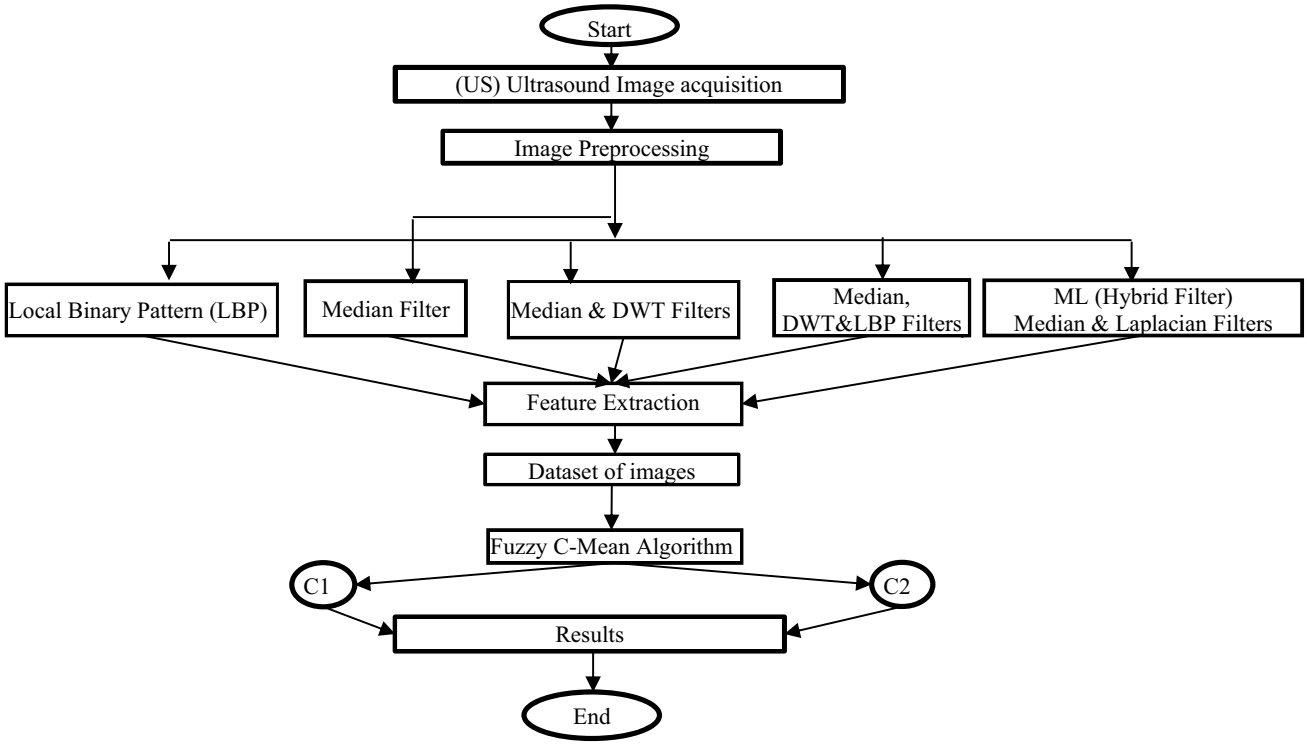

Figure 2 The Proposed System CUHF

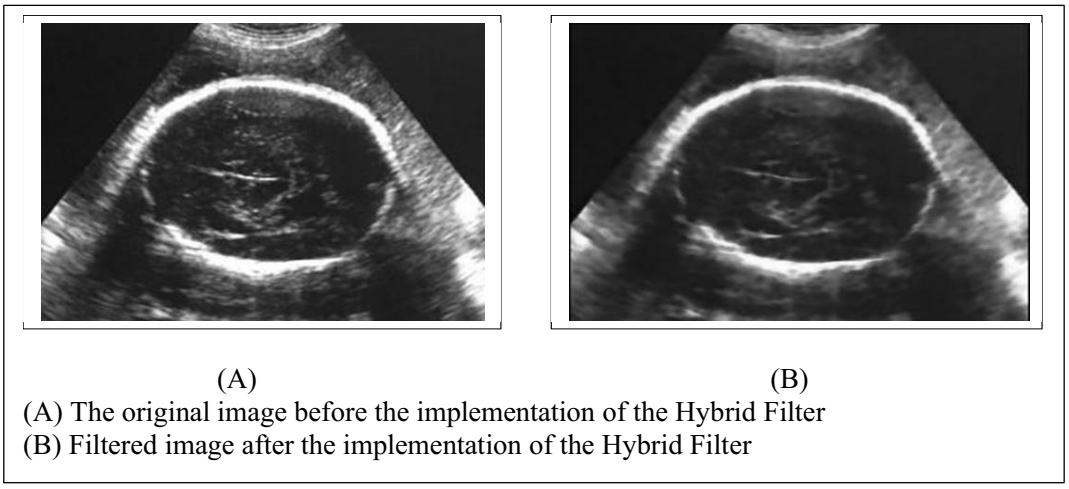
4. Results and Discussions



(A) (B)

(A) The original image before the implementation of the Hybrid Filter
(B) Filtered image after the implementation of the Hybrid Filter

Figure 3 Applying Hybrid Filter

To examine the accuracy of CUHF, tests were carried out using a dataset gained from Kadhimiya teaching hospital.

Algorithm: CUHF
Input dataset: 100 ultrasound images.
Preprocess (Try filters):

1- LBP.
2- Median.
3- Median & DWT.
4- Median, DWT & LBP.
5- Median & Laplacian (ML).

Feature Extraction (FL, BPD, Liquor, Placenta, FH+ve, uterine wall contraction, congenital anomaly, longitudinal lie, single or twin).
Dataset of images.
Fuzzy c-mean:
1: select the data set of feature extraction.
2: Select the number of clusters Cn.
3: Select an appropriate level of cluster fuzziness m > 1.
4: Initialize the partition matrix randomly, such that $U = [u_{ij}]\ matrix\ , U^{(0)} \in$ Mf c.
5: Calculate the cluster centers Vector $C^{(k)} = [C_j]\ with\ U^{(k)}$, using the expression given below:
6: Calculate the Euclidean distance
7: Update fuzzy membership matrix. $U\ according\ to\ D_{ij}\ .if\ D_{ij} > 0,$
then STOP; otherwise return to step 5
Results: c1 or c2

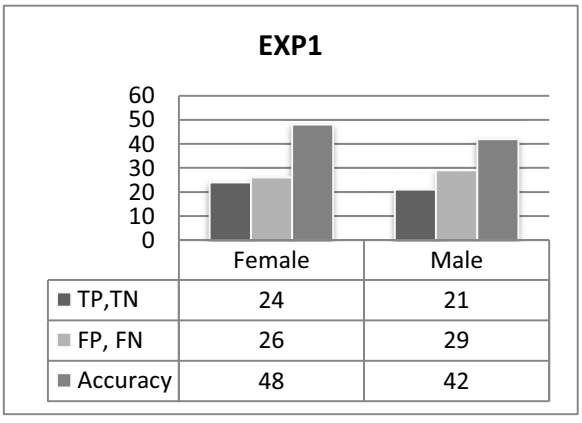


Figure 4 LBP Results

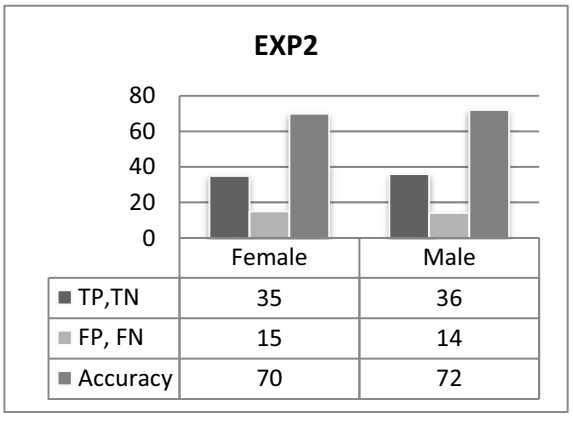

Figure 5 Median Filtering Results

In the conducted experiments, the results of CUHF approach will be illustrated as a clustering of the fetal sex, the determination of the ultrasound images is divided into 2 clusters. In addition, a total of 100 images of the ultrasound device were used to measure the features dimensions 50 males and 50 female. This section highlights the implementation of LBP, DWT, and combination of (Median & DWT), (Median, DWT&LBP) and (Median & Laplacian) filters, and how the best results are obtained.
Figures displayed in the results section are to show the outcomes of the experiments conducted on the proposed approach. It starts with the experiments of LBP and ends with the hybrid ML filter till the research reached reasonable outcomes. For all charts, The "Accuracy" recaps the evaluation of FCM after applying a filter of LBP, Median, Median & DWT, (Median, DWT & LBP), and proposed ML. TP, FP, TN, FN refer to True Positive, False Positive, True Negative, and False Negative respectively. In addition, Cluster1 and Cluster2 represent the images of the females and males respectively.

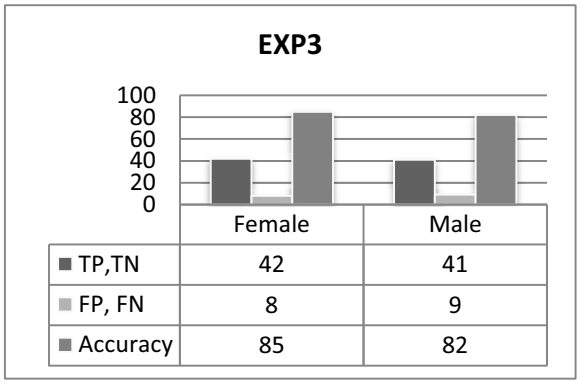

Figure 6 Median & DWT' Filtering

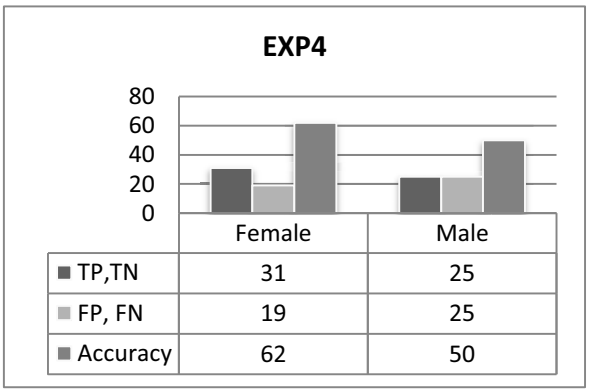

Figure 7 Median, DWT& LBP Filtering

The initial experiment was conducted on the FCM algorithm to obtain reasonable clusters. FCM algorithm on its own returns 20 TP & 19 FP which records 40% and 38% respectively. This research attempts to enhance the performance of FCM by improving accuracy.
Experiment1: the bar chart in Figure 4 shows the accuracy of the LBP filter. From the chart, it clear that cluster1 consists of (24) images which are clustered as a TP, whereas 26 of them are clustered as a FP wrongfully. The Accuracy summarizes the evaluation of LBP respectively 48%, which is lowest among the conducted experiments. Also, Cluster2 returned a 21 TN and 29 FN of males with an accuracy of 42% which gave unsatisfactory results. Therefore more experiments are needed to obtain better results.
Experiment 2: From the chart in Figure 5, it is noticed that the accuracy of Median Filtering is 70% with 35 TP and 15 FP wrongfully clustered images, cluster1. In addition, in Cluster 2, 36 are clustered as a TN and 14 FN with an accuracy of 72%. This gave a better accuracy compared to Experiment 1.

The third experiment is conducted using Median & DWT filters. The outcomes show that cluster1 consists of 42 TP whereas 8 are categorized as FP with an accuracy 85% as shown in Figure 6. Also, 41 TN and 9 FN of males are clustered with an accuracy of 82%, this gave a better accuracy compared to experiments 1 and 2.
The Fourth experiment (Median, DWT&LBP) is integrated. Figure 7 shows the results of cluster1 which consists of 31 TP images, 19 FP with an accuracy of 62%. Clusters contained 25 TN and 25 FN which indicates 50% accuracy. This outcome refers to the worst results compared to experiments 2 and 3 but better than 1, which indicates that LBP could cause non-preferred results due to produce rather long histograms, which slow down the recognition especially on image database.
In the fifth experiment, when the Median & Laplacian filter is applied to the CUHF approach, the outcomes of cluster1, cluster2 consist of 45 TP, 5 FP, 47 TN, and 3 FN with the accuracy of 90% and 94% respectively as shown in Figure 8. This gives the highest accuracy when compared to all the conducted experiments in this study.

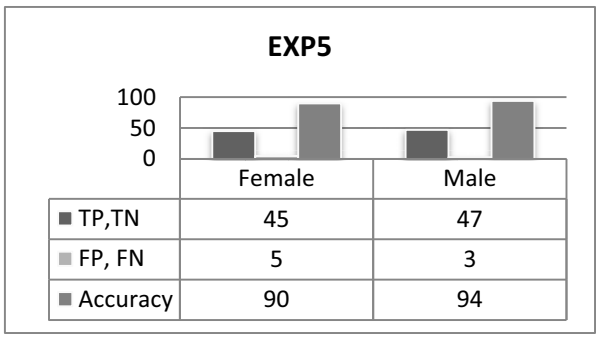

Figure 8 ML Hybrid Filtering

The result in experiment 5 showed that the best method of clustering was obtained from the application of the ML hybrid filter. The implementation of the median filter and Laplacian filter has directed the experiments to the highest accuracy. In experiment 5, total accuracy in both Claster1 and Claster2 was higher than the results obtained in experiments 1, 2, 3 and 4.
Besides, when using the median filter, the results were fairly good compared to LBP. (Median & DWT) filter, the results were better compared to the accuracy when using the (Median, DWT & LBP), because it is affected by the contours that are often (High Contrast). The greatly improved accuracy rate is obtained in the proposed ML filter when the union of median and discrete wavelet was employed to match a target of enhanced ultrasound images. The CUHF approach is presented with a path to take this research further.

5. Conclusion and Recommendations

This paper has presented a new approach, CUHF, to improve the performance of FCM clustering. The CUHF approach uses a new hybrid filter ML as a process that produces far fewer clustered images than would be produced from basic FCM. It uses a new approach to extracting important features to determine the gender of the fetus in ultrasound images. The best ratings were obtained from the images for the ML filter and the inability of the LBP images to give correct clustering. The experimental results have shown that the advantages of CUHF over classic FCM when unrelated images are clustered. The outcome of the

CUHF approach, cluster1, cluster2 returned 45 TP, 5 FP, 47 TN, and 3 FN with the accuracy of 90% and 94% respectively. This gives the highest accuracy when compared to all the conducted experiments in this study. It is recommended to consider other methods such as Fourier Transform as well as the adoption of other prediction algorithms e.g. SIFT to reduce the dimension in the field of clustering. Also, the Fuzzy Neural Network for clustering fuzzy images can be used for a training net that can predict the gender of the fetus in the early stages to obtain better results.

E-mail: eng.sajasattar@yahoo.com

Abstract. Air pollution has a wide and great influence on the concentration of constituents of the atmosphere, which leads to many effects such as acid rains and global warming. In order to avoid such unwanted adverse imbalances in the nature, designing an air pollution monitoring system (APMS) is very important. This paper discussed the development of an effective solution for monitoring the air pollution by making an Arduino-Based Air Pollution Monitoring System (APMS) . Carbon monoxide and Carbon Dioxide concentration levels in air were measured and monitored using MQ4 and MQ7 gas sensors and Arduino atmega microcontroller. These sensors can detect many harmful gases and can be used for measuring their amount very accurately .The concentrations of CO and CO2 in particle per million (PPM) will be monitored and displayed on the LCD very easily. based on these measurements the pollution level could be monitored, determined, and displayed .The experiments were carried out using the developed wireless APMS under various physical conditions. The results showed that the designed system collects reliable and reasonable real time pollution data .Three hour sampling time was executed in each location. One of the logical functions that are widely used is fuzzy logic . A fuzzy logic artificial intelligence for gas sensors is used which clarifies the presence as well as the concentration of CO and CO2 efficiently. Fuzzy logic will gives the decision about whether the air is polluted or unpolluted. This logic function we can process some existing data into a form of output which can be in the form of a status or state of action that will be performed by a tool .This proposed system will contribute in the construction of an APMS in the outdoor or even in the indoor environment.

Keywords: Air pollution, Carbon monoxide, Carbon dioxide, Arduino, Gas sensors, Fuzzy Logic, Membership Function

1. Introduction.

One of the world's unembellished environment issues is air pollution. World Health Organization (WHO) reported that, in developing countries there are about 3 million people died annually due to air pollution [1]. The emergence of air pollution in many countries all over the world is a result of the industrial growth and road transport [2]. Air pollution contributes in the climate change. Exposure to CO gas leads to various and different health effects. This gas affects the central nervous systems, the cardiovascular system, blood, and lungs [2]. Effect of CO depends on the physiological status, the health of exposed person, exposure time and the pollutant concentration [3]. On the other hand CO2 gas can be considered as a basic indication for air quality. The concentration of CO2 is about 350 PPM

in the outdoor atmosphere [4]. The main profits of APMS are improving the environment, reducing costs, better risk control, better pollution detection, and reduced errors. The main artificial intelligence methods of soft computing namely fuzzy logic, neural network and genetic algorithm have shown great ability in solving complex non-linear system identification and control problems. Several research efforts have been expended to use evolutionary methods as effective tools for system identification. Among these methodologies, fuzzy rule based systems have been an active research field for their unique ability to build models based on experimental data [4]. This paper is arranged as follows: Section 2 contains the related works and Section 3 explains background theory. It also explains the implementation of the system. Section 4 presents, demonstrates, and discusses the results obtained from the developed system while Section 5 presents the conclusions of this proposed system.

2. Related works:

There are many studies and researches that have been proposed, analyzed, and published on the subject of air pollution monitoring systems (APMS), such as [3], where concentrations of carbon monoxide in indoor and outdoor air of Ghalyun cafes were measured using a portable gas meter (Honeywell BW MAX XTII, Brandt Instruments, Inc. Canada). In [5], shows a Novel Fuzzy Logic Model for Multiple Gas Sensor Array where the outputs from an integrated multiple gas sensor was used to specifically select the presence and concentration of four gases namely Hydrogen, methane, LPG and Carbon monoxide. In [6], the concept of IoT is used to monitor the air pollution using MQ135 Gas sensor through Arduino Uno. In [7], the author attempts to develop an effective solution for pollution monitoring using wireless sensor networks (WSN) on a real time basis namely real time wireless air pollution monitoring system. Each of these studies has different methods, number of sensors, types of machine learning, microcontrollers to realize of the APMS. In this paper, the carbon dioxide (CO_2) concentration and carbon monoxide (CO) concentration were monitored, and then the readings were analyzed using fuzzy logic with several rules and memberships to decide the degree of risk according to air pollution, and display the results and measurements of CO and CO_2 and the output of fuzzy logic. The Atmega microcontroller was used in this system. This proposed APMS may participate in the development process of a comprehensive outdoor air pollution monitoring systems in the future. It may also support indoor air pollution monitoring.

3. Background theory

3.1. Carbon monoxide (CO): It is a non–irritating, colorless, odorless, tasteless, poisonous and Pollutant gas [7][8]. It may be emitted by anthropogenic or natural sources into the environment [3]. It is formed when carbon (C) in fuels such as petrol, wood, coal, and natural gas hasn't burned completely. Air quality may be affected by emitting sources of CO such as tobacco smoke, gas stoves, fireplaces, and other types of fuel burners [2]. CO produces carboxyhemoglobin (COHb) through reacting with blood hemoglobin molecules; this will reduce oxygen (O_2) supplied to the body organs. The concentration of COHb in blood is considered as an indicator for exposure to CO [2][9]. In this article CO concentrations had been surveyed in the outdoor air in Baghdad; the capital of Iraq.

3.2. Carbon dioxide (CO_2): It is a non-toxic, non-flammable, colorless, odorless, and non-reactive gas. It is a naturally sub product of cellular respirational process and a as a result of burning the fossil fuels. Exposure to high concentrations of CO_2 may cause a risk to life [7]. In this article CO_2 concentrations had been surveyed in the outdoor air in Baghdad; the capital of Iraq.

3.3. MQ7 Gas Sensor (CO Sensor): This is a low cost, simply used with extremely high sensitivity for sensing Carbon Monoxide (CO) concentrations in the air. This sensor has the ability to sense and detect CO-gas concentrations within a range from 20 to 2000 PPM wherever the sensor is placed. MQ7 has fast time of response. The output of the sensor is the analog resistance of it. MQ7 sensor consumes not more than 150 mA at a voltage of 5 V. It is very stable sensor with the characteristic of long life. It is an ideal sensor to use for a CO alarm [7]. MQ7 Gas Sensor is shown in fig.1.

Figure 1 MQ7 Gas Sensor (CO Sensor)

The sensitive material of MQ7 is SnO_2 is. It has a low conductivity in the clean air. MQ7 can detect CO at low temperatures when heated by 1.5V. The conductivity of MQ7 sensor is high along whenever the gas concentration is rising. At high temperatures when the sensor is heated by 5.0V, it will clean the gases which had been adsorbed at low temperatures. MQ7 can detect various gases that contains CO. This sensor is very suitable to use for different applications [7].

3.4. MQ4 Gas Sensor (CO_2 Sensor): The MQ4 gas sensor is using SnO_2 as a sensitive material to sense and detect combustible gasses which includes methane, propane, and butane. This gas sensor can detect concentrations of methane / natural gas in the range of 200 PPM to 10,000 PPM. This range is very suitable to detect gas leaks. MQ4 is simple and analog voltage interface that requires one analog input pin only from the microcontroller. MQ4 is a perfect gas sensor for Air Pollution Monitoring System (APMS) can sense CO_2, smoke, NH3, Benzene, alcohol, and other gases. MQ4 is a low cost gas sensor and it's suitable for many different applications [7]. MQ4 Gas Sensor is shown in fig.2.

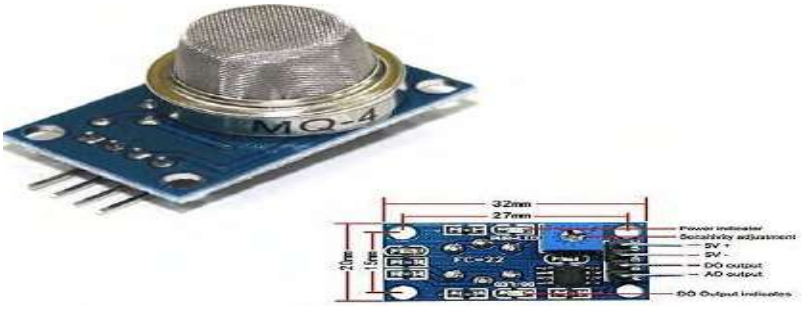

Figure 2 MQ4 Gas Sensor (CO2 Sensor)

MQ4 is a sensitive gas sensor to the changes in temperature. The variations in the readings of CO_2 are small if it happened according to temperature changes. It's (<100 PPM) on the low range, and it's (<1000 PPM) on the high range. These variations in the readings of CO_2 due to the change in temperature may become negligible as compared to the whole changes in concentration of CO_2 if the design was good. Sensor's accuracy can be improved to make the entire experiments in a constant temperature if the sensor is calibrated at the desired temperature. MQ4 operates in temperatures within the range 20-30°C, but it may be used outside this range [5].

3.5 Arduino:

Arduino is a flexible micro-controller and a development environment that is used for controlling devices and reading data from all types and categories of sensors. It's simple, extensible; also it has a great success, wide adoption and spread between users. The previous properties of Arduino lead to continuous development of several software libraries and hardware extensions which enable it to

communicate wirelessly as well as using wires with the Internet. Arduino is an open hardware platform. Sensors do the function of collecting data from the surrounded environment and generating information to raise awareness about the context by monitoring any change in the environment, then the corresponding things will make the needed responses. Here, using the MQ4 and MQ7 gas sensor gives the ability to monitor various kinds of dangerous gases and Arduino mega 2560 microcontroller considered as the heart of Air Pollution Monitoring System (APMS) because it controls the entire monitoring process. Arduino mega 2560 is a microcontroller board based on the ATmega2560. It has 54 digital input / output pins where 15 of them can be used as PWM outputs, 16 analog inputs, 4 UARTs (hardware serial ports), a 16 MHz crystal oscillator, a power jack, a USB connection, an ICSP header as well as a reset button. Arduino contains all the things that are needed for supporting the microcontroller. It can be connected simply and easily to a computer using a USB cable. Arduino also can be powered with a battery or an AC-to-DC adapter to get started [6]. The tracking APMS was developed in order to monitor air pollution even at the remote and far sites accurately. APMS is very helpful for those who are involved in monitoring the environment. Arduino-Based APMS uses the required data to adjust air parameters on time and to update the risk of environmental parameters during the standard period of time. In addition to that, Arduino-Based APMS and its sensors readings of measurements relevant to environmental parameters can be employed in a very efficient manner to detect the carbon monoxide concentration (CO) and carbon dioxide concentration (CO_2). Arduino Mega is shown in fig.3.

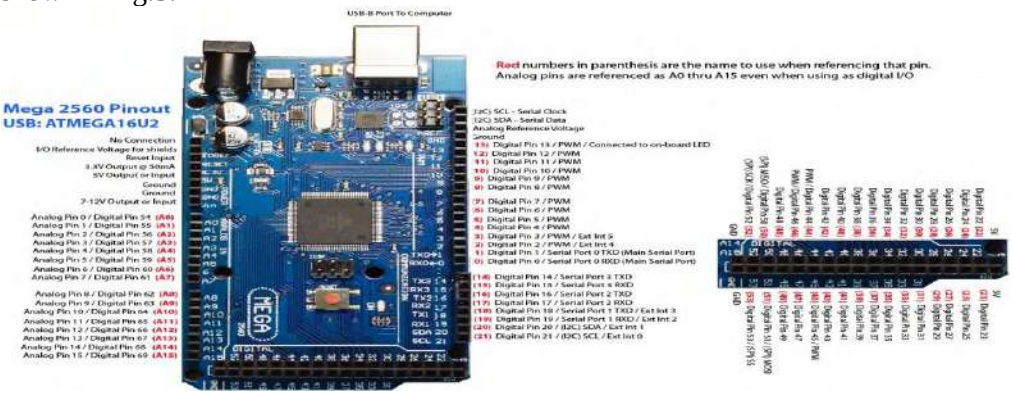

Figure 3 Arduino Mega

3.6. Fuzzy Logic:

The approach of Fuzzy logic (FL) has been introduced by the artificial intelligence researcher Lotfi A. Zadeh in 1965. FL methodology focuses on the purpose of making a decision for deficient data with a concept named true or false and the degrees of truth. The fuzzy logic set includes the classical set [9][10]. The fuzziness of elements had been implemented using membership functions in the set of solution which is based on experiment regardless knowledge. The membership function is implemented using the methodology of weighted rate inside fuzzy logic interference system [11][12][13].

4. The designed system and implementation

4.1 Proposed system architecture:

In this paper an Arduino-Based Air Pollution Monitoring System (Arduino-Based APMS) was designed and implemented with the use of Fuzzy logic as a type of artificial intelligence as shown in Fig 4. The data collected using MQ4 and MQ7 sensors is analyzed by the method of FL and graphs based on the fuzzy inferences had been also generated using this method. Using FL has many advantages like there isn't any need for many data sets for analyzing the collected data. The second advantage of using FL is its power of interpretation as well as its simplicity [10][14][15]. The approach of

Mamdani Fuzzy Inference (MFI) is a simple and a commonly used Fuzzy methodology [13]. The MFI structure depends on the operations of min-max. MFI method has a wide spread acceptance. It is a well suited method for human inputs. The output of MFI can be transferred easily to a linguistic form [13]. In this system we can monitor air pollution using Arduino and gas sensors that available locally to monitor gases such as Carbon monoxide (CO) and Carbon dioxide (CO_2) which considered so dangerous and harmful gases to people. This APMS will display the concentration of CO and CO_2 in PPM on LCD so we can observe and monitor them very easily. Measurements of CO and CO_2 concentration levels were taken in the Iraqi capital, Baghdad. Different measurements were made within different times during day and night. The reading were recorded and displayed such that there is 2 minutes between each reading and another. The information obtained from these gas sensors is recorded then will be sending to the destination device through the Arduino atmega microcontroller. The level of air pollution can be viewed by people wirelessly using this method. APMS will reduce cost, it's reliable and a very comfortable system to use it for any place to monitor these gases.

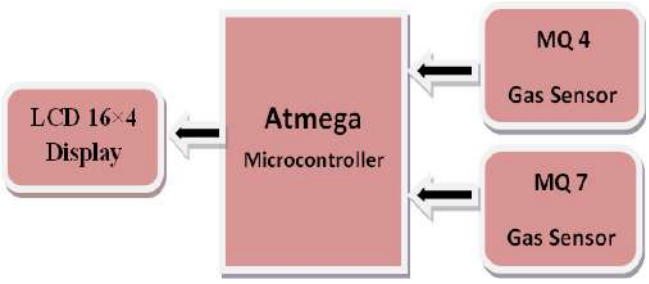

Figure 4 APMS architecture

In this paper the outputs were produced using a fuzzy rule based system according to the inputs for the system. Two input parameters had been entered to the APMS. The first input is CO concentration and it consists of 2 membership functions. The second input is CO_2 concentration and it consists of 3 membership functions. The output of APMS is the degree of pollution and it consists of 3 membership functions.

All the membership functions of inputs and output were graphed in Matlab using the trapezoidal function. The membership function for CO concentration is demonstrated in Fig. 5 with the parameters low and high to analyze CO concentration whereas Fig. 6 shows the membership function for CO_2 concentration with the parameters low, medium and high for analyzing CO_2 concentration. In Fig. 7 the membership function for output is shown with the parameters low, medium and high to analyze it.

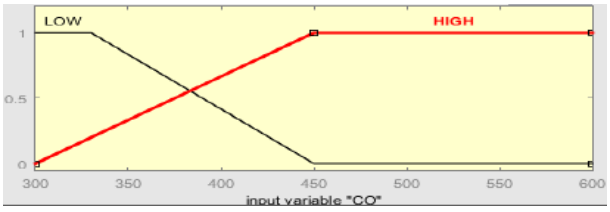

Figure 5 membership function of CO concentration

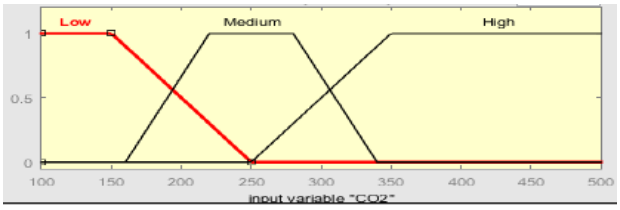

Figure 6 membership function of CO2 concentration

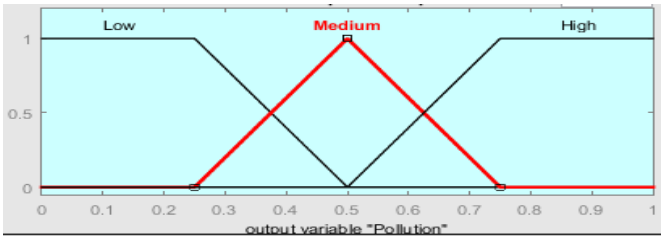

Figure 7 membership function of the output

The number of fuzzy rules that governed the APMS is 6 and it's determined according to the given membership function of the parameters as shown in Table 1.

Table 1. Fuzzy rules of the APMS input and output parameters

No.	Input		Output
	CO concentration	CO_2 concentration	degree of pollution
1	Low	Low	Low (Normal air)
2	High	Low	High (Low level of pollution)
3	Low	Medium	Medium (Low level of pollution)
4	High	Medium	High (Air is polluted)
5	Low	High	High (Low level of pollution)
6	High	High	High (Air is polluted)

Fig. 8 shows the Fuzzy Logic Inference System where CO and CO_2 concentrations are the inputs of the system. Fuzzification and Defuzzification methods were carried out and the degree of pollution is the output of APMS.

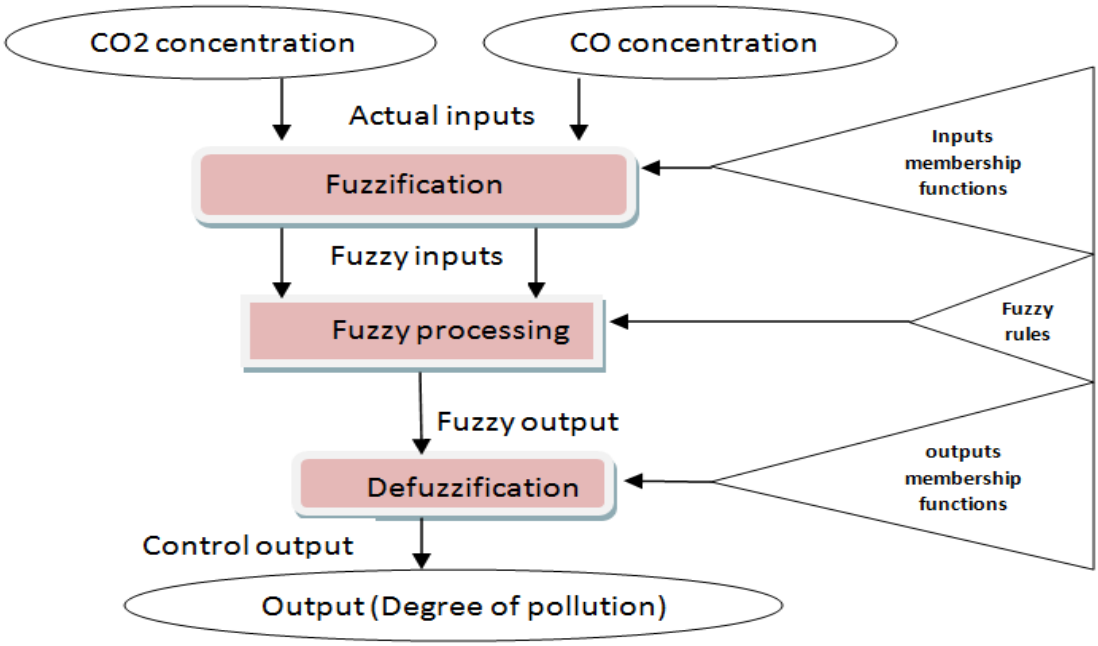

Figure 8 Fuzzy Inference System

4.2 Implementation of APMS:

Figure 9 shows the connections between of the LCD and the Arduino microcontroller board through the VCC, GND, SDA and SCL pins also the figure shows how to connect the sensors MQ4 and MQ7 to the power (5v) and ground through wires, while the wire that transfers information of the CO concentration sensor was connected to one of the analog pins (A0) and the information wire of the CO2 concentration sensor was connected by wire to the analog pin (A1) of the Arduino. The power of the Arduino microcontroller can be supplied in the following three ways, the 1st way is by laptop using the USB port and the 2nd way is by using an external adapter which connected to the power jack in the microcontroller and the 3rd way is by using batteries that are connected to Vin port.

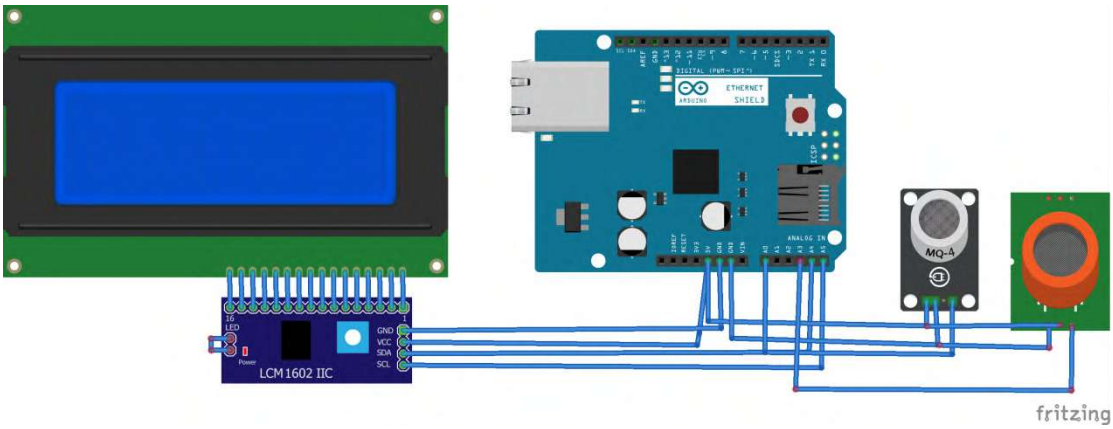

Figure 9 Installation of Arduino-Based APMS circuit

5. Results and discussion.

The developed Arduino-Based Air Pollution Monitoring System (APMS) is checked using different measurements in different situations and conditions from normal and common states to abnormal and uncommon states of air. These different tests and results shows minimum error rate and high accuracy in sensing CO and CO_2.

Through the experiments that had been carried in several times and conditions, it had been noticed that when the levels of air pollutions (CO and CO_2 concentrations) are within the normal range, APMS gives a low risk notification whereas if one of the levels of CO and CO_2 concentrations is not within the normal range and the pollution is in risky levels, APMS will give a risk notification which is appropriate to the data as shown in fig.10, so people who involves with air pollution will be able to know how dangerous the situation is, in very easy and high speed way, in order to do the necessary measurements.

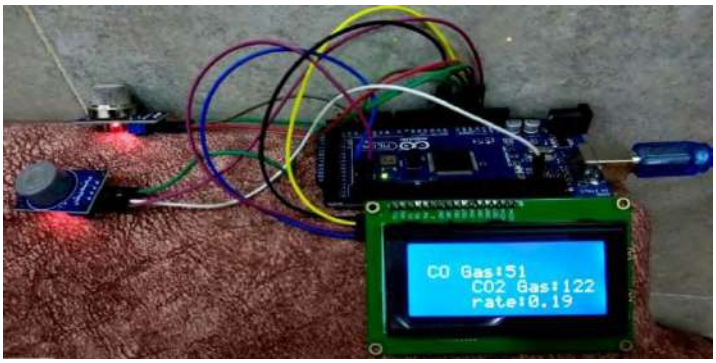

Figure 10 Implementation of Arduino-Based APMS circuit

6. Conclusion and future work.

The risk of environmental pollution can be reduced when Arduino and gas sensors are used in detecting air pollution with the aid of an intelligent fuzzy logic system. Arduino can enable easy and simple integration with air pollution monitoring sensors (MQ4 and MQ7 gas sensors). This paper demonstrates a very simple and easy-to-use system. The libraries of fuzzy logic system which is found in the Arduino mega microcontroller software was used to analyze the data and information recorded from MQ4 and MQ7 sensors, and then it gives the decision about the risk directly. Using Arduino made the information of the APMS to be recorded for all of those who are involved with environmental monitoring. It's appeared from this experiment that using APMS gives good results that one can rely on it. APMS is easy, quick, and accurate system. It can be used for monitoring everywhere and for any period of time without any obstacles or problems.

Abstract. Animal detection techniques are one of the researcher's interests and challenge. There are many difficulties faces by the researchers in this field that reduce the detection performance and efficiency, such as variation of image illumination, animal occlusion, the similarity of animal colors with background environment, etc.
Multi-label Image Detection and classification of Mammals animals is the goal of this paper which we proposed to achieve in this proposal by using Single Shot Multi-Box Detector (SSD) and MobileNet v1 coco_2017 model. Localizing and classifying multiple objects (animals) of the Mammal category in digital images is another goal. The suggested SSD is regarded as a more accurate, fast, and efficient way to detect objects of different sizes based on deep learning technology.
In this proposal, we used 2000 images in the network were collected from the standard dataset (such as Caltech 101) and the net. The SSD framework improves the detection and recognition processes of Convolution Neural Network (CNN). During the prediction time, the network introduces scores to the presence of every object class and bounded each object in the image with a box. Each box has a label that indicates the type of the object and the score represents the probability of the relationship of the object to that type. Boxes during the process are modified for getting the best matching to the object's shape. The experimental results of this work proved the efficiency of classifying and detecting animals even in the variation of illumination, pose, and occlusion. Detection and classification accuracy is up to 98.7 %. This suggestion is more reliable and accurate than other similar works and detects a wide range of Mammals animals, unlike other similar works.

Keywords: Deep Learning, Convolutional Neural Networks, Animals Classification, Mammals, Reptiles.

1. Introduction

Visual monitoring in animal scenes is currently one of the most distinguished research issues in the field of Computer Vision (CV), but the ways of detecting and understanding dynamic objects are still inaccessible [1], [2]. Animal detection methods are helpful to solve various problems such as prevent risky animal intrusion in a residential area [3]. It is also a part of a large work for a robot to detect and classify objects in critical situations such as natural disasters or other accidents which need to different objects such as human, animal and other [4]. Another example is self-driving cars, for which accurately detecting pedestrians, animals, street signs, or other vehicles, is a crucial feature when maximizing the safety of such systems. As well, it provides a great value in biomedical laboratories by monitoring laboratory animals using a powerful following method which can extract a rodent from a

frame under an uncontrolled environment [5]. Furthermore, it increases the efficiency and productivity of laboratory staff by reducing the time spent in direct monitoring of animals, also, to have a better understanding of animal behavior. Deep (CNN) or ConvNet has accomplished important success in the computer vision field, like target detection, target tracking, image classification, and semantic image segmentation [6]. It is a multi-layered neural network with a special architecture to detect complex features in data. Object detection means to predict the location of an object along with its category in static images which is one of the most critical computer vision problems [7], [8]. It often uses extracted characteristics and learning algorithms to identify the object belonging to a certain category of objects in a static image [9]. Several types of CNNs are existing; MobileNet is considered as one of the important applications for this type of CNN networks [10]. The architecture of "Depthwise Separable Convolutions" greatly decreases the number of parameters compared to the normal CNN that has the same depth. This results in lightweight neural networks. The MobileNet-SSD Model is a Single-Shot Multibox Detection (SSD) used as the pre-trained models for detecting and classification multi animals in difficult cases like detect part of an animal in lighting/illumination conditions [11], [8]. This combining between them gives us fast and sufficient performance to detect and classify the object. This architecture is more suitable for mobile and vision-based mobile applications where there is a lack of computing power [12]. SSD approach utilizes deep neural network technique to detect and classify the target objects and this limits the output area for bounding boxes in the default boxes set over different aspect ratios and scales per each spatial position of the feature map. At the prediction time, the network introduces scores to the presence of each object class in every default box. As well, it inserts modification to these boxes for getting the best matching of the object's shape. Then, the current network collects predictions from multi-feature maps with various scales for handling objects of different volumes.

1.1. Research Problem

Animal detection and recognition is still a challenging task at the moment and there is no distinctive technique that provides a strong and efficient solution to all situations.
To summarize some of these challenges as follows:
1. The great variation in the appearance and the size of animals belonging to a particular category.
2. Lighting / Illumination Conditions: The image color of the picture is highly susceptible to light intensity and light direction variations.
3. Detect and classify animals are placed in arbitrary poses in the cluttered and the occluded environment, and in rotate states.

1.2. Paper Contributions

The contributions of this paper are presented in this section as follows:
1. Detecting the single and multi-animals of the Mammals category and also no animal category in case there is no mammal animal inside the image.
2. Detecting all types of the mammals' category.
3. Detecting and classifying the animals when the variation of image light/illumination, in a blurry and dark image.

2. Related Work

This section briefly presents the existing related works on the classification and tracking of animals.
Norouzzadeh, et al. (2018) trained Deep Convolutional Neural Networks (DCNNs) to recognize, amount, and describe behaviors of 48 species in 3.2 million images (Dataset Snapshot Serengeti). This neural network automatically recognized animals with 93.8% accuracy. Their results suggested that Deep Learning (DL) enables an inexpensive, large-scale, unobtrusive, and real-time gathering of wealth information around large numbers of wild animals. To test how best DL can automatic information elicitation from images of the camera trap, they collected millions of labeled data from the

Snapshot Serengeti (SS) dataset, the latest development of (DNN) engineering, and modern supercomputing [13].

Verma and Gupta (2018) focused on monitoring and analysis of wildlife through detection of the animal from natural scenes obtained by camera trap networks. They implemented a model of animal recognition using a self-learned feature of feature Deep CNN. Then this set of features was used for the process of classification using the state of art algorithms of Machine Learning (ML), which supported k-nearest neighbor, vector machine, and ensemble tree. Their results presented an accuracy of 91.4% [14].

(Schneider, et al. 2018) proposed network to train and compare two classifiers of deep learning object detection, Faster YOLO v2.0, and R-CNN to recognize, classify, and localize species of animals within images of camera-trap using datasets. The results were with average accuracies of 93.0% and 76.7% on the two datasets [15].

Xuefeng Liu et al. (2019) suggested a MobileNetV2-based embedded system combined with deep learning and learning transfer. This model aims to classify images of marine animals in an efficient way and in real-time. Firstly, these images were collected by using a robot equipped with a built-in device underwater. Subsequently, the proposed model has been created depending on CNN according to the images of "marine animals" which could guarantee the requirements in real-time.

Then, for further enhance rankings, learning transfer was used. After that, the model was trained using selected images of marine animals. Lastly, this trained model has been applied in the embedded devices and categorized underwater images of marine animals in real-time [16].

Deboleena Roy, et al. (2020) proposed an adaptive hierarchical network architecture made up of DCNNs which can evolve and learn as new data becomes available. This network organized the incrementally accessible data into feature-oriented super-classes and enhanced it by applying self-growth functionality to existing hierarchical CNN models. Compared to fine-tuning a deep network, the proposed hierarchical model achieved an important reduction in training effort while retaining competitive accuracy on CIFAR-10, and CIFAR-100 [17].

3. SSD MobileNet Pre-Trained Model

MobileNet SSD model is one of the pre-trained models which includes integrating the SSD and MobileNet model [18]. SSD is a popular algorithm used as an object detector while Mobilenet is a convolutional neural network used as a features extractor to produce high-level features [19]. It is pre-trained on some public datasets like the Common Objects in Context (COCO) dataset for detecting and classifying multi-objects. The architecture of the SSD MobileNet model is lightweight in its architecture which is more suitable for mobile and embedded based vision applications where there is a lack of computing power. This architecture was proposed by Google. It uses depthwise separable convolutions which basically means it performs a single convolution on each colour (input) channel rather than combining all three and flattening it.

The pointwise convolution then applies a 1×1 convolution to combine the outputs of the depthwise convolution. This factorization has the effect of drastically reducing computation and model size [20], [21].

This type of convolution divides the resulting output into two layers: a separate filtration layer, and a combination layer. The combination of these two layers will reduce the size of the model, thereby decreasing computational power requirements. A pre-trained model transfers the learned features or weights to begin the tuning process, and it allows the object detector to be trained with a limited amount of training. It is a very common and powerful method for the technique of deep learning of small image datasets which is to usage a pre-trained network [18].

4. SSD MobileNet Architecture

CNN in SSD is fully convolutional, based on MobileNet which serves as the backbone network [22]. Next, many additional CONV layers gradually decrease in size [23]. To detect smaller objects, the SSD uses extra shoaly layers with higher accuracy. For objects of various sizes, SSD detects multi metrics

by working on multiple convolution feature maps, each of which has the appropriate bounding boxes that predict dozens of categories and box offsets [24], [25]. In SSD, for the primacy of every object category inside each bounding box, a score is generated, followed by adjusting the bounding box to best match the shape of the object before detection [11]. SSD accomplishes its goal with the help of the multi-tasking loss function which represents the difference between the predicted and actual values [24]. It is created for getting the minimal of that function for optimizing the model and improving the accurate predictions. SSD is a feed-forward CNN. it associates each cell in the feature maps used for prediction with a set of the default bounding boxes (it is called also anchors) [24]. The algorithm predicts the offsets relative to a default box in the cell and a confidence score that expresses the presence of a target object class inside the default box [22]. For making the bounding box detectors particular, so each detector tries to predict just one object and various detectors will find various objects. SSD assigns each bounding box's detector to a particular position in the image. In this manner, detectors learn to specify objects at specific locations. MobileNet SSD model is shown in figure 1.

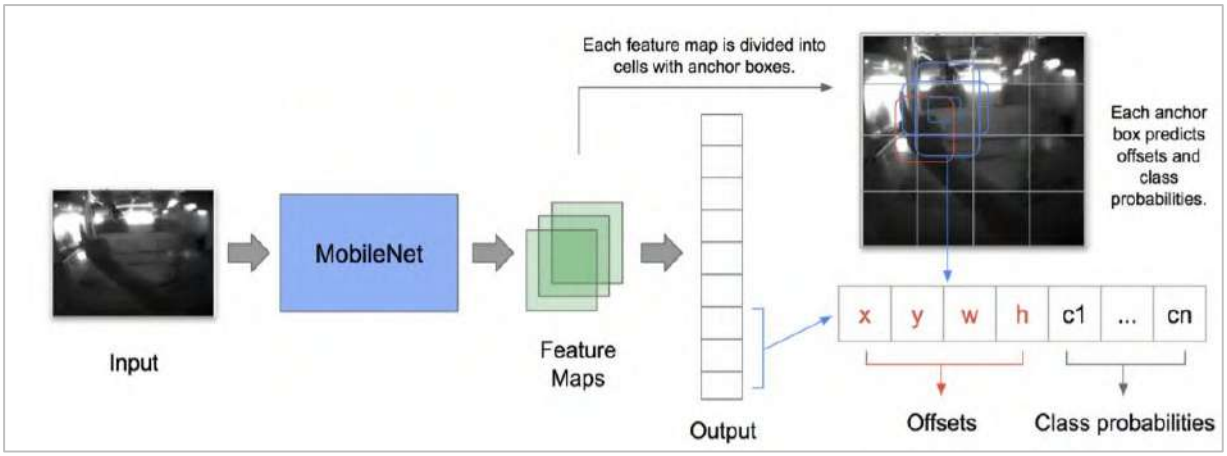

Figure 1: MobileNet SSD Model [26]

5. Research Methodology

The multi-label image classification model is proposed for detecting and classifying multiple objects (animals) of the Mammal category in static images. SSD MobileNet v1 model is used in this work, figure 2 illustrates the block diagram of the proposed model.

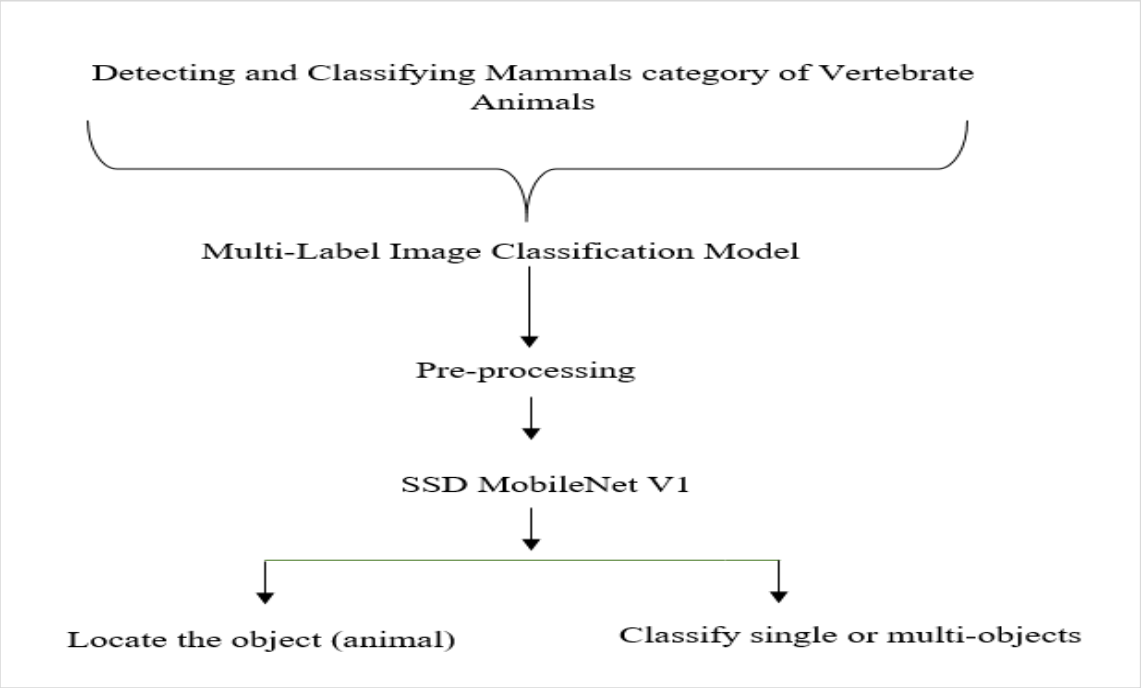

Figure 2: Block diagram of the proposed model

5.1. Pre-processing Stages for Deep Learning

The most common parameters for input image data are the number of images, number of channels, image height, and image width. Several steps of images pre-processing should be implemented before using it in deep learning:

a. Standard aspect ratio image scaling

b. Normalize the input image to the range of (0, 1) and reduce the dimension of the image to meet the standard range value and dimension for the SSD network.

c. Image Augmentations Techniques are used in this work to solve some of the challenges facing the detection and classification of the animal in static images, for example, when the animal may appear truncated or partially occluded, the animals may change their shape, or problem of Lighting/Illumination Conditions.

5.2. Proposed Method of Multi-Label Image Classification

The proposed method of Multi-Label Image Classification is used for the following:

1. Classification + Localization: Classifying an image as a mammal category or no animal, also, localizing the target object inside the image to locate the main object in an image.

2. Object Detection: Detecting all types of mammal categories and drawing bounding boxes around them. Figure 3 shows the localization, classification, and detection of two samples of our results by this method.

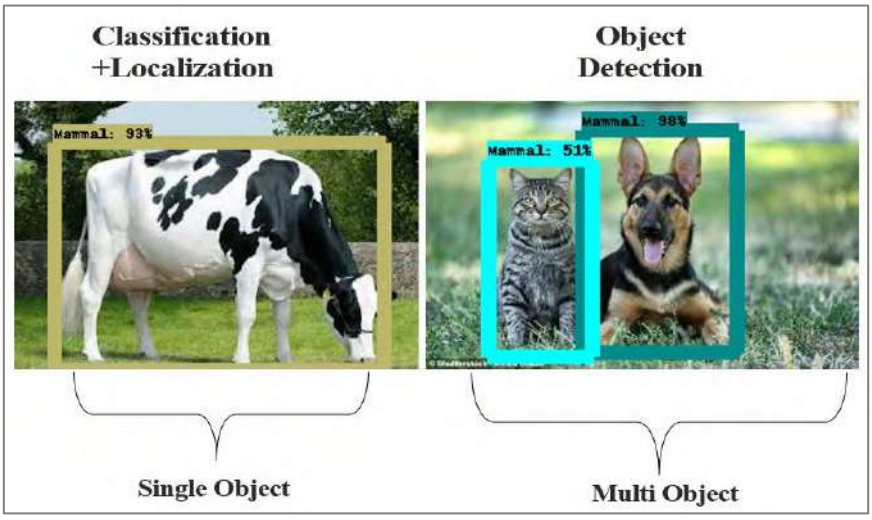

Figure 3: Localization, classification, and detection object (animal)

In this research, the SSD MobileNet v1 model is used to detect and classify multiple (objects) animals of mammal's class even in difficult cases like detecting part of the animal in lighting/ illumination conditions. Both MobileNets and Single Shot Multibox Detection (SSD) are combined and pre-trained on the COCO_2017 dataset for detecting and classifying multiple objects in difficult cases. It is an efficient CNN architecture for mobile and applications of embedded vision [19].

The Common Objects in Context (COCO) dataset is the public dataset used widely to address the issue of large training datasets and to train models to depend on the image and to overcome of data limitations problem provided by Microsoft. Presently, this dataset performs like some of the best object detection data. It includes (300,000) segmented images with (80) various object categories with highly accurate location labels. This combination of SSD and MobileNet has achieved fast detection speed while maintaining high detection quality. The dataset used in this work includes 2000 colored images in different sizes like (128 x 128, 256 x 256, 512 x 512, 1024 x 1024) pixels of two categories (Mammal category and no animal category).

This model pre-processes the images by resizes the input image sizes into 300×300 pixels to meet the requirements of the SSD mobile net model. This new size of images is used for the process of detection. Detection performs with localizing and classifying multiple objects in still images.

The outputs of the proposed model represent four matrixes which mapped to the indices 0 - 3, (Locations, Classes, Scores, and No. of detections) as shown in table 1. 20 epochs have been selected during the network training.

Table 1. The model outputs

Index	**Name**	**Description**
0	Locations	They represent (floating-point values which fall in the range [0 – 1]), where object location represents the "top, left, bottom, right" of the bounding boxes at the model.
1	Classes	A matrix of two integers is output as floating-point values [0 – 1], every index referring to the class label index for the labels file.
2	Scores	An array of two floating values which are between 0 and 1 represents the probability of detecting a class.
3	No. of detections	A matrix of length one implicates the term "floating-point value" which is the entire No. of detection results for two objects detected.

5.3. Algorithm of SSD Detection

The steps of the SSD algorithm which used in this work are as follow:

Input: RGB image.

Output: Represent four matrices that are mapped to the indices 0 - 3 (Locations, Classes, Scores, and No. of detections).

1. Apply CONV Layers to extract features at different sizes using various filters to get Feature Maps.
2. Get various feature maps at different sizes as output to fed SSD.
3. From each spatial location in Feature Maps, generate MultiClass Classification and Bounding Box Regression.
4. Add CONV layers to get smaller feature maps and continue the steps of detection.
5. Filter the bounding boxes by using IoU metrics, and the hard negative mining.
6. Compute the loss using a collection of classification (softmax), and detection (smooth L1).

5.4. Proposed Model Architecture

Our architecture of the Single Shot MultiBox Detector MobileNet model is based on (Depthwise Separable Convolutions) which is divided into two CONV layers, one layer for the filtering and the other for combining. The MobileNet model implements a single default filter for each neural input channel to initiate feature extraction. After the Depthwise Convolution, a (1 × 1) Pointwise Convolution follows to incorporate the Depthwise Convolution output. All these separable layers are followed by the batch norm, and ReLU nonlinearity expects the last (FC) layer that feeds into a softmax layer to classify as having no nonlinearity.

Filters on Mobilenet work for each color channel separately unlike the traditional CNN, and later combine the three results in one value. This factorization has the effect of drastically reducing computation and model size.

In this proposed model, (32, 64) filters with sizes (5 x5) are used to extract features from the input images followed by 2 max-pooling (pool size=2). Figure 4 illustrates the proposed model SSD MobileNet.

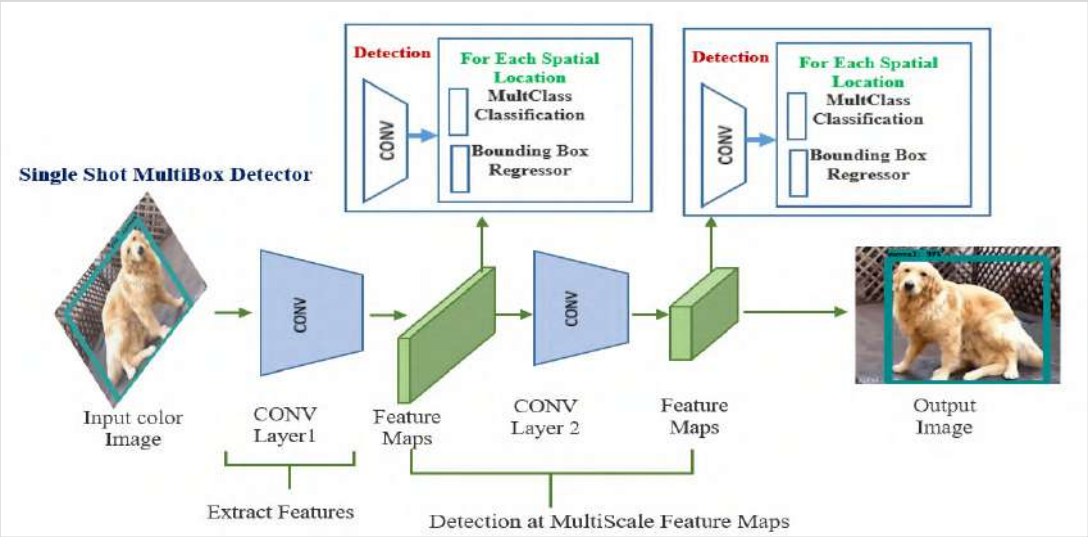

Figure 4: Proposed model SSD MobileNet V1

The model is extended by many convolutional layers. In SSD, the priority of creating a bounding box is to the target object with a high score. And then adjusting the bounding box according to the

location, scale, and aspect ratios to get the best match to the shapes of the object (to the ground truth boxes).

During training time, each feature map is used for predicting bounding boxes and the variety in the size of the feature map allows object detection with various accuracy. Boxes are filtered by IoU metrics and Hard Negative Mining. IoU is a perfect metric to measure the overlap between the predicted box and the ground-truth as computed in equation (1) and as shown in figure 5. The ideal value between them has a 100% IoU, but particularly, the result over 50% is commonly considered a correct prediction. Finally, the predicted box will be determined with maximum overlap with ground truth.

$$IoU = \frac{area\ of\ overlap}{area\ of\ union} \quad \ldots\ldots\ldots\

Figure 6: Detection and classification of the single animal from different types of Mammals

6.2. Detection and Classification Single Object of no animal Category

In this test, 1000 images of no animal category which include different types of objects belong to no animal category have been used. This model has detected and classified the objects of this category in images and bounded them by a box successfully as shown in figure 7.

Figure 7: Detection and classification of a single object of no animal's category

6.3. Detection and Classification Multi animals of Mammals Category

In this test, the model has detected and classified the multi similar and different animals of mammals in one image successfully and bounded them by a box as shown in figure 8.

Different animals **Similar animals**

Figure 8: Detection and classification multi animals of mammals Category

6.4. Detection and Classification Multi Objects of no animal Category

In this test, the model has detected and classified multi objects of no animal category and bounded them by a box successfully as shown in figure 9.

Figure 9: Detection and classification multi objects of no animal category

6.5. Detection and Classification Parts of Mammals in Image

In this test, the model has been detected and classified parts of animals displayed in the image successfully, figure 10 shows samples of the detected cut parts of animals.

Figure 10: Detection and classification cut parts of animal

6.6. Detection and Classification Mammals with Rotate Their Shapes

In this test, the proposed model has detected and classified the Mammals even in case of rotating their shapes in image and bounding them by box successfully as shown in figure 11.

Figure 11: Detection and Classification Mammals with Rotate Their Shapes

6.7. Detection and Classification the Animals from Dark Images

In this test, the model has detected and classified the animals from dark images successfully and bounding them by a box successfully as shown in figure 12.

Figure 12: Detection and classification of the Animals from Dark Images

6.8. Detection and Classification of the Animals from Blurry Images

This model tested to detect and classify the animals from blurry images; the model successfully detected and classified the animals in the blurry image as shown in figure 13.

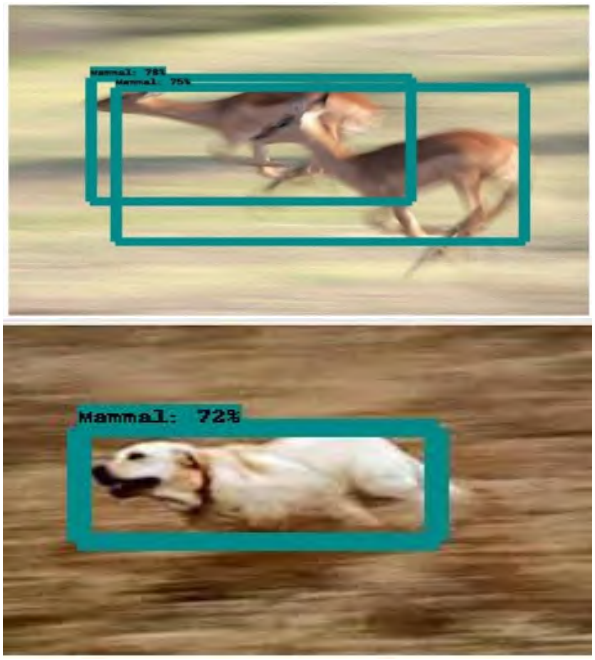

Figure 13: Detect and classify animals from blurry images

7. Comparison Between the Proposed Work Against the Others

Most studies are only detecting the specific types of a certain category but they are not detecting all types of animals that belong to a certain category. These studies also are not detecting a part of (object) animal in image, and are not detecting the objects in the dark images or under variation of illumination conditions. Most of them have not collected images; they used the online ImageNet dataset. Table 2 shows a comparison between the proposed work against the other works.

Table 2: Comparison between the proposed work against the other works

No.	Research Goal	Method	Test Accuracy
[27]	Detecting of large fauna in the open savannah of "Maasai Mara National Reserve, Kenya from very altitude resolution GeoEye-1 satellite" images.	By combining the features of "pixels based and object-based approaches of image classification".	90-96%
[28]	Identifying, and recognizing the animal images for Monitoring of Automated Wildlife" Bird, Rat, Bandicoot, Rabbit, Mouse, Cat".	Using Deep CNNs.	94.2 %
[29]	Recognizing and classifying animals located in "Slovak country" which is called "wolf, fox, brown bear, deer, and wild boar".	Using a collection of some approaches "SIFT - Scale-invariant feature transform, SURF - Speeded Up Robust Features".	(50 , 80, 86)%
[13]	Detecting animals in images, identifying species, and counting them.	Applying DNNs to automatically extract features from the images in the wild animal's dataset called "Snapshot Serengeti (SS) dataset".	93.8%

[30]	Detecting and monitoring cattle with a drone.	Using (CNNs) for recognizing the objects taken in the images.	87%
[6]	Tracking a group of unmarked zebrafish.	Suggesting a "semi-automatic multi-organism tracking method" for dealing with partial blockages by using Kalman Filter to keep tracking of every animal.	87.85%
[**7**]	Detecting and classifying “bear, hog, fox, deer, and wolf”, in the image.	Using CNN, this model is compared to high image recognition approaches like, “Principal Component Analysis, Local Binary Patterns Histograms, Linear Discriminant Analysis, and Support Vector Machine”.	97%

[12]	Developing a detector that analyses the images of video from camera traps in real-time. These images are related to "rhinoceros, humans and a set of six common large animals in the African savannah".	Using CNN “ SSD MobileNet V2”.	90%
The proposed work	Detecting, localizing, and classifying mammal in an image. Also, solve the problems of detecting animals in case of part of an animal in image, various illumination environment, and blurry image.	The proposed method used a “CNNs training, combine with pre-trained Single Shot Detector (SSD) MobileNet v1 architecture”.	98.7%

8. Conclusions

In this work, the SSD and Mobilenet-v1 are proved as an accurate and fast method for detection, classification, and localization the animal in static images.
Most other studies are only detecting the specific types of a certain category but they are not detecting all types of animals that belong to the Mammals category as we did in the current proposal.
Several tests have been done in the SSD MobileNet v1 model, and the model has achieved good results in the detection and classification of the object (animal). The results were very effective, the accuracy of detection using 20 epochs was up 98.7% which is promising compared with the other works.
This model successfully detected and classified the single and multiple objects in the static images. Moreover, this model successfully detected and classified the animal in different illumination such as dark and blurry images. Also, it could detect and classify the animal when there is a part of the animal in the image. Each object in the image was detected and bounded by boxes, besides labeling it.

E-mail: namar.t@ihcoedu.uobaghdad.edu.iq

Abstract. The art of preventing the detection of hidden information messages is the way that steganography work. Several algorithms have been proposed for steganographic techniques. A major portion of these algorithms is specified for image steganography because the image has a high level of redundancy. This paper proposed an image steganography technique using a dynamic threshold produced by the discrete cosine coefficient. After dividing the green and blue channel of the cover image into 1*3-pixel blocks, check if any bits of green channel block less or equal to threshold then start to store the secret bits in blue channel block, and to increase the security not all bits in the chosen block used to store the secret bits. Firstly, store in the center of the block and then store another bit in the write or left bit depended on differences between them.
The proposed method was applied to many color images and many measurement terms used to show the efficiency of it. The experiment result showed good result that the PSNR = 53.76, MSE = 0.273, SSIM= 0.999, with embedding rates 0.55

Key Words: Steganography, DCT, and Least Significant Bit (LSB)

1. Introduction

Steganography is the technique of covered writing [1] it tends to hide the digital message with the digital data of different carriers' media, the carrier's media may be audio, image, movie, etc. [2,3]. For hiding secret information inside an image, several algorithms have been proposed. The main important element used in image steganography is carrier image also known as cover-image; it is the media to hide the secret information by using some embedding algorithms. Embedding algorithm: it is combining the cover image with the secret information. Stego -image: it is the image obtained after embedding the secret message that is the goal of the image steganography technique. The two images (the stego -image and cover image) must have the same quality and without distorting the quality of the cover image [4].

Steganography techniques can be done into two types of domains: spatial and frequency domain. In the spatial domain technique, the secret information is embedded directly in pixels of the image. Where in the frequency domain also known as the transform domain, the image is transformed, and then the secret information is embedded in it [5].

The most common and simplest steganography method is the Least Significant Bit. It is a spatial domain substitution process where the secret message is hidden in the least significant bit pixels of the

cover image [6]. Various algorithms for steganography hide a large number of secret information in the first least significant bits of the cover-image pixels. Because the sensitivity of the human visual system is very weak, the Presence of the hidden secret information unable to be noticed [7]. If the message is simply hidden in the least significant bits of the Sequential pixels, it can be easily destroyed by filtering, compression, or a less than size transmutation to get the original hidden message. So, this technique must be modified and combined with another transform to resist any stego-analysis methods [8] transformation technique based on the covert the cover image from the spatial domain into frequency coefficients by manipulation of the orthogonal transform of the image through using different transformation techniques like Discrete Cosine Transformation DCT [9].

This paper proposed a method that combines the Least Significant Bit (LSB) and Discrete Cosine Transform (DCT). This is done by separate the color image into RGB channels and then applying DCT transform on the green channel to find the dynamic threshold by using the DCT coefficient. The dynamic threshold used to select the block to hide text data in the blue channel based on the absolute differences between the value on the pixels in the block, The pixels in the block of cover image satisfying the threshold condition are not in Sequential locations makes this proposed method stronger and secured. The rest of the research is ordered as follows; Section 2 illustrated the discrete cosine transform with its general equation. Section 3 described the proposed algorithm with its block diagram, performance measurement explained in Section 4 and the corresponding simulations and discussions are done in section5. Finally, the conclusion of the paper was given in section 6.

2. Discrete Cosine Transform (DCT)

For image and signal processing DCT is orthogonally transformed with many advantages such as little in bit error rate and high compression ratio with good in both synthetic effects of calculation complexity and information integration ability. It broke the image into three frequency bands the low, high, and mid as in Fig1 [8,9].

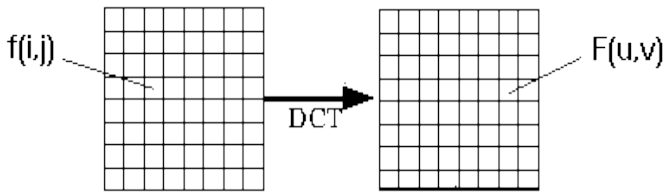

Fig 1. The DCT transform of An Image

The one-dimension DCT equation (k data items) is:

$$F(u)=\alpha(u)\sum_{x=0}^{k-1} f(x)cos\left[\frac{(2x+1)u\pi}{2k}\right] \qquad (1)$$

for u = 0, 1, 2, . . . , K-1.

The two-dimension DCT equation (k by L image) is [10]:

$$F(u,v)=\alpha(u)a(v)\sum_{x=0}^{k-1}\sum_{y=0}^{K-1} f(x,y)\cos\left[\frac{(2x+1)u\pi}{2K}\right]cos\left[\frac{(2y+1)u\pi}{2K}\right] \qquad (2)$$

for u,v = 0, 1, 2, . . . , K-1 Here, the input image is of size K × L. The pixel intensity is f(i, j); and DCT coefficient is F(u,v).

Broken the image into 8 by 8 blocks pixels and applying DCT to each block Through working left to right, top to bottom is how to used DCT in steganography [11].

3. Proposed algorithm

The proposed algorithm used the discrete cosine transform on the cover image. The DCT transform was applied on the green of the color cover image, calculate the threshold for each row, divide the blue channel and green channel into non overlapping block 1*3 and then check if any bits of green channel block less or equal to threshold then store one of the secret bits in center of blue channel block and the other in right or left according to the differences between the pixels. This way is ensuring secret bits is non embedding in consecutive pixels, which increase the security. Final step in the proposed method applied inverse DCT transform on green channel and combined it with blue channel after embedding and red channel to get the stego- image as shown in Fig 2 and explain the hiding for two bit of secret text in example as shown in Fig 3.

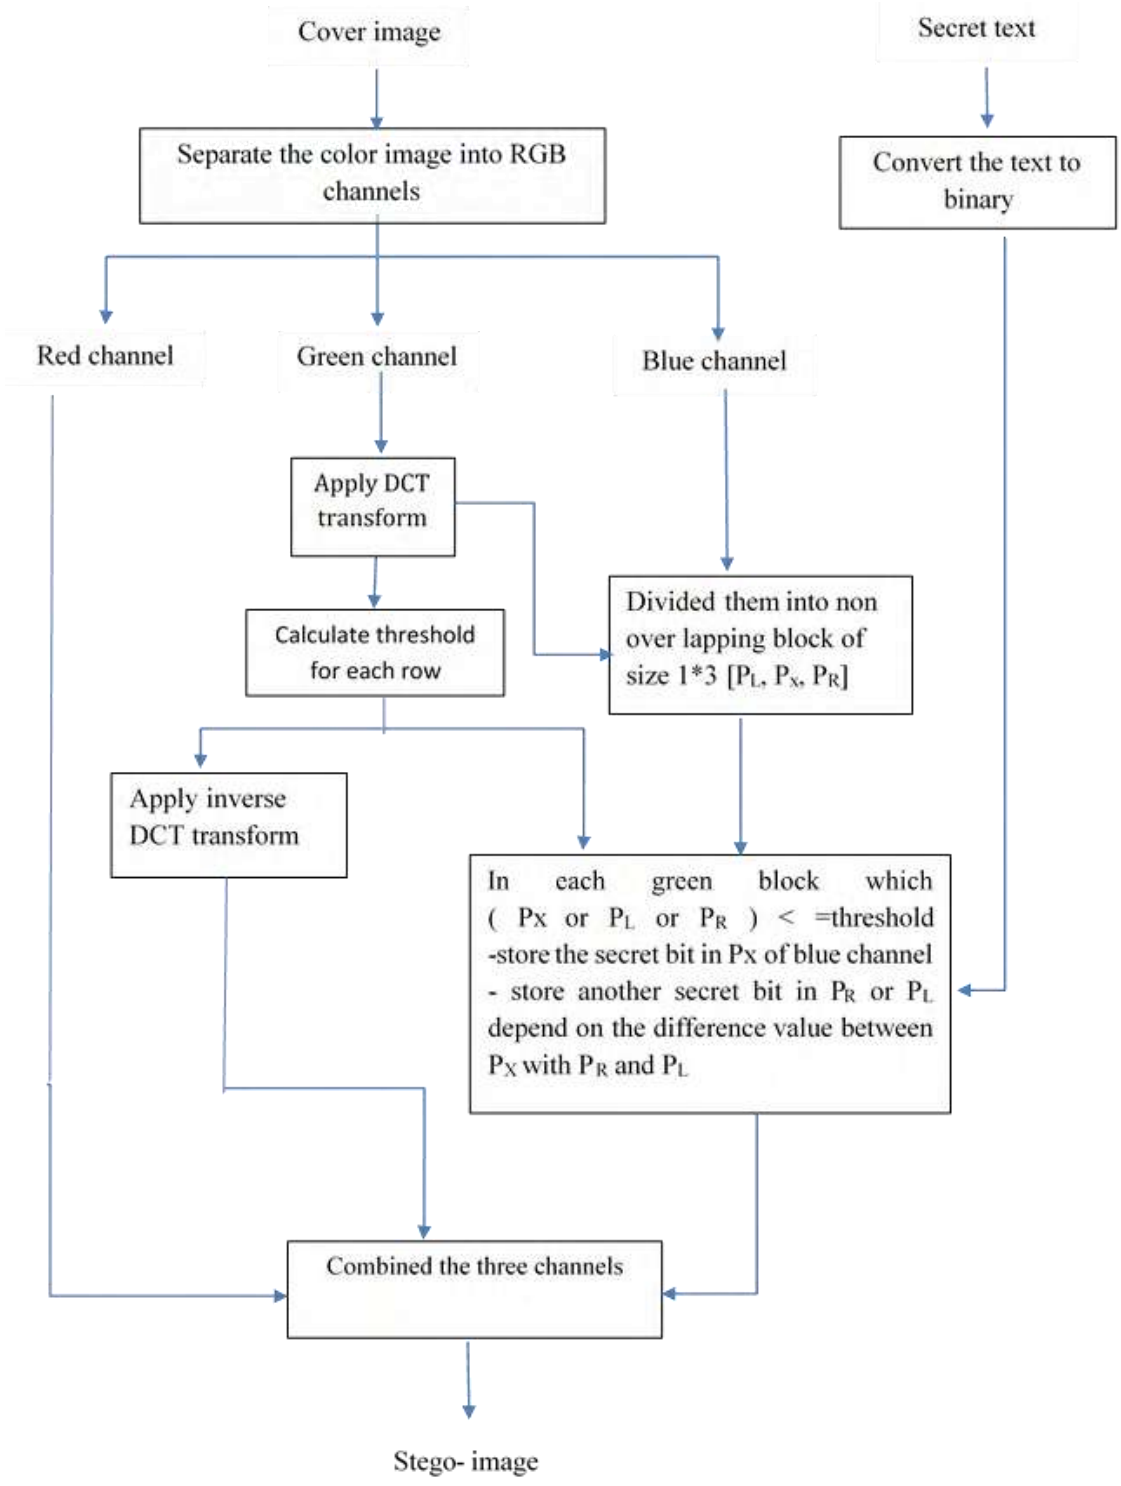

Fig 2. The main block diagram of the proposed method

An embedded and extracts algorithm are shown in 3.1 & 3.2

3.1. Embedded data process

The embedding algorithm

Input: color image with the size [M x N], secret text.

Output: stego_image.

Begin

Step 1: Read the color image and separate it into three channels R, G, and B.
Step 2: Apply DCT transform on G channel.
Step3: Calculate the dynamic threshold by the following equation (3) $\mathrm{Ti} = 1/(N-1)\sum_{j=1}^{N-1} |(\mathrm{Ci,j} - \mathrm{Ci,j+1})|$, i= 1 to M (3)
Where
$C_{i,j}$ is the DCT coefficient in i row, j column
Step 4: Apply inverse DCT on G channel
Step 5: Divide B and G channels into non overlapping blocks of size 1 x 3, P_L, P_X, and P_R.
Step 6: Convert the secret text into binary bits.
Step 7: i=1, L=1
While (i≤ M and L≤ length of secret bits) do
j=1 // the counter of blocks in each row
While (j≤ N/3 and L≤ length of secret bits) do
If (P_L, P_X, and P_R) in block [i, j] in G channel ≤ Ti then
- Store secret bit in LSB of P_X in block [i, j] in B channel
- If $|(P_X - P_L)| \geq |(P_X - P_R)|$ of B channel
- store another secret bit in LSB of P_R
Else
- store another secret bit in LSB of P_L
L= L+2;
End //
- j= j+1
End // end of j
i=i+1
End // end of i
Step 8: Reconstruct the stego-image by combination the three-color channels of the image to produce stego-image
End.

3.2. Extraction Secret text process, the extracting algorithm

Input: stego_image
Output: secret text
Begin
Step 1: Read the color image and separate it into three channels R, G, and B.
Step 2: Apply DCT transform on G channel.
Step3: Calculate the dynamic threshold by using eq. (3)
Step 4: Divide G and B channel into non overlapping block of size 1 x 3, P_L, P_X, and P_R.
Step 5: i=1, L=1
While (I ≤ M) do
j=1 // the counter of blocks in each row
While (j ≤ N/3) do
If (P_L, P_X, and P_R) in block [i, j] of G channel ≤ Ti then
- extract secret bit from LSB of P_X in block [i, j] of B channel
- If $|(P_X - P_L)| \geq |(P_X - P_R)|$ of B channel
- extract another secret bit in LSB of P_R
Else
- extract another secret bit in LSB of P_L
End //
j= j+1
End // end of j
i=i+1
End // end of i

Step 6: Convert the extracted bits to Ascii then to text
End

An Implementation example for the proposed algorithm is as follows:
After applying DCT on the green channel and calculate the dynamic threshold for each row, divide the blue and green channel into non overlapping blocks of size 1 x 3, (P_L, P_X, and P_R).
Suppose the threshold of row **i** in green channel = 151
If any pixel (P_L or P_X or P_R) in the block (i, j) of green channel < =151

Store secret bit in LSB of P_X in the block (i, j) of blue channel

Calculate the difference between the center pixel and the right, left pixels in block (i, j) of blue channel

$|Px-P_L|= |165-170| =5$

$| Px-P_R|=|165-162|= 3$

$$| (P_X - P_L) | \geq | (P_X - P_R) | \qquad (4)$$

Store another secret bit in LSB of P_R of blue channel.

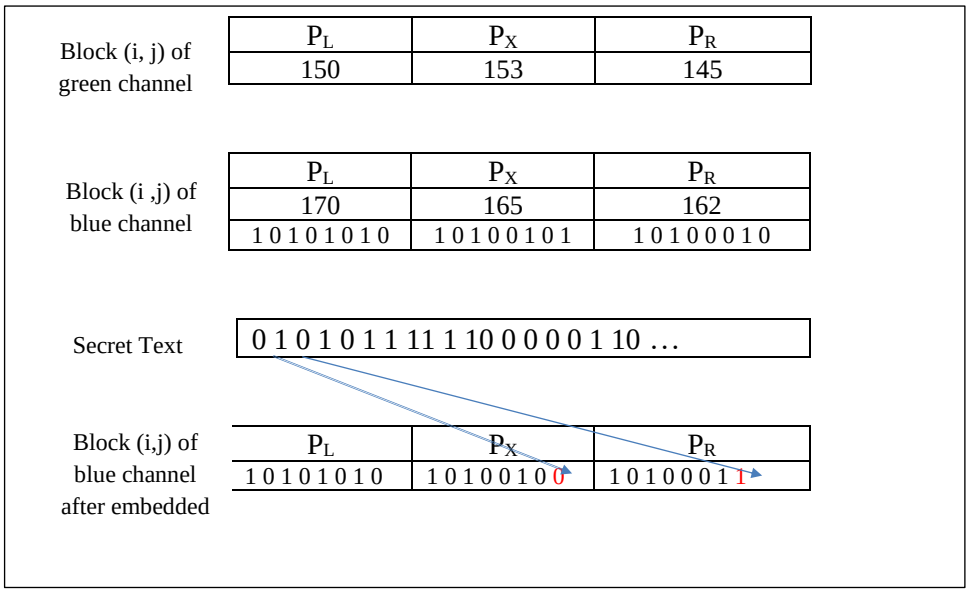

Fig 3. shows the blocks of the green and blue channel of the implemented example.

4. Performance measurement

The digital quality of an image can be calculated by using many parameters to measure the performance of the proposing method:

4.1. *Peak Signal to Noise Ratio (PSNR)*

The peak signal-to-noise ratio between two images is computed using PSNR the ratio is used to measure the quality between the cover-image and a stego- image. When PSNR is high, good quality of stego-image is obtained. (MSE) mean square error represents the differences between the pixels of two images (cover image (CI) and stego-image (SI)). The PSNR equation is [13,14].

$$\text{PSNR} = 10 \text{ Log10 } \frac{\text{RI}^2}{\text{MSE}} \qquad (5)$$

$$\text{MSE} = \frac{1}{\text{mn}} \sum_{\text{k}=1}^{\text{m}} \sum_{\text{l}=1}^{\text{n}} [\text{CI}(\text{k},\text{l}) - \text{SI}(\text{k},\text{l})]2 \qquad (6)$$

Where *m* and *n* are representing the image size, RI is the maximum value of the image's pixels.

4.2. *Structural Similarity Index Measure (SSIM)*

SSIM is an improvement method of the classical PSNR & MSE methods which is used to determine the resemblance between two images. [0,1] is the range value of the SSIM index. If the index is high then it means more similarity of two images (cover image (CI), and stego-image (SI)), and it's calculated as the follows:

$$SSIM\ (x_1,y_1) = \frac{(2\mu_{x1}\mu_{y1} + c_1)(2\sigma_{x1y1} + c_2)}{(\mu_{x1}^2 + \mu_{y1}^2 + c_1)(\sigma_{x1}^2 + \sigma_{y1}^2 + c_2)} \qquad (7)$$

Where x_1 and y_1 are two windows of common size, μ_{x1} is the average of $x1$, μ_{y1} is the average of y_1, $\sigma x_1{}^2$ is the variance of x_1, $\sigma y_1{}^2$ is the variance of y_1 and $\sigma x_1 y_1$ is the covariance of x_1 and y_1 [15].

4.3. *Image histogram*

One of the important criteria of security analysis is histogram. The security for the encrypt message is more guaranteed as the histogram of the image being is more uniform [16]. The x axis and y axis of the histogram graph explains the pixel difference between each pair and the number of occurrences, respectively. Comparing the histogram of cover and the stego-image to monitor unusual shapes as a result of an embedding algorithm or to identify pixels distribution, it is considered as one of the effective experiments of a stego-image identify the pixels distribution [17, 18].

5. Results and Discussion

The proposed algorithm was implemented and tested on several standard images. The cover images with the size (256 × 256) color – scale are used such as (a) Lena, (b) Baboon, (c) pepper, (d) monarch, (e) sails and (f) tulips as shown in Fig. 4. Fig 5 shows the stego image after embedding 36000 secret bits with embedded rate ER =0.55.

Many metrics are used to measure the performance of proposed method such as PSNR, MSE and SSIM and the result shown in table -1, High value of PSNR indicates good perceptual quality of stego-image and the high value of SSIM indicate that have more similarity between cover image and stego-image

(a) (b) (c)

6. Conclusion

To increase the security in the steganography methods, the process of hiding the secret bits must not in a consecutive manner. In this proposed method the dynamic threshold was produced based on DCT coefficient in the green channel of the cover. The blue channel was divided into blocks of size 1*3. The block is selected to hide the secret data depend on the dynamic threshold. Two pixels only in each selected block were used to hide the secret bit to increase the security, these two pixels are the center pixel in the block and the right or left pixel of the center. The proposed method maintained good result depend on the high value of PSNR and SSIM

Impact of Feature Selection for Data Classification Using Naive Bayes Classifier

Impact of Feature Selection for Data Classification Using Naive Bayes Classifier

Eman Hato

Email: emanhatto@gmail.com

Abstract. In the field of data processing and analysis, the dataset may be a large set of features that restrict data usability and applicability, and thus the dimensions of data sets need to be reduced. Feature selection is the process of removing as much of the redundant and irrelevant features as possible from the original dataset to improve the mining process efficiency.This paper presented a study to evaluate and compare the effect of filter and wrapper methods as feature selection approaches in terms of classification accuracy and time complexity. The Naive Bayes Classifier and three classification datasets from the UCI repository are utilizing in the classification procedure. To investigate the effect of feature selection methods, they are applied to the different characteristics datasets to obtain the selected feature vectors which are then classified according to each dataset category. The datasets used in this paper are the Iris, Ionosphere, and Ovarian Cancer dataset.Experimental results indicate that the filter and wrapper methods provide approximately equal classification accuracy where the average accuracy value of the Ionosphere and Ovarian Cancer dataset is 0.78 and 0.91 for the same selected feature vectors respectively. For Iris dataset, the filter method outperforms the wrapper method by achieving the same accuracy value using only half number of selected features. The results also show that the filter method surpasses when considering the execution time.

Keywords: Feature selection, Naive Bayes classifier, Iris, Ionosphere, Ovarian cancer.

1. Introduction

Data Classification is an analysis technique used to categorize data into different classes. Classification process is carried out in two phases which are training phase and testing phase. In the first phase, also known as learning phase, the classifier model is trained using a classification algorithm with a pre-determined set of data inputs called the training data set. The classifier model, in the second phase, is employed for the classification process with another set of data, called the testing data set. The training and testing data sets are prepared by dividing the general data set by a certain percentage, noting that testing data samples are not included in the training data set [1].

The classification process depends on two main factors which are the classifiers used and the feature vectors extracted [2]. Different advanced classifiers have a powerful learning ability and high performance such as Convolution Neural Networks (CNN), K- Nearest Neighbor (KNN), Support Vector Machine (SVM), Naive Bayes Technique, and Random Forest [3, 4]. Feature extraction is an important step for multimedia processing such as video retrieval, image classification and object recognition. Feature extraction aims to extract relevant information from the data to obtain a robust descriptor and reduce huge data content. Massive data will produce a high dimensionality of the feature vector, which greatly decreases the efficiency of the classification process [5].

Feature selection is always discussed with feature extraction; it is a procedure in machine learning to selects a useful sub-features set that helps in finding the most important features of model

construction. Feature selection eliminates redundant and irrelevant features as much as possible [6]. The motivation for feature selection is dimensionality reduction of feature vectors to decrease the time complexity, as well as remove irrelevant features that lead to false prediction and thus reduce the performance of classifier [7].

Researchers attempt to extract important features or minimize noise and redundant features from the high dimensions of feature vectors utilizing diverse feature selection techniques.

In [8] Torija and Ruiz proposed prediction model for urban environments based on machine learning regression and feature selection techniques. Three feature selection methods were used which are correlation based feature subset selection, wrapper for feature subset selection and the principal component analysis to reduce time complexity and resources cost for the large number of variables involved in urban environments.

Imtiaz et al. in [9] designed brain tumor segmentation method using multi planar superpixel level features extracted from magnetic resonance imaging. A histogram based consistency analysis was applied as a feature selection method to reduce the feature vectors. In [10] Haidar and Verma proposed a method for selecting optimal input features and network parameters based on a hybrid genetic algorithm for artificial neural networks which was applied for rainfall forecasting.

In [11] Bolon-Canedo and Remeseiro give a detailed survey of feature selection techniques using in image analysis process, they considered four fields in the review which are image classification, image segmentation, image annotation and image retrieval. Silva et al. in [12] combined the feature selection methods applied on training data and machine learning algorithms to identify predictors of prediabetes for enhancing predictive performance of prediabetes. Tumar et al. in [13] Binary Moth Flame Optimization (BMFO) was used as feature selection algorithm to reduce data dimensions for improving the performance of Software fault prediction (SFP) model.

Magesh and Swarnalatha employed Decision Tree (TD) for optimal feature selection in [14]. After identifying a subset of the features, classification algorithms such As Random Forest (RF), Support Vector Machine (SVM), Linear Model (LM) and DT were applied for heart disease prediction and their performances are evaluated. Feature dimensions were reduced by approximately 61% without affecting classification accuracy. In [15] Liu et al. presented feature selection method based on independent feature space search to improve the text classification performance.

The summary from previous studies is that feature selection methods aim to reduce the feature dimensions as much as possible while maintaining the predictive accuracy of the classifiers. The objective of this paper is to evaluate and compares the effect of feature selection methods in term of classification accuracy and time complexity.

2. Feature Selection Approaches

Feature selection methods aim to reduce the data dimensionality by selecting a subset of extracted features to create a classification models. Feature selection methods search for a subset of features that achieve an optimal response from the classification algorithms so that the learning algorithms can focus on the relevant features that are more useful for the prediction process. Improving the performance of prediction and providing more faster and cost effective predictors are the main advantages of feature selection methods. Using too many features can degrade performance of prediction even when all features are relevant and contain information about the response variable [16, 17].

The feature selection methods can be classified into three approaches [18]:

1. Filter approach aim to measure features importance based on the general features characteristics such as features variance and features relevance to the response. The important features are selected as a step in pre-processing the data and then the model is trained using the selected features. Therefore, this approach is not related to the training algorithm.
2. Wrapper approach aims to select better subsets of features to enhance the performance of the learning algorithm. It starts training model using a subset of features and then removes or add a features based on a selection criterion. The selection criterion directly evaluates the model performance that results from removing or adding a feature. Model training and improving is repeated until the stopping criteria are met.

3. Embedded approach learns importance of feature as part of the model learning process. When the model is trained, the importance of the features is obtained in the trained model. Often the embedded approach cannot achieve better learning performance than wrapper approach.

3. Naive Bayes Classifier

Naive Bayesian classifier is a probabilistic classifier that applies the Bayes' theorem along with Naive assumptions about feature independence. Assume that each instance in the learning set is defined by attribute vector X = (x1, x2, x3,……xn), and the m classes C = (C1, C2, …,Cm,) exist. The naive Bayes classifier assigns the X to the class of maximum probability. The maximized probability can be defined as the follows [19, 20]:

$$P(C_i|X) = \frac{P(X|C_i)\ P(C_i)}{P(X)} \quad (1)$$

Where
P(Ci | X): The probability of Ci in case X occurs.
P(X | Ci): The probability of X in case Ci occurs.
P(X): The probability of X.
P(Ci): The probability of Ci.
The classification problem according to equation (1) is calculating the P(Ci | X) since it finds the probability that the given X belongs to class Ci. Because P(X) is a constant and generally assumed P(Ci) have the same probability, only the maximum value of P(X | Ci) must be determined. Assuming that the relationships of attribute in each class are statistically independent of each other, P (X | Ci) can be estimated as follows [19, 20]:

$$P(X|C_i) = \prod_{k=1}^{n} P(x_k|C_i) \quad (2)$$

This assumption results in efficient data classification process and simpler computation cost.

4. Methodology and Materials

In this section, details of methodology, classification datasets and performance evaluation measures are described.

4.1. The Methodology

The method in this paper is designed for comparison and finding the most appropriate feature selection methods for classification task. Their effects are evaluated based on performance of Naive Bayes classifier according to classification accuracy and time complexity.
The paper method consists of several steps. First, three popular datasets are collected from the UCI repository to conduct the experiments. Each dataset is divided into two subsets including training data and testing data. Second, the features selection methods are applied to select essential features. The next, Naive Bayes classifier is employed for classification process. Further, the comparison is performed to highlight the strengths and effectiveness of features selection methods in data classification.
The feature selection approaches employed in this paper are filter and wrapper method. The filter method rank importance of features using Relief algorithm. Whereas, wrapper method defines a subset of the training data that best predict the testing data by sequentially selecting features until there is no change in defined criterion value. The criterion adopted is mean squared error.

4.2. Classification Datasets

Three classification datasets from the UCI Machine Learning Database Repository were used in the process of evaluating the impact of feature selection methods for data classification. Datasets vary in the number of instances, the number of attributes, and the number of classes, which allows testing the effect of feature selection in different cases.

- **Iris Dataset**: represent data describing Iris flower of three related species. The dataset consists of 150 instances belonging to three classes which are "Iris Setosa", "Iris Virginica" and "Iris Versicolor". Each instance consists of 4 attributes measured in centimeters which are the sepal length, sepal width, petal length and petal width [21].
- **Ionosphere Dataset**: represent data receiving from the classification of radar returns from the ionosphere. The dataset consists of 351 instances belonging to two classes which are "Good" and "bad" and each instance consists of 34 attributes [22].

- **Ovarian Cancer Dataset**: the dataset exemplify the information on cancer of ovarian for different patients. The dataset consists of 261 instances belonging to two classes which are "Cancer" and "Normal" and each instance consists of 4000 attributes [23]. Table 1 gives a summary describing the three datasets.

Table 1. The datasets summarization

Dataset Name	Attribute Characteristics	Instances Number	Attributes Number	Associated Task
Iris	Real	150	4	Classification
Ionosphere	Integer, Real	351	34	Classification
Ovarian Cancer	Real	261	4000	Classification

4.3. Performance Evaluation Measures

The evaluation measure is based on the classification accuracy that summarizes the classification performance as the percentage of the number of correctly classified instances out of the total number of instances. The measure values are based on the statistical values of True Positive (TP: actual and predicted values are correct positive), True Negative (TN: actual and predicted values are correct negative), False Positive (FP: actual value is negative while predicted value is positive), and False Negative (FN: actual value is positive while predicted value is negative) [24, 25].

$$\text{Accuracy} = \frac{TP+TN}{TP+FP+TN+FN} \quad (3)$$

The error classification can be calculated from classification accuracy because they are complements of each other. The classification error measured as the percentage of the number of incorrectly classified instances out of the total number of instances [1].

$$\text{Error Rate} = \text{Accuracy} - 1 \quad (4)$$

A confusion matrix is a visual summary of the predictions made by a classification model organized as a matrix. It provides a clear picture of which classes are being correctly and incorrectly predicted and what type of errors are being made. Matrix rows represent the actual classes, and matrix columns indicate the predicted classes. The cell values represent the number of predictions made for a class that are actually for a given class. Classification accuracy can be calculated by computing by averaging the values across the main diagonal of confusion matrix. High score refers to high classification accuracy [6, 24].

Computational complexity is an important aspect of an effective classification model. Since features selection helps reduce the time consumed, execution time is also used to evaluate performance; it measures the response speed of the classification model.

5. Experimental Results

Initially, from each dataset, 70% of samples are selected randomly for training data and 30% of samples are also selected randomly for testing data. The method implementation and experiments are performed on Hp PC with an Intel Core i7–5500 4.40GHz CPU and 12GB RAM running Matlab 2018a.

The filter method is applied to three datasets, where the importance of each feature attribute is calculated. To get an accurate assessment, Naive Bayes performs the classification process using the most important feature attribute, and then gradually increases the feature attributes used in the classification process according to their importance. The classification accuracy, error rate and execution time are recorded with each addition.

Table2 shows the classification performance of Iris dataset for different cases, starting with the first case that uses the most important attribute feature, which is the fourth attribute, and ending with the last case that uses all the features attribute. Table 3 shows confusion matrixes of the predictions made by a classification model to the four cases.

Table 2. Effect of the filter method for Iris dataset classification

Cases	Selected Attributes	Accuracy	Error Rate	Execution Time in sec.
Case 1	4^{th}	0.944	0.055	0.1162
Case 2	4^{th},3^{th}	0.972	0.027	0.1361
Case 3	4^{th},3^{th},1^{th}	0.972	0.027	0.1512
Case 4	4^{th},3^{th},1^{th},2^{th}	0.972	0.027	0.1812

Versicolor	0	1	0
Virginica	0	0.166	0.833

The effects of filter method are clear, it can correctly determine the most important feature attribute. It can be noted that the classification accuracy based on only one feature attribute is very close to the accuracy using more than one feature attribute and with less execution time.
With the same procedure, the filter method is applied to the Ionosphere and Ovarian Cancer dataset, taking into account that the number of feature attributes is large in these datasets, so larger numbers of feature attributes are used by the classifier in each time for brevity.
The performance results are presented in Table 3 and Table 4 for Ionosphere and Ovarian Cancer dataset respectively, while Table 5 and Table 7 show the corresponding confusion matrixes.

Table 4. Effect of the filter method for Ionosphere dataset classification

Cases	Selected Attributes	Accuracy	Error Rate	Execution Time in sec.
Case 1	The first 4^{th} attributes	0.784	0.215	0.3030
Case 2	The first 8^{th} attributes	0.874	0.125	0.3273

For Ionosphere dataset, the accuracy is improving every time a new feature attribute is added and correspondingly execution time increases as shown in Table 3.
Referring to Table 4, fluctuations in the accuracy values can be observed. Where the accuracy values are expected to have a uniform increase when the feature attribute used are also increased, as in previous datasets. This is due to the variousness and heterogeneity of the Ovarian Cancer dataset, which influenced the process of determining the importance of each feature attribute.
The wrapper method is applied on the training data only from each dataset to determine the feature attributes that can be used in the classification process as explained earlier. The results of criterion values and the final features attributes selected are listed in Table 5, Table 6 and Table 7 for Iris, Ionosphere and Ovarian Cancer dataset respectively.

Table 8. Wrapper feature selection for Iris dataset

Steps	Added Attributes	Criterion Value
1	4^{th}	0.00457491
2	2^{th}	0.00456496
3	3^{th}	0.00449546
4	1^{th}	0.00308608
Final Attributes	1^{th}, 2^{th}, 3^{th}, 4^{th}	

Table 9. Wrapper feature selection for Ionosphere dataset

Steps	Added Attributes	Criterion Value
1	5^{th}	0.00704117
2	1^{th}	0.00434487
3	10^{th}	0.00416756
4	24^{th}	0.00401223
Final Attributes	1^{th}, 5^{th}, 10^{th}, 24^{th}	

Table 10. Wrapper feature selection for Ovarian Cancer dataset

Steps	Added Attributes	Criterion Value
1	3032^{th}	0.00748559
2	2337^{th}	0.00432453
3	2680^{th}	0.00218727
4	2735^{th}	0.00085638
5	2236^{th}	0.00045620
Final Attributes	2236^{th} , 2337^{th}, 2680^{th} , 2735^{th} , 3032^{th}	

It is noticeable that the feature dimensions of Ionosphere and Ovarian Cancer dataset were reduced by wrapper method, while the Iris dataset was not affected**.**
The classification was performed by Naive Bayes algorithm based on the selected attributes feature only. The results are presented in Table 8 details the classification accuracy, error rate and execution

time of the three datasets, while Table 11 illustrate the classification performance as confusion matrixes.

Table 11. Effect of the wrapper method for datasets classification

Dataset Name	Attributes Included	Accuracy	Error Rate	Execution Time in sec.
Iris	4^{th}, 2^{th}, 3^{th}, 1^{th}	0.972	0.027	4.5212
Ionosphere	1^{th}, 5^{th}, 10^{th}, 24^{th}	0.793	0.206	37.654
Ovarian Cancer	2236^{th}, 2337^{th}, 2680^{th}, 2735^{th} , 3032^{th}	0.917	0.082	2400.106

Table 12. Confusion matrixes of wrapper method for datasets classification

Classes Name	**Cancer**	**Normal**
Cancer	0.945	0.054
Normal	0.111	0.888

.

Although the accuracy classification achieved by applying the wrapper method or filter method appears to be similar to the same number of selected feature attributes as shown in Table 8. But the execution time increased exponentially when using a large dataset, which is consistent with the expected results.

It should be noted that the wrapper method was able to identify the most related feature attributes from Ovarian Cancer dataset. Whereas the five selected feature attributes employed in the classification process can achieve 0.917 accuracy classification. This indicates the efficiency and ability of the wrapper method to deal with heterogeneous and varied datasets.

A clear picture was presented by visualizing the comparison of the filter and wrapper method according to the classification accuracy and execution time in a graphical representation illustrated in Figure 1 and Figure 2.

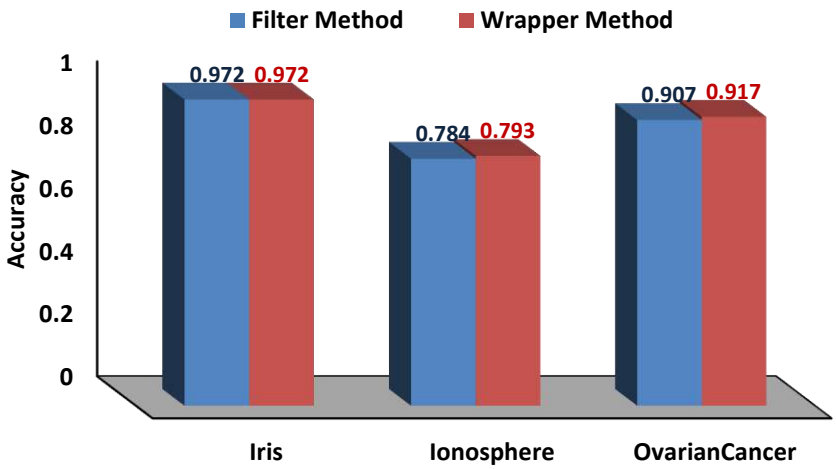

Figure 1. The Accuracy comparison

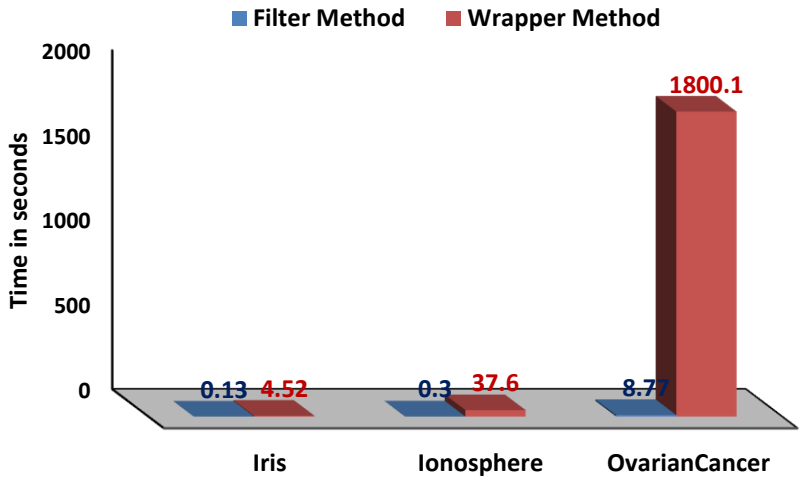

Figure 2. The execution time comparison

The comparison was made and it can be inferred from the accuracy values that applying the filter and wrapper method has almost the same accuracy value, but the wrapper method consumed more time.

6. Conclusions

Feature selection methods aim to find the most relevant features to the problem domain resulting in improved prediction accuracy and computational speed. The effect of two feature selection methods was assessed in this paper depended on the time consuming for determining the selected feature vectors and the classification accuracy of Naive Bayes algorithm for different datasets.

It is noted upon examining the results obtained that the wrapper method achieved almost the same classification accuracy as the filter method, but at the cost of time consumption. The exaction time required to determine the selected feature vectors increases dramatically with the volume of the dataset. Regardless of the extraction time, the wrapper method specified the most relevant features than the filter method when using heterogeneity dataset.

On the other hand, the filter method gave flexibility in choosing the appropriate features that helped to achieve high classification accuracy while maintaining a reasonable execution time. This makes the filter method more suitable for datasets of various sizes.

Abstract. The present paper builds a security system to encrypt and hide important text data. The system utilized an AES method to conduct an encryption process, followed by hiding the encrypted data using an improved Pixel Value Difference (PVD) technique. The method works to builds a map to hide data in a non-sequential way by relying on a hyperchaotic system to increase the security level. The system methodology proposed that the data embedding process is in one of the three levels of the colour image (Red, Green, and Blue), where the embedding level will determined based on the coordinates of the PVD pair points that is increase the efficiency of performance. A set of measures was used to measure the quality of steganography where we used MSE, PSNR, SNR, and Corr, and the results are well and satisfactory. The proposed method records the least MSE value with 0.85348784908256, while the Corr values did not decrease about 0.994145776227782. The proposed method also proved successful and effective in retrieving and decoding data, where the BER scale was equal to zero for all retrieved text.

Keywords: Data hiding, AES, Pixel Value Difference, hyperchaotic.

1. Introduction

In the last era, the Internet has been seen as a suitable manner for transferring digital data, as it can be considered an inexpensive manner to transfer digital quickly [1]. Using the internet has many disadvantages, one of them is the weakness of data security due to all forbidden users from accessing data can monitor and detect the data, and that's why steganography was used[2].Steganography is a way to keep communication protected and minimize the risk of attack while moving through the channel. In general, different kinds of files, such as text, photos, video, and sound can be used as covers to hide information. However, the cover with high redundancy will be more appropriate, so the sound and image files are the typical format used to hide information [3].The classic steganography included a confidential text in the original file to enhance the level of security. Moreover, the use of keys makes the removal or detection of original embedded text very hard when the user keys are not known.Steganography and cryptography are two ways of protecting confidential data. However, they are different, steganography hides the existence of secret data, but cryptography hides the meaning of secret data. These are important technologies that work on the internet to provide security [4], [5]. Many authors proposed methods that used the chaotic system to verify encryption and information hiding [6], [7], [8]. In our paper, a method that combined cryptography and steganography was used by relying on a hyperchaotic system.

2. Related work

In the last era, a large number of authors have proposed different methods for encrypting and hiding secure data. In [9] Das and Basak propose a scheme of data hiding, focusing on the security of message, and uses the pixel value difference to hide confidential data where the bitstream has altered before hiding in each block of the pixel. The cover image is split into non-overlapping blocks, then these blocks are distinguished with specific ranks, evaluated from the pixel value difference of every specific block. In the process of embedding, the secret data are chosen from different bins that are identified rely on the array of rank. A new data hiding method has been proposed using pixel-value differencing (PVD) in dual images. In this method, more secret data can be embedded with the increase in the value of the difference from neighboring pixels. In the suggested method, the original image is split into non-overlapping blocks and the maximum pixel value difference is computed to embed confidential data. On the sender's side, the secret data length that can be embedded is computed by using the maximum difference value of a pixel and the log function, convert the bits of confidential text to decimal, and then embedded them into the two stego-images after applying the floor function and ceil function. On the receiver's side, confidential text can be extracted and the original image restored by using correlation between two stego-images. After restoring the original image from two stego-images, the confidential text can be obtained using the maximum value difference (PVD) and the log function [10]. A new steganography technique was proposed to hide secret data and produce the stego-image. To estimate the smoothness and contrast of the pixels, we examine the relationship between adjacent pixels. In this technique, the pixels are first arranged in an ascending manner, then take the value of the highest pixel common with the other two pixels, after that apply Pixel Value Difference (PVD) method in each block. To obtain the three-pixel components, should be readjusting the two overlapping blocks. After that calculate the block of the new stego-pixel. In this method, take the lowest and middle pixel as the common pixel and perform the same procedure [11]. A new method was proposed that combined compression of data with the data hiding technique. To enhance the quality after embedding and the flow of data processing signal, the neural network was used in the communication channel. Compression of Data enhances the capacity when hiding a large amount of data. Steganography of Image that relying on neural network ensure that the size and quality of the stego-image do not change after hiding the secret data [12]. A method of improved reversible image steganography is proposed to rely on the ordering of pixel value to enhance the capacity of steganography. Before the process of steganography, one group of three continuous and adjacent pixels are considered, where the minimum and maximum values are used for calculating the value of difference and the values of difference are registered. The method determines the pixels in rows and columns that have more steganography difference values, after that steps of cipher text retrieval are implemented in the rows and columns of the image. It replace the block in the selected frame with groups of pixels that are read continuously, thus improve the capacity of steganography effectively [13]. Swain in [14] suggested a method of steganography in two variables using a combination of modified LSB substitution and pixel value difference (PVD). The first variable uses blocks of 2 × 3 pixels and the second uses blocks of 3× 3 pixels. In one of a block of the pixels, pixel value difference with other adjacent pixels are computed. This method exploited the edges in more than one direction, so analysis of pixel difference histogram (PDH) cannot find out this steganography. The substitution of LSB is performed in one pixel of the block, so this steganography cannot be detected by RS analysis also. To address the fall-off boundary problem (FOBP), appropriate equations must be used during the embedding process. In [15] the proposed method found a solution to the problem of detection of pixel value differencing (PVD) by analysis of pixel difference histogram (PDH). The resolution for this problem could be (1) using vertical, horizontal, and diagonal edges and (2) utilizing adaptive quantization ranges. This displays an adaptive pixel value difference (PVD) method utilizing blocks of 6-pixels. There are two variants. Variant1 operates on blocks of 2×3-pixels, and variant 2 operates on blocks of 3×2-pixels. For each block in variant1, secret data are hidden utilizing the four

pixels of the corner utilizing the pixels of the column in the middle for discovering the horizontal and diagonal edges. In the same way, for each block in variant2, secret data are hidden utilizing the four pixels of the corner utilizing the pixels of the row in the middle for discovering the vertical and diagonal edges. In [16] Rojali and et al show that the concealment of secret data is utilizing the Multi Pixel Value Differencing (MPVD) algorithm, using the pixel value difference. The improvement was done by utilizing tables of six intervals. This method aims to increase the capacity of steganography and to maintain the level of security.

3. The proposed algorithm:

The proposed algorithm contains three stages (i) Encryption of secret data using Advanced Encryption Standard (AES) algorithm, (ii) Selection the locations of the pixels that will be used to hide the encrypted secret data by relying on the hyperchaotic system to enhance the level of security and the efficiency of performance, (iii) Hiding the encrypted secret data in the cover image using Pixel Value Difference (PVD) method in order to enhance the capacity of information hiding.

The process of encryption is done using AES. AES is an asymmetric encryption algorithm, encryption and decryption operations include a number of rounds, and the number of rounds is depending on the length of the key. Each round performs four transformations in the encryption process. Decryption in AES includes reverse of the processes using in the encryption process [17], [18].

Hyperchaotic system: Chaos is the science of the nonlinear, unexpected, and unpredictable. Therefore, it has recently been used in a lot of research to enhance the security level and confidentiality. We used the Hyperchaotic system to select the locations of the pixels that the encrypted secret data will be hidden in them. This system shows us to expect the unexpected. Chaos Theory deals with things that are nonlinear and impossible to control or predict effectively [19], [20]. Theory of Chaos is one of the branches of physics and mathematics, rely on the manner of dynamical systems that are effected to initial conditions highly. That is defined as the effect of a butterfly. The chaos is useful in hiding secret data because: (i) nonlinear behaviours and complexity, (ii) Sensibility rely on initial values. When the initial value is specified in any system, it is easy to expect the new state of the system, but in the chaos system is impossible to predict the long term [21].

We used a 4D hyperchaotic system is derived from the famous 3D Lorenz system [19], [20] which is depicted as:

$$\begin{cases} \dot{x} = a(y - x) \\ \dot{y} = cx - y - xz + w \\ \dot{z} = xy - bz \\ \dot{w} = -dx \end{cases} \quad \dots\dots\dots\dots\dots\dots\dots\dots\dots\dots (1)$$

In which x, y, z, w are state variable, and $a, b, c, d > 0$ are control parameters. The above system is exhibiting hyperchaotic behaviour under the initial parametersa $= 10, b - \frac{8}{3}, c = 28, d = 5$. Figure (1) shows the system attractors. In our method, we use the hyperchaotic system to determine the positions of the pixels that are used to hide secret data.

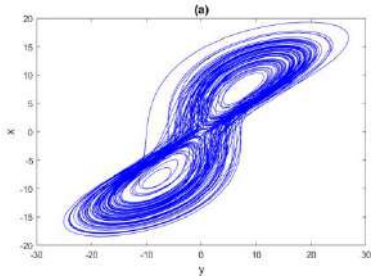

Figure (1): The attractors of hyperchaotic system

Hiding of encrypted secret data is rely on the Pixel Value Difference (PVD) method, but in a style that ensures a type of distributed diffusion depending on the x-axis coordinate and y-axis coordinate of the pair of pixels that are used in the hiding process, hiding three bits from the encrypted confidential data in the red layer, green layer and blue layer in a specified manner.

3.1 **Suggested method steps at a sender's side:**

1. Select the cover image.
2. Enter the important secret text to be encrypted.
3. Make the important text encryption process using AES to get the encrypted text.
4. Convert the encrypted text to Binary code.
5. Calculate the size of encrypted text.
6. Enter the initial values for the hyperchaotic system.
7. Build a hiding map based on a hyperchaotic system.
8. Comparing the capacity of the resulting map with the size of the encrypted text to be hidden, If the capacity is sufficient, go to step 9, else go back to 6 to update the initial values of hyperchaotic system.
9. Determine which layer will be used to hide data (Red layer, or Green, or Blue) depending on the x-axis coordinate and y-axis coordinate of the pair of pixels that are used in the hiding Process:
   If $(X_i * Y_{i+1})\%3$
   - =0 Then the hidden process will be Red layer.
   - =1 Then the hidden process will be the Green layer.
   - =2 Then the hidden process will be the Blue layer.
10. Calculate the number of bits that will be hidden in any layer using the PVD method, this process is done according to the range table that was used to find the number of bits depends on the difference of pixels.
11. Repeat step 9 until all encrypted text has been hidden.
12. Get the stego-image that contains the encrypted text data.

3.2 Suggested method steps at a receiver's side:

1. Enter the stego-image.
2. Enter the initial values for the hyperchaotic system.
3. Build an extraction map based on a hyperchaotic system.
4. Determine which layer will hold the hidden data (Red layer, or Green, or Blue) depending on the x-axis coordinate and y-axis coordinate of the pair of pixels that are used in the extraction process:
   If $(Xi * Y_{i+1}) \%3$
   - =0 Then the extraction process will be Red layer.
   - =1 Then the extraction process will be the Green layer.
   - =2 Then the extraction process will be Blue layer.
5. Calculate the number of bits drawn from any layer using the PVD method, this process is done according to the range table that was used to find the number of hidden bits depends on the difference values of pixels.
6. Retrieve all cipher hidden text.
7. Decrypt cipher text using AES algorithm.
8. Get the important secret text.

4. Results and Analysis:

The Suggested method was implemented in Matlab 2019, and it has implemented to different size images to show the capability of using it for all different images sizes and the results were shown in table.1 which is below.

Table 1. The Used Cover & Stego images

Name of Image	Cover Image	Stego Image
Img 1		
Img 2		
Img 3		
Img 4		
Img 5		
Img 6		

Img 7	

Table 2. The histogram of images before and after Hiding

Name of Image	Cover Image histogram Stego Image histogram
Img 1	Img 2	Img 3	Img 4	Img 5	Img 6	
Img 7	
We are used many metrics to show the efficiency, the Mean Square Error (MSE), the Peak Signal to Noise Ratio (PSNR) and the Signal to Noise Ratio (SNR), correlation coefficient (Corr).
MSE is used to calculate the amount of distortion in the image, whereas PSNR is a measure of the stego image quality by comparing the cover image with the stego-image. MSE, PSNR and SNR can be calculated as follows: [22], [23], [24].

$$PSNR = 10 \log_{10}\left(\frac{C_{max}^2}{MSE}\right) \dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots (2)$$

Where $C_{\_max}$ represents the max value in the image.

$$MSE = \frac{1}{MN} \sum_{i=1}^{M}\sum_{j=1}^{N}(x_{ij} - y_{ij})\,2 \dots\dots\dots\dots\dots\dots (3)$$

$$SNR = 10 \log_{10} \frac{\sum_{i=1}^{N}\sum_{j=1}^{M} x_{ij}^2}{\sum_{i=1}^{N}\sum_{j=1}^{M}[x_{ij} - y_{ij}]\,2} \dots\dots\dots\dots\dots\dots\dots (4)$$

Where M, N Represents row and column of the image, $x_{\_(ij)}$ represents the cover image and $y_{\_ij}$ represents an image that includes secret text.

Also, it could compare the two images by using the correlation. The better value of correlation is to be near to one [25],[26],[27].

$$Corr = \frac{\sum_{i=1}^{N}\sum_{j=1}^{M}(x_{ij} - \bar{x})\,(y_{ij} - \bar{y})}{\sqrt{\sum_{i=1}^{N}\sum_{j=1}^{M}(x_{ij} - \bar{x})2}\ \sqrt{\sum_{i=1}^{N}(\sum_{j=1}^{M}(y_{ij} - \bar{y})2}} \dots\dots\dots\dots\dots (5)$$

Where $\bar{x}$, $\bar{y}$ Represents the mean of images x and y and can be calculated as follows:

$\bar{x} = \sum_{i=1}^{N}\sum_{j=1}^{M}\frac{x_{ij}}{NM}$ …….. (6) And $\bar{y} = \sum_{i=1}^{N}\sum_{j=1}^{M}\frac{y_{ij}}{NM}$…….. (7)

Bit error rate (BER) It is a measure of the accuracy of the retrieved information calculate as the actual number of bit positions which are varied in the stego-image compared with the original image [5].

Table 3. The Values of metrics on different Images

Image name	MSE	Corr	SNR	PSNR	BER
Image 1	2.42928299387316	0.999463019629443	33.9135498071767	41.3058183398367	0

Image 2	2.84100851187182	0.999436178520677	33.0398631471044	39.8278753104839	0
Image 3	1.93450888296249	0.999704386489412	37.9550318696187	41.7862567233412	0
Image 4	1.69615192209505	0.994145776227782	25.9174259673571	32.9150448252477	0
Image 5	0.85348784908256	0.999717801954953	33.5559859881410	44.8064898245093	0
Image 6	1.43589641645462	0.999595710880613	36.5437518677764	43.3625274094347	0
Image 7	3.26398121243482	0.999161047633477	33.4770570635068	39.2480536436209	0

After noticing the values in table 3, we find that the values of the MSE are small amount, the maximum value is 3.26398121243482, and this gives a good idea aboutthe algorithm quality. And find that the values of Corr between two images is very near to one, which indicates a high correlation between two images. The PSNR values between the cover image and the stego-image were large, so that no noticeable distortions occurred, meaning that the algorithm achieved a high percentage in the inability to distinguish the cover image from the stego-image, or in other words the inability to detect. And as shown by the (BER) values, the algorithm was able to retrieve the hidden secret data completely without errors.

Table 4. Comparison between previous methods that used PVD and Suggested method

Method name	MSE	PSNR
Our method	0.853487849082563	44.8064898245093
Ref9	4.926098000000000	41.2057720000000
Ref12	3.532000000000000	44.5273000000000

In Table 4 the values of best results were compared in the three methods (In this comparison, we compared between the best results in our method, Ref9 and Ref12). We note from the table that the proposed method achieved the best results.

Conclusion

The combination of encryption and hiding is one of the successful ways to protect confidential data from exposure to any detection or disclosure by unauthorized persons or entities. The system suggested using the AES method to perform the encryption process. Moreover, the system also suggested using the PVD method to perform the concealment process, but using this method for traditional masking may lead to the easy discovery of the hidden data. So we used it differently than the usual manner, where we suggested that the selection of the pixel pairs for the PVD method depends on a very turbulent system, which adds to the method's complexity and the inability to guess the locations of the data hiding. The research also suggested using all three levels of the image to perform the hiding process, where hiding is done at one of the levels for each pixel, and the level is determined depending on the location of the hiding, which increases the level of security provided by the proposed method. And because the success rate of the work can only be determined through metrics, we have tested the quality of our work through metrics MSE, PSNR, SNR, and Corr, and all of them have proven the good quality of the hiding process. The BER standard also confirmed the validity of the hiding and encryption process, which indicates that the proposed method can be adopted to protect important data.

Acknowledgments

The authors thank the University of Mosul/ College of Computer Science and Mathematics for providing facilities and support, which led to the development of the quality of this work.

Abstract: In this paper, we propose an experimental study of multi-camera collaborative network for surveillance the highway traffic turn in real life scenario, the target of surveillance based offline video processing is capturing the violated vehicles that driving violated paths in many cases specified by user-defined rules. Best topology of the experiment zone is considered and covered by four pillars; each has two (fixed and motorized) cameras that casing the entire specific effective field of view. As to author knowledge, there is no such available experiment, and hence, it could serve researchers that interested in. However, the experiment is done for around 180 recorded hours for 8 videos during 9 days, each video for one camera. It is designed based on the collaborative cameras principle for intelligent video surveillance systems and the outcomes show that the surveillance and the tracking of violated vehicles have been successes in most user-defined rules cases for more than 90 % cases.

Keywords: Traffic violations; Area topology; Multi-camera collaborative network; Video analysis; Intelligent video surveillance systems.

1. Introduction

Nowadays, the cameras in use not only respond on the basis of the sensed data, but also support each other by their information, through multi-camera collaborative network MCCN. Coupling between two cameras may be affected geometrically and kinematic connections are the principal forms of coupling. To analyze low and higher resolution events, cooperation between static and dynamic cameras with their specific parameters is important. Field of view FOV is the maximum viewable angle from a camera. Spatial resolution is the ratio of the total number of pixels on its image element excited by the projection of an object in the real world. Higher spatial resolution may capture more data and makes pictures clearer. Depth of field is called the sum of distance between nearest and farthest objects that appear in an acceptably sharp focus of an image. To automatically extract valuable information from video data, intelligent video surveillance systems IVSSs is required with more scalability, flexibility and efficiency. IVSSs technology was used to monitor traffic, identify road collisions and control crowd activity in public spaces. The primary aim for surveillance is to retain understanding of the situation by fusing information from various cameras into a cohesive model of people, actions, and events to help a remote user understand anomalous and irregular activities [1, 2].

Single camera is weaker for tracking because it is covering a small area of such environment. It has problems such as segmentation of objects, occlusion of objects, etc. Multi-camera coordination had, until recently, allowed overlapping FOV. MCCN Setup works more efficiently with occlusion. Occlusion can be managed as the job of monitoring every single object by switched to another camera which can clearly realize it. Coordination and monitoring of MCCN performs many tasks; capturing and analyzing videos obtained from multiple cameras; Fuses the important information gained from different network cameras; it carries out the control actions necessary for the monitoring task in question [3-6]. However, we introduce short introduction at first section, and the traffic experimental considerations with weaknesses is arranged on second. The methodology and the topology of the experiment showed at the third section. The results and discussions, and conclusion have been explained consequently at last two sections.

2. Traffic experimental considerations

According to [7], many situations need to be addressed as to the surveilled area as following. The state transportation departments also maintain traffic cameras which simply track vehicle flows on roads and major arteries to conclude the valuable data. As well as monitoring the roads for collisions or significant delays, traffic camera footage is instrumental in future road growth and construction decisions. Monitor rules, cameras used to monitor speed and red light rules efficiently record driving violations and issue tickets. Promote safe driving, the visible intersection security cameras will encourage healthy driving practices and prevent moving violations. Weather-Traffic cameras are vulnerable to weather harm when they are tracking intersections or checking for traffic jams. The traffic security camera can damage, or destroy, heating, wind, rain, snow and ice. Accidents, there is also the risk that accidents will damage traffic cameras as they are placed on busy roads and intersections. Traffic surveillance cameras and red light or speed cameras have different functions and should therefore be regarded separately during set-up. For installing traffic control in right way, one may need to answer the following questions, what are your area's main roads? When is traffic the heaviest in your area (Rush Hour) at what time? Is traffic actually congested by other features on the roads? However, you need to install cameras to overlook specific areas of congestion and to make certain that all camera lanes are clearly clear and have a good view. Camera bodies can help protect the sensor from weather conditions by temperature and humidity. All above situations are considerations for specific surveillance systems which is very important to be taken into account when such system designs.

3. Methodology

3.1. Experiment design and considerations

Wired video system design is reliability and confidence; the ensuring to mix and match the most appropriate system components from different vendors as well as the power to optimize or expand the system to any size which demands quite knowledge. We need to know what the different components and how they work, and how they interact to construct a good reliable and perfect system. At the same time, the appropriate network and storage solutions depend greatly on the selected cameras, the camera settings such as resolution, compression, frame rate, and the number of cameras. One advantage of such wired system is to avoid the bandwidth and storage problems over complex and dynamic scenes on the applied scenario, so you may have to work on easy solutions, reducing the frame rate, lowering the resolution, or increasing the compression as to your proposed system requirements and best performance [8]. The considerations of our experiment include the following. We use outdoor-ready bullet cameras in general because of the environment of our scenario is noisy on traffic highway road. We use fixed cameras to keep all field of view FOV in watching, and (motorized, or PTZ) cameras with a large optical zoom to give us high-quality images for an effective zone in the work area especially for capturing the platelet numbers of vehicles, and to balance the cost of the budgets. Other considerations are involved within the devices such as day and night light-

sensitivity measurements, tamper- proof requirements, discreet installation, covering the area, FOV detection with high-details images for objects like license platelet recognition, analytic the system in general. To represent one meter of a scene, you need to 70-100 pixels in general, but for more details images such as human faces recognition or license platelets numbers' capturing and identification, operations like this needs to increase as many as 500 pixels per one meter. For license platelet numbers identification on vehicle with size 2×2 meters, we need to use one megapixel camera resolution or more. As to Fredrik Nilsson [8] in chapter (17), practices for indoor dome camera 2.8 mm lens mounted at 3 meters with straight FOV founded that the 125 pixels per meter is for face recognition while more than 250 pixel per meter is for face identification as to figure 1.

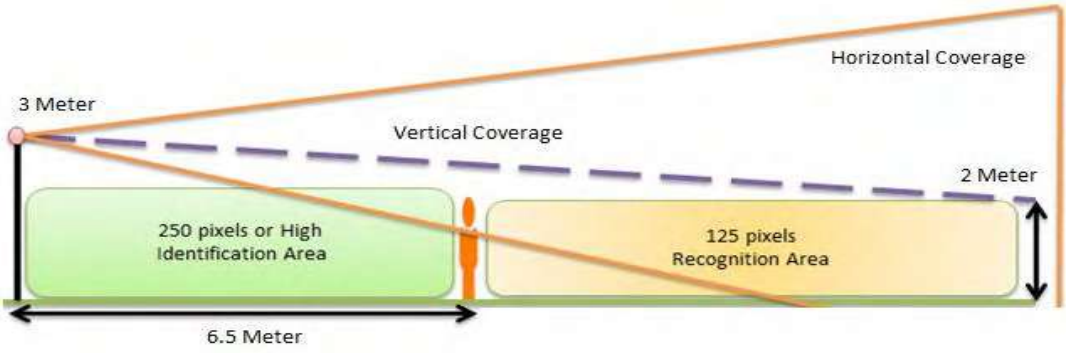

Figure 1. Person standing 6.5 meters away can be identified when the camera is mounted at a height of 3 meters. The horizontal coverage of the camera is shown in (a) and the vertical coverage in (b).

For positive identification of such small details of license platelets numbers or human faces and based on pixel density of horizontal dimension, Swedish National Laboratory of Forensic Science SKL recommend 80 pixels across a face for identification, while the international standard published by CELENEC, recommend a sufficient 40-100 pixels [9]. Because of most license platelets have the same width which is around 0.16 meter, then measuring its pixels will be easy as to the following figure 2.

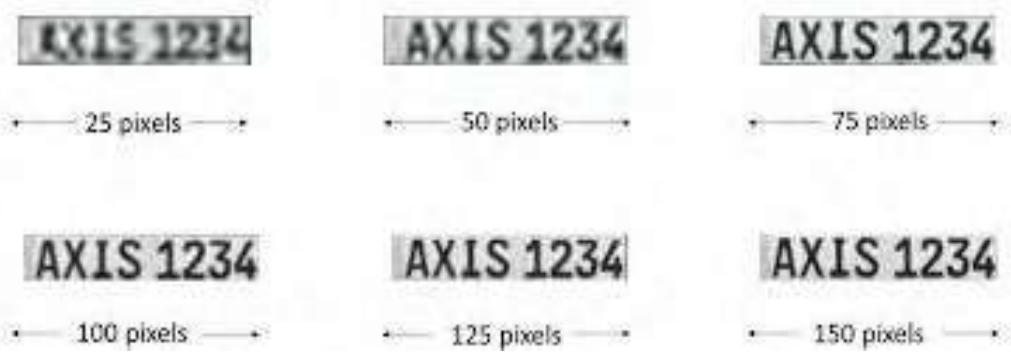

Figure 2. The impact of resolution increasing over different pixels number.

For calculation, we need the surveillance area dimensions which are scene width SW, scene high SH, the number of pixels needed for platelet resolution PR, and platelet width PW. Now, we can compute the number of pixels for the scene resolution horizontally SRH and vertically SRV as to the following Equation (1) and (2).

$$SR(H) = \frac{SW}{PW} \times PR\ (width) \qquad (1)$$

$$SR(V) = \frac{SH}{PH} \times PR(high) \qquad (2)$$

Now, to calculate SRH as to Equation (1), the general platelet dimensions are (20×10) (width×high) cm and assume that SW equal to (4 m ×125 pixel /20 cm) × 80, the result is 2,000 pixels. For SRV calculation, by assume SW equal to (0.70 m ×250 pixel/10 cm) × 40, the result is 700 pixels. In the scene, to identify the platelet number with high resolution based on above, we need 2000×700 pixels resolution which stands for 1080p to PTZ or Motorize cameras (optical zooming) while fixed 5MP 2560×1920 pixels (digital zooming) over the entire scene resolution to identification the vehicles. The general dimensions measures as standard for high definition HD videos are as following. 720p (1 MP) 1280×720 HD equal to 921.600 pixels (resolution = 922 of kilo pixels), 1080p (2MP) 1920×1080 Full HD (FHD) equal to 2.07 million pixels, 2048 × (unspecified) (2 K) equal to more than 2.000.000 pixels (cinema resolution), 1440p (4MP) 2560×1440 Quad HD (QHD) equal to 3.686.400 pixels, 2560×1920 (5MP) equal to 4.915.200 pixels, 2160p (4 K) (3480×2160) Ultra HD (UHD) equal to 7.516.800 pixels, and 4680p (8K) (7680×4320) as in figure 3[10]. However, by determining the required resolutions, the calculation of the number of cameras needed to cover the surveillance area can be identified. Number of cameras needed is equal to horizontal scene resolution divided by camera resolution. For our experiment, the vehicles size more than 2×1.5 meters and then 5MP camera will be more quite enough.

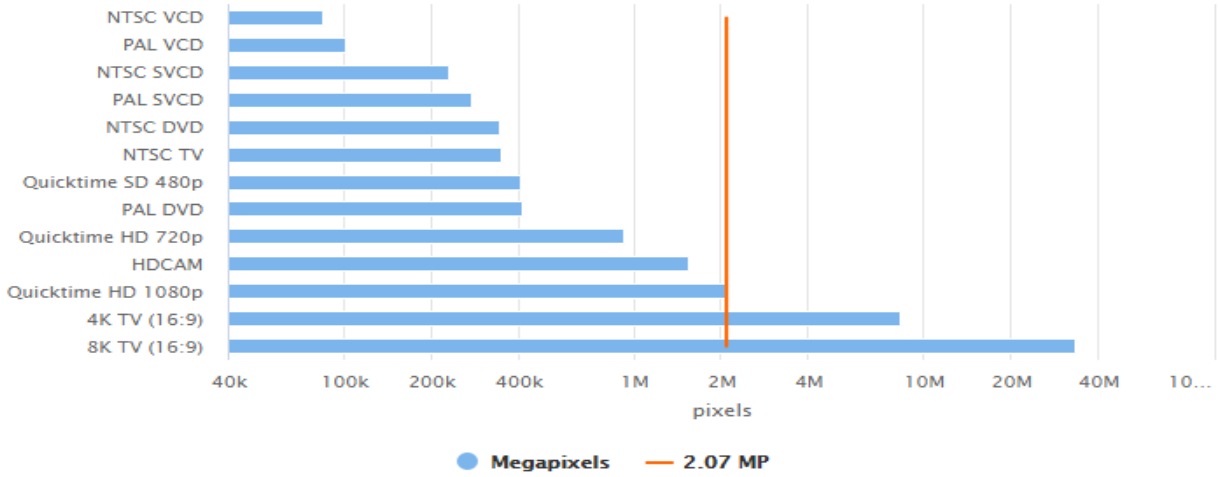

Figure 3. 1080p (2MP) specifications.

3.2. Experiment topology

We test and select the best topology of cameras positions of our experimental system by four pillars, two cameras for each, four rules to detect the violated vehicles as in figure 4. The first rule is rule 1, vehicles that take the violated path (inverse direction) for cross over to the opposite side of the road straight from the area of pillar 1 to the best topology of cameras positions of our experimental system area of pillar 3 and vice versa. The second rule is rule 2, vehicles that take the violated path (inverse direction) for cross over to the opposite side of the road straight from the area of pillar 2 to the area of pillar 4 and vice versa. The third rule is rule 3, vehicles that take the violated path (inverse direction) for moving on the same side of the road straight from the area of pillar 2 to the area of pillar 1 and vice versa. The forth second rule is rule 4, vehicles that take the violated path (inverse direction) for moving on the same side of the road straight from the area of pillar 4 to the area of pillar 3 and vice versa.

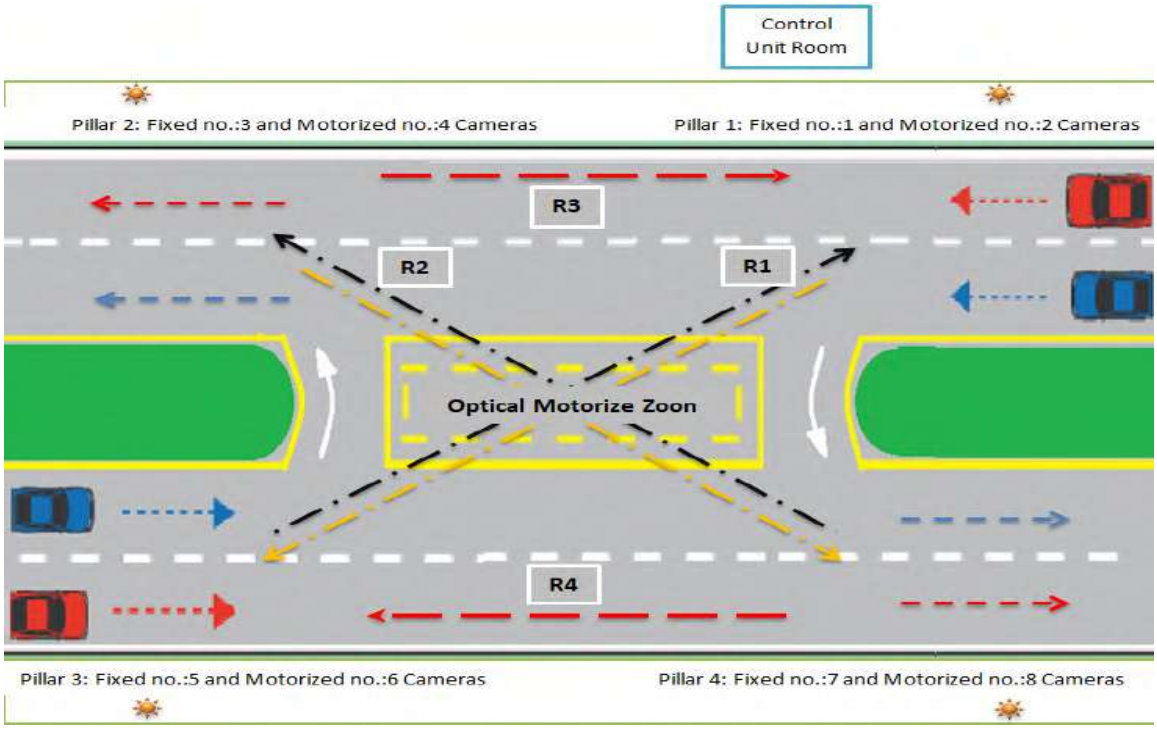

Figure 4. Applied topology based the proposed user-defined rules (R1: rule one, R2: rule two, R3: rule three, and R4: rule four) of our scenario. Yellow rectangle: effective FOVs (optical motorized zone) watched by all four motorized cameras in the pillars.

For achieving that, we cooperates four fixed and four motorized cameras to capture the violated vehicles and its plate late numbers for identification purposes. Based on that, the vehicles tracking will be done based on birth and death zones and trajectories of them will be analyzed based on above rules to report each violated one. Each violated vehicle will be reported with its specific properties and metadata such as (time, numbers of frames, front side images of vehicle, rear side images of vehicle, platelets licenses images, etc.) using video processing and machine learning techniques such as Haar cascade classifier. Also, it is important to consider the relations of effective FOVs time and objects appearances between cameras over the scene cameras' motion, and scene structure for any applied tracking algorithm. Several relationships exist between the images with different views are very important for the construction of vehicles tracking. However, the performance of any IVSS is subject to the performance of its cameras, hardware costs, installation costs, maintenance costs and operating costs [11, 12, 13].

3.3. Experiment Setting up

The purpose of our experiment is to detect all violated vehicles such as car, bus, truck, and scooter that take a violated path to be turned on double inverse side of highway road. The detection will be done based on the conception of MCCNs on single device video recording DVR system via RG59 coaxial cable based on two stages. The first stage is for measuring the distances between each pillar that will carry up two cameras as in figure 5. Four pillars positioned on the rectangle figure, each carried up two cameras, the upper camera is fixed 5MP (at 3 meters of height) to covering the entire area while the lower one is a motorized or PTZ 2MP (at 2.75 meters of height) which set to capture platelets of vehicle. This scenario will help in covering the front and rear of the vehicle at same time. Capturing platelets of vehicles over specific recorded frames is done by setting the optical lens for the better length (4 – 5 meters) to be wider (catch misleading vehicles) and clear when recovering the

frames from both two opposite pillars. The fixed 5MP cameras are settled as to covering the same FOV for each pillar. DVR unit is used to control and simultaneous the time ticks and dates on frames of different recorded videos, and however, many positions and situations are tried and studied until the best setting up and shooting video is accomplished. However, the following Figure 5 shows all first stage representations.

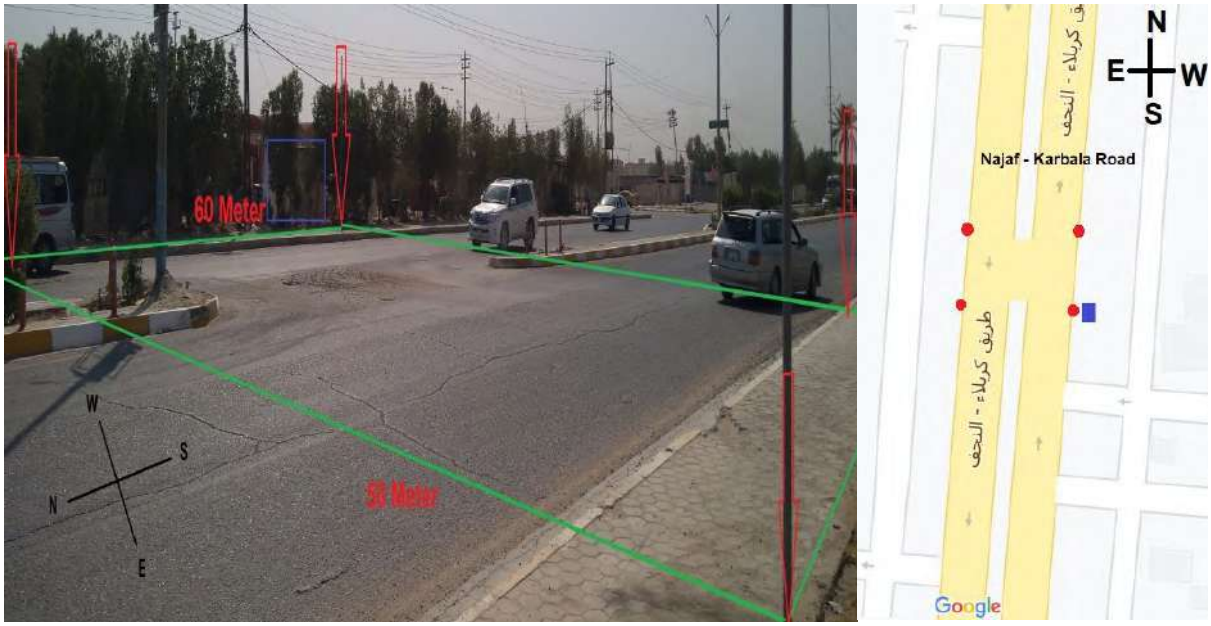

Figure 5. First stage representations: area topology with distances and directions. Red arrows: pillars positions, blue box: control unit position.

The second stage is for DVR software installation and setting up different properties for all eight cameras where all viewed in one control monitor. For best recording process, we choose one hour time duration of each video (to be saved), 11 frame per second FPS for fixed cameras, and 13 (manufacturing setting) FPS for motorized or PTZ cameras. Table 1 below shows the setting options used in practices.

Table 1. The applied setting for cameras and video information.

Camera	Frame rate	Width × Height	Video Type and Duration
Fixed Cameras	11 FPS	1920×1080	MPEG-4 / H.264 / 1 hour
	11 FPS	2560×1920	
Motorize or PTZ Cameras	25 FPS	1920×1080	
	13 FPS	1920×1080	

Figure 6. Second stage representation: setting process of experiment tools and DVR software.

4. Results and Discussions

We show how the recording videos are cooperated for the purpose of capturing the violated vehicles based on the proposed user-defined rule one (R1) and rule two (R2) with its platelets information identification, the times of violation, and other important metadata from all cameras as to their specific purposes into scenario and generating them as new reports. We present the cooperating benefits for avoiding the problems of overlapping effective E-FOVs such as full and partial occlusions, technology mistakes during recording time, and other situations.

4.1. Overall Scene

One violated vehicle based user-defined rule one (R1) of scene number 1926.jpg from all four fixed 5MP cameras (11 fps) and its corresponding 2276.jpg from all four motorized cameras (13 fps) on (29/09/2019 1:02:59 PM) as to the following figures 7, and 8.

Figure 7. Background scene over four fixed cameras at frame 1926.jpg. Top left: fixed camera installed on pillar 3. Top right: fixed camera installed on pillar 1. Bottom left: fixed camera installed on pillar 2. Bottom right: fixed camera installed on pillar 4.

Figure 8. Capturing platelets of violated vehicle (2276.jpg) that detected by R1. First row: two frames of PTZ cameras on optical motorized zone. Second row: two frames of motorised cameras on optical motorized zone. Third row: zoomed PTZ frames of first row. Note that platelets license form in Arabic language and numbers (50972 M / Baghdad, Iraq).

4.2. Occluded Scene

The following situations in figures 9 and 10 are for occluded scenes, the first one is harmed platelets case and the second one is for misleading vehicles case. It solved by other cooperated cameras on different positions.

Figure 9. Harmed Platelet of violated vehicle captured by rule two (R2) from one rear side only at frame (15412.jpg) in 29/09/2019 on 1:19:45 PM. Note that platelets license form in Arabic language and numbers (6406, Iraq, Basra).

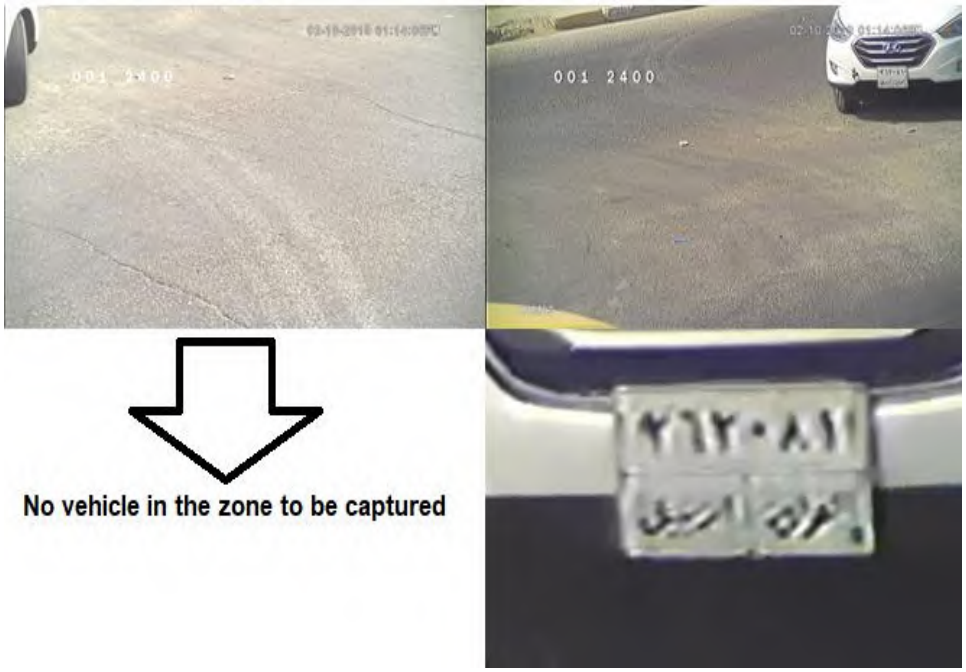

Figure 10. Violated vehicle of inverse rule one (R1) from one front side only at frame 14802.jpg. Note that only one tire is present on PTZ motorized zone by pillar 3 camera while it is captured by PTZ camera of pillar 1 clearly. Date of recording is 2/10/2019 on 1:14:06 PM. Note that platelets license form in Arabic language and numbers (362081, Irbil, Iraq).

4.3. Technical and emerged mistakes

The founded noisy camera video output (factory errors) as in fixed camera of pillar 4 can be avoided by other cooperated cameras' videos based MCCN principle and video processing techniques. The number of each frame for each camera should be equal but in the PTZ and motorized cameras and based on factory setting; they have 13 FPS while it is 11 FPS in fixed cameras. This problem is solved

as the calculation of the following Equations (3), (4), and (5) for fixed cameras and Equation (6) for motorize or PTZ cameras.

$$Current\ second\ (CS) = \frac{Frame\ Number(fixed)}{11} \quad (3)$$

$$First\ Frame\ at\ CS = CS\ \times 11 \quad (4)$$

$$Fixed\ Current\ Frame\ (FCF) = Frame\ Number - First\ Frame\ at\ CS \quad (5)$$

$$Motorize\ Current\ Frame\ (MCF) = CS\ \times 13 + FCF \quad (6)$$

As an example of above figures 8 and 9, the current second (1926÷11) equal to 175 seconds as to Equation (3) while the current frame in the current second is 1926 - (175×11) equal to 1 as to Equation (4) and Equation (5). The current frame in motorize camera is (175×13) +1 which equal to frame number 2276.jpg as to Equation (6). The fixed cameras on pillars 3 and 4 (both are 5MP) have noisy appearance video output (company errors) and they need to be processed, therefore the problem is solved by the opposite and cooperated cameras as to the same rules of violated. Over all the recorded videos of different daytimes, there are more than 90% cases are successes in capturing the violated vehicles among the user-defined rules. This will help effectively in vehicles detection and tracking using video processing and machine learning techniques. However, by solving and avoiding the technical and emerge errors of experiment setting; there will achieving 100 % success.

5. Conclusion

We propose a methodology of using techniques and technologies in cooperate with MCCN and area topology principles by explain how to take the important criteria into account for achieving a good IVSS results. Based on that, we design an experimental study following the mentioned scenario of traffic turn on highway in real life environment; the resulted recorded videos will be very helpful and serve in design and test IVSS over video processing and machine learning techniques. The topology of the experiment has been set as best as possible to eliminate the costs of financial, technical, and operational equipment's and hence; the four settled user-defined rules summarize the surveillance process of the violated vehicles by allowing to detect objects initially and tracking it over specific regions of interests in offline processing (to be identified) finally. However, the gathered raw data set will be available online for researchers to use and generate perfect IVSS for object detection, tracking, and identification.

Abstract. Blockchain technology has revolutionized economic transactions, and it is expected to spread and influence other fields. It can create innovative and destructive effects on the systems that need to be executed, store, verified, and continually update digital data among participating parties. Moreover, it provides security, privacy, trust, and transparency. In the education field, there is a shy presence of some blockchain applications, and the majority of them have a pilot character. Hence, a model based on blockchain is introduced in this study, which aims to provides easy to apply for certificates, as well as share and verify these certificates with a third party. Moreover, the mechanism of the proposed model proposes permanent distributed hashes records of students' certificates in Higher Education to reduce forgery. In conclusion, the study discussed the opportunities, benefits, features, and challenges are represented by deploying this model in the Higher Education field.

Keywords. Blockchain Applications, Consensus, Automated Certificate Educational Systems, University Digital Certificate.

1. Introduction

In our increasingly interconnected world and with the constantly increasing and evolving use of computer systems in various areas of contemporary life. In addition to the rapid increase in the speed of internet connections and with the fact that most computer users are novice or untrusted, who have sophisticated computers with high-speed internet connection [1]. Consequently, all that lead to facilitate and increase of security threats and abuse rises that facing the digital systems. Therefore, it is necessary to replace or develop other technologies to preserve digital systems from many security threats and adds layers of protection and trust. A powerful opportunity can emerge from utilizing new blockchain technology. This technology is expected to develop various industries objectives such as economic, society, medical, businesses, and education. As a result, it is necessary to explore and identify the advantage and challenges of blockchain technology [2].

Blockchain technology can be defined as a time-stamped and tamper-resistant distributed digital ledger. It can allow validate and secure the transactions and update records in a transparent, synchronized, and decentralized with the consensus of a majority scheme and is considered a part of the fourth industrial revolution.

[3]. This mechanism for generating and managing digital data can be effective across sectors, for instance, when it moves toward increasing productivity and automating processes, reducing cost, or promote new organizational and business models [4].

Blockchain technology has numerous advantage, it enables known and unknown parties who do not have a specific trust in each other to exchange any kind of digital assets such as educational and medical records, services, money, goods, or contracts on a peer-to-peer network without the need to central authorize to provide the trust [5]. On the other hand, blockchain faces many underlying technical challenges such as bottlenecks, scalability and performance, interoperability, high-energy consumption, and protection of personal and sensitive data, which are, depending on the type of blockchain [5]. Moreover, regulatory and standardization uncertainties about the formal status of this technology also lead to more risks and ambiguity for companies and other organizations that are interested in deploying blockchain or experimenting with it [6].

At present, many of the potential advantages of blockchain are unrealized or yet to be fully examined. Blockchain evolution faces critical questions about the potential effect, added value, or the specific direction of adoption [7]. However, blockchain technology has seen a burst of interest in recent years and it is expected that it will lead to a revolution that will significantly disrupt the way that the data are shared and create prominence in the evolution of the digital world. It is a highly promising field that requires further researches, experiments, and implementation in different areas [8].

This study objectives not only to explorer blockchain technology and its features but also to provide a view on the opportunities and challenges for it's used within the Higher Education context. So, we designed a model that utilized blockchain features that could be applicable used to secure, fast, online, and accurately generate and verify academic certificates with a few manual work and without the chance to certificates forgery. After this introduction, the study reviews in section 2, the most related works that discuss the document forgery problem. Section 3 presents the proposed model. In section 4, the outputs of the proposed model based on a set of theoretical points are discussed and lastly the conclusion.

2. Background

The origin of prevalent academic fraud can be traced back to people without educational qualifications who want to become rich, powerful, honor, or being employed in a short period. Unemployed youth, graduates, and potential college students soon learned that intellectual effort and the need for serious study is not required to achieve their wish, instead, seek connections and then obtain forgery credentials by any means [9]. However, hired fraudulent means became broad.

In [10], the researcher explains that academic fraud consists of a broad range of suspicious activities in the academic field, among them is mutating of the content of the certificates, which originated from a legitimate issuer to suit the holder's need. Researchers in [11] defined academic fraud as the intended misrepresentation of academic achievement that may have a harmful consequence on other parties. Another definition of fake degrees has been introduced by [12,13] which describes it as a certificate obtained from a bogus institution (diploma mills) that holds an

original establishment but has not been issued by the claimed institution. Furthermore, another type of academic fraud is both the origin and content of the certificate are fake; however, it may be difficult to disclose them [13]. According to [14], there are various sources of fake degrees including unaccredited degree-granting institutions, degree mills, and corrupt officials at academic foundations.

Document verification is the process taken to ensure that the documents received from the owner are genuine and that the owner is legitimate [15, 16]. The verification of the certificate removes suspicion about the certificate content and the issuer educational institution. Whether the certificate issued by the alleged institution, as well as, the issuing institution is authentic[15,17]. This always validates the issuing institution and the qualifications provided. The goal of verification is also to ensure that the certificate has not been altered by the holder and whether it has been truly issued to the owner [11, 16- 17]. Certificate verification is steps to seeks and trace to ensuring that the certificate is authentic from its source, means of issuance, and other details about the basis for issuance. It is the process that establishes the originality of something using a confirmed technique. [18].

Electronic verification was used, to facilitate and automation of some processes, as well as, the authentication can be accomplished instantly, which saves time for all parties. Furthermore, certificates are shared more easily and securely [18, 19]. It is automation and uses some of the appropriate tools such as verification through a web portal without making a central database to ensure data privacy. This technique operates within a digital certificate and facilitates automatic verification of a degree by a third party without the need of the issuing institution [18.19].

An online certificate system is a web-based system that contains a secure database that can be viewed by three levels of users - the issuing institution, the degree holder, and the third party. The institution issues a digital certificate to a graduate student after fulfilling the academic requirements. On the other hand, the student applied the affirmation to access and share the electronic certificate. Meanwhile, a third party (verifier) also inquires into the system webpage to verify the certificate.

Blockchain technology is a distributed digital ledger with the consensus of a majority scheme that promotes systems that need to be executed, store, verified, and continually update digital data among participating parties. Distributed ledger technology protects and retains the transaction recording and asset tracking and sharing in a decentralized manner [20].

Through the previous studies, it can be noted the there are big problems with forging official documents and the methods to verify these documents. This research aims to propose a model based on permission blockchain that stores compact data proofs of academic certificates in a decentralized database that enables students easy to apply certificates and easy methods to verify and share with a third party.

3- The Proposed Model

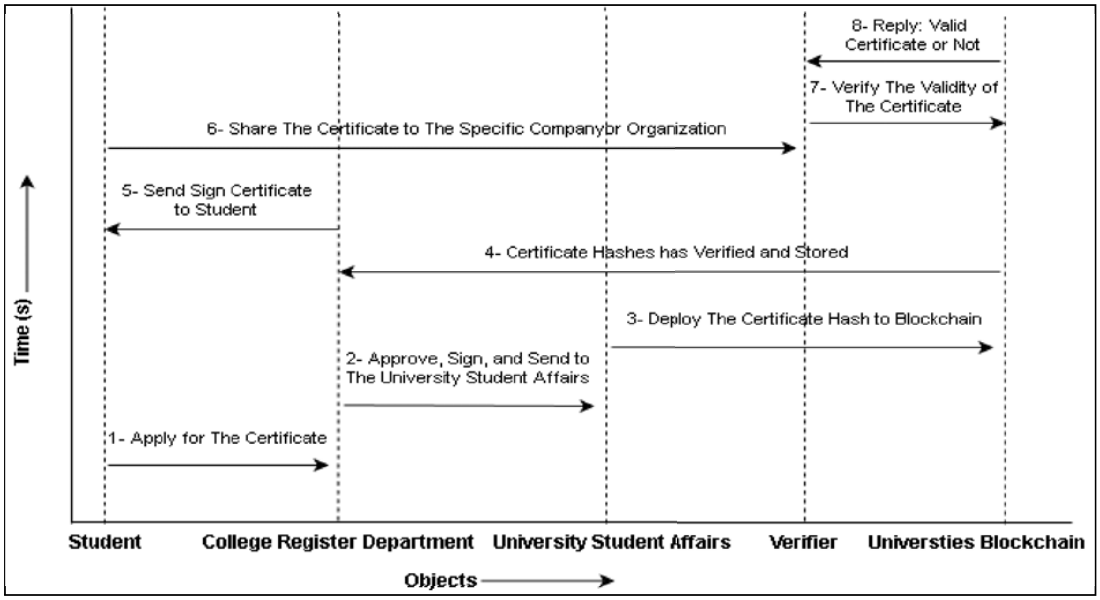
In this section, we will describe and illustrate the phases and workings steps of the proposed model. We start with a high-level overview of the main phases in the proposed model. The research aims to

design a model for a trust system to exporting, securing, and ensure the validity of the higher certifications of graduate students.

The main advantage of the proposed model is to ensure the validity of students' certificates in a safe, direct, trust, and fast manner. It also allows students to electronically request a copy of the certification. The proposed model store the validity of academic certificates in a safely electronically compact method depending on blockchain technology. Furthermore, it allows ensuring the validity of students' academic certificates by any interested verifier and from anywhere. This model proposed a permission blockchain distributed system to deployed verifications of students' certificates to prevent the process of forgery certificates, as well as to add transparency and trust in the issuing and export process by ensuring the authenticity of the issuance of those documents. The permission blockchain proposed by the model involved in all student affairs departments belongs to universities of the Ministry of Higher Education. It allows the network participating to add, update, and confirm the student's certifications by a consensus mechanism.

The hash function was used to obtain a one-way encrypted and compressed copy of the students' certifications, and these hashes are stored on the blockchain after the verification processes by participants parties are done. As a result of using the proposed techniques above in the proposed model, we prevent the process of issuing a tampered certificate. Furthermore allowing non-participants parties of blockchain networks such as other companies and organizations to securely and instantaneously check the validity of the student's certificate that is provided to it.

The proposed system includes three main stages, which are issuing certificates, demanding the creation of certification, and verifying the validity of the certifications. Each one of these phases



will be explained in the following sections. Fig. 1. Show workflow of research proposed model.

Fig. 1. Proposed Model Work Flow

3.1 Students Certificates Issuer

The first phase of the proposed model work begins with the process of submitting the graduating student's grades by the department's examination committee to the proposed central system of the university. After completing this process, the system directs these results to the dean of the faculty, the person who in charge, or the person with authority and here there are two cases. The first case is returning the results to the examination committee for modification within the terms and conditions. The second case agrees to approval (consider as a signed) and issue students' grades and certificates. Then the each signed students' certificate is hashed by the system and forwarded with the hashes to the college's registration department. As well as the same copy of these certificates is sent to the student affairs department at the university. The output of the hash function is a string of a certain length, which is the hash value. The proposed model extracting the hash value for each student's certificate separately which is considered a verification checksum for each certificate.

After receiving certificates carried out by the approval of the authority holder, these certificates with their hashes are stored in a local database individually by the college's registration department and the student affairs department at the university. The system sent and deploy only hash values on the universities' blockchain network if the match of hash values occurs between the Student Affairs Department compared with the College Register Department for the same certificates, and if no match means suspicious altering has occurred in certificates, and a person with authority revisions are required. Fig.2. show the steps of certifications issuer.

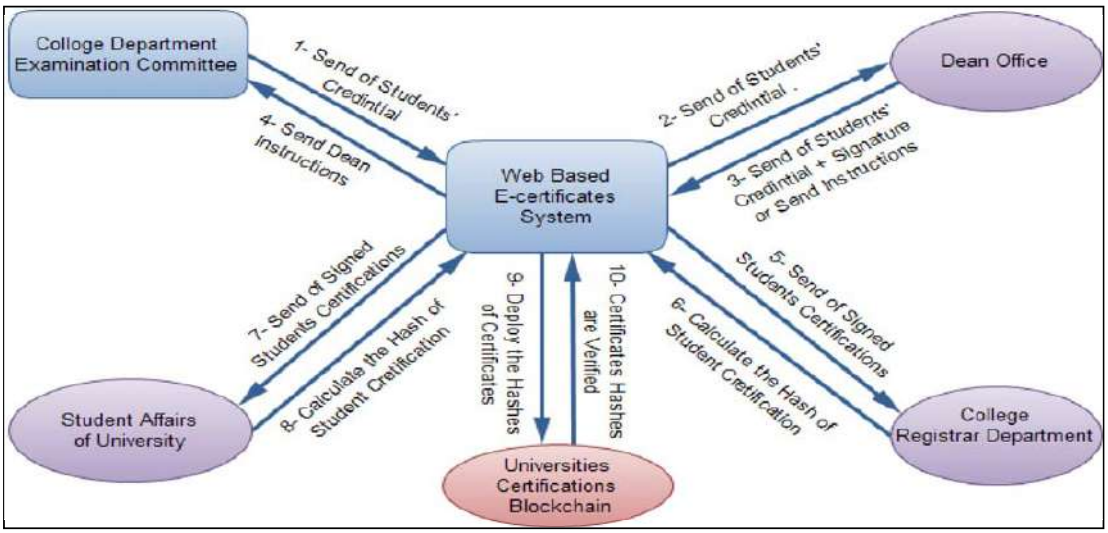


Fig.2. Steps of Certificates Issuer

3.2 Request the Student's Certificate

The proposed system allows any graduated students from any one of the participating universities in this system to request a graduation certificate from anywhere in the world at any time. It provides a portal or application based on the Internet that allows the student to request an addressed certificate to the desired destination according to the rules. In the case of using the portal, the student should enter important information such as the full name, college, department, and the destination to which the certificate is to be addressed in addition to a valid email address. The certificate issued is sending to the student's email address. In the case of using the application, it will be an electronic wallet in which the student receives and save all the certificates issued to him. Furthermore, by this wallet, all the details of the student can be identified through a specific serial number or a public key when contacting the system or when requesting the certificate. It also saves all previously issued certificates.

Upon receiving the application submitted by the student to get the academic certificate, the system will verify the student's identity and whether he has the right to apply for the certificate. If the information provided by the student is correct, the system will direct the application to the registration department in the specified college for the required procedure. The Registration Department performs a first validity check by extracts the student's information and grades stored locally and calculates the hash value for this information and compares it with the hash value stored on the blockchain network to ensure that there is no tampering with locally stored certificate information. Upon completion of the verification of the validation process of the students' information, this information with the destination to which the certificate is to be addressed that taken as requested from the student shall be submitted as an unsigned student certificate issued to the Dean's office for approval (signing).

After obtaining the approval of the dean, the date and number of the certificate issued are given by the system. To deploy the newly created certificate information, it is sent to the Student Affairs Department that performs a second validity check by calculating the hash value of the new certificate's main information and comparing it with the stored hash value in the universities blockchain network. When a match occurs, it means that there is no tampering with the newly created certificate main information and sends a newly created hash value of the new student certificate to the blockchain network to be approved and stored.

After obtaining the approval of the members participating in the network to publish and store the value of the new hash, the process of storing the new hash is performed and a confirmation message sends to the system. Upon completion of the storage process, a copy of the certificate required by the system is sent to the student's electronic wallet or via the electronic email, as mentioned previously. Students can also go to the college's registration department to receive the hard copy of that attested certificate.

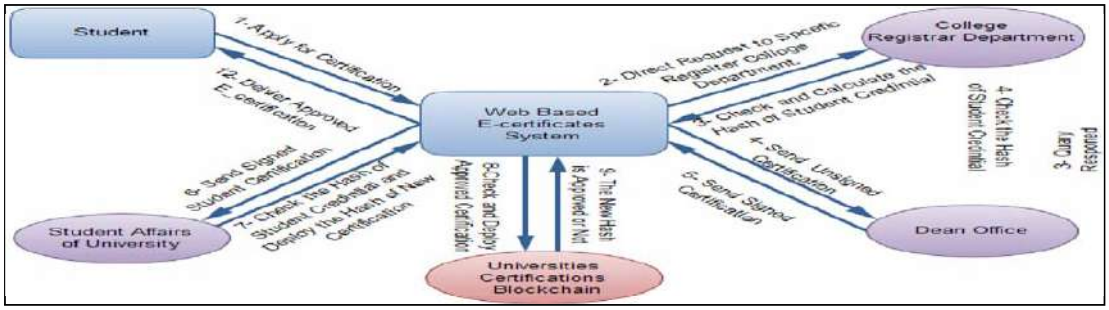

Fig. 3. Steps to Apply for Certificate

3.3 Validations of Certificates

This phase is considered the practical and actual result of the system, as it represents the benefit of applying the proposed model. Actual works of this phase begin when an institution or a company wanted to verify the validity of the certificates submitted to it to obtain the advertised position. As the proposed system provides a webpage or application that can be accessed from anyone, any time, and anywhere in the world without the need to participate or pay for the system. The gate could be a portal or an application based on the Internet, which enables anyone to verify the correctness of the students' certification instantly. Even when the absence of the institution that granting this certificate for any reason, such as stopping its work or being exposed to any natural or intentional disaster such as fires or floods.

When the graduate student provides his gained higher certificate information to obtain a specific position within a specific company(get hire). Therefore, the company or organization needs to verify the validity of the submitted certificate from the concerned person. In this case, the company employer can verify the validity of the provided certificate in a real, reliable, and safe way through a portal belong to the system.

The work of this phase begins when enters only the important information of the certificate which is the name, average grade, date, issue number, agency, or the certificate is uploaded electronically (if the certificate is submitted to the company electronically) through the portal by an employer in the company. The received information of the certificate submit to the portal is entered at the same hash function used when creating and stored the original certificate hash on the blockchain network. Then a query is created to perform a search for a match of the generated hash within universities blockchain network stored hashes. If a match is found means that the certificate information is correct and the validity message will be shown.

If there is no match for any reason such as a mistake in the entry process or a process that changes any information from the certificate information (forging the certificate). In this case, there will be no match of the stored hashes on the blockchain network and the system will be shown a message of failure or error through the portal. Fig.4. show steps to verify the certificate.

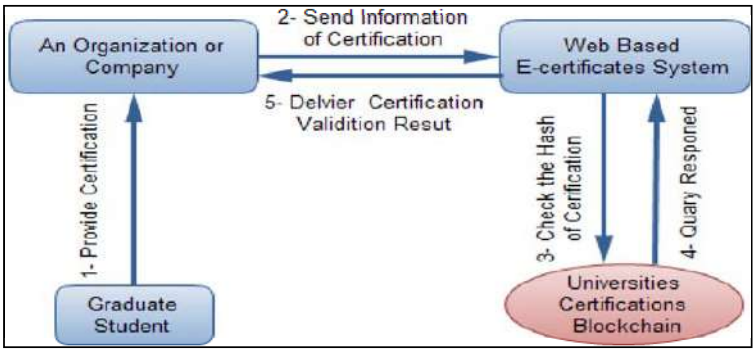

Fig.4. Steps of Certificate Verification

4. Results and Discussion

To understand the expected outputs from applying this model to the certificates system, it must be compared with the current systems of the issuer the paper and electronic certificates. Moreover, explain the problems and weaknesses to solve or enhance them using blockchain technology. This section describes the most important problems in the current systems.

Certifications acquired over a long period from different accredited educational institutions throughout the country or the world, need to be approved for their originality. The verified process is becoming more difficult and takes long periods due to the increase in the number of universities, colleges, courses, and students. Educational institutions spend a lot of time, effort, and resources in creating academic certificates for students as well as verifying transcripts and data starting from their date's births, records of accomplishment, and capabilities.

The trust, security, transparency, and speed along with automation through digitization are offered by blockchain technology that comes as leverage to the education industry across the world. The results of adopting the proposed model are summarized below:

1- Easy Verification Mechanism and Accurate Information: A portal can be used by the third-party who want to verify the certificate.

2- Convenient**:** The students need to no longer provide many papers with proof of their originality each time they use to apply for a job.

3- Cost-effective: The digitization of the process of the creation and validation of the certificates reduces the costs for all parties.

4- Time-efficient: The increased speed of creating and verifying the certificates as the certificates can be delivered and verified digitally.

5- Data Privacy and Security: Students' academic achievement is stored in the local and private database of an educational institution, as well as store hashes of those credentials, which are stored on the blockchain that is cryptographically protected. As result, prevent the issuance of forgery certificates and at the same time, students' creational is safe and reliable.

6-. Secure Transactions, Transparent, and Immutable Data: The hashes are approved and authorized by a consensus mechanism. Moreover, all blockchain participants store the same transactional data that vastly improve the trust in the whole system.

7- Availability: The verification of certificate is there at any time and from anywhere even when the problem of unavailability of the educational institution such stops using the network, that their equipment malfunctions, or even stop institution work.

On the other hand, to develop a reliable and secure blockchain certificate system with high functionality and usability, a group of solid technical and mathematical foundation experts of blockchain is needed. This presents a shortcoming for practitioners and researchers in the field of

education. Blockchain technology is difficult to comprehend by educators, learners, and other professional parties. Universities need to know how the adoption of the blockchain will affect their privacy, database rights, and other confidential information. This study aims to establish a model for blockchain technology accreditation for certificate verification systems but does not address the technical aspects of implementation. Further studies will be necessary to realize the implications of adopting this technology for enhanced implementation.

5. CONCLUSION

The development of distributed and secure electronic systems has become an important subject in line with the development of the digital world. The application of blockchain technology is an excellent example of these systems that provides exciting features such as transparency, trust, and decentralization with untampered and permanents data records. The implementation of such technology to systems for issuing students' certificates, especially when the individuals are subject to many academic studies and training from several different institutions and they obtain several certificates, is critical. The process of preserving these certificates in a way that is permanent, not tampered with, or forged is very important. Moreover, it is important to presents an opportunity for third parties to verify shared certificates quickly, securely, and independently. The proposed model fulfills for preventing forgery certificates and managing digital academic credentials mainly in terms of the trust, high outputs, availability, transparency, low costs, and resource consumption, especially with the existence of many educational institutions nowadays. This study does not address the technicalities of implementation. Further studies to design and facilitate the creation and implementation of the blockchain solution in education are recommended.

Abstract. The concept of interfacing brains with robots/machines has been capturing human interests for a long time. The technology of the Brain-computer interface (BCI) has been aimed at building an interface between the brain and any electronic/electrical device (such as, smart home appliance, a wheelchair, and robotics devices) with the use of the electroencephalogram (EEG) that can be defined as a non-invasive approach for the measurement of the electrical potentials from the electrodes that have been placed on the scalp, produced by the activity of the brain. Over the past years, pattern classification was a highly challenging research field. Presently, the tasks of the pattern classification. In this paper, we chose motor imagery with the use of the single trial EEG signal, the SOM has been utilized to classify the signal processing algorithm (FICA). In comparison to other algorithms of the EEG signal analyses. It has achieved a classification accuracy of up to 88.% in comparison with the other method where the reported accuracy has been 65%. The SOM classification algorithm has been fast, simple, efficient, and easy to use. It achieved satisfactory results at the BCI

Keywords: brain computer interface (BCI), FICA, SMO,

1. Introduction

BCI can be defined as a direct connection between an animal or human brain (or brain cell culture) and an external device that has the ability the directly conducting of some external actions, based on signals provided by the brain. Before that, a team of researchers at Tsinghua Univ. have developed a set of internationally advanced approaches for pattern classification and signal processing, they have utilized this group of approaches for the successful implementation of BCI for the real-time brain activity cortical signal interpretations [1].

The EEG method was utilized for establishing portable asynchronous and synchronous controls for the applications of the BCI.

BCI may also be known as the Mind-Machine Interface (MMI), BMI or the direct neural interface. Those terms have led to the recognition of the BCI as a tube of direct communication between the brain and an external device as can be seen in Fig1 [2].

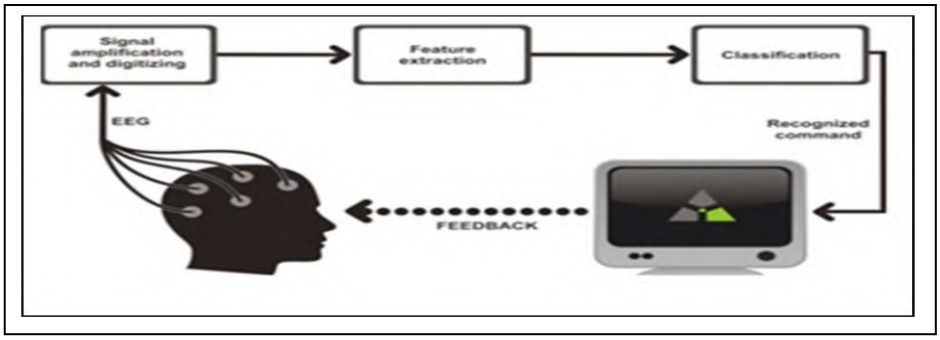

Figure1 Brain computer interface system

The technology of the BCI has been divided mainly into 2 brain activity measurement types, which are: the invasive BCI, and the non-invasive BCI, according to the way that the electrodes to record the electrical brain activity.

The non-invasive EEG-based BCIs can be defined as the best interface for space of the applications for the people who have severe motor disabilities due to their non-invasiveness, practicality, low cost, simplicity to use and portability. For some of the disabled patients that have paralysis or physical disabilities whereas the brain functions normally, even though they have the consciousness and thought of a normal large brain, they are not capable of communicating with the external environment by severely damaged nervous system and muscle and independently complete daily works. Which resulted in serious mental and physical trauma, and they live very painful lives that will have an impact on their process of recovery to some degree. The way of restoring or enhancing their communication and control abilities to outside world was the aim which was pursued for years in the medical rehabilitation area[3].

Invasive BCI can result in immune reactions, causing dangerous harm to a user, and it's barely accepted by the disabled people due to the method's invasiveness, requiring a special surgery, and its cost with the equipment is quite high and not yet covered by most of the governments. Even though the non-invasive BCI has a lower accuracy compared to invasive BCI, which remains rather less expensive in comparison to all of the other approaches and everyone can accept it easily [4][5].

There is a number of the models for controlling computer or machine with the use of the signal characteristics of the human brain and most popular ones are the motor imagery [6][7][8] [9]. P300 wave[10][11][12], steady state visual evoked potentials (SSVEP) [13].

The commonly utilized signal processing and classification approaches of the motor imagery with the use of the single trial EEG signal. Which include fast Fourier transformation (FFT), canonical correlation analysis (CCA), wavelet transformation, support vector machine (SVMs), and linear discriminant analysis (LDA).

In some previous research, the EEG has been used for various tasks [26].

In [8] it is seen that authors suggested new deep NNs like the Convolutional Neural Network (CNN) and Multi-Layer Perceptron (MLP) have been utilized for the classification of right- and left-hand motor imagery. after analyzation with Wavelet Transform.

In [14]: They have utilized an FFT for the extraction of the important features from a signal. After that, the obtained features are input signals of an FNN based classifier, the BCI for Controlling Wheelchairs they have discovered that using FFN is of a high effectiveness in classifying the signals of the EEG.

In[15]: have suggested an innovative model of classification, which has been referred to as multi-modal fuzzy fusion-based brain-computer interface system. There have been 10 volunteers who have carried out a motor imagery-based BCI experimentation, the system accomplished the maximum accuracy, of up to 78.45% and 78.81% with Sugeno and Choquet integrals, respectively. The authors have presented a new idea for the enhancement BCI systems that adopt fuzzy integrals
In[16]: This study implemented algorithms that have the ability of separating and classifying the task-associated EEG signal from the ongoing signals of EEG. This separation has been carried out through the hybridization between a classical approach which is represented by the process of filtering and a modern approach which is represented by Stone's BSS method to their ability of the isolation and deletion of the artefacts have an impact on system efficiency, as well as the task-related EEG signal have been categorized with the use of the NB. The obtained recognition rate results have been 82%
The remainder of this paper was arranged as: the important topics are discussed in the following section. In part3, the proposed model is discussed. Experimental results are presented in part4. Finally, the conclusions of this research are presented in part5.

2. Features extraction and dimension reduction

Raw EEG this raw was not used as a feature to identify patterns in the interfaces between the brain and the computer (BCI) due to the large amount of data generated from it. One second of an EEG recording containing 8000 features, it needs a method to reduce the dimensions or extract Important information only.
(FFT) As in a raw EEG, the Fourier transform contains a large amount of data,
(Autoregressive AR) In regression techniques, the model is modeled so that a voltage is predicted from a voltage N that precedes it. Regression coefficients are used as features for pattern recognition,
(wavelet) Wavelet shifting features of the (time-domain) and (frequency- domain) due to the fact that it allows the user to view the change in frequency bands over time. In the case of an intermittent wave transfer,
(Transform wavelet Discrete) The maximum number of conversion parameters is equal to the number of samples in the basic signal, While (a continuous Wavelet transfer) creates a lot of additional transactions.
Several methods have been utilized for the extraction of the features from the EEG signals like the independent component analysis (ICA), principal component analysis (PCA), wavelet Packet Decomposition(WPD), and genetic algorithms.

3. Fast Independent Component Analysis (FICA).

Fast ICA is an efficient implementation of ICA technique and a technique of popularly utilized BSS approach [17]. It has computational efficiency and needs a smaller amount of memory compared to other algorithms due to the fact that it is capable of estimating independent components one after the other. It additionally has the benefit of multi-component extracting, and the performance of the system does not degrade [18]. The ICA modeling is performed with the use of Equation (1):

$$Z = A_M . s_D \quad (1)$$

Here, Z indicates the observed matrix, Am represents the separating matrix, and sD represents determined sources. ICA is mainly utilized for the identification of separating matrix X for the sake of attaining the independent components in independent criteria pre-requisites.

$$s_D^* = X.Z \quad (2.)$$

$$X = A_m^{-1} \quad (3)$$

FastICA uses kurtosis for the independent components estimation Whitening is usually performed on data before the execution of the algorithm[19].
Before applying a FICA algorithm on the data, it is necessary to perform some pre-processing techniques, like the centering and whitening of the data that makes the issue of the estimation of ICA

better and simpler conditioned [20]

1**. Centering**: the most necessary and basic pre-processing is centering observed variables through the subtraction of their sample average, that is:

$$x = x' - E\{x'\} \ldots \quad (4)$$

where x represents centered signal,

x' is the observed signal, and

E{x'} represents the expectation of x'.

Also the independent components have been made 0-mean, since

$$E\{s\}=A\text{-}1E\{x\}$$

After the estimation of mixing matrix as well as independent components for 0-mean data, this subtracted mean may be re-constructed simply through the addition of the A-1E{x'} to 0-mean independent component.

2. **Whitening**: whitening the observed data is another useful preprocessing strategy in FICA. The purpose of whitening is to transform the observed vector x to another vector z, so that its components have not been correlated and their variance equal to unity. In another word the covariance matrix of z equals the identity matrix:

$$E\{z\,zT\}=I \ldots (5)$$

The whitening is a linear transformation that transforms the observed vector x by linearly multiplying it with some matrix V

$$z(k)=Vx(k) \ldots 6)$$

where z is the whitened vector, and

V represents the whitening matrix.

The whitening matrix has been obtained by using Eigen value decomposition (EVD) approach of covariance matrix:

$$Cx=E\{xxT\}=EDET \ldots (7)$$

where Cx represents covariance matrix of x,

D represents the diagonal Eigen values matrix of Cx.

E represents orthogonal Eigen vectors matrix of Cx,

Thus, whitening matrix has been given as

$$V=D\text{-}1/2\ ET$$

Sequential Minimal Optimization (SMO) Algorithm

SMO can be defined as one of the algorithms, which improve SVMs algorithm for the purpose of tackling QP problem. It performs the reduction of large amounts of the time, which is consumed by the SVMs throughout the phase of the training due to the QP optimization problem solution. The concept of the SMO is that it performs the separation of QP problem to smaller problems and analytically solves them. SMO has more capability for handling larger training sets due to the fact that it requires a linear memory amount on the training set. Therefore, the SMO is more appropriate for the EEG signal, which involves large size feature vectors. Moreover, it scales with large training sets and its implementation is quite simple [21][22].

3.The Proposed Classification System

The formation of a system of interfaces between the brain and the proposed computer includes three main steps that are included in Fig (2). The first step: obtaining the signal, the second step: processing the signal using a FICA, JADE algorithm, in the third step: classifying the data by SOM algorithm to classify the movement the left or right index finger.

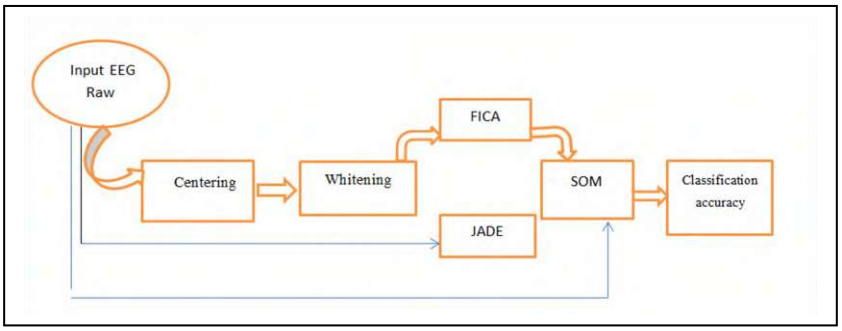

Figure2 Block diagram of the proposed system

3.1 Data Recording

EEG signals data were collected using computerized EEG device at a sampling rate of 256Hz according to computerized EEG device specifications. The scalp was covered by 19 electrodes that were based on 10-20 international system, as can be seen from (Fig3). The were been acquired from [12]

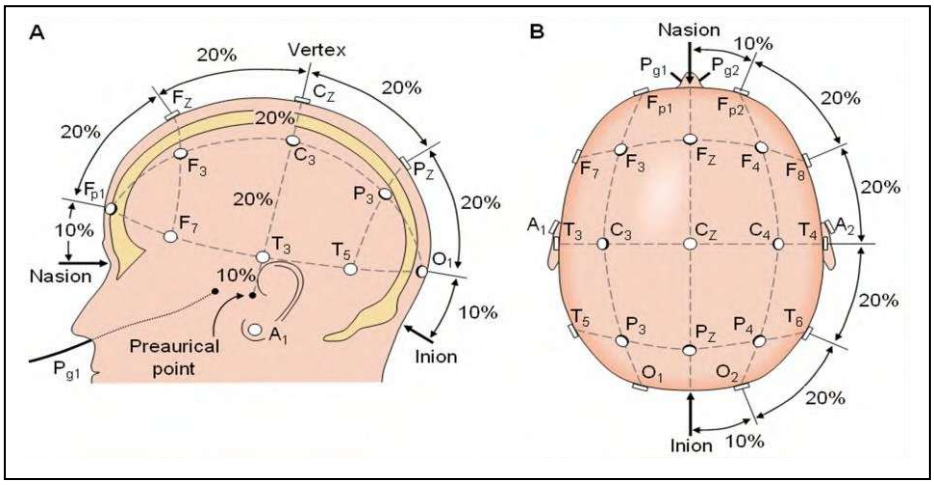

Figure3 Location of the EEG channels based upon the international 10-20 system [23].

This step includes obtaining the information that has been gathered from the EEG device and arrange it into excel sheet for additional processing. Table1. illustrates the basic data specifications. Data recording in 2 sessions one for the left index finger and the second one for the right movements each one of the sessions consists of numerous trails, every one of which is 10sec long, 19 channel signals and every one of the signals includes 256 samples in Hz.

TABLE1 DATA SET SPECIFICATIONS.

Gender	***age***	***position***	***motion***	***Medical condition***	***situation***
male	24	1meter from computer monitor	static	healthy	**Sit on chair**

3.2 Processing signals

3.2.1 **Attribute extraction and proposed algorithms**

In the original articles, the datasets have been pre-processed in a variety of ways. In order to gain fair comparison of the performance, to eliminate noises. in this work, we using FICA to analyses signal EEG raw To improve the system.

Steps of FICA Algorithms

Step1: Centering

Step2: Whitening

Step3: data have been centered through the subtraction of the average value of every one of the data matrix columns X.

Step4: data matrix will be 'whitened' through the projection of data on its principal component orientations in other words, X -> XK where K stands for a pre-whitening matrix. The number of the components may be identified by a user.

Step5: ICA algorithm performs an estimation of a matrix W s.t XKW = S . W has been selected for the maximization of neg-entropy approximation under constraints that W represents orthonormal matrix. Such constraint makes sure that estimated components are not correlated. This algorithm has been based upon a fixed-point scheme of iteration for the maximization of neg-entropy.

3.2.2 Classification

The classification procedures were performed In the presented study, through the use of Sequential Minimal Optimization algorithms (SMO): As shown by the algorithm below[22].

Algorithm: Simplified SMO

Input

C=regularization parameter

tol: numerical tolerance

max- passes: max # of times to iterate over α' s without changing

$(x^1,y^1),\ldots\ldots(x^m,y^m)$:training date

Out put

$\alpha \in R^m$: Lagrange multipliers for solution

b $\in$R: threshold for solution

- Initialize $\alpha_i = 0, \forall_i$, b = 0.
- Initialize passes=0
- **While** (passes < max- passes)
    - num-changed -alphas = 0
    - for i = 1, . . . m,

Calculate $E_i = f(x^{(i)}) - y^{(i)}$ using (2).

if $((y^{(i)}E_i < -tol \;\&\&\; \alpha_i < C) \;||\; (y^{(i)}E_i > tol \;\&\&\; \alpha_i > 0))$

- Select j ≠ i randomly.
- Calculate $E_j = f(x^{(j)}) - y^{(j)}$ using (2).
- Save old α′s: $\alpha_i^{(old)} = \alpha_i$, $\alpha_j^{(old)} = \alpha_j$.
- Compute L and H by (10) or (11).
- if (L == H)

continue to next i.

4. Results

Classification Accuracy

The present section includes a discussion of results in the case of using 2 algorithms, which are (FICA, JADE) and a SOM Classifier in the system of the brain interface between computer. Comparing them in the case of using the same classifier, we noticed that the classification accuracy when using the SOM algorithm with the FICA algorithm reached 88% and it led to the improvement of the system where the classification accuracy without processing was 64%, and when it was processed using the JADE algorithm, the classification accuracy was 65%.. The results are shown in tables (2)-(4).

Table (2) illustrates the Detailed Accuracy by movement Right index finger

EEG RAW	Preprocessing	Classification	precision	F-Measure	Recall
Right index finger	Without processing	SOM	0.792	0.069	0.036
	With JADE		0.750	0.667	0.66
	with FICA proposed work		1.000	0.800	0.667

Table (3) illustrates the Detailed Accuracy by movement Left index finger

EEG RAW	Preprocessing	Classification	precision	F-Measure	Recall
Left index finger	Without processing	SOM	0.495	0.660	0.990
	With JADE		0.500	0.571	0.667
	with FICA proposed work		0.800	0.889	1.000

Table (4): results of the suggested study and table numbers have shown that the suggested work performs better and provides higher accuracy of the rating. Where it represents Results of weighted Average classification And the time it takes to build the classifier model

Table 4. Results of weighted Average classification and time utilizing the suggested methods

	Pre-processing	Classification	precision	F-Measure	Recall	Time
EEG data	With no processing	SOM	0.647	0.358	0.502	0.13 seconds
	With JADE		0.656	0.631	0.625	0.05 seconds
	with FICA proposed work		88.6	0.851	0.857	0.05 seconds

In general, the suggested study has been providing more sufficient performance: compared to other methods through the experimentation whit, which is why, the FICA was chosen to be enhanced due to the fact that it has been more sufficient already, compared to other utilized blind source separation approaches with the SOM method. Results have given gave better rating accuracy equal to 88% . as can be seen from Fig (4)

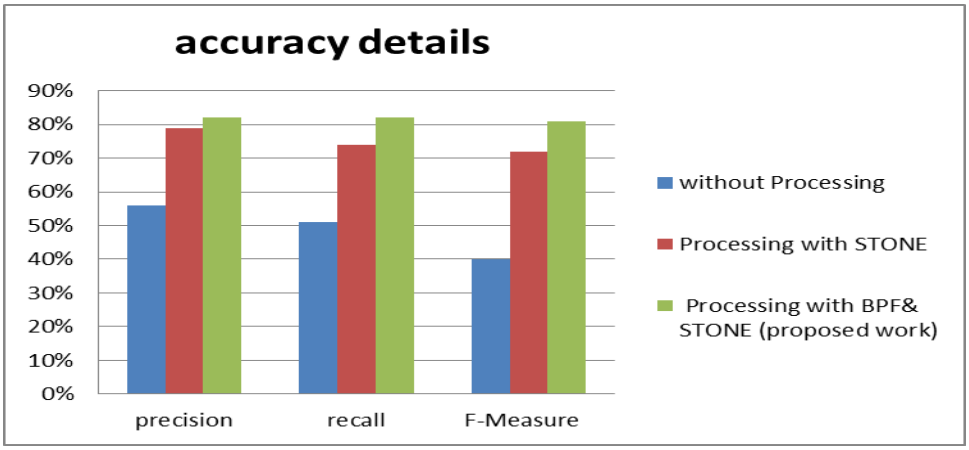

Fig 4. accuracy using proposed techniques.

The thesis presented by Salem 2007 [20] under the title (Design and The implementation of an AI control unit based on the 'brain-computer interface) is the closest research in this study. Use the same dataset (19) channels and FICA algorithm for analyses the EEG of signal the BCI. Signal was classified using an adaptive pattern classifier Consists of a set of Kohonen Self-Organization Map (SOM) And LVQ While we used classifier Sequential Minimal Optimization (SMO). The results of the comparison between the system in the proposed study and the thesis [20] were shown in table (5) and Fig (5).

Table 5. Results of comparing the proposed techniques with previous technologies

input data	data analysis	Classifier	Precision %	
			Left index finger	right index finger
	RAW EEG	(SOM) And LVQ	25	45.8
		Sequential Minimal Optimization	49	79
	FICA	(SOM) And LVQ	53.3	75
		Sequential Minimal Optimization	80	100

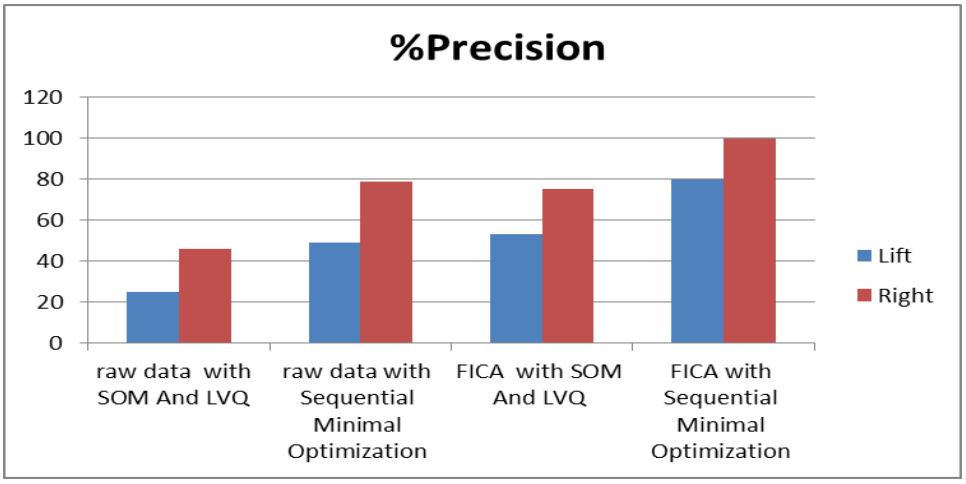

fig (5). comparing the proposed techniques with previous technologies

5. Conclusions

In the present research, the impact of the EEG -BCI performance enhancement has been shown by employing a suitable classifier. There are numerous sparse characteristics with dimensions that exceed 2,650. Training a massive amount of data with the use of traditional approaches is insufficient and expensive. This is why SMO has been chosen which operates best on the sparse data with the high dimensions. The results of the classification have been enhanced by utilizing it. The SMO speeds up the process of training, as well as reducing the classification errors. The precision which has been obtained from the use of the SMO has been 88%

E-mail: zainabkadhm10@gmail.com

Abstract. Automatic Modulation Recognition (AMR) has a significant impact in the military as well as civil applications. Recognizing the modulation of the received signal has been considered as an intermediate step between the detection and demodulation of the signal. Which is why, in many military and communication systems, the AMR is considered as part of the system. Presently, due to increasing digital modulations in military and civil applications. Digital modulation recognition is especially important. Usually for the AMR a small number of the received signal features are obtained and utilized. The choice of the suitable feature plays an important part in the increase of AMR efficiency. The presented paper indicates hybrid intelligent system for the recognitions of digital signal types, consisting of 3 major modules: classifier module, feature extraction module and J48 Classifier that was used for the first time in our research in the field of classification of modulated signals and optimization module by Chicken Swarm Optimization (CSO) . To get better results of the system suggested optimization the features to discard weak or irrelevant features in the system and keep only strong relevant features Chicken Swarm Optimization. The results of simulation confirm the high accuracy of recognition that is related to the suggested system even at low SNR.

keywords: Hybrid System, Automatic modulation recognition, Chicken Swarm Optimization Algorithm, J48 Algorithm

1.Introduction.

Automatic Modulation Recognition the second stage which is used after detection of the embedded signals to demodulate them [1] is capable of recognizing the received signal's modulation type between the pre-supposed modulation numbers. The automatic modulation recognition is of a significant impact on the military and civil applications in the present day, as a result of the increase in the digital modulations in the military and civil applications the recognition of the digital modulation is particularly important. Generally, for the automatic modulation recognition, a few features of the received signal will be obtained and utilized. The choice of suitable features is of a significant impact on the increase of recognition efficiency [2]. In [3] used the neural network algorithm choosing 10 modified signals (2-ASK, 4-ASK, 2-FSK, 4-FSK, 2-PSK, 4-PSK, 4-QAM, 16-QAM, 64-QAM). The existence of the Gaussian noise -5dB to 20dB. Results have shown an increase in the accuracy of recognition of the modification type. In [4] This study uses 2 convolutional neural network (CNN)-based DL models. The experimental results have demonstrated the considerable advantage of the performance and the feasibility of the applications of the DL-based method for the classification of the modulation. In [5] Suggested novel algorithm for distinguishing six types of digital: modulation approaches (2ASK, 2FSK, 2PSK,4 ASK,4 FSK, and 4 PSK) High-resolution result for new algorithms have been demonstrated even when SNR = 4dB. In [6] They proposed a data-based model to classify automatic settings without relying on expert features such as high-frequency moments. The accuracy of the results was 90% in the SNR variance ranging from 0dB to 20d In this research, the following

digital signals have been considered: (2ASK, 2PSK, 4PSK, 8PSK, 8QAM,16QAM,32QAM, 64 QAM, 128QAM, and 256QAM) is enhancing modulated signal features, which leads to the reduction of the properties of the signal by the increase of system accuracy in detections and identifications of the signal type with the use of the Chicken Swarm optimization algorithm . In The general outline of the present paper is: After introduction, features extraction and algorithms of the optimization will be reviewed in Section2 the classification will be provided in Section3. Section4 provides some of the simulation results, and finally, the conclusions of the present research will be provided in section5.

2. Feature Extraction and Optimization

The standard system of pattern recognition after carrying out some operations of the pre-processing usually decreases the raw data set size through the extraction of a group of the distinctive attributes that are referred to as features. The necessity for the feature extraction results from the potential incapability of using raw data. In the field of signal recognition, selecting good features results in enabling the classifier from distinguishing higher and more digital signals, as well as helping the reduction of the classifier's complexity. A variety of digital signal types are known for different characteristics which is why they find the accurate features to identify them (particularly in the cases of the higher-order moment, cumulant) is a complicated task.. according to the researches, statistical features present a good way to discriminate the types of the considered digital signals [7] .

2.1. **Moments**

Probability distribution moments can be defined as a model of expected value and defining the character of the probability density function. Concerning digital signals the specification for i^{th} the moment for finite length is specified via:

$$\mu_i = \sum_{K=1}^{N} (s_k - \mu)^i f(s_k) \quad (1)$$

Where N can be defined as the data length, s_k is the random variable, subscript (k) is integer-valued, μ is the mean value of a random variable. Let the signal has a zero mean (μ= 0), thus equation (1) becomes:

$$\mu_i = \sum_{K=1}^{N} S_k^i \ f(s_k) \quad (2)$$

The auto-moment regarding random variable is:

$$E_{s,p+q,p} = E[S^P (S^*)^q] \quad (3)$$

The (p) represents the number of the non-conjugated terms (q) represents the number of conjugated terms, (p+q) represent moment order, and (S) is a discrete random variable[8]

2.2 **CUMULANTS**

Cumulants are also statistical features If the characteristic equation of a random variable S with zero mean is :

$$\mathrm{F}(t) = E\left[e^{jts}\right] \quad (4)$$

Expanding the Logarithm of equation (4) by applying a Taylor series we obtain
$:g(t)\ log\left\{E\left[e^{jts}\right]\ \sum_{n=1}^{\infty} k_n\ \frac{(jt^n)}{n!}\right\}$

Where(k_n) is called the cumulant, (t) is time The nth-order cumulant is comparable to nth order moment thus

$$C_{s,p+q,p} = Cum\left[\underbrace{s(t),\dots,s(t),}_{pterms}\ \underbrace{S^*(t),\dots,S^*(t),}_{qterms}\right] \quad (5)$$

The cumulants can be derived from moment :

$$cum[s_1,\dots.s_n] = \sum_{\forall v}(-1)^{q-1} \quad (q-1)!\,E\left[\prod_{j\epsilon v_1} s_j\right]\dots E\left[\prod_{j\epsilon v_q} s_j\right] \quad (6)$$

The summation will be implemented on partitions $v = (v_1,\dots.,v_q)$ for the indexes (1, 2, ..., n), (q) represents the number of elements in partition [1].

2.3 **Optimization**

To get better results of the system optimization is suggested to the features to discard weak or irrelevant features in the system and keep only strong relevant features, to check the accuracy of the system and comparing the results obtained from applying the feature optimization algorithm and without applying it .algorithm used for feature optimization (BAT swarm).

2.4 **Chicken Swarm Algorithm (CSO)**

CSO may be characterized as an advanced intelligent approach that has been proposed to a lot of behaviors related to chickens cocks and hens in their process when they search for food. In the CSO the chicken swarm in the search space is mapped as a specific individual of the particle. The chicken particle swarm, cock particle swarm, and hen particle swarm have been organized according to the fitness value of the particle, and a variety of the search modes will be utilized by every one of the sub-swarms [9]**.** In this algorithm, more than a few particles with the best fitness are selected as the cock particle swarm which can be characterized as:

$$(x)_{i,j}^{t+1} = (x)_{i,j}^{t} + randn(0,\sigma^2) \quad (7)$$

where $x_{i,j}^{t+1}$ and $x_{i,j}^{t}$ represents the position regarding j-the dimension of a particle i in t+1 and t iterations respectively rand n (0, σ^2) represents the random number of Gauss distribution whose variance is σ^2The parameter σ^2 could be computed via

$$\sigma^2 = \begin{cases} 1, & fit_i < fit_k \\ \exp\left(\dfrac{(fit_k - fit_i)}{(|fit_i| + \xi)}\right), & fit_i \geq fit_k \end{cases} \quad (8)$$

where i, $k \in [1, r\ \text{size}]$ and $i \neq k$. $r$size can be defined as the number of cock swarms. fit_i and fit_k represents the values of the fitness regarding cock particle i & k, respectively; ξ can be defined as a fairly small number. Moreover, most particles with the best fitness will be selected as the hen swarm**.** Its random search will be carried out by population cocks of **.**hen and that of others, which may be given as**:**

$$X_{i,j}^{t+1} = X_{i,j}^{t} + s2rand.\left(X_{r1,j}^{t}, X_{i,j}^{t}\right) + ..s2\ rand.\left(X_{r2,j}^{t}, X_{i,j}^{t}\right) \quad (9)$$

where $X_{r1,j}^{t}$ and $X_{r1,j}^{t}$ represents the position related to cock individual $r1$ in a population of the hen X_j and cock individual $r2$ in other populations, respectively. rand can be defined as a uniform random number over [0, 1]. $S1$ & $S2$ indicate the weight that is estimated by

$$S1 = exp\left(\frac{(fit_{i-fit_{r1}})}{(|fit_i|+\xi)}\right)$$

$$S2 = exp(fit_{r2} - fit_i) \quad (10)$$

where fit_{r1} and. fit_{r2} represents, fitness value regarding the cock individual $r1$ in hen population X_j and the cock individual $r2$ in other populations. Each one of the individuals, apart from a hen**.** swarm and cock swarm will be specified as chick swarm. Its mode of search follows the search mode of the hen swarm which has been provided as:

$$X_{i,j}^{t+1} = X_{i,j}^{t} + FL.\left(X_{m,j}^{t} - X_{i,j}^{t}\right), FL \in [0,2] \quad (11)$$

where FL**.** represents a parameter, indicating that a chick will follow its mother to search for food. $X_{m,j}^{t}$ indicates the *i*th chick's mother's position ($m \in [.1,N]$) [9]**.**

3. CLASSIFIER

3.1 Classification Algorithms

Classification can be defined as a very important problem of data mining. Its input can be described as a data-set of the training record, where every one of the records got several attributes. Numerical attributes can be defined as the attributes that have numerical domains and categorical attributes, which are attributes that have non-numerical domains. In addition to that, there has been as well, a distinguished attribute which has been referred to as Class label. Such classification has been intended for the construction of a console model that may be utilized for the prediction of the future of the class label [10] unlabeled records. Numerous models of classification have been utilized and a method which is referred to as the called decision tree has been utilized in the present paper.

3.2 . Decision trees

Decision trees are used for delineating the process of decision-making. It is a classifier that is embodied with a tree construction that is similar to a flowchart, which was used extensively for embodying the models of association, as a result of its graspable nature which holds to mind human reasoning. They have been used for categorizing the instances through sorting those instances down the 3 from origin to a small leaf node, running the instance association. Each one of the nodes is specifying an instance examination and each one of the divisions is corresponding to a potential advantage of that attribute. The decision tree in [11] performs the building of the regression or classification models as a tree structure. It performs a division of the data-set to smaller and smaller sub-sets as at a similar period a related decision tree has been developed incrementally. The final result is a tree alongside the leaf and the decision nodes. The decision node has 2 or more divisions and the leaf node embodies a decision or association. The topmost decision node in the tree, corresponding to the optimal predictor produced the origin node

3.3 DECISION TREE (J48)

One of the best algorithms of machine learning to examine the data continuously and categorically. J48 is utilized for the classification of a variety of applications and provide precise classification results: J-48 is a highly sufficient algorithm of machine learning which is utilized for the categorical and continuous examination of data C 4.5 (J-48) is one of the algorithms utilized for the generation of the decision tree, it has been advanced by R. Quinlan. C 4.5 is an extension of the earlier ID-3 algorithm by Quinlan. The C 4.5 actualizes (J 48) for the creation of a trimmed C 4.5 decision tree. All information aspects are split into smaller sub-sets to base a decision. J 48 considers the standardized data gain which is the result of splitting information through the selection of an attribute. In a summary, attribute extreme standardized data gained has been deployed. The smaller sub-sets are gathered again by the algorithm. Split strategies are stopped in the case where a sub-set has an index that has a similar class in every instance. J-48 produces a decision node with the use of expected class (J 48) estimations, the decision tree is capable of dealing with certain properties, the missing or lost data attribute estimations, and different attribute costs. Here the precision may be expanded with pruning [12, 13].

4. The Step of J48

Step1// Labeling of the leaf with a similar class in the case where instances are part of the same class.
Step2// For every one of the attributes, the possible data is figured and data gain will be obtained from the attribute test.
Step3// Ultimately, the optimal attribute is selected according to the current parameter of selection:

4.1 THE PROPOSED MODULATION CLASSIFICATION SYSTEM

The System which has been presented in This paper consists of 2 phases: Phase one: the electromagnetic signals. HOMs and HOCs were used for feature extraction (FE). MATLAB programs were designed to fulfill the tasks. the extracted HOMs and HOCs were obtained as a matrix of the dataset. Output FE was improved using the Chicken swarm optimization algorithm Phase 2: The outputs of the first stage are applied as inputs into the J48 to classify the signal and predict the signal type Fig. (1) demonstrates the -diagram of the Proposed System.

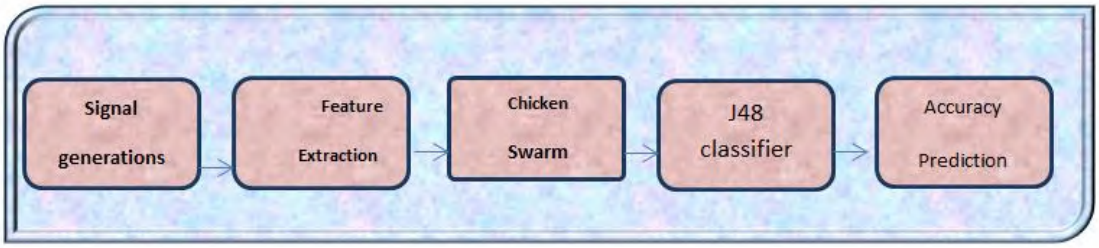

Figure 1 . A diagram of the proposed method

4.2 IMPLEMENTATION AND RESULT:

This section discusses the Results of using the Algorithm chicken Swarm Optimization and (J48) to classify 10 types of The modified signal (8 QAM, 16QAM, 32 QAM, 64QAM, 128 QAM, 256 QAM, 2PSK, 4 PSK, 8 PSK, 2 ASK Within the level of SNR (-2, -1,0,1,2,3,4,5,6,7, 8,910,11and 12) dB and comparing these results when classifying without optimization the feature of signals in an algorithm (J48 decision tree) is for each type of signal and the accuracy of the rating as shown in Table 1 Each type of signal. The success rate in identifying signals after using the CSO algorithm is higher as indicated in Table 3which means more system efficiency.
Results of classification accuracy using (J48 decision tree) without optimization where the accuracy ratio was 87% to the proposed methodology.

College of Technical Al-Mussaib, Al-Furat Al-Awsat Technical University, Iraq

E-mail: abduljaleel.alhasnawi@atu.edu.iq

Abstract. An opportunistic resource utilization network (denoted as Oppnet) is a type of network that enables its node to cooperate in an opportunistic and ad hoc manner. Cooperation in oppnet includes sharing node computational resources, rather than only opportunistic communication in the traditional opportunistic networks. The key idea of oppnet is its ability to grow from seed node (initiator) to expanded oppnet via joining more nodes until getting the desired resources in a timely manner. This expansion raises the security risk of joining malicious nodes and threatens the oppnet including nodes and data. Besides, uncontrolled oppnet expansion might allow joining nodes with low computational capabilities or limited resources that have delayed responses, and hence affect the performance of oppnet. This study aims to mitigate these two problems by proposing a new oppnet paradigm (an enhanced version of original oppnet) called Trust-based Secure Cooperative Oppnet (TSCO) that utilizing a trust as a foundation for security and cooperation. Trust foundation is the major aspect of TSCO, which relies mainly on establishing trust value for each oppnet node and updating these values based on cooperation experience with those nodes. In TSCO, oppnet nodes have classified based on their trust values in which the highest trust value has the priority to join oppnet, if it exists within the specific range. Otherwise, the second-highest trust value takes priority, and so on. To test the feasibility of TSCO in realistic systems, a framework of using TSCO as an oppnet expansion control regarding security and cooperation is simulated. The experimental results show that TSCO has a better performance in terms of secure, success expansion, and cooperation. The success rate of TSCO is higher than the success rate of the original oppnet (our experimental baseline). In addition, regarding the time of satisfying oppnet tasks, TSCO shows less average latency than the baseline.

Keywords: Trust, Security, Cooperation**,** Opportunistic Networks

1. Introduction

Opportunistic resource utilization networks (oppnets) considered in this study are categories of ad hoc networks where diverse nodes, not originally designed as oppnet nodes, join it dynamically to perform certain tasks they have been called to participate in. Oppnets use opportunistically all kinds of resources including computation, communication, storage, sensing, actuation, etc.

Trust considered in this study is an aspect of security and reliability. In other words, trust is formulated and integrated within oppnet architecture to assure that only secure nodes with a sufficient level of trust, resources, reliability, and past cooperation experience can join the oppnet. If a node does not has an experience, an initial trust value assigns for it, and then this value is updated based on the new experience with oppnet. This section provides a theoretical background about the major aspects and terms considered in this research including oppnet, trust, security, and cooperation. Section 2 reviews

the literature and outlines a selected set of works that have similarity with our work and distinguishes our work in the literature. Section 3 describes the proposed Trust-based Secure Cooperative Oppnet (TSCO) static and dynamic architectures. Section 4 presents an evaluation framework for testing the feasibility and efficiency of the proposed TSCO model. Section 5 shows the experimental results and discusses the results in terms of the satisfying the goals of the study. Finally, section 5 concludes the paper and draws the directions for future work.

2. Background

2.1. Opportunistic Resource Utilization Networks

Opportunistic resource utilization network (Oppnet) is a special kind of ad hoc networks that enables opportunistic use of all kinds of resources, services, or capabilities (incl. hardware, software, applications, etc.), and opportunistic communications which happen to be within the oppnet's reach [1]. Oppnet starts as a relatively small network, known as seed network, which grows into an expanded oppnet. It should be noted that the more pervasive is the environment in which the oppnet operates the more benefits they can provide (the higher interoperability, with more heterogeneous software and hardware components). Oppnets can be consider collaborative distributed systems [2], since integration of resources can only be achieved through collaboration. Entities collaborate with an oppnet, by sharing diverse resources, to help it achieving a certain goal. Oppnets can also be consider ad hoc networks, peer-to peer (P2P) systems, and self-organizing networks (SONs) since they share many of their capabilities and characteristics. In particular, they share node localization and self-organization qualities with ad hoc networks; growth-by-joining abilities with P2P systems and forming, organization, and management.

Oppnet consists of three major components: seed, Decentralized Command Center (DCC), helpers, and Oppnet Virtual Machine (OVM) [3]. Seed is a single node or multiple neighboured nodes that initiated the oppnet deployment (expansion) process due to a need for resources. DCC is a controller, which can include an arbitrary subset of seed, works on inviting foreign nodes to help in reaching oppnet goals. The initial seed oppnet grows into an expanded oppnet. Helpers are foreign or oppnet entities that accept the DCC invitation. The OVM is a set of primitives that create a universal platform for application-level communication within and among oppnets. This communication is the basis for opportunistic utilization of all resources. OVM primitives can be downloaded to any system or device to make it oppnet-enabled, that is, able to communicate and share resources with other oppnets or oppnet-enabled nodes. Oppnet operation, illustrated in Figure 1, initiated by the seed oppnet when it declares the need for help by other surrounding nodes. The DCC notified by this declaration, via command sent by the seed, and starts the growth process. The growth consists of three steps: discovering enough candidate helpers, admitting them into oppnet, and integrating their resources into oppnet. This process prepare helpers to cooperate. Once the cooperation has done and the goal of an oppnet has achieved, DCC releases helpers' resources and finalizes the oppnet process. Note that the oppnet DCC presides over the operations of the oppnet throughout its lifecycle.

2.2. Trust

Trust is an abstract concept, which combines many complicated factors. It can be reflected by utility, availability, reliability, confidence, and quality of services, reputation, and other concepts [4]. Trust can be defined as a particular level of subjective probability which an agent will perform a particular action for a specified period within a specified context. In opportunistic networks, trust of a specific node is a subjective estimation done by another peer node on the reliability and accuracy of information received from or traversing through that node [5]. The Level of trust is a probability varying from 0 (complete distrust) to 1 (complete trust). In this sense, trustworthiness is a measure of the actual probability that the trustees will behave as expected. Trustworthiness defined as the objective probability that the trustee performs a particular action on which the interests of the trustor depend. If the trustor ignores the difference between the believed (i.e., trust) and the actual (i.e., trustworthiness) probability, there is a risk of trust miscalculation. There is misplaced trust when the perceived trust is higher than the actual trustworthiness. Misplaced trust increases risk and thus

enhances the chance of deceit as well. On the other hand, when the perceived trust is lower than the actual trustworthiness, the trustee is distrusted more than warranted. Hence, the trustor may lose potentially good opportunities to cooperate with partners with high trustworthiness [6].

2.2.1. **Trust Properties**. Due to the unique characteristics of oppnets environments and the inherent unreliability of the wireless channels, the concept of trust in oppnets should be carefully defined. The main properties of trust in such environments can be defined in many directions. Trust is dynamic: In mobile environments, information is typically incomplete and can change rapidly due to node mobility, so building trust in such environments is based on temporally and spatially local information [7]. In order to capture the dynamicity of trust, it should be expressed as a continuous variable, rather than as a binary or even discrete-valued entity. Trust is subjective: Different level of trust can be determined by a trustor node against the same trustee node due to different experiences derived from a dynamically changing network topology. Trust is not necessarily transitive: If A trusts B, and B trusts C, it does not guarantee A trusts C. Transitivity of trust between two entities to a third party requires two types of trust to be done by a trustor: trust in a trustee and trust in the trustee's recommendation of the third party [8]. Trust is asymmetric: Node A with higher capability (e.g., more energy or computational power) may not trust node B with lower capability at the same level that node B trusts node A.

2.2.2. **Establishment of Trust.** Two common ways to establish trust are through using policies or reputation. Hard evidence trust used in policies, and the estimation of trust used in reputation systems [9]. Policies determine specifically the conditions necessary to obtain trust, and can predetermine the actions and outcomes if certain conditions are met. Using policies to establish trust is based on managing and exchanging credentials and enforcing access policies. Reputation is an assessment based on the history of observations of or interactions with an entity. This assessment can be done either directly with the evaluator (subjective experience) or as reported by others (recommendations or third party verification). Using reputation to establish trust, focusing on the past performance or interactions for an entity which are combined to assess its future behavior. English et al. [10] defines four steps for establishing trust: trust formation, trust evolution, and trust exploitation. Trust formation is the process of establishing the initial trustworthiness value of each cooperator, then using the available trust evidences of the principal to set the initial trust value. If no evidence available for a principal regarding the specific action, it is possible use available trust evidence from other actions with the principal. Trust evolution is the evolution of trust values over time. New evidence from experience can modifies the stored trust value directly, producing a new trust value. Trust update is the process of adding experience evidence to the store of trust after each evaluation. The store contains the set of all trust evidences, and it is possible to re-evaluate trust values based on the most recent evidence. Trust exploitation is the process of determining the expected behavior of cooperator based on trust values of that cooperator.

2.3. Security

One of the major challenges of an oppnet is to timely detect and identify the malicious devices, and to prevent them from joining the network and ensure the privacy and security of the oppnet. Based on the standard ISO 7498-24 [11], there are eight security services with acronym CIA-AANN-A that define security are confidentiality, integrity, availability, authentication, access control, non-repudiation, notarization, auditability. Confidentiality is the property that information is not made available or disclosed to unauthorized individuals, entities, or processes. Integrity is the property that data has not been altered or destroyed in an unauthorized manner. Availability is the property of being accessible and useable upon demand by an authorized entity. Authentication is the corroboration that an entity is the one claimed, and the source of data received is as claimed. Access control is the prevention of unauthorized use of a resource. It includes the prevention of use of a resource (by an authorized entity) in an unauthorized manner. Non-repudiation is the prevention of entities' denial to be involved in all

or part of a communication. Notarization is the registration of data with a trusted third party that allows (to assure) the accuracy of its characteristics such as content, origin, time, and delivery. Auditability is the ability of a system to trace all actions related to a given asset.

2.4. Cooperation

Cooperation can be defined as a joint collaboration interaction between two or more principals (Ps), to perform one or more actions (As) on one of the principals' resources. There are five services for cooperation process, outlined in Figure 2, are cooperation request analyzer, cooperative risk assessment, cooperation decision, cooperation monitoring, and cooperation evaluation [10]. Functionally, cooperation services process the cooperation request denoted by *Req(P, A),* where *P* determines which node has to participate, *A* determines which action has to be done by *P* in cooperative processing. Cooperation services work in a sequence manner to determine whether the action *A* can take place by using the principal's *P* resources. In cooperation request analyzer service, the contents of the received cooperation request *Req(P, A)* is analyzed to determine whether *P* has the necessary resources to allow the action *A* to take place. The request analyzer provides cooperative risk assessment with the results of request analysis. Cooperative risk assessment determines whether the risks are acceptable to enable cooperation to proceed. It estimates the risk of interacting with a particular principal P for a particular action A based on the outcomes from cooperation request analyzer and trust exploitation. In cooperation decision service the decision about enabling cooperation process takes place. The cooperation decision made based on the outcomes from cooperative risk assessment. In cooperation monitoring service, the progress of the individual cooperation actions is monitored to ensure that the interaction is progressing towards the desired outcome, and a negative outcome predicted during the cooperative risk assessment for that interaction. In cooperation evaluation service, trust foundation is provided with the evaluation of the interactions. The evaluation based on the range of outcomes established during cooperative risk assessment.

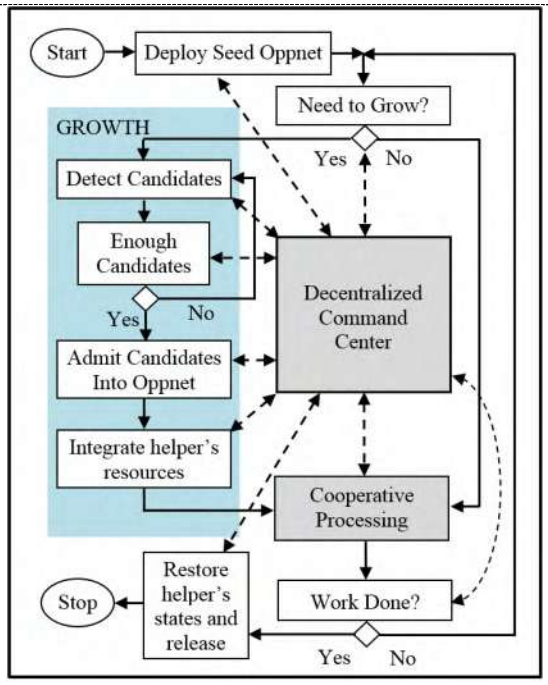

Figure 1. Oppnet operation flow diagram.

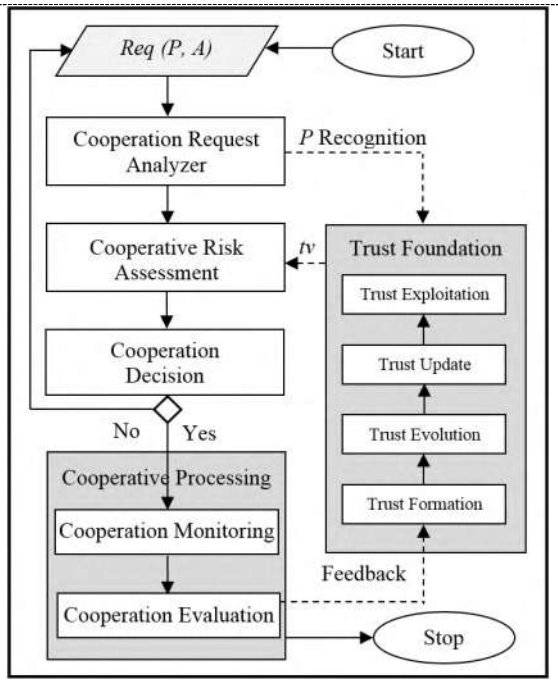

Figure 2. Cooperation process flow diagram.

3. Literature Review

Message forwarding opportunistic networks are wider investigated in the literature than opportunistic resource utilization networks. Although, they share that same opportunistic principle unless the latter is more general and includes opportunistic communication. This section outlines researchers' work in the literature regarding trust, security, and cooperation in opportunistic networks or opportunistic resource utilization networks and distinguishes our work from them.

In [3], the author proposed a virtual machine for opportunistic resource utilization networks as a universal standard for the application-level of oppnet resource sharing. Oppnet virtual machine (OVM) is defined as a set of primitives that are designed to create a middleware for application-level resource acquisition by oppnet-enabled devices and systems. Any computational entity can be oppnet-enabled by downloading and installing the OVM primitives that enables those entities acquire and communicate computational resources in an opportunistic manner. The author improved the original OVM primitives by developing non-monolithic OVM-based oppnet middleware to support a very broad and diverse set of applications. This work improved oppnet in terms of primitives and applications. While, our work improves oppnet in terms of security and cooperation. Wu et al. [12] provided a systematic description of security threats in opportunistic networks. They also proposed a general security architecture of opportunistic networks and analyzed many security aspects including access control and authentication, privacy protection, secure routing, cooperation mechanisms, and trust management. In addition, they surveyed various trust and security solutions for opportunistic networks. This work investigated security and trust management in opportunistic communication rather than opportunistic resource utilization, as we do. Yao et al. [13] proposed the incorporating social trust concept for the routing decision opportunistic networks. They presented a Trust Routing based on Social Similarity (TRSS) scheme based on the common interests or social similarities of nodes. Social features are extracted from the social history record of a given node in opportunistic network. They established social trust based on observed nodes' trustworthiness and based on direct or indirect recommendations. This work utilized social similarities to establish trust. While, we utilize actual cooperation experience to establish and maintain trust values for nodes. Kumar et al. [14] proposed altruism-dependent trust-based data forwarding mechanism, denoted ATDTN. In ATDTN, altruism value associated with each node representing its trust in the opportunistic network and determining its participation in forwarding messages or sharing resources. This study relied on altruism, which is established by social interactions, as a major factor of trust. While, we classify oppnet nodes based on their calculated trust values and manage their task assignment in opportunistic recourse utilization based on the calculated trust. Alajeely et al. [15] provided an overview of the major security issues in opportunistic networks and surveyed various security protection approaches to mitigating these issues. They described different types of attacks that can specifically affect routing in opportunistic networks, such as Blackhole attacks Wormhole attacks, Sybil attacks, Selective Dropping attacks, and Selfish attacks. Then, they outlined the defense against each type of attacks in terms of trust as a factor used in the defense process. Trust calculated mutually by interactive nodes through direct and indirect reputation and recommendation. This study utilized trust for security only. While, we utilize trust for security and cooperation to assure secure, effective, and efficient oppnet.

4. The Proposed TSCO Model

This section presents the proposed Trust based Secure and Collaborative Oppnet (TSCO) by outlining its static and dynamic architectures as well as the way of establishing trust based on the helpers classification described in Ref. [16].

4.1. Static TSCO Architecture

Figure 3 illustrates the static TSCO architecture, which includes four major components: oppnet, cooperation blocks, security services, and trust foundation. TSCO architecture components built in the matter that follows the basic oppnet operations to keep the functionality of oppnet. Security block consists of eight sub blocks; each represents a single security services (as explained in Subsection 2.3). Cooperation block consists of five sub blocks; each represents a single cooperation service in the cooperation process (as explained in Subsection 2.4). Trust Foundation acts as a basis for both cooperation services and security services. It sends *tv* for *P* to cooperative risk assessment to help determining risk level of *P* and to ensure that P satisfies security services. It also update trust value of an admitted helper based on information from cooperative processing unit that includes cooperation monitoring and cooperation evaluation.

4.2. Dynamic TSCO Architecture

Figure 4 shows the basic TSCO operations. DCC can grow the oppnet into the expanded oppnet by admitting other nodes. After determining enough candidates by DCC, cooperation request analyzer can analyze each cooperation request *Req(P, A)* to determine whether the helper *P* has the required resources to participate doing the action *A*. Then it feeds this information to the cooperative risk assessment. In this stage, cooperative risk assessment estimates every helper's risk with respect to its trust value; it also helps DCC to make decision about the admission of the candidate helpers. Once candidate helper admitted, this means it passed cooperative risk assessment, and it is expected to be cooperative. Then DCC integrates helper's resources in oppnet to start cooperative process. In this stage, the admitted helper will be under cooperation monitoring and evaluation stages to provide the information needed for trust calculation. Based on the cooperation monitoring and evaluation information, trust foundation starts calculating trust value for the admitted helper, and supplies cooperative risk assessment with this information. All the security, cooperation, and trust information about a specific helper stored in the DCC record for future references. In Figure 4, DCC controls every single block. However, control interactions by CC are not shown to avoid "crowding the picture." The solid arrows indicate control flow between architecture blocks, and broken lines indicate data flow.

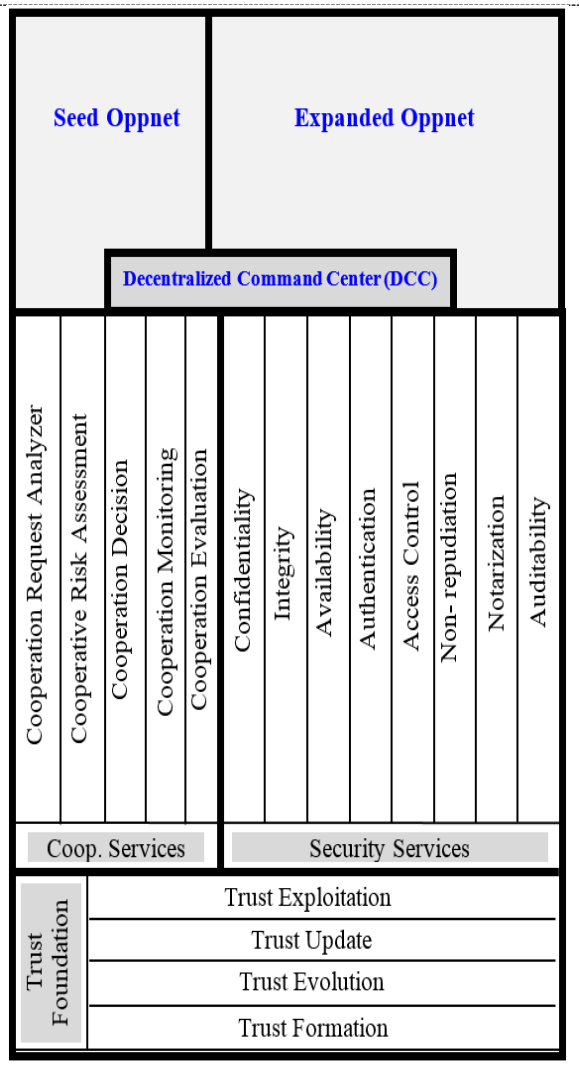

Figure 3. Static TSCO architecture.

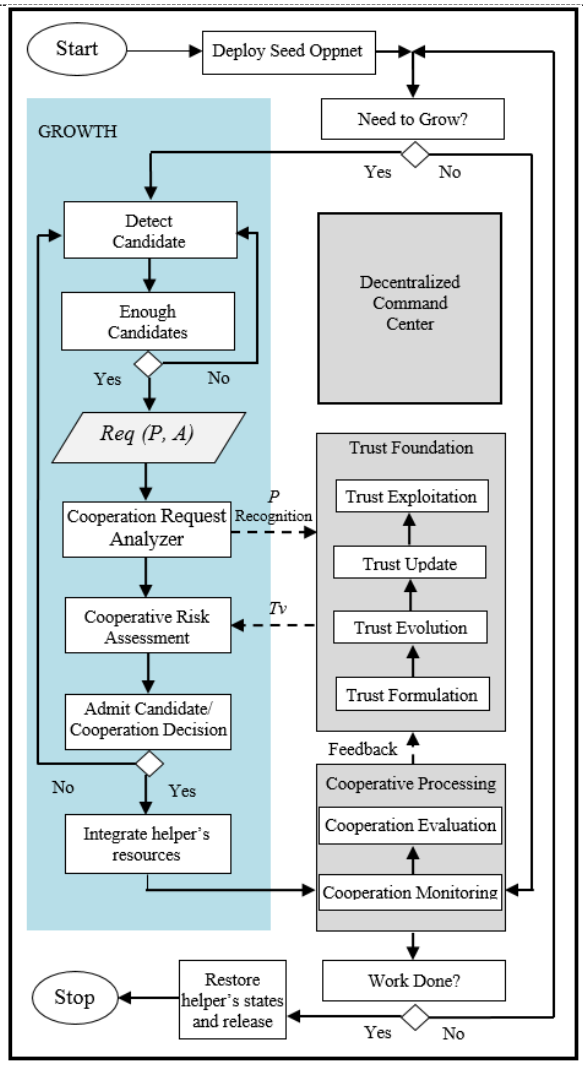

Figure 4. Dynamic TSCO architecture.

4.3. Establishment of Trust in TSCO

In TSCO system, DCC maintains trust value (*Tv*) for each helper *P* based on the set of all evidence values (EV) that related to the helper *P* including *first-hand experience* (EX) values and *second-hand reputation* (RP) values. Each of these sets of evidence has two subsets, positive and negative. For instance, EX represents the set of possible experience values for Helper *P*. Experience values consists of two subsets, $EX_{pos.}$ (positive experience) and $EX_{neg.}$ (negative experience) for the interactions. If there is no evidence related to the admitted helper *P*, DCC has to establish an Initial Trust Value (ITv) for *P*. Establishing an ITv in TSCO system depends on the helper type, based on the classification of helpers [16]. Table 1 illustrates estimate interval values for each helper type that can be establish as ITv. The evolution of a stored *Tv* value over time is important in TSCO system to ensure accuracy of *Tv*. For this reason, Trust Evolution takes a new piece of evidence and modifies the stored trust value *Tv* directly, producing a new trust value *Tv′*. After cooperative processing, new evidence outcome is an experience evidence that shoud be added to the stored trust information. This information contains all trust evidence, EV. When new ev′∈EV arrives as the latest experience of the helper, Trust Update

modifies EV to produce an updated set of trust evidence, EV′ [10].

Table 1. Initial and evolution of helpers' trust values.

Helper Type	Initial tv Range	tv Evolution	tv Change	Resulting tv Range
Private Unknown	0 - 50%	Up / Down	Large	0 - 70%
Public Unknown	50 - 70%	Up / Down	Medium	30 - 90%
Trusted Known	70 - 90%	Relatively Constant	Small	60 - 100%
Oppnet Reservists	90-100%	Constant	None	90 - 100%

5. Evaluation Framework

This section presents an evaluation framework for testing the feasibility and efficiency of the proposed TSCO model. The evaluation framework including experimental setup, simulation parameters, and evaluation metrics.

5.1. Experimental Setup

Simulation experiments are conducted for original oppnet model, which considered as a baseline in which a performance of TSCO compared with, and TSCO model. For the purpose of accurate comparison, experiments are designed to be implemented for both models (baseline and TSCO) simultaneously and within the same network configuration. The simulation is conducted using SimPy, a process-based discrete event simulation package based on standard Python. The simulation is implemented in the PyCharm IDE (Integrated Development Environment). The simulation runs on an Intel Core i7-4710 HQ 250 GHz processor with 8 GB RAM. To test TSCO performance on different network topology sizes, we have varied the size of expanded oppnet by considering five levels of scalable oppnet, namely, L_1, L_2, L_3, L_4, and L_5. These levels starting from small scale to a larger scale and so on. We consider these levels to simulate the realistic oppnet scenarios. Note that, within each level, many oppnet tasks can be done locally at the edge level. While, other oppnet tasks might require more communications to be done at fog or cloud levels [17].

5.2. Simulation Parameters

Three major types of nodes are defined and configured in the simulation are SEED, DCC, and HLPR. These nodes are the major actors in the simulation where the SEED (defined in Subsection 2.1) initiates oppnet growth process, the DCC (defined in Subsection 2.1) manages the growth and the cooperation processes, HLPR (helper) participates in the oppnet cooperation process. As a network node, we define two simulation parameters, CPU speed and the number of processing cores. The CPU speed is the maximum number of instructions in which a node's CPU can process per second. CPU speed defined in MIPS (Million Instructions Per Second) [18]. Note that DCC has higher computation power that both SEED and HLPR nodes due to the management tasks required by it. In addition, typically, SEED nodes have the lowest computation power in oppnet environment since they always need resources from others so they initiate oppnet to get help. Helper resources are defined in the simulation using two parameters: capacity, which define the number of computational resource a helper has; and queuing type, which defines how helper node handle multiple help request based on network queuing theory [19]. Three major types of packets are defined in the simulation are Help Request (HR), Normal Help (NH), and TSCO Help (TH). These packet types are configured using two parameters: packet size, which simulated as a random variable with Poisson distribution [20]; and packet processing efforts, which simulated as a random variable with Binomial distribution [21]. The type of carried packet into three types defines the network links: Help Request Link (HR-Link),

Normal Help Link (NH-Link), and TSCO Help Link (TH-Link). These link types are configured using two parameters: bandwidth, which is the maximum number of bits per second that can be transmitted via the link, defined by Mbps (Megabits per second) [22]; and propagation delay, which is a period from the instant when the last bit of a packet is placed onto a transmission link by the sending node till the instant when the last bit of the packet is received by the receiving node [23]. Trust value for each type of oppnet helpers (outlined in Table 1) is defined in the simulation for four classes of oppnet helpers: Private Unknown Helper (PrUH), Public Unknown Helper (PuUH), Trusted Known Helper (TKH), and Oppnet Reservists Helper (ORH). Each helper class is configured in the simulation using two parameters: Trust Value Range, which determines the minimum and maximum trust value this helper class can have; and Trust Value Probability, which simulated as a random variable with Uniform distribution [24]. Table 2 lists the simulation the abovementioned parameters.

Table 2. Simulation Parameters.

Parameter	Instance	Type	Value	Type	Value
Node	SEED DCC HLPR	CPU Speed (MIPS)	4000 10000 6000	Number of Cores	2 4 2
Resource	HLPR_REC	Capacity	2	Queuing Type	FIFO
Packet	HR NH TH	Packet Size (Poisson)	$\lambda = 10$ $\lambda = 20$ $\lambda = 20$	Processing Effort (Binomial)	$n = 30, p = 0.75$ $n = 30, p = 0.75$ $n = 30, p = 0.75$
Link	HR-Link NH-Link TH-Link	Bandwidth (Mbps)	50 100 120	Propagation Delay (ms)	2 4 4
Trust	PrUH PuUH TKH ORH	Trust Value Range	0 - 49 50 - 69 70 - 89 90 - 100	Trust Value Probability (Uniform)	$l = 0, h = 0.49$ $l = 0.5, h = 0.69$ $l = 0.7, h = 0.89$ $l = 0.9, h = 1$

5.3. Evaluation Metrics

Two metrics are considered in the simulation experiments are latency and success rate. The latency (LAT) for an oppnet task is defined as the period between the moment of submission of help request by seed node and the moment when competing the oppnet task. More specifically, LAT is the period from the instant when the *first* bit of HR is sent by a given SEED for a task till the instant when either the *last* bit of NH packet is delivered to SEED or the *last* bit of TH packet for this task is delivered to the SEED oppnet via DCC-HLPRs hope of communications. The success rate is defined as a number of successfully performed oppnet tasks to the number of total tasks in the experiment. We conducted two ways to accurately calculate success rate for oppnet task. First, we define a threshold in term of response time by helper to help request. The motivation for that is the mobility nature of oppnet helper, if a helper A within the seed oppnet reach at time t_1 and it receives the help request, there is no guarantee that at time t_{1+n}, the helper A is still in the reach of oppnet or it successfully forwarded the help request to other candidate helper. Second, we use the hypergeometric distribution [25], which is a discrete probability distribution that describes the probability of successes within a scale of events. Where uniform distribution used to calculate the probable range of success helps for the baseline and TSCO models and similarly the probable range of fail helps. Then, the binomial distribution used to calculate the probability of good samples (successes) and bad samples (fails) from the total sample size. Finally, hypergeometric distribution utilized to find the success rate of an experiment.

6. Results and Discussion

This section shows and discusses the experimental simulation results of using the proposed TSCO model as compared with the baseline (original oppnet model outlined and illustrated in Section 2.1 and Figure 1, respectively). According to our evaluation metrics (Subsection 5.3), experimental results have shown and discussed for each metric separately in a separate subsection.

6.1. Success Rate

Figure 5 shows the simulation experimental results regarding the absolute success rate . The simulation experiments are conducted for five levels of expanded oppnet are L_1, L_2, L_3, L_4, and L_5. For each level, the chart shows the total number of helps happened at that level of network configuration as well as the number of normal (baseline) success helps, which is used as the base in which the number of TSCO success helps compare with. The results show that with increasing the scale of oppnet from L_1 to L_5, the number of helps increase as well as the number of successes for both baseline and TSCO models. This is a normal phenomenon since based on the nature of oppnet structure and operation, the victims increases the probability of helps happened and hence increases the number of successes, accordingly. However, TSCO shows a higher number of success rate than the baseline for all levels. In the baseline oppnet, only 47% of total helps happened in the system are succeeded. While, in the TSCO system, 75% of total helps happened in the system are succeeded. Hence, TSCO shows a better performance than the baseline with 28% regarding the absolute success rate.

Figure 6 shows the simulation experimental results regarding the relative success rate. For each level, the chart shows the relative success rate at that level both the baseline and TSCO models. The experimental results show that with increasing the scale of oppnet from L_1 to L_5, the success rate is relatively stays stable with slightly increasing for both baseline and TSCO models. This is also a normal phenomenon since the success rate calculated relatively with the scale of victims. However, TSCO shows a higher success rate than the baseline for all levels. The average success rate for baseline is 44%. While, The average success rate for TSCO is 76%. Hence, TSCO over performances the baseline with 32% regarding the relative success rate.

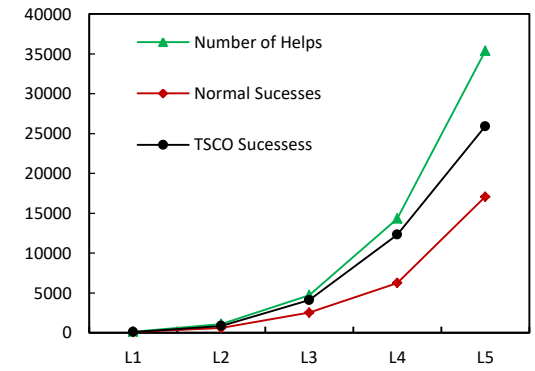

Figure 5. Absolute success rate .

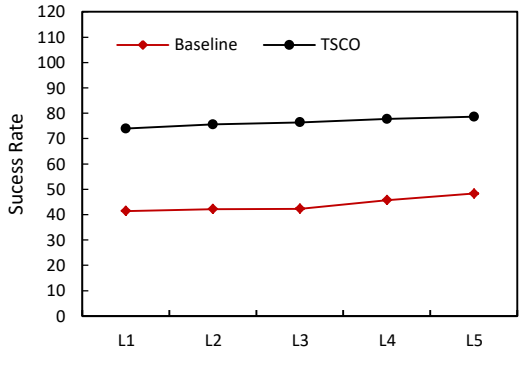

Figure 6. Relative success rate.

6.2. Latency

Figure 7 shows the simulation experimental results regarding the absolute latency. The simulation experiments are also conducted for five levels of expanded oppnet are L_1, L_2, L_3, L_4, and L_5. For each level, the chart shows the absolute latency at that level for both the baseline and TSCO models. The results show that with increasing the scale of oppnet from L1 to L5, the absolute latency increases slightly for both baseline and TSCO models. This is a normal phenomenon since the latency in this experiment is calculated as an accumulative quantity. Hence, increasing the scale of oppnet victims

increases the absolute latency, accordingly. However, TSCO shows a lower latency than the baseline for all levels. In average, TSCO has 35% less absolute latency than the baseline.

Figure 8 shows the simulation experimental results regarding the relative latency. For each level, the chart shows the relative latency at that level for both the baseline and TSCO models. The experimental results show that with increasing the scale of oppnet from L1 to L5, the relative latency is sharply decreasing for both baseline and TSCO models. This is a normal phenomenon since the latency is calculated relatively with the scale of victims. The absolute latency divided by the number of helps happened at each level and with increasing the scale by levels, the relative latency decreases accordingly. TSCO shows a lower relative latency than the baseline for all levels. In average, TSCO has 26% less relative latency than the baseline.

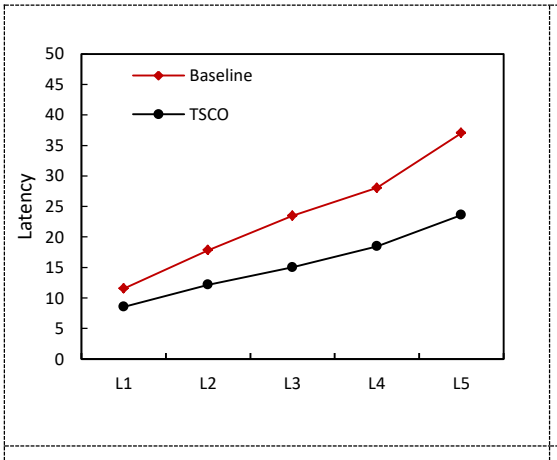

Figure 7. Absolute latency.

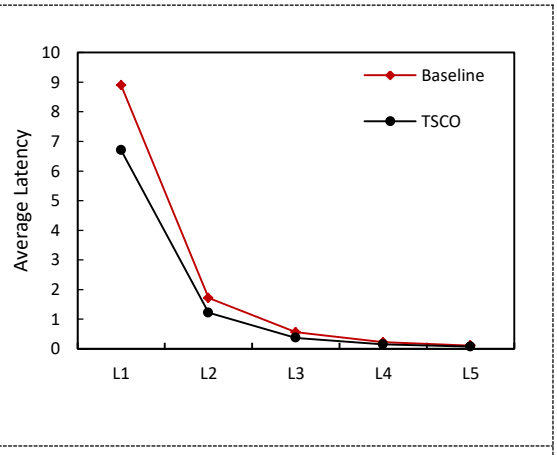

Figure 8. Relative latency.

7. Conclusions

Opportunistic resource utilization networks can be significantly optimized by increasing their performance in terms of security and cooperation. Adding security control to the oppnet architecture assures the protection from selfish or malicious helpers. Furthermore, adding cooperation control improves the reliability of oppnet performance. In our perspective, the common key to improve both security and cooperation in oppnet is Trust.

In this paper, we proposed a new oppnet paradigm denoted TSCO, which integrate security and cooperation controls based on trust with the original oppnet architecture. A theoretical background on the major research terminologies, including oppnet, trust, security, and cooperation, is provided. Then, we distinguished our work in the literature. A conceptual design is presented for the proposed TSCO model including its static and dynamic architectures.

To prove the feasibility and efficiency of the proposed TSCO model, we have introduced a framework of performance evaluation including simulation experimental setup, simulation parameters, and evaluation metrics. Experiments are conducted for both TSCO and the original oppnet, simultaneously. The experimental results show that TSCO over performed the original oppnet (as a baseline) regarding absolute and relative success rate with 28% and 32%, respectively. TSCO also have shown a better performance than the original oppnet regarding absolute and relative latency with 35% and 26%, respectively.

Using Chebyshev Polynomials in Solving Diffusion Equations

Using Chebyshev Polynomials in Solving Diffusion Equations

Ghuson S Abed

University of Information Technology and Communications, Iraq

E-mail: Ghsonabed.2019@uoitc.edu.iq

Abstract. In this work, we modified Chebyshev polynomials of the first kind to match the characteristics of a second order differential equation that is a result of a separation of the variable technique used to solve a partial differential diffusion equation. The resultant polynomials solution in one spatial dimension is found and the corresponding changing parameters for the first order differential equation in time are extracted accordingly. The method is tested for applicability, stability, and convergence.

1. Introduction

Differential Equations (DEs) are widely used as models for variables behavior in many phenomena in different fields of science. While setting DE to the model certain phenomenon can be achieved if all the variables, parameters, and relations are known, the solution of this DE is another story. An only a small fraction of different types of DEs can be solved analytically and exactly, while most of them have no known analytical exact solution. Partial Differential Equations (PDEs) represent a special type of DEs, where two or more independent variables exist, and they have special importance in the fields of engineering and physics. PDEs have no analytical exact solution in most cases; so many techniques are used to find an approximate solution instead. These techniques can be classified into two major types: numerical solution and series solution. Each technique has its advantages and disadvantages. The numerical solution, mainly by using a finite difference technique, has the advantages of both simplicity and wide applicability if convergence criteria are followed. The disadvantage of the numerical solution is the non function results representation, the result is only values of the variables at the limited number of nodes specified by the solution. The series solution has the advantage of representing the solution as a sum of analytical functions applied at all the space of the problem, but to achieve this task more complicated steps and different approaches are needed for different DEs.One of the most powerful methods used to solve PDEs is using Orthogonal Polynomials (OPs) together with the separation of variables technique [17, 18, 3, 19, 9]. Different other techniques also used such as the Fokas method [6, 1, 2]. There are different types of OPs, most of them were used for solving DEs. Among them, Fourier series are widely used, due to their characters that their second derivatives are a constant multiple of their values that match, widely used, second order DEs [26, 25, 15, 12]. But when the Fourier series is not compatible with the problem symmetry and\or boundary values, then other OPs can be used, where they can be matched to the problem boundary conditions [7,4,21,24,16,5], or they can be matched to the problem symmetry [20] and develop a correct solution. Chebyshev Polynomials CPs are OPs, which have many interesting properties [22, 29, 11]. CPs are widely used in fitting due to their high efficiency in reducing the error of interpolation [27], and for that, they are used to find the particular solution of different types of DEs [23].CPs are also used in solving different types of DEs [8,13,10,28].

In this work we used CPs of the first kind [22] and the separation of variables technique, to solve the diffusion equation. CPs is modified to match the diffusion equation characteristics and boundary conditions. The strategy is tested for convergence and stability, and the results are compared with that of well-known method of using the Fourier series and separation of variables that compatible with the chosen examples.

2. Problem definitions:

2.1 Diffusion equation

The diffusion equation represents a time varying, the spatial balance of specific particles that are generated, absorbed, and leaked out/in due to non field diffusion [14].

Diffusion equation in a homogeneous medium can be written as:

$$\frac{1}{v}\frac{\partial \emptyset(\bar{r},t)}{\partial t} - \mathrm{D}\,\nabla^2\emptyset(\bar{r},t) = s(\bar{r},t) - \sum_a .\emptyset(\bar{r},t) \tag{1}$$

Where:
First term: Particles flux rate of change with time
Second term: Particles leakage rate
Third term: Particles generation rate
Fourth term: particles absorbing rate

2.2 Orthogonal series

Any continuous function can be expanded in an infinite series as:

$$f(x) = \sum_{i=0}^{\infty} a_i . s_i(x) \tag{2}$$

An orthogonal series is a special type, with the property:

$$\int_{x1}^{x2} s_i(x) \times s_j(x) \times w(x) = \begin{cases} 0 & i \neq j \\ constant & i = j \end{cases} \tag{3}$$

Chebyshev Polynomials $\sum_{i=0}^{\infty} a_i . T_i(x)$, and trigonometric polynomials $\sum_{i=0}^{\infty} a_i . \cos(ix)$, are examples of orthogonal polynomials.

2.3 Problem setting and examples

Normalizing the problem, eq. (1), by setting: $v = 1,\ D = 1,\ \sum_a = 1$ and let: $s(x,t) = K.\sum_a \emptyset(x,t)$, $K: constant$. Equation (1) in one spatial dimension will be

$$\frac{\partial \emptyset(x,t)}{\partial t} - \frac{\partial^2 \emptyset(x,t)}{\partial x^2} = (k-1)\,\emptyset(x,t) \tag{4}$$

The method will be tested for two examples:
Example A, have a spatial symmetrical initial condition:

$$\emptyset(x,0) = 4x(1-x);\ \emptyset(0,t) = 0;\ \emptyset(1,t) = 0 \tag{5A}$$

Example B, asymmetrical initial condition:

$$\emptyset(x,0) = x(1-x)(2-x)(3-x);\ \emptyset(0,t) = 0;\ \emptyset(1,t) = 0 \quad (5B)$$

3. Solution using Fourier analysis and Separation of Variables (SFASV).

Let

$$\emptyset(x,t) = \emptyset x(x).\emptyset t(t) \quad (6)$$

Equation (4) will be:

$$\emptyset x(x)\frac{d\emptyset t(t)}{dt} - \emptyset t(t)\frac{\mathrm{d}^2\emptyset x(x)}{\mathrm{dx}^2} = (k-1)\,\emptyset x(x).\emptyset t(t) \quad (7)$$

$$\frac{1}{\emptyset t(t)}\frac{d\emptyset t(t)}{dt} - \frac{1}{\emptyset x(x)}\frac{\mathrm{d}^2\emptyset x(x)}{\mathrm{d}x^2} = (k-1) \quad (8)$$

Equation (8) can be split to two equations:

$$\frac{1}{\emptyset t(t)}\frac{d\emptyset t(t)}{dt} = a_1 \quad (9)$$

$$\frac{1}{\emptyset x(x)}\frac{d^2\emptyset x(x)}{dx^2} = -(b_1)^2 \quad (10)$$

Where their solutions are:

$$\emptyset t(t) = A2.e^{a_1.t} \quad (11)$$

$$\emptyset x(x) = B1.cos(b_1.x) + B2.sin\,(b_1.x) \quad (12)$$

The general solution will be

$$\emptyset(x,t) = [C1.cos(b_1.x) + C2.sin\,(b_1.x)].e^{a_1.t} \quad (13)$$

From the boundary condition $\emptyset(0,t) = 0$, one can find that C1=0.
From the boundary condition $\emptyset(1,t) = 0$, one can find that:$b_1 = n.\pi,\ \ n = 1(1)\infty$
Note that $a_1 + (b_1)^2 = (k-1)$, hence $a_1 = (k-1) - (n\pi)^2$
Then the solution will be:

$$\emptyset(x,t) = \sum_{n=1(1)\infty} C_n.sin\,(n\pi.x)\,.e^{\left((k-1)-(n\pi)^2\right).t} \quad (14)$$

And from the initial condition: $\emptyset(x,0) = 4x(1-x)$

$$\emptyset(x,0) = \sum_{n=1(1)\infty} C_n.sin\,(n\pi.x) \quad (15)$$

This will give:

$$C_n = 2\int_0^1 \emptyset(x,0).sin(n\pi.x)\,.dx \quad (16)$$

Moreover, for the given examples:

$$C_n = 2\int_0^1 4x(1-x).\sin(n\pi.x)\,.dx \tag{17A}$$

$$C_n = 2\int_0^1 x(1-x)(2-x)(3-x).\sin(n\pi.x)\,.dx \tag{17B}$$

$$C_n = \left[\frac{32}{(n\pi)^3}\right], \quad n = 1(2)\infty\,, odd \tag{18A}$$

$$C_n = 0, \quad n = even$$

$$C_n = \left[\frac{48}{(n\pi)^3}\right], \quad n = 2(2)\infty\,, even \tag{18B}$$

$$C_n = \left[\frac{40}{(n\pi)^3} - \frac{96}{(n\pi)^5}\right], \quad n = 1(2)\infty\,, odd$$

Then (14) will be:

$$\emptyset(x,t) = \sum_{n=1(2)\infty}\left[\frac{32}{(n\pi)^3}\right].\sin(n\pi.x).\exp\left(\left((k-1)-(n\pi)^2\right).t\right) \tag{19A}$$

$$\emptyset(x,t) = \sum_{n=2(2)\infty}\left[\frac{48}{(n\pi)^3}\right].sin(n\pi.x).exp\left(\left((k-1)-(n\pi)^2\right).t\right) + \sum_{n=1(2)\infty}\left[\frac{40}{(n\pi)^3} - \frac{96}{(n\pi)^5}\right].sin(n\pi.x).exp\left(\left((k-1)-(n\pi)^2\right).t\right) \tag{19B}$$

4. Solution using Chebyshev Polynomials and Separation of Variables (SCPSV).
Chebyshev polynomials of the first kind have the following recurrence relations [22].

$$T_1(x) = 1, \qquad T_2(x) = x, \quad T_{n+1}(x) = 2x.T_n(x) - T_{n-1}(x)$$

They are listed with their second derivatives up to i=9 in Table1.

Table1: Some Chebyshev first kind polynomials, and their second derivatives.

i	$T_i(x)$	$T_i''(x)$
1	1	0
2	X	0
3	$2x^2$-1	4
4	$4x^3$-3x	24x
5	$8x^4$-$8x^2$+1	$96x^2$-16
6	$16x^5$-$20x^3$+5x	$320x^3$-120x
7	$32x^6$-$48x^4$+$18x^2$-1	$960x^4$-$576x^2$+36
8	$64x^7$-$112x^5$+$56x^3$-7x	$2688x^5$-$2240x^3$+336x
9	$128x^8$-$256x^6$+$160x^4$-$32x^2$+1	$7168x^6$-$7680x^4$+$1920x^2$-64

We have equation (4): $\frac{\partial\emptyset(x,t)}{\partial t} - \frac{\partial^2\emptyset(x,t)}{\partial x^2} = (k-1)\,\emptyset(x,t)$, and the boundaries are: x= [0,1], and $t_{initial}$ =0.

Note that for the problem {x=[0,1], t=[0,∞)}, while Chebyshev polynomials are defined in the interval {y=(-1,1)}. Therefore, axis transformation is required. Let: $x = \frac{y+1}{2},\ y = 2x - 1$. Then (4, 9, and 10) will be:

$$\frac{\partial \emptyset(y,t)}{\partial t} - 4\frac{\partial^2 \emptyset(y,t)}{\partial y^2} = (k-1)\,\emptyset(y,t) \tag{4.1}$$

$$\frac{1}{\emptyset t(t)}\frac{d\emptyset t(t)}{dt} = a_1 \tag{4.2}$$

$$\frac{d^2 \emptyset y(y)}{dy^2} = -\left(\frac{b_1}{2}\right)^2 \emptyset y(y) \tag{4.3}$$

The boundaries are y= [-1,1], and $t_{initial}$=0, and where for example (A):
$\emptyset(y,0) = (1-y^2);\ \emptyset(-1,t) = 0;\ \emptyset(1,t) = 0$
And for example (B):$\emptyset(y,0) = \left(\frac{15-8y-14y^2+8y^3-y^4)}{16}\right);\ \emptyset(-1,t) = 0;\ \emptyset(1,t) = 0$
Let the solution of (10.1) is:

$$\emptyset y(y) = \sum_{i=1}^{\infty} c_i . \emptyset y_i(y) \tag{20}$$

$$\emptyset y_i(y) = (T_i(y) - T_{i+2}(y)) + EP \tag{21}$$

And the total solution is:

$$\emptyset(y,t) = \sum_{i=1}^{\infty} c_i . \emptyset y_i(y) . \exp(a_{1i} . t)$$
$$a_{1i} = (k-1) - (i\pi)^2 \tag{22}$$

Where Equation Polynomial is an extension to $(T_i(y) - T_{i+2}(y))$ that will make the second derivative of $\emptyset y_i(y)$ a constant, $\left(-\left(\frac{b_i}{2}\right)^2\right)$, multiple of $\emptyset y_i(y)$ itself, and matching the characteristics of (10.1). To find the *EP(extended polynomial)*, multiply the second term in the function $(T_i(y) - T_{i+2}(y))$ by the value of $\left(-\left(\frac{b_i}{2}\right)^2\right)$, and add it to the second derivative, and add its double integral to the function, and so on. Some $\emptyset y_i(y)$, their second derivatives, and the corresponding $\left(-\left(\frac{b_i}{2}\right)^2\right)$ values are shown in Table2.

Table2: Some $\emptyset y_i(y)$, their second derivatives, and $\left(-\left(\frac{b_i}{2}\right)^2\right)$ values.

i	$T_i(y)$	$\emptyset y_i(y) = T_i(y) - T_{i+2}(y)$ + EP	$\frac{d^2 \emptyset y(y)}{dy^2}$	$-\left(\frac{b_i}{2}\right)^2$
1	1	$-y^{10}/56700+y^8/1260-y^6/45+y^4/3-2y^2+2$	$-y^8/630+2y^6/45-2y^4/3+4y^2-4$	-2
2	y	$-3y^{11}/3850+y^9/70-6y^7/35+6y^5/5-4y^3+4y$	$-3y^9/35+36y^7/35-36y^5/5+24y^3-24y$	-6
3	$2y^2-1$	$3125y^{14}/13621608-625y^{12}/149688+125y^{10}/2268-125y^8/252+25y^6/9-y^4/3-8y^4+10y^2-2$	$3125y^{12}/74844-625y^{10}/1134+625y^8/126-250y^6/9+250y^4/3-4y^2-96y^2+20$	-10

4	$4y^3-3y$	$-59049\ y^{17}/238238000 +6561\ y^{15}/1751750 -8(18)^7\ y^{13}/(13!) +8(18)^5\ y^{11}/(11!) -8(18)^4\ y^9/(9!) +8(18)^3\ y^7/(7!) -28\ y^5/5-16y^5+24y^3-8y$	$-59049\ y^{15}/875875 +19683\ y^{13}/25025 -13122\ y^{11}/1925 +1458\ y^9/35 -5832\ y^7/35 +1944\ y^5/5-112\ y^3-320\ y^3+144y$	-18

Note that:

$(b_i)^2(s)=4*s^2+4,$ s=odd (23)

$(b_i)^2(s)=4*s^2+8,$ s=even (24)

$$\emptyset y_s(odd)(y) = \sum_{j=1,3,5}^{\infty} (-1)^{\frac{s-1}{2}} (2) \left(\frac{b_s^2}{4}\right)^{\frac{j-1}{2}} \cdot \frac{y^{j-1}}{(j-1)!} \quad (25)$$

$$\emptyset y_s(even)(y) = \sum_{j=2,4,6}^{\infty} (-1)^{\frac{s+2}{2}} (2s) \left(\frac{b_s^2}{4}\right)^{\frac{j}{2}-1} \cdot \frac{y^{j-1}}{(j-1)!} \quad (26)$$

Note that the solution in (22), SCPSV, is a floating solution with respect to the boundary conditions. This represents an advantage, that it can be used for any boundary conditions while SFASV is limited to zero boundary conditions. To match the solution to the problem boundary conditions, the stated boundary conditions and that obtained from the floating solution are matched by a quadratic function in the spatial dimension, since it is the order of $\emptyset y_1(y)$. This show reasonable stability and convergence.

5. Results and discussion:

The (SFASV) is found according to (19) for the two examples. The solutions are modeled using Matlab, and it is found that the results are stable for N=7 (n truncated at 7). The (SCPSV) are also found according to (22) using Matlab, for different values of N (series truncation value of i), where $\emptyset y_i(y)$ are found according to (25 &26) and where j truncated at different (M_i) values (M=1, 2, &3 are used), and where for M>3 there are no effective changes in the results. (bi) values are found by (23&24) and C_i values are found by a least-square fitting of $\emptyset y_i(y)$ to the initial condition, according to (20).The total transient solutions for (k=20, t_{final}= 0.1) by SFASV with N=7 and by SCPSV with N=25, M=3 are shown in Fig. (1) for example A and in Fig. (2) for Example B. While total transient solution figures show no differences between the two methods, one can use better descriptive comparisons. Fig. (3&4) shows the solutions by SCPSV for different N&M values compared to the solution by SFASV with N=7, for examples A & B respectively. Fig. (5) shows an average of the absolute difference of the whole solutions between SFASV with N=7 and SCPSV for different N & M values, for example, B. Example A shows the same behavior. Figures (3, 4 &5) show clearly the SCPSV stability and convergence with N & M values.

Three Weighted Residuals Methods for Solving the Nonlinear Thin Film Flow Problem

Three Weighted Residuals Methods for Solving the Nonlinear Thin Film Flow Problem

Abstract. In this paper, the methods of weighted residuals: Collocation Method (CM), Least Squares Method (LSM) and Galerkin Method (GM) are used to solve the thin film flow (TFF) equation. The weighted residual methods were implemented to get an approximate solution to the TFF equation. The accuracy of the obtained results is checked by calculating the maximum error remainder functions (MER). Moreover, the outcomes were examined in comparison with the 4th-order Runge-Kutta method (RK4) and good agreements have been achieved. All the evaluations have been successfully implemented by using the computer system Mathematica®10.

1. Introduction

Physical phenomena and engineering problems are often formulated in the form of ordinary differential equations with initial or boundary conditions. Many researchers have studied the exact or approximate solution of these types of equations [1, 2].

Thin liquid films are important in many applications, for example, the non-Newtonian fluids are polymer, oils, and greases, melts, blood and drilling muds. Solving the nonlinear problems is still not an easy task, and the exact solution cannot be obtained for many problems, therefore, either approximate or numerical solutions can be achieved. Many researchers have studied and addressed non-Newtonian fluid behavior problems with a wide range of applications [3, 4].

During the past few years many researchers have been interested to study the non-Newtonian fluids, thin film equation and treated by using different analytic methods such as: He [5] has solved the TFF equation by using the variational iteration method (VIM), AL-Jawary [6] solved the TFF equation by Temimi and Ansari method (TAM), Al-Jawary *et al*.[7] applied the Banach contraction principle method (BCPM) to find the approximate solutions of the nonlinear TFF equation and made a comparison with the solutions obtained from the variational iteration method and the homotopy perturbation method. Moreover, Sajid and Hayat [8] applied the homotopy perturbation method to provide the analytic solutions to two TFF equations of third order. Also, Manafian and Sindi [9] have solved the TFF equation by the optimal homotopy asymptotic method (OHAM).

On the other hand, there are accurate and reliable approximate techniques used to solve differential equations: the Collocation method, least square method and Galerkin method. Arnau et al. [10] introduced and used a new method constructed on a polynomial collocation to solve the models of one-dimensional flow in the systems of intake and exhaust of interior combustion engines. Also, Aswhad [11] applied the collocation method with the Bernstein polynomials as a basis function to solve the first

order linear delay differential equations approximated. Moreover, Vaferi *et al*. [12] presented the transient pressure response study by using the method of orthogonal collocation to solve the diffusion equation in the system of radial transient flow, Raghad *et al*. [13] obtained the approximate solutions for nth-order retarded by using Collocation method with the aid of B-Spline functions and Weddle method, Ahuja [14] obtained the solution using the technique of normal modes and weighted residual Galerkin approximation. Also, Ganji and Hatami [15] have been applied the collocation, Galerkin and least square methods for solving Jeffery-Hamel Flow. Daşcioğlu and Acar [16] used the collocation method for approximate solutions of initial and boundary value problems. Furthermore, Al-Hawasy and Jaber [17] used the Galerkin method to demonstrate the existence and uniqueness theorem of the state vector solution, Al-Hawasy and Jawad [18] applied the Galekin finite element method for the equations of the nonlinear parabolic boundary value problem, Tufekci *et al*.[19] studied the forced vibration characteristics of the rotating disk by using the Galerkin method.

This paper aims to apply the weighted residuals methods (WRMs): Collocation Method (CM), Least Squares Method (LSM) and Galerkin Method (GM) to find the approximate solutions of the TFF equation.

This paper is arranged as follows: In section 2, the nonlinear TFF problem will be presented. The basic concepts of the methods of weighted residuals are introduced in section 3. In section 4, solving the nonlinear TFF equation will be introduced by the weighted residuals methods. Finally, the conclusion is given in section 5.

2. The Nonlinear TFF Problem

In this section, the flow of thin film of the non-Newtonian fluid will be presented on a moving belt [20]. The flow is fixed, laminar and uniform. The thickness of the film is uniform as well as the flow. We can introduce the governing equations of this problem as follows

$$\frac{d^2u}{dx^2}+\frac{6(k_2+k_3)}{\mu}\left(\frac{du}{dx}\right)^2\frac{d^2u}{dx^2}-\frac{\rho g}{\mu}=0, \tag{1}$$

$$u(0)=k, \text{ and } \frac{du}{dx}=0, at\ \ x=\delta, \tag{2}$$

where u is the velocity, k_2 and k_3 are the third degree fluid materiality constants, μ symbolize the dynamic viscosity, ρ present a density, g is gravitational acceleration, δ describes the thickness of the film and k is the belt speed.

We can write the dimensionless variables as below

$$\check{x}=\frac{x}{\delta}\ ,\check{u}=\frac{u}{k}\ ,\gamma=\frac{(k_2+k_3)k^2}{\mu\delta^2}, \text{ and } \sigma=\frac{\rho g\delta^2}{\mu k} \tag{3}$$

By removing (ˇ) from equation (3) and substituting equation (3) in equations (1) and (2), the equation of dimensionless form for the nonlinear boundary value problem is

$$\frac{d^2u}{dx^2}+6\gamma\left(\frac{du}{dx}\right)^2\frac{d^2u}{dx^2}-\sigma=0, \tag{4}$$

$$u(0)=1, \text{ and } \frac{du}{dx}=0, x=1. \tag{5}$$

Equation (4) is considered to be a well-posed problem because it is a second order nonlinear ODE and it has two boundary conditions.

By integrating equation (4) twice and using the boundary conditions given in equation (5), we get:

$$\frac{du}{dx}+2\gamma\left(\frac{du}{dx}\right)^3-\sigma x=a, \tag{6}$$

where a is the constant of integration process. To calculate the constant in equation (6), we used the 2nd condition given in equation (5), and then the value of $a = -\sigma$. Thus, we can write the nonlinear system in equations (4) and (5) as follows

$$\frac{du}{dx} + 2\gamma(\frac{du}{dx})^3 - \sigma(x-1) = 0, \text{ where } u(0) = 1. \quad (7)$$

3. Weighted Residuals Methods (WRMs) [12, 15]

The basic idea of the weighted residuals method is to find the approximate solution in the form of a polynomial to the differential equation of the formula

$$D[u(x)] = \varepsilon(x). \quad (8)$$

Let us assume that $\tilde{u}$ is approximate to u, and $\tilde{u}$ is a linear combination of basis functions selected by a linearly independent set that must satisfy the boundary conditions, that is:

$$u \cong \tilde{u} = \sum_{i=1}^{n} c_i \varphi_i. \quad (9)$$

Substituting equation (9) in equation (8), when the differential operator *D* is linear or nonlinear, the result of the operation is generally $\varepsilon(x)$. So, there will be an error or residual:

$$R(x) = D\big(\tilde{u}(x)\big) - \varepsilon(x) \neq 0. \quad (10)$$

The idea in the WRMs is to impose the error to zero. That is:

$$\int_X R(x) W_i(x) dx = 0, \ i = 1,2, \dots, n \quad (11)$$

The number of weight functions W_i is similar to the number of unknown constants c_i in $\tilde{u}$. The results will be the set of *n* algebraic equations of c_i. Three methods of WRMs will be presented in the next subsections to solve these equations and get the values of unknown constants.

3.1. Collocation Method(CM)

This method is based on the weighting functions, which depend on the Dirac δ functions in the domain. Such that

$$\delta(x - x_i) = \begin{cases} 1 & x = x_i \\ 0 & otherwise \end{cases}. \quad (12)$$

Thus, the integral of the weighted residual results in the residual equals zero at some selected points in the domain. That is, insert equation (12) in equation(11), results in $R(x_i) = 0$.

3.2. Least Squares Method(LSM)

This method depends on the minimization of the continuous summation of all the squared residuals. That is, a minimum of

$$S = \int_X R(x) R(x) dx = \int_X R^2(x) dx, \quad (13)$$

The derivatives of equation (13) must be zero with respect to all the unknown parameters, in order to obtain a minimum of a scalar function. That is,

$$\frac{\partial S}{\partial c_i} = 2 \int_X R(x) \frac{\partial R}{\partial c_i} dx = 0. \quad (14)$$

Then, compared equation (14) to equation (11), the weight functions can be

$$W_i = 2\frac{\partial R}{\partial c_i}. \quad (15)$$

However, the "2" will be canceled from the equation (15), we can neglect it. Then, the LSM weight functions are just the residual derivatives for the unknown constants:

$$W_i = \frac{\partial R}{\partial c_i}. \quad (16)$$

3.3. Galerkin Method (GM)

This method can be considered as a modification of the LSM. The derivative of the approximate function is used instead of the residual derivative for the unknown c_i. In other words, if the function is approximated as in equation (9), then the weight functions are given by

$$W_i = \frac{\partial \tilde{u}}{\partial c_i}, \quad (17)$$

$$\int_X W_i R(x)dx = 0, \ i = 1,2,\dots,6. \quad (18)$$

By substituting equation (17) in equation (18) and putting the weighted residual integration equal to zero, then the unknown coefficients in the approximate solution will be determined.

4. Solving The Nonlinear TFF Equation by The Method of Three Weighted Residuals

Before solving the nonlinear TFF equation, we recall the Weierstrass theorem [21]:

Theorem 4.1: If $u: [a, b] \to \mathbb{C}$ is continuous and $\epsilon > 0$ then there exists a polynomial p such that $|u(x) - p(x)| < \epsilon$, for all $x \in [a, b]$.

4.1. CM for Solving TFF Equation

The trial function is considered as [22]:

$$\tilde{u}(x) = 1 + \sum_{i=1}^{n} c_i x_i^n \qquad n = 6\,. \quad (19)$$

Where, equation (19) satisfies the initial condition. By replacing equation (19) in equation (10) and using equation (7), then we get the residual function:

$$R(x) = -\sigma(-1 + x) + c_1 + 2xc_2 + 3x^2c_3 + 4x^3c_4 + 5x^4c_5 + 6x^5c_6 + 2\gamma(c_1 + 2xc_2 + 3x^2c_3 + 4x^3c_4 + 5x^4c_5 + 6x^5c_6)^3, \quad (20)$$

Furthermore, the residual function should be tend to zero, to reach this goal, we first collocate equation (20) at $n - 1$ suitable points and choosing by [23]:

$$x_i = \left(\frac{1}{2}\right)\left(cos\ \left(\frac{i\pi}{n}\right) + 1\right), \ i = 1, 2, \dots, n \quad (21)$$

By substituting equation (21) and choosing the values of $\gamma = 0.5$ and $\sigma = 0.3$ as proposed in [24] in equation (20), then a set of six equations and six unknown coefficients were obtained by replacement these points into the residual function $R(x)$ with $n = 6$. After solving these unknown parameters c_1, c_2, c_3, c_4, c_5 and c_6, the formula of the $\tilde{u}(x)$ will be determined

$$\tilde{u}(x) = 1. - 0.2784179903218099x + 0.12170283596956218x^2 + 0.013323650734029828x^3 + 0.00064163429638052 9x^4 - 0.0012608938213647149x^5 - 0.00020578092642242158x^6. \quad (22)$$

4.2. LSM for Solving TFF Equation

The trial function in equation (19) must satisfy the initial condition, and the residual will be defined by equation (20). By replacing the residual function *R(x)* given in equation (14) with taking into account equation (16), a set of six equations will be obtained. We will solve this system of equations to find the values of coefficients c_1, c_2, c_3, c_4, c_5 and c_6, we get:

$$\tilde{u}(x) = 1. - 0.2784200109488398x + 0.12174092145386706x^2 + 0.013114374195112015x^3 + 0.0011173100601081297x^4 - 0.00173639971405525 5x^5 - 0.00003254002646081224 4x^6. \quad (23)$$

4.3. GM for Solving TFF Equation

In this method, the approximate function $\tilde{u}(x)$ is derived with respect to the unknown coefficients c_i to obtain the weight function W_i as mentioned in the equations (17) and (18), the weight functions will be:

$$W_1 = x\,, W_2 = x^2, W_3 = x^3, W_4 = x^4, W_5 = x^5\,, W_6 = x^6. \quad (24)$$

$$\int_a^b (1 + W_i) R(x) dx = 0,\ i = 1,2, \dots ,6. \quad (25)$$

By substituting equation (24) into equation (25), and applying equation (14), we getting a system of algebraic equations that will be solved to get the values of unknown coefficients, and substituting these values into equation (19), we have:

$$\tilde{u}(x) = 1. - 0.2784269835482562x + 0.12180368394378813x^2 + 0.012886759804023607x^3 + 0.0015069962962708115x^4 - 0.00205157568378486x^5 + 0.00006458861736018161x^6. \quad (26)$$

To check the accuracy of the approximate solutions and since the exact solution is unknown, we define the following maximal error remainder function

$$MER_n = |ER_n|\,, \quad (27)$$

where

$$ER_n(x) = \frac{d}{dx}\left(\tilde{u}(x)\right) + 2\gamma\left(\frac{d}{dx}\left(\tilde{u}(x)\right)\right)^3 - \sigma(x-1) = 0. \quad (28)$$

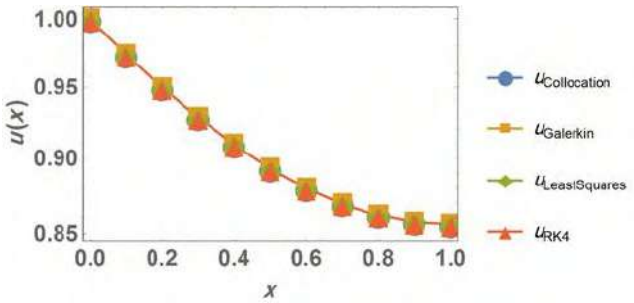

Figure 1. Comparison between ũ(x) obtained by the WRMs and the RK4 for $0 \le x \le 1$ when $\gamma = 0.5$ and $\sigma = 0.3$.

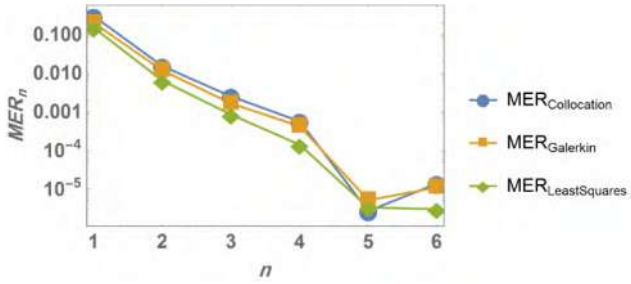

Figure 2.The logarithmic plots for the curves of the $MER_{Collocation}$,$MER_{Galerkin}$ and $MER_{LeastSquares}$ when $\gamma = 0.5$ and $\sigma = 0.3$.

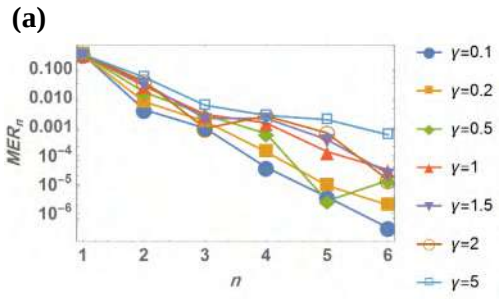

Figure 3. (a) $MER_{Collocation}$ with various value of γ when $\sigma = 0.3$

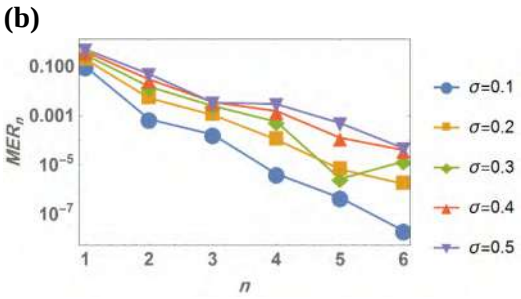

(b)$MER_{Collocation}$ with various values of σ when $\gamma = 0.5$

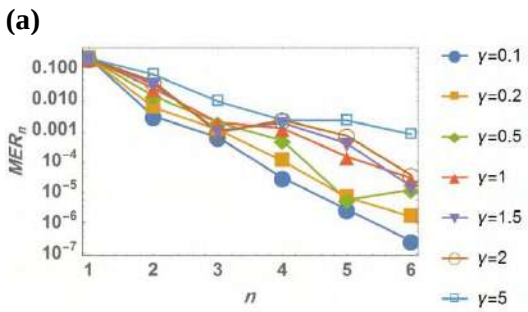

Figure 4. (a) $MER_{Galerkin}$with various values of γ when $\sigma = 0.3$

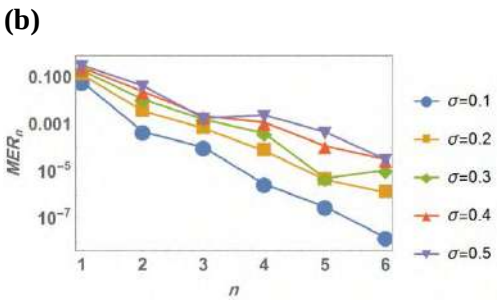

(b) $MER_{Galerkin}$with various values of σ when $\gamma = 0.5$.

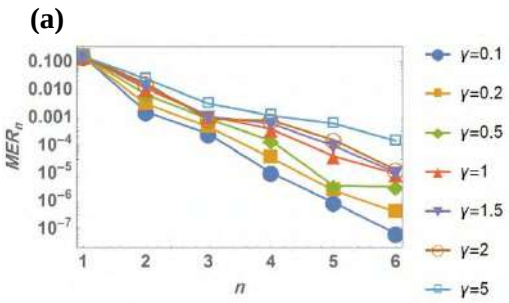

Figure 5. (a) $MER_{LeastSquares}$with various values of γ when $\sigma = 0.3$.

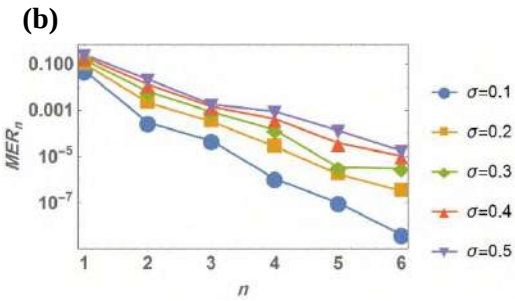

(b)$MER_{LeastSquares}$ with various values of σ when $\gamma = 0.5$.

Figure 1 shows good agreements have been obtained between the approximate solution from the use of WRMs as shown in the equations (22), (23) and (26) and the numerical solution obtained by the RK4 method. Also, Figure 2 shows the approximate solution obtained by the LSM has a lower error and good accuracy compared to the other methods.

Moreover, figures 3, 4 and 5 are present the effects of γ and σ values on the error of MER_n of the WRMs of the CM, GM and LSM, respectively that calculated according to the equations (27) and (28). An additional numerical examination can be performed by studying the influence of the non-Newtonian parameter γ and the value σ on the velocity given in equation (7). The differences are shown in figures 6(a), 7(a), and 8(a), when the γ value is stationary, the velocity tends to the Newtonian state when σ values increase. On the other side, figures. 6(b), 7(b), and 8(b) show that the non-Newtonian parameter γ is decreased when σ is kept fixed; the solution approaching the Newtonian case.

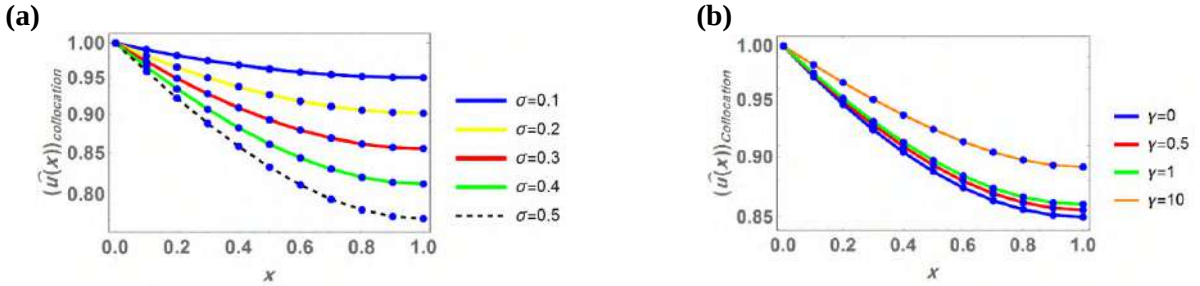

Figure 6. (a)Impact of σ on ũ(x) when $\gamma = 0.5$. (b)Impact of γ on ũ(x)when $\sigma = 0.3$.

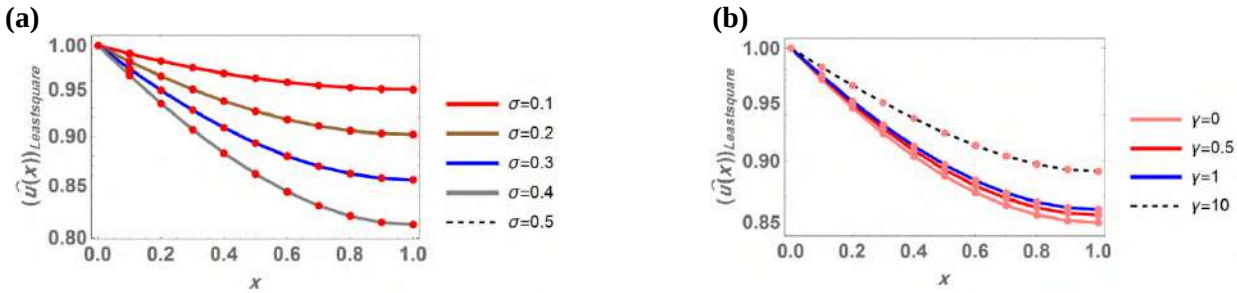

Figure 7. (a) Impact of σ on ũ(x) when $\gamma = 0.5$. (b) Impact of γ on ũ(x)when $\sigma = 0.3$.

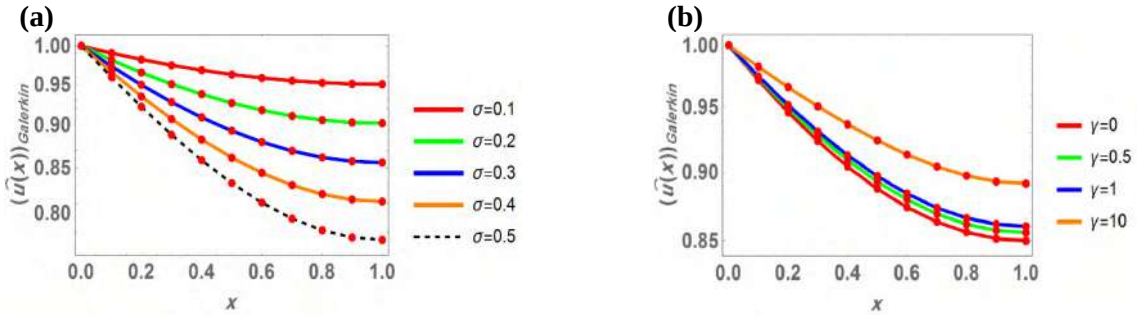

Figure 8. (a) Impact of σ on ũ(x) when $\gamma = 0.5$. (b) Impact of γ on ũ(x) when $\sigma = 0.3$.

Table 1 presents the values of $\tilde{u}(x)$ when $\gamma = 0.5$ and $\sigma = 0.3$ which are obtained by applying the CM, LSM, GM and RK4 method, a good agreement between the approximate solution obtained by the proposed methods and RK4 method. Furthermore, table 2 presents the numerical values of the MER functions for the three proposed methods, and the errors will be reduced when the values of *n* are increased, and the errors of the LSM are less than others which state that the LSM provides the best approximate solution.

5. CONCLUSION

In this paper, we obtained the approximate solution to the TFF equation by applying the WRMs which are the CM, LSM, and GM. The approximate solutions obtained that provided the WRMs are reliable and effective methods. A good agreement has been achieved by comparing the numerical solution obtained by using the 4th-order Runge-Kutta method and the proposed methods. It can be concluded from the figures and tables, that the maximal error remainder will be reduced when the values of polynomial power *n* are increased. Moreover, the LSM provided the best approximate solution with less error. Finally, we found that selecting the parameters had an influence on convergence as well.

Abstract: Binary knapsack problem has received considerable attention in combinational optimization. Various meta-heuristic algorithms are dedicated to solve this problem in the literature. Recently, a binary flower pollination algorithm (BFPA) was proposed, which has been successfully applied to solve 0-1 knapsack problem. In this paper, two new time-varying transfer functions are proposed to improve the exploration and exploitation capability of the BFPA with the best solution and short computing time. Based on small, medium, and high-dimensional scales of the knapsack problem, the computational results reveal that the proposed time-varying transfer functions not only to find the best possible solutions but also to have less computational time. Compared to the standard transfer functions, the efficiency of the proposed time-varying transfer functions is superior, especially in the high-dimensional scales.

1. Introduction

The process of optimization is searching and finding the optimal solution of a given problem [1, 2]. In general, based on the nature of the search space and decision variables, an optimization problem can be divided into three main classes: continuous, discrete and mixed integer optimization problem [3, 4]. The binary optimization problems are a set classes of the discrete optimization problem in which the decision variable is a set of bits.

The knapsack problem is an optimization problem that can be modelled as a discrete binary optimization problem. The knapsack problem has widely studied in many real world applications, such as project selection, cutting stock problems, scheduling problems, resource allocation, and investment decision making [5-7].

There are several methods that have been developed to solve knapsack problem which can be divided into two types: exact methods, such as branch and bound method and dynamic programming. These methods can give the exact solution, but it is effective for small sized problems. The second type includes approximate methods that can give an approximate solution, but at reasonable times compared to exact methods [8-10].

In recent years, several meta-heuristic methods were proposed for tackling 0-1 knapsack problem, such as monarch butterfly optimization (MBO)[11], bat algorithm (BA)[12,13], particle swarm optimization (PSO)[14-16], monkey algorithm (MA)[17], ant colony optimization (ACO)[18], amoeboid organism algorithm (AOA)[19], and harmony search (HS)[20].

The flower pollination algorithm is a bio-inspired algorithm that mimics the pollination characteristics of flowers in plants. Flower pollination algorithm is first proposed by Yang [21] for solving single objective optimization problems. In (2014) Yang et al.[22] extended flower pollination algorithm for solving multi objective optimization problems. In (2015) Yang [23] proposed a binary flower pollination algorithm to tackle a feature selection problem. Abdel-Basset et al. [9] proposed a binary version of flower pollination algorithm for solving both small and large scale knapsack problem. Compared with some other algorithms, the flower pollination algorithm can perform better in terms of the global convergence and the convergence speed.

In the binary flower pollination algorithm, a transformation function is used to convert the continuous values generated from the algorithm into binary ones, and, therefore it is able to provide a binary flower pollination algorithm a sufficient amount to balance between exploration and exploitation [24].

In this paper, two efficient time-varying transfer functions are proposed to solve the 0 –1 knapsack problem. The proposed transfer functions are based on combining the S-shaped and V-shaped transfer functions with time-varying concept.

The remainder of this paper is organized as follows. Section 2 describes the basic 0 –1 knapsack problem. Section 3 introduces binary flower pollination algorithm. In Section 4, the proposed time-varying transfer functions are presented. Section 5 presents and discusses the experimental results. In section 6, conclusion is drawn.

2. Knapsack problem

Knapsack problem is a NP-hard combinatorial optimization problem and defined as follows [8, 25]:

Given a set of n items, each item i has a profit c_i and weight w_i. The objective is to select a subset of the items such that the total profit is maximized without exceeding the knapsack's capacity M. Mathematically, the knapsack problem can be formulated as follows:

$$Max\ f\left(x\right)=\sum_{i=1}^{n}c_i x_i \qquad (1)$$

s.t.

$$\sum_{i=1}^{n}w_i x_i \le M \qquad (2)$$

where

$$x_i=\begin{cases}1 & \text{if item i is selecled}\\ 0 & \text{otherwise}\end{cases}$$

To solve knapsack problem, we select a subset of the items of the binary vector x_i such that the optimal solution satisfies the constraint in Eq. (2) and maximizes the objective function in Eq.(1).

In such a constrained optimization problem, the penalty function is used to handle the constrained knapsack problem. As known, the knapsack problem is a maximization problem that can be converted into minimization by multiplying Eq. (1) by -1. As a result, the penalty function can be written as follow:

$$Min\phi\left(x\right)=-f\left(x\right)+\lambda Max\left(0,h\right) \qquad (3)$$

Where $h=\sum_{i=1}^{n}w_i x_i - M$ and λ represents the penalty coefficient. In this paper λ set to 10^{10} for all tests. The penalty function can be described in Figure1.

Penalty function

- **input** solution x_i
- Calculate total weight of x_i by $\left(\sum_{i=1}^{n} w_i x_i\right)$
- **if** $\left(\sum_{i=1}^{n} w_i x_i \le M\right)$
- $\phi(x) = -\sum_{i=1}^{n} c_i x_i$
- **else**
- $\phi(x) = -\sum_{i=1}^{n} c_i x_i + \lambda\left(\sum_{i=1}^{n} w_i x_i - M\right)$
- **end**

Figure 1: Penalty function

A Repair operator is treated the infeasible solutions which violates the constraint in Eq. (2) by converting them into feasible solutions and also improve the feasible solutions. The repair operator algorithm can be applied in two stages. The first stage is to convert the infeasible solution into feasible by taking out the items of the lower c_i / w_i ratio so as the constraint in Eq. (2) is not to exceed the knapsack capacity. The second stage is to improve the feasible solution by adding the items of the high c_i / w_i ratio to the knapsack with the keeping of the constraint.

3. Binary flower pollination algorithm(BFPA)

Yang (2012) proposed a new algorithm for global optimization called flower pollination algorithm [21]. It is a meta-heuristic algorithm that mimics nature, inspired of the pollination process in flowers.

Pollination in flowers can be taken two forms: biotic pollination and abiotic pollination. In the first type, the pollen is transferred by pollination like insects and animals. While the second form based on wind and diffusion in the water.

Pollination can be divided into self-pollination and cross-pollination. Self-pollination is transferring the pollens from one flower to the same flower or different flowers in the same plant. Cross-pollination is transferring the pollens from one flower to another flower of a different plant. A flower and its pollen represented a solution to the optimization problem. In the flower pollination algorithm, four basic rules are used[21, 26, 27]:

1. The global pollination includes biotic and cross-pollination, the pollinators move in a way that follows a lévy flight distribution.
2. The local pollination includes abiotic and self-pollination.
3. Flower constancy can be considered as the reproduction probability that is proportional to the similarity of two flowers involved.
4. We use a switch probability $p \in [0,1]$ to switch between global pollination and local pollination.

Rules 1 and 3 can be expressed mathematically as:

$$x_i^{t+1} = x_i^t + \gamma L(\lambda)\left(x_i^t - g^*\right) \quad (4)$$

where x_i^t is the solution vector or the pollen i at iteration t, g^* is the current best solution that is found at the current iteration, γ is a scaling factor to control the step size, $L(\lambda)$ is the step size in the lévy flights which is representing the strength of the pollination. Since pollinators move over a long distance with various distance steps, a lévy flight can be used to mimic this behaviour. That is, $L > 0$ from a lévy distribution as

$$L \sim \frac{\lambda\Gamma(\lambda)\sin\left(\frac{\pi\lambda}{2}\right)}{\pi}\left(\frac{1}{S^{1+\lambda}}\right)(S >> S_0 > 0) \quad (5)$$

Yang (2012) proposed $\Gamma(\lambda)$, the standard gamma function, and $\lambda = 1.5$. This distribution is valid for large steps $S > 0$. In (1994), Mantegna used the Gaussian distribution for generating the step size S by generating two random numbers U and V as follows [26]:

$$S = \frac{U}{|V|^{1/\lambda}} \quad U \sim N\left(0,\sigma^2\right),\ V \sim N(0,1) \quad (6)$$

$$\sigma^2 = \left(\frac{\Gamma(1+\lambda)}{\lambda\Gamma\left[(1+\lambda)/2\right]} * \frac{\sin(\pi\lambda/2)}{2^{\frac{\lambda-1}{2}}}\right)^{1/\lambda} \quad (7)$$

For local pollination, rules 2 and 3 can be expressed as:

$$x_i^{t+1} = x_i^t + k\left(x_j^t - x_k^t\right) \quad (8)$$

where x_j and x_k are the pollens (solution vectors) from different flowers of the same plant. k is the parameter draws from a uniform distribution in $[0,1]$. To switch between common global pollination to intensive local pollination, we used rule 4. In 2012,Yang suggested that switch probability or proximity probability $p = 0.8$ for most applications. The flower pollination algorithm can be presented in Figure 2.

Flower Pollination Algorithm

Begin

- Define the objective function max or min $f(x)$, and switch probability $p \in [0,1]$
- Initialize the population of n random flowers
- Evaluate each flowers in the population
- Find the best solution
- **while** (stopping criterion)
- **for** i=1:n
- **if** (r<p)
- New solution =global pollination Eq. (4)
- **else**
- New solution = local pollination Eq. (8)
- **end if**
- Evaluate new solution
- If new solution is better , update the population
- **end for**
- Find current best solution
- **end while**

Figure 2: Flower pollination algorithm

4. The proposed time-varying transfer functions

The knapsack problem can be modeled as a discrete problem in which the solution vector is binary, where 1 corresponds to that an item will be selected in the knapsack and 0 otherwise. In any binary algorithm, where one uses the step vector to calculate the probability of changing positions, the transfer functions significantly impact the balance between exploration and exploitation[24, 28].

In BFPA, the transfer function is used to map a continuous search space to a binary one, and the updating process is designed to switch positions of pollens between 0 and 1 in binary search spaces. In order to build this binary vector, a transfer function in Eq. (9) can be used after Eq. (8), in which the new solution is constrained to only binary values:

$$x_i^t = \begin{cases} 1 & if \quad T(x) > r \\ 0 & o\,w \end{cases} \tag{9}$$

where $r \in [0,1]$ is a random number, $T(x)$ is the transfer function.

Mirjalili and Lewis [29] introduced eight transfer functions and divided them into two families: S-Shaped transfer functions and V-Shaped transfer functions. These transfer functions are listed in Table 1. The transfer function was tested by Mirjalili and Lewis on 25 benchmark functions. The results show that V-shaped transfer functions are useful for the binary particle swarm optimization, especially V_4 function has merit for solving these functions. Teng et al.[30] has demonstrated the effect of V-shaped transfer function using binary particle swarm optimization on the feature selection problem. The experimental tests reveal that the efficiency of the proposed method.

In optimization algorithm, it is expected that the focus of the early stages of the implementation the algorithm will be on exploration to avoid falling into the local point, but in later stages of implementing the algorithm focuses more on exploitation to improve the quality of the solution[24, 28].

In this paper, two dynamic transfer functions are adapted form Mafarja, Aljarah [28] and Islam, Li [24], and proposed to improve the BFPA with the following considerations [24]:

1. In the early stages of the implementation, the transfer function should provide a high probability of flipping all the bits of x_i so that the BFPA can provide a stronger exploration.
2. In the intermediate stages of the implementation, the BFPA should start shifting from exploration to exploitation. This can achieved by using a transfer function that can reduce the probability of flipping all the bits of x_i .
3. In the final stages of the implementation, the transfer function should provide a low probability of flipping all the bits of x_i , so that the BFPA can provide a stronger exploitation capability.

In our proposed time-varying transfer function (TV), a new control parameter τ is added in the original transfer function. This τ is a time varying variable which starts with large value and gradually decreases over time. Two types of τ are proposed as follow:

$$\tau_1 = \left(1 - \frac{t}{T}\right)\tau_{1,\max} + \frac{t}{T}\tau_{1,\min} \tag{10}$$

and

$$\tau_2 = \tau_{2,\max} - t\left(\frac{\tau_{2,\max} - \tau_{2,\min}}{T}\right) \tag{11}$$

where $\tau_{\max}$ and $\tau_{\min}$ are the minimum and maximum values of the control parameter τ , and T is the maximum iteration of the BFPA. Table 2 lists the two proposed time-varying transfer functions.

Table 1: Families of transfer functions

	S-Shaped family		V-Shaped family
S1	$T(x)=\frac{1}{1+e^{-2x}}$	**V1**	$T(x)=\left\lvert erf\left(\frac{\sqrt{\pi}}{2}x\right)\right\rvert$
S2	$T(x)=\frac{1}{1+e^{-x}}$	**V2**	$T(x)=\lvert\tanh(x)\rvert$
S3	$T(x)=\frac{1}{1+e^{-\frac{x}{2}}}$	**V3**	$T(x)=\left\lvert\frac{x}{\sqrt{1+x^2}}\right\rvert$
S4	$T(x)=\frac{1}{1+e^{-\frac{x}{3}}}$	**V4**	$T(x)=\left\lvert\frac{2}{\pi}\arctan\left(\frac{\pi}{2}x\right)\right\rvert$

Table 2: The two proposed time-varying transfer functions.

	Time-varying 1		Time-varying 2
T1S1	$TVS(x)=\frac{1}{1+e^{\frac{-2x}{\tau_1}}}$	**T2S1**	$TVS(x)=\frac{1}{1+e^{\frac{-2x}{\tau_2}}}$
T1S2	$TVS(x)=\frac{1}{1+e^{\frac{-x}{\tau_1}}}$	**T2S2**	$TVS(x)=\frac{1}{1+e^{\frac{-x}{\tau_2}}}$
T1S3	$TVS(x)=\frac{1}{1+e^{-\frac{x}{2\tau_1}}}$	**T2S3**	$TVS(x)=\frac{1}{1+e^{-\frac{x}{2\tau_2}}}$
T1S4	$TVS(x)=\frac{1}{1+e^{-\frac{x}{3\tau_1}}}$	**T2S4**	$TVS(x)=\frac{1}{1+e^{-\frac{x}{3\tau_2}}}$

Table 3: The two proposed time-varying transfer functions.

T1V1	$TVV(x)=\left\lvert erf\left(\frac{\sqrt{\pi}x}{2\tau_1}\right)\right\rvert$	**T2V1**	$TVV(x)=\left\lvert erf\left(\frac{\sqrt{\pi}x}{2\tau_2}\right)\right\rvert$
T1V2	$TVV(x)=\left\lvert\tanh\left(\frac{x}{\tau_1}\right)\right\rvert$	**T2V2**	$TVV(x)=\left\lvert\tanh\left(\frac{x}{\tau_2}\right)\right\rvert$
Γ1V3	$TVV(x)=\left\lvert\frac{x/\tau_1}{\sqrt{1+x^2/\tau_1}}\right\rvert$	**Γ2V3**	$TVV(x)=\left\lvert\frac{x/\tau_2}{\sqrt{1+x^2/\tau_2}}\right\rvert$
Γ1V4	$TVV(x)=\left\lvert\frac{2}{\pi}\arctan\left(\frac{\pi x}{2\tau_1}\right)\right\rvert$	**Γ2V4**	$TVV(x)=\left\lvert\frac{2}{\pi}\arctan\left(\frac{\pi x}{2\tau_2}\right)\right\rvert$

5. Computational results

5.1. Parameter setting

For the binary flower pollination algorithm, the parameters were setting as follows: the population size =50, $\lambda = 1.5$, $p = 0.8$. In this paper, we use linear decreasing time varying where $\tau_{\max} = 4$, $\tau_{\min} = 0.1$, and T represents the maximum number of iterations.

5.2 Comparison results

To verify the feasibility and effectiveness of the proposed time-varying transfer functions method for solving 0–1 Knapsack problem, three scales of the knapsack problem are considered: low, medium, and high-dimensional scales. In this paper, all the results are obtained from 50 independent trials. The best solution, the worst solution, the mean and the standard deviation (SD) values, Mean iterations are reported as evaluation criteria. All of the computational experiments were conducted in Matlab 13a on a PC with an Intel Pentium Core i7-7500 processor (2.9 GHz) with 16GB of RAM in the Windows 10 OS.

5.2.1 Low scale 0-1 KP

The performance of the improved algorithm is investigated to solve ten low scale 0-1 KP instances (kp-1 to kp-10), which are taken from [9, 13]. The dimensions in this case are ranging from 4 to 23. The information dimension, capacity, weights and profits for these ten instances are described in Table S1 (Appendix). Table 4 shows the comparison results for all the used different transfer functions for the kp1 and kp10. The rest instances are listed in Table S2 (Appendix).

As observed from the results in Table 4 and Table S2, for the low scale knapsack problems, there is no difference among the results of using the proposed time-varying transfer functions and the standard transfer functions in terms of the best, worse, mean, and SD values. The major difference among the performance of the proposed time-varying transfer functions and the standard transfer functions in not expected because of relatively small numbered items. Contrary, the proposed time-varying transfer functions give optimal results with less number of iterations. The mean iterations of the proposed time-varying transfer functions are obviously better than the standard transfer functions for kp8, kp9, and kp10 where the number of items is higher than the others. Moreover, comparing between the two proposed transfer function, the required iterations to get the optimal solution using Eq. (11) is less than of Eq. (10) for kp8, kp9, and kp10.

	T2V4	9767	9767	9767	0	1

5.2.2 Medium scale 0-1 KP

To further evaluate the performance of proposed time-varying transfer functions in medium scale 0-1 Knapsack problem, ten medium size 0-1 KP instances (kp-11 to kp-20) are taken from [9, 13] in which the items are between 30 and 75. The description of these ten instances is described in Table S3 (Appendix). Table 5 summarizes the comparison results for all the used different transfer functions for the kp15 and kp20. The rest instances results are reported in Table S4 (Appendix).

Obviously, it is evident from Table 5 and Table S4 that the proposed time-varying transfer functions obtained the same best, worse, mean, and SD values as the standard transfer functions. From Tables 5 and S4, for the mean iterations, the proposed time-varying transfer functions are superior to the other eight standard transfer functions on kp11 to kp20. This indicates that the proposed time-varying transfer functions is comparatively fast. For example, in kp20, the reduction in mean iteration of T1S2 and T2S2

functions was 37.61% and 49.81% lower than that of S2, respectively. On the other hand, the reduction in mean iteration of T1V4 and T2V4 functions was 40.08% and 60.32% lower than that of V4, respectively.

Further, it was noted that the v-shaped transfer functions are usually yielded the least iterations compared to S-shaped transfer functions. On the other hand, comparing between the two proposed transfer functions, the required iterations to get an optimal solution using Eq. (11) is less than of Eq. (10) for all the 0-1 Knapsack problems. Additionally, the number of iterations of T2V1, T2V2, T2V3, and T2V4 are obviously small than T1V1, T1V2, T1V3, and T1V4.

5.2.3 High-dimensional scale 0-1 KP

To further highlight the benefits of our proposed time-varying transfer functions, three cases have been investigated. The first case handles the uncorrelated problem (kp21 – kp25) where the weights w_i are uncorrelated with the profits c_i. Each w_i and c_i is randomly chosen from 5 to 20 and from 5 to 40, respectively. The second case handles the weakly correlated problem (kp26 – kp30). In this case, the weights w_i and the profits c_i can be expressed as follows: $w_i \in [5,20]$ and $c_i \in [w_i - 5, w_i + 5]$. The third case handles the strongly correlated problem (kp31 – kp35). In this case, w_i and c_i can be calculated as: $w_i \in [5,20]$ and $c_i \in [w_i + 5]$. The knapsack capacity for the kp-21-kp35 can be calculated as $M = 0.75 \times \sum_{i=1}^{n} w_i$. The dimension sizes varying from 100 to 2000 items. For all used transfer functions, the maximum iteration is set to 10000. Tables 6 – 8 reports the comparison results for all the used different transfer functions for the kp22, kp25, kp27, kp30, kp32, and kp35. The rest problems are listed in Tables S5 – S7 (Appendix). Based on the obtained results, several points are concluded.

(1) It can be seen that the proposed time-varying transfer functions significantly outperform the standard transfer functions on all evaluation measures including the best, mean, worst, and standard deviations.
(2) As observed from the results, the proposed time-varying V-shaped transfer functions, T1V1 – T2V4, can easily find the optimal values with small SD in all uncorrelated, weakly correlated, and strongly correlated problems.
(3) It is obvious that there is an improvement for searching the global optimal solution when using T2V1, T2V2, T2V3, and T2V4 compared to T1V1, T1V2, T1V3, and T1V4. This leads to the performance dominance of T2V1, T2V2, T2V3, and T2V4 against those performed on the T1V1, T1V2, T1V3, and T1V4.
(4) The mean iteration values of time-varying V-shaped transfer functions, T1V1 – T2V4, are obviously superior to S1, S2, S3, S4, V1, V2, V3, and V4 for all high-dimensional scale problems. The performance of T2V1, T2V2, T2V3, and T2V4 is better than that of T1V1, T1V2, T1V3, and T1V4.
(5) Compared to the proposed time-varying V-shaped transfer functions, T2V4 is significantly improving the performance metrics with lower SD and mean iterations.

6. Conclusion

In this paper, two time-varying transfer functions are proposed to improve the exploration and exploitation capability of the binary flower pollination algorithm in solving the 0–1 KP problem efficiently. The experimental results show that the introduction of time-varying parameter in the transfer function can improve the performance of BFPA in solving small, medium, and high-dimensional scales 0–1 KP problems. Additionally, the experimental results show that proposed time-varying V-shaped transfer functions outperform the other S-shaped transfer functions in terms of the best, worse, mean, SD values, and the mean iterations.

Abstract. The Syriac language is one of the oldest languages in the world. So far, some people speak it, for example in Iraq, Syria, southeastern Turkey and other countries. In this work, the Syriac letters were coded according to what was adopted by Sami and Mahmood in 2017 using the e-abacus diagram. More than one method is used to encode the English letters or diagrams that follow the concepts of partition theory. Each of them was taking its own path and the vision was to start with what Mohommed et al looked like in 2015 through the orbit concept. Then make the comparisons to observe the most efficient, fastest and most accurate method that could be followed.

1. Introduction

Let r be a nonnegative integer. The composition $\delta = (\delta_1, \delta_2, \dots, \delta_n)$ of r is a sequence of non-negative integers such that $|\delta| = \sum_{j=1}^{n} \delta_j = r$. The composition is called a partition of r if $\delta_j \geq \delta_{j+1} \ \forall\, j \geq 1$. Fix δ is a partition of r and defining $\beta_i = \delta_i + b - i$, $1 \leq i \leq b$. The set $\{\beta_1, \beta_2, \cdots \beta_b\}$ is said to be the set of β - number for δ, see [1]. Let e be a positive integer number greater than or equal to 2, we can represent numbers by a diagram called e-abacus diagram, see [2], as shown in Table 1:

Table 1. e-Abacus Diagram

run.1	**run.2**	**...**	**run. e**
0	1		$e-1$
e	$e+1$	...	$2e-1$
2e	$2e+1$	...	$3e-1$
⋮	⋮	⋮	⋮

Where every β-numbers will be represented by a (●) which takes its location in e-abacus diagram and in case of non-existence of β- numbers then the value in e-abacus diagram will be represented by a

blank. For example, if $\delta = (7,7,6,5,5,5,4,2,1)$ and $e = 4, b = 9$ then the set of β – number is $\{1,3,6,8,9,10,12,14,15\}$ then e-abacus diagram for this partition is:

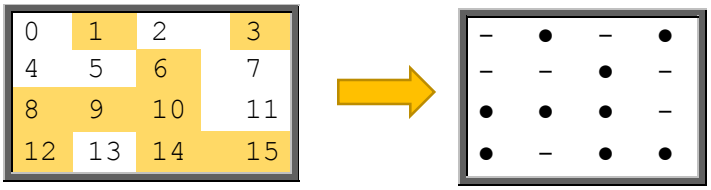

Figure 1. e-Abacus Diagram for $\delta = (7,7,6,5,5,5,4,2,1)$

Fayers is one of the creators who added a lot to this topic so much so we might refer here to [3-5]. Sami and Mahmood [6] developed a design for the shape of the 22 Syriac letters; (to learn more about this language see [7,8], through the e-abacus diagram technology and $e = 7$ in order to ensure that the shape becomes more accurate and clear if we choose e less than 7. We mention, the following example:

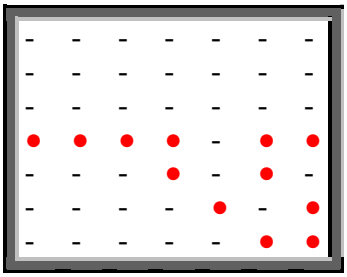

Figure 2. The Partition of 3rd - Syraic letter is$(37^2, 32,31,26,25, 22^2, 21^4)$ where e=7.

The problem that, we want to solve is how we change the parameters of the Syraic letters (to become unreadable as if I were sending a secret message), so we had the concept of "Orbits" presented in 2015 by Mohommed et al the best assistant to solve this dilemma.

2. The Orbits

The movement in orbits that were presented by Mohommed et al [9-11] and later on [12], made a major impact on the research that followed on the e-abacus diagram as it lads here to many ideas such as [13,14]. A new coding idea for the English letters which adopted $e = 5$ was introduced [15]; (these comparisons are possible, especially since there is a lot of research dealing with more than one language, for example we mention each of them [15], Based on [16] there are four orbits in e-abacus if $e = 7$ as shown in Figure3:

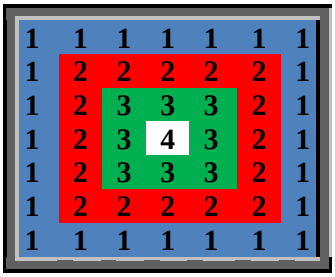

Figure 3. The four orbits.

The first (**1**), is the external path, where we do not change anything as a result of our need for the first site to be empty, see [17]. The Second (**2**), which is immediately following the first and here we will notice the presence of 16 sites that have not been fully studied in [11]. The third (**3**), this path contains 8 possible movements, and the fourth (**4**), is the last orbit that is usually fixed in place, because it contains only one location (site), then this orbit has no effect.

In this work we would like to point out here that we will move only on the second orbit without the rest, because the third orbit is the same movements that were addressed in [11]. We denoted by any move in each orbit by m_k, where $1 \leq k \leq 4$.

2.1. Movement on the Second Orbit

It is normal to move in the movement from the first until the arrival of the possible movements, in order to formulate this work easily, the James abacus diagram is converted to matrix form [12] as shown in Figure4.:

	a_{22}	a_{23}	a_{24}	a_{25}	a_{26}	
	a_{32}				a_{36}	
	a_{42}				a_{46}	
	a_{52}				a_{56}	
	a_{62}	a_{63}	a_{64}	a_{65}	a_{66}	

Figure 4. The locations of 2nd-orbit.

Rule (2.1.1): When choosing a partition for any Syriac letter where $e = 7$ and the value of β_i is equal to the location $a_{\tau\rho}$ within $[m_1;1; m_3; m_4]$ where ρ be column number, and τ the number of rows in the James abacus diagram then:

$$a_{\tau\rho} \rightarrow \begin{cases} a_{\tau(\rho\mp1)} & \text{if} \quad (\tau = 2\ (\text{or } 6)) \wedge (\rho = 2, \dots, 5\ (\text{or } 3, \dots, 6)) \text{resp.}, \\ a_{(\tau\mp1)\rho} & \text{if} \quad (\tau = 2, \dots, 5\ (\text{or } 3, \dots, 6) \wedge (\rho = 6\ (\text{or } 2))\ \text{resp.}, \end{cases} \quad (1)$$

Proof: Here is the ideal movement (with clockwise and the amount of movement is equal to one), we have one path, it will start from a_{22} up to a_{26} (respectively from a_{66} to a_{62}) provided it does not exceed it; we mean that does not go to a_{27} (respectively a_{61}) where this is outside the scope of the second orbit. Also form $a_{26} \rightarrow a_{36} \rightarrow \cdots \rightarrow a_{66}$ (respectively from $a_{62} \rightarrow a_{52} \rightarrow \cdots \rightarrow a_{22}$). This movement is not complicated and therefore the possibilities are limited.

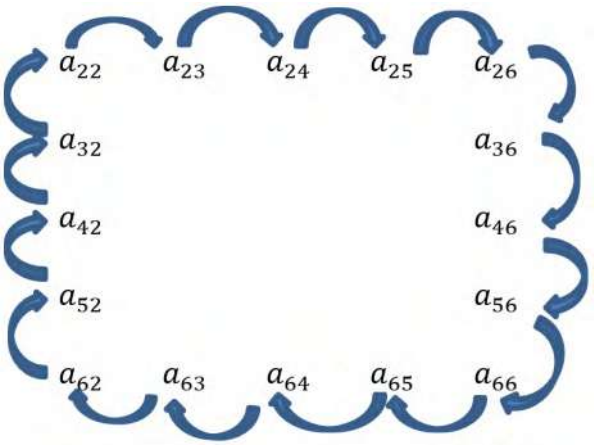

Figure 5. The movement when $m_2 = 1$

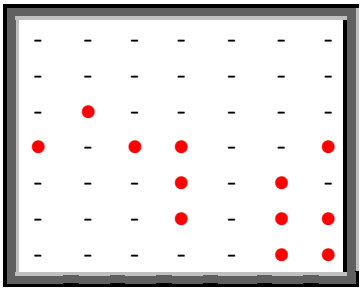

Figure6. The new partition of 3rd-Syriac letter is $(37^2, 32^2, 31,27,26,23, 21^2, 20,15)$

Then we have a new partition for each Syriac letter after using this method, the movement will generate a new table and a new partition as show in Table 2:

Table2. Syriac Letters

Letter	Origin partition	Letter	After one move

ن	$(35^4,29,23,17)$	$_{ن}^{[m_1,1,m_3,m_4]}$	$(35,34^3,29,23,17)$

Rule (2.1.2): When choosing a partition for any Syriac letter where $e = 7$ and the value of β_i is equal to the location $a_{\tau\rho}$ within $[m_1;2; m_3; m_4]$ will be:

$$a_{\tau\rho} \rightarrow \begin{cases} a_{\tau(\rho\mp2)} & \text{if } (\tau = 2 \text{ (or 6)}) \wedge (\rho = 2,\dots,4 \text{ (or 4,}\dots\text{,6)) resp.,} \\ a_{(\tau\mp2)\rho} & \text{if } (\tau = 2,\dots,4 \text{ (or 4,}\dots\text{,6)}) \wedge (\rho = 6 \text{ (or 2)}) \text{ resp.,} \\ a_{(\tau\mp1)(\rho\mp1)} & \text{if } (\tau = 2 \text{ (or 6)}) \wedge (\rho = 5 \text{ (or 3)}) \text{resp.,} \\ a_{(\tau\mp1)(\rho\pm1)} & \text{if } (\tau = 5 \text{ (or 3)}) \wedge (\rho = 6 \text{ (or 2)}) \text{resp.,} \end{cases} \quad (2)$$

Proof: The reason for the many relationships here is that there are two paths that never cross between them.
The calculating all cases of each path separately, we will be in front of all the cases mentioned in the text of the theorem.

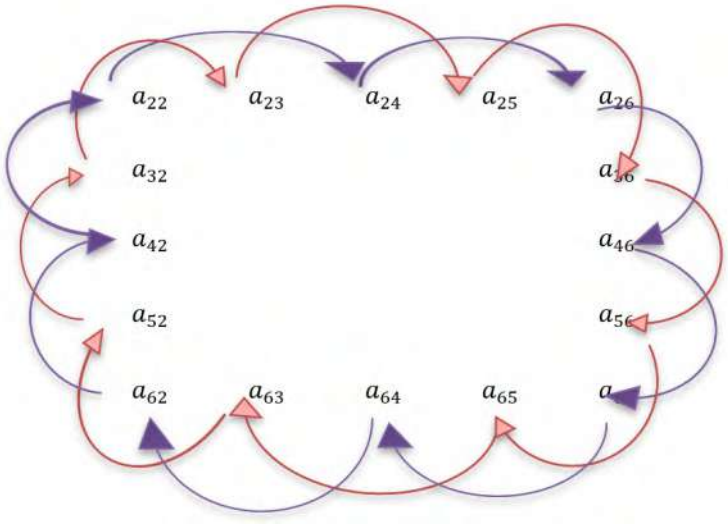

Figure 7. The movement when m_2=2.

For example, if we have the 3rd - Syriac letter then the new partition when $m_2 = 2$ it will be:

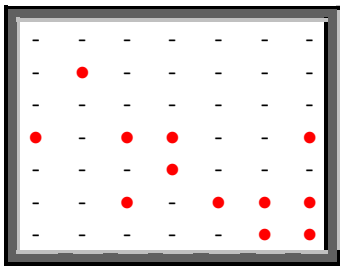

Figure 8. The new partition when $m_2 = 2$ is $(37^2 32^3, 31,26,23, 21^2, 20,8)$

It is important to say that whenever the value of m_2 exceeds 1 or 2, we will have completely different paths for each of the rules (2.1.1) and (2.1.2), meaning that we will inevitably have completely different possibilities, as the following relationship shows:

Rule (2.1.3): When choosing a partition for any Syriac letter where $e = 7$ and the value of β_i is equal to the location $a_{\tau\rho}$ within $[m_1; m_2; m_3; m_4]$ will be:

(i) When $m_2 = 3$, then we have:

$$a_{\tau\rho} \rightarrow \begin{cases} a_{\tau(\rho\mp 3)} & \text{if } (\tau = 2 \text{ (or } 6)) \wedge (\rho = 2,3 \text{(or } 5,6)) \text{resp.,} \\ a_{(\tau\mp 3)\rho} & \text{if } (\tau = 2,3 \text{ (or } 5,6)) \wedge (\rho = 6 \text{ (or } 2)), \text{resp.,} \\ a_{(\tau\mp 2)(\rho\mp 1)} & \text{if } (\tau = 2 \text{ (or } 6)) \wedge (\rho = 5 \text{ (or } 3)) \text{resp.,} \\ a_{(\tau\pm 2)(\rho\mp 1)} & \text{if } (\tau = 4) \wedge (\rho = 2 \text{ (or } 6)) \text{resp.,} \\ a_{(\tau\mp 1)(\rho\mp 2)} & \text{if } (\tau = 2 \text{ (or } 6)) \wedge (\rho = 4) \text{ resp.,} \\ a_{(\tau\mp 1)(\rho\pm 2)} & \text{if } (\tau = 5 \text{ (or } 3)) \wedge (\rho = 6 \text{ (or } 2)) \text{ resp.,} \end{cases} \quad (3)$$

(ii) If we take $m_2 = 4$:

$$a_{\tau\rho} \rightarrow \begin{cases} a_{\tau(\rho\mp 4)} & \text{if } (\tau = 2 \text{ (or } 6)) \wedge (\rho = 2 \text{ (or } 6)) \text{ resp.,} \\ a_{(\tau\mp 4)\rho} & \text{if } (\tau = 2 \text{ (or } 6)) \wedge (\rho = 6 \text{ (or } 2)) \text{resp.,} \\ a_{(\tau\mp 1)(\rho\mp 3)} & \text{if } (\tau = 2 \text{ (or } 6)) \wedge (\rho = 3 \text{ (or } 5)) \text{resp.,} \\ a_{(\tau\pm 1)(\rho\pm 3)} & \text{if } (\tau = 5 \text{ (or } 3)) \wedge (\rho = 6 \text{ (or } 2)) \text{ resp.,} \\ a_{(\tau\mp 2)(\rho\mp 2)} & \text{if } (\tau = 2 \text{ (or } 6)) \wedge (\rho = 4) \text{ resp.,} \\ a_{(\tau\mp 2)(\rho\pm 2)} & \text{if } (\tau = 4) \wedge (\rho = 6 \text{ (or } 2)) \text{ resp.,} \\ a_{(\tau\mp 3)(\rho\mp 1)} & \text{if } (\tau = 2 \text{ (or } 6)) \wedge (\rho = 5 \text{ (or } 3)) \text{resp.,} \\ a_{(\tau\mp 3)(\rho\pm 1)} & \text{if } (\tau = 3 \text{ (or } 5)) \wedge (\rho = 6 \text{ (or } 2)) \text{ resp.,} \end{cases} \quad (4)$$

(iii) If we take $m_2 = 5$, then we have:

$$a_{\tau\rho} \rightarrow \begin{cases} a_{(\tau\mp1)(\rho\mp4)} & \text{if} \quad (\tau = 2 \text{ (or } 6)) \quad \wedge \quad (\rho = 2 \text{ (or } 6)) \text{ resp.,} \\ a_{(\tau\pm1)(\rho\mp4)} & \text{if} \quad (\tau = 3 \text{ (or } 5)) \quad \wedge \quad (\rho = 2 \text{ (or } 6)) \text{ resp.,} \\ a_{(\tau\mp4)(\rho\mp1)} & \text{if} \quad (\tau = 2 \text{ (or } 6)) \quad \wedge \quad (\rho = 5 \text{ (or } 3)) \text{resp.,} \\ a_{(\tau\mp4)(\rho\pm1)} & \text{if} \quad (\tau = 2 \text{ (or } 6)) \quad \wedge \quad (\rho = 6 \text{ (or } 2)) \text{resp.,} \\ a_{(\tau\pm2)(\rho\pm3)} & \text{if} \quad (\tau = 6 \text{ (or } 2)) \quad \wedge \quad (\rho = 5 \text{ (or } 3)) \text{resp.,} \\ a_{(\tau\pm3)(\rho\pm2)} & \text{if} \quad (\tau = 6 \text{ (or } 2)) \quad \wedge \quad (\rho = 4) \text{ resp.,} \\ a_{(\tau\mp3)(\rho\pm3)} & \text{if} \quad (\tau = 2 \text{ (or } 5)) \quad \wedge \quad (\rho = 6) \quad \text{resp.,} \\ a_{(\tau\pm2)(\rho\mp3)} & \text{if} \quad (\tau = 4) \quad \wedge \quad (\rho = 2 \text{ (or } 6)) \text{ resp.,} \end{cases} \tag{5}$$

(iv)When $m_2 = 6$, then we have the following formula:

$$a_{\tau\rho} \rightarrow \begin{cases} a_{(\tau\mp2)(\rho\mp4)} & \text{if} \quad \big(\tau = 2 \text{ (or } 6)\big) \quad \wedge \quad \big(\rho = 2 \text{ (or } 6)\big) \text{resp.} \\ a_{(\tau\pm2)(\rho\pm4)} & \text{if} \quad (\tau = 4) \quad \wedge \quad (\rho = 6 \text{ (or } 2)) \text{ resp.,} \\ a_{(\tau\mp4)(\rho\mp2)} & \text{if} \quad (\tau = 2 \text{ (or } 6)) \quad \wedge \quad (\rho = 4) \text{ resp.,} \\ a_{(\tau\pm4)(\rho\mp2)} & \text{if} \quad (\tau = 6 \text{ (or } 2)) \quad \wedge (\rho = 2 \text{ (or } 6)) \text{resp.,} \\ a_{(\tau\mp3)(\rho\mp3)} & \text{if} \quad (\tau = 2 \text{ (or } 6)) \quad \wedge \quad (\rho = 3 \text{ (or } 5)) \text{resp.,} \\ a_{(\tau\pm3)(\rho\mp3)} & \text{if} \quad (\tau = 5 \text{ (or } 3)) \quad \wedge \quad (\rho = 2 \text{(or } 6)) \text{resp.,} \\ a_{\tau(\rho\pm4)} & \text{if} \quad (\tau = 5 \text{ (or } 3)) \quad \wedge \quad (\rho = 6 \text{ (or } 2)) \text{ resp.,} \\ a_{(\tau\mp4)\rho} & \text{if} \quad (\tau = 2 \text{(or } 6)) \quad \wedge \quad (\rho = 5 \text{ (or } 3)) \text{ resp.,} \end{cases} \tag{6}$$

(v) When $m_2 = 7$, we have:

$$a_{\tau\rho} \rightarrow \begin{cases} a_{(\tau\mp3)(\rho\mp4)} & \text{if} \quad (\tau = 2 \text{ (or } 6)) \quad \wedge \quad (\rho = 2 \text{ (or } 6)) \text{ resp.,} \\ a_{(\tau\mp4)(\rho\mp3)} & \text{if} \quad (\tau = 2 \text{ (or } 6)) \quad \wedge \quad (\rho = 3 \text{ (or } 5)) \text{ resp.,} \\ a_{(\tau\pm1)(\rho\pm4)} & \text{if} \quad (\tau = 5 \text{ (or } 3)) \quad \wedge \quad (\rho = 6 \text{ (or } 2)) \text{resp.,} \\ a_{(\tau\pm4)(\rho\pm1)} & \text{if} \quad (\tau = 6 \text{ (or } 2)) \quad \wedge \quad (\rho = 4) \quad \text{resp.,} \\ a_{(\tau\pm1)(\rho\mp4)} & \text{if} \quad (\tau = 4) \quad \wedge (\rho = 2 \text{ (or } 6)) \text{resp.,} \\ a_{(\tau\mp4)(\rho\pm1)} & \text{if} \quad (\tau = 2 \text{ (or } 6)) \quad \wedge \quad (\rho = 5 \text{(or } 3)) \text{resp.,} \\ a_{(\tau\mp3)(\rho\pm4)} & \text{if} \quad (\tau = 3 \text{ (or } 5)) \quad \wedge \quad (\rho = 6 \text{ (or } 2)) \text{ resp.,} \\ a_{(\tau\pm4)(\rho\mp3)} & \text{if} \quad (\tau = 6 \text{(or } 2)) \quad \wedge (\rho = 2 \text{ (or } 6)) \text{ resp.,} \end{cases} \tag{7}$$

(vi) When $m_2 = 8$, we have:

$$a_{\tau\rho} \rightarrow \begin{cases} a_{(\tau\mp4)(\rho\mp4)} & \text{IF} \quad (\tau = 2 \text{ (OR } 6)) \quad \wedge \quad (\rho = 2 \text{ (OR } 6)) \text{ RESP.,} \\ a_{(\tau\pm4)(\rho\pm2)} & \text{IF} \quad \big(\tau = 6 \text{ (OR } 2)\big) \quad \wedge \quad \big(\rho = 5 \text{ (OR } 3)\big) \text{RESP.} \\ a_{(\tau\mp4)\rho} & \text{IF} \quad (\tau = 2 \text{ (OR } 6)) \quad \wedge \quad (\rho = 4) \text{ RESP.,} \\ a_{(\tau\mp4)(\rho\pm2)} & \text{IF} \quad (\tau = 2 \text{ (OR } 6)) \quad \wedge \quad (\rho = 5 \text{ (OR3)}) \text{RESP.,} \\ a_{(\tau\pm4)(\rho\mp4)} & \text{IF} \quad (\tau = 6 \text{ (OR } 2)) \quad \wedge \quad (\rho = 2 \text{ (OR } 6)) \text{RESP.,} \\ a_{(\tau\mp2)(\rho\pm4)} & \text{IF} \quad (\tau = 3 \text{ (OR } 5)) \quad \wedge \quad (\rho = 6 \text{(OR } 2)) \text{RESP.,} \\ a_{\tau(\rho\pm4)} & \text{IF} \quad (\tau = 4) \quad \wedge \quad (\rho = 6 \text{ (OR } 2)) \text{ RESP.,} \\ a_{(\tau\mp2)(\rho\mp4)} & \text{IF} \quad (\tau = 3 \text{(OR } 5)) \quad \wedge \quad (\rho = 2 \text{ (OR } 6)) \text{ RESP.,} \end{cases} \tag{8}$$

Finally, (vii) if $m_2 = 9, \ldots, 15$, then we have the same cases as $m_2 = 7, \ldots, 1$ respectively but with changing rows by columns in additions to reversing the values of τ and ρ.

Table 3. The partition of two letters after application $3 \leq m_2 \leq 15$.

Letter	Partition	Letter	Partition
ט	$(30^8, 24^4)$	ר	$(37^2, 32, 31, 26, 25, 22^2, 21^4)$

$ט^{[m_1,15,m_3,m_4]}$	$(30^5, 29^3, 24, 23^2, 19)$	$ר^{[m_1,15,m_3,m_4}$	$(37^2, 32^2, 24, 23, 22^2, 21^2, 20, 19)$

3. Computer Solution

In this work we used mohommed et al method [9,10] to encode any Syriac letter by using Microsoft Visual Studio 2017 and C#. The Program starts by creating two (1-D) arrays with 49 values each (index starts from 0 to 48 because C# is a zero-based array indexing language). The first array is the ***nodes*** array. By default, all values of nodes array are set to zero. The other array is the ***modified-nodes*** array. This is where the values of nodes are stored after applying the movement steps.

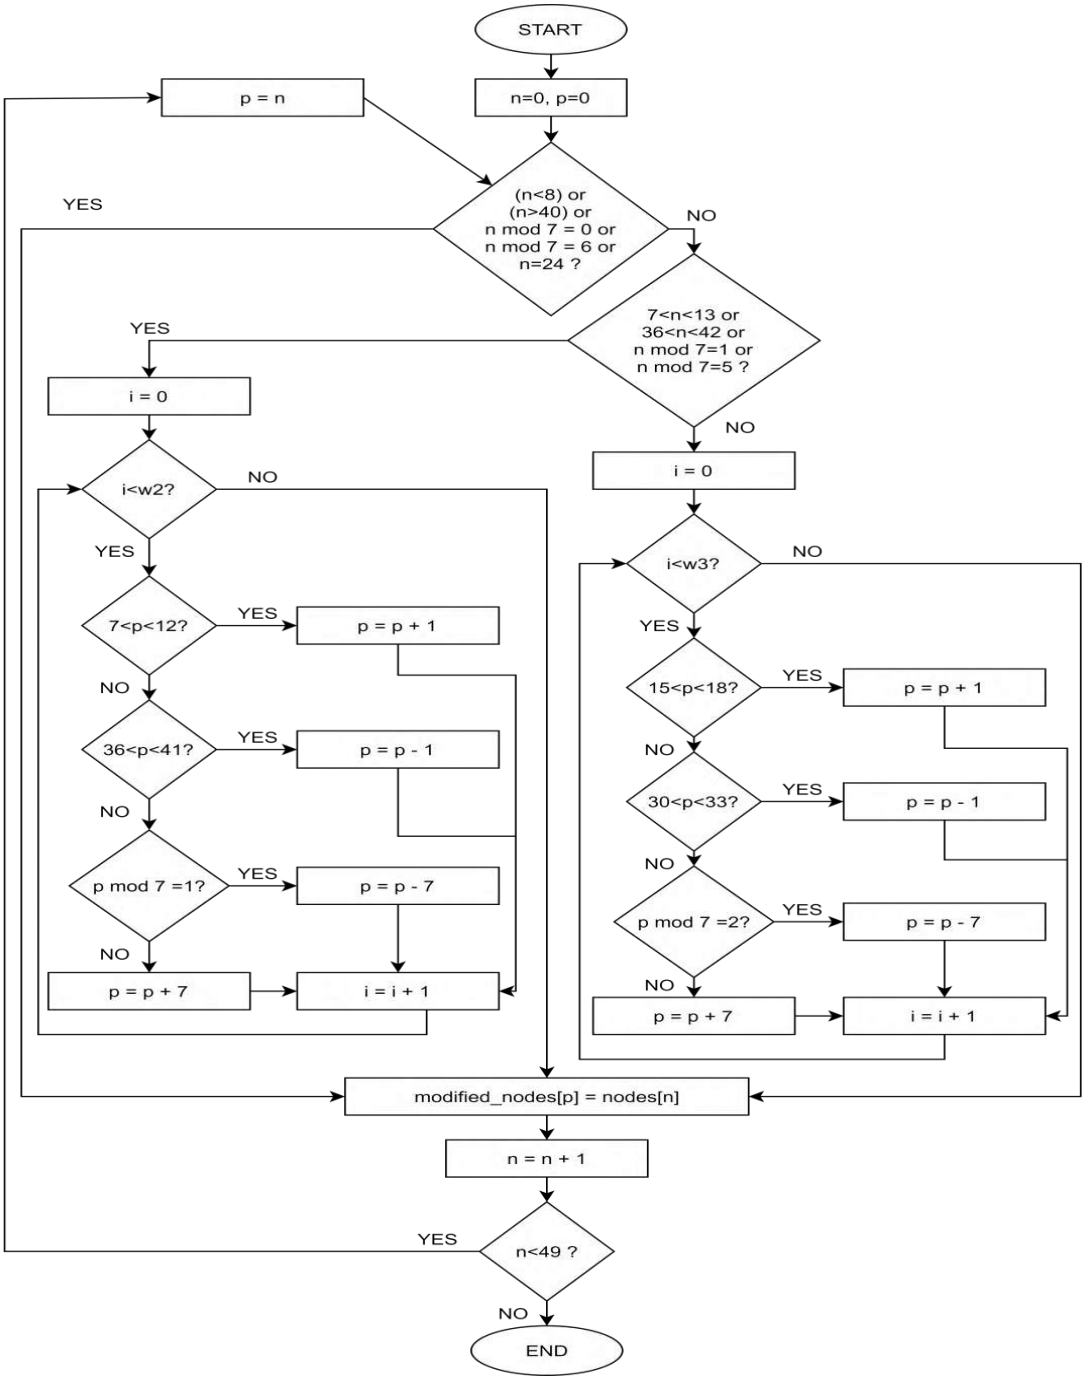

Figure 9. Chart illustrates the values of an array (modified- nodes) of an array (nodes).

The first step of this algorithm is to choose the nodes that form the most similar shape to the desired letter. When a cell at row R and column C is selected to be a node; the ***nodes*** array value of address (R*7+C) is set to1. After selecting all nodes values, the next step is the orbital movement. To avoid data loss, the modified array is stored in a separate array called ***modified-nodes***. Values of first orbit and forth orbit are moved directly from ***nodes*** array to ***modified-nodes*** array. Values of second and third orbit are displaced depending on m_2 and m_3 values respectively.

Note that the same chart can be used to copy values from ***modified-nodes*** array back into ***nodes*** array (in case of receiving coded data and trying to retrieve the original layout). The only differences in that case will be replacing values of (m_2 with $16 - m_2$) and ($m_3$with $8 - m_3$) and the equation (modified-nodes[p] = nodes[n]) will be (nodes[p] = modified-nodes[n]).

The last step of the algorithm is to number the partitions based on the (Partition theory). One important point to mention is that the *modified-nodes* array is a one-dimensional array used to store data of a two-dimensional array. The addresses of the *modified-nodes* are converted into 2-D array addressing by dividing the address of modified-nodes by 7. For each modified-nodes index i, the row index of the corresponding 2-D array address r is $i/7$ (ignoring the reminder) while the column index r is i mod 7; (this method can change if the formulas used in [18,19].

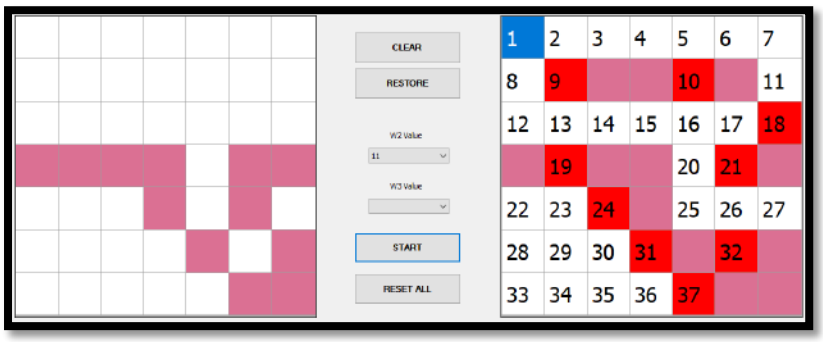

Figure 10. Illustrates The 3rd Syriac letter After Applying $[m_1;11;m_3;m_4]$.

4. Results and Discussion

It is quite natural to study the basics of the subject matter of coding, for examples we mention each of them [20-22], let's understand how we deal with developing ideas here. Perhaps it is important to note that, this coding note that, this coding used for Syriac letters is completely different from how the coding of these letters was handled by Sami and Mahmood [6] which was by extended Vigenere Cipher; (more on this technology can see [22,23], in the sense of using another medium and not died through the scheme itself, also [24,25].

We also have to add that the technology prepared by [26, 27] has a benefit that can be combined with the idea of this paper to become more difficult to reveal or infer the origin of the letter.

5. Conclusion

From the foregoing it becomes quite clear that each method followed was useful for changing the features of the letter and each time according to a specific mechanism completely different from the other. Some of it is easy and it changes a simple part of the shape, and another is complicated, so I have a case whose details are not easy to reveal, especially if more than one case is combined. For this, we suggest that if we want a very difficult message, we should use merging more than one method.

Acknowledgments

The authors are very grateful to the (Kirkuk Education Directorate), (University of Al-Hamdaniya, College of Education) and (University of Mosul, College of Education for Pure Science) for their provided facilities, which helped to improve the quality of this work.

Application of Fixed Point in Algebra Fuzzy Normed Spaces

Application of Fixed Point in Algebra Fuzzy Normed Spaces

Jehad R Kider

Abstract. In the present paper first we recall the definition of algebra fuzzy metric space and some basic properties of algebra fuzzy metric space are introduced. Our goal is to prove the fixed point theorem in fuzzy complete algebra fuzzy metric space. Finally, the application to this theorem introduced.

1.Introduction

Kider in 2011 [1] introduced a fuzzy normed space. Also he proved this fuzzy normed space has completion in [2]. Again Kider introduced a new fuzzy normed space in 2012 [3]. Kider and Hussain in 2014 [4] introduced a new type of fuzzy metric space called standard fuzzy metric space and they study continuous, uniform continuous mappings on a standard fuzzy metric spaces. Again Kider in 2014 [5] study completeness of Hausdorff standard fuzzy metric spaces.

Kider and Kadhum in 2017 [6] introduced the fuzzy norm for a fuzzy bounded operator on a fuzzy normed space and proved its basic properties then other properties were proved by Kadhum in 2017 [7]. Ali in 2018 [8] proved the basic properties of complete fuzzy normed algebra. Kider and Ali in 2018 [9] introduced the notion of fuzzy absolute value and study properties of finite dimensional fuzzy normed space. Again Kider and Ali in 2019 [10] introduced a new type of fuzzy normed algebra and they study properties of a complete fuzzy normed algebra.

The concept of general fuzzy normed space was presented by Kider and Gheeab in 2019 [11] [12] also they proved basic properties of this space and the general fuzzy normed space GFB (V, U). Kider and Kadhum in 2019 [13] introduce the notion of fuzzy compact linear operator and proved its basic properties a gain Kider and Kadhum in 2019 [14] study properties of fuzzy closed linear operator. For more information about fuzzy metric spaces also see [15, 16].

In 2020 Kider [17] introduced the notion of fuzzy soft metric space after that he investigated and proved some basic properties of this space again Kider in 2020 [18] introduced a new type of fuzzy metric space he called it algebra fuzzy metric space after that the basic properties of this space is proved.

In the present paper first we recall the notion of algebra fuzzy metric space which is a new type of fuzzy metric space then we recall basic properties of this space that will be used later in this paper. After that we introduce the main result in this paper it is the fixed point theorem with which prove to show that the important of this theorem and application to system of linear equation, solution of the differential equation, Fredholm integral equation and Volterra integral equation are introduced.

2. Basic Properties of Algebra fuzzy metric space

Definition 2.1: [18]

Let $\otimes: I \times I \to I$ be a binary operation function then $\otimes$ is said to be continuous t-conorm (or simply t-conorm) if it satisfies the following conditions $s, r, z, w \in I$ where $I = [0,1]$
(i)$s \otimes r = r \otimes s$
(ii) $s \otimes [r \otimes z] = [s \otimes r] \otimes z$
(iii) $\otimes$ is continuous function
(iv)$s \otimes 0 = 0$
(v) $(s \otimes r) \leq (z \otimes w)$ whenever $s \leq z$ and $r \leq w$.

Lemma 2.2: [18]
If $\otimes$ is a continuous t-conorm on I then
(i)$1 \otimes 1 = 1$
(ii)$0 \otimes 1 = 1 \otimes 0 = 1$
(iii)$0 \otimes 0 = 0$
(iv)$a \otimes a \geq a$ for all $a \in [0,1]$.

Example 2.3: [18]
The algebra product $a \otimes b = a + b - ab$ is a continuous t-conorm for all $a, b \in I$.

Definition 2.4: [18]
Assume that $S \neq \emptyset$, a fuzzy set $\widetilde{D}$ in S is represented by $\widetilde{D} = \{(s, \mu_{\widetilde{D}}(s)): s \in S, 0 \leq \mu_{\widetilde{D}}(s) \leq 1\}$ where $\mu_{\widetilde{D}}(s): S \to [0,1]$ is a membership function.
The following definition the main definition

Definition 2.5: [18]
A triple $(S, m, \otimes)$ is said to be the algebra fuzzy metric space if S$\neq \emptyset$, $\otimes$ is a continuous t- conorm and $m: S \times S \to [0,1]$ satisfying the following conditions:

(1)$0 \leq m(s,r) \leq 1$;

(2) $m(s,r) = 0$ if and only if $s = r$;

(3) $m(s,r) = m(r,s)$;

(4) $m(s,t) \leq m(s,r) \otimes m(r,t)$
For all s, r, t $\in$ S then the triple $(S, m, \otimes)$ is said to be the algebra fuzzy metric space
Example 2.6:[18]
If (S,d) is a metric space and $t \otimes r = t + r - tr$ for all t, r $\in$ [0, 1]. Put $m_d(s,u) = \frac{d(s,u)}{1+d(s,u)}$ for all s, u $\in$ S. Then $(S, m_d, \otimes)$ is algebra fuzzy metric space. m_d is known as the algebra fuzzy metric comes from d.

Example 2.7: [18]
If $S \neq \emptyset$ put $m_D(s,u) = \begin{cases} 0 & if\ s = u \\ 1 & if\ s \neq u \end{cases}$
Then $(S, m_D, \otimes)$ is algebra fuzzy metric space known as the discrete algebra fuzzy metric space.

Definition 2.8: [18]
If $(S, m, \otimes)$ is algebra fuzzy metric space then $fb(s,j) = \{u \in S: m(s,u) < j\}$ is known as an open fuzzy ball with center s$\in$S and radius j $\in$(0, 1). Similarly closed fuzzy ball is defined by $fb[s,j] = \{u \in S: m(s,u) \leq j\}$.

Definition 2.9: [18]

If $(S, m, \otimes)$ is algebra fuzzy metric space and W⊆S is known as fuzzy open if $fb(w, j) \subseteq W$ for any arbitrary w∈W and for some j ∈(0, 1).
Also $D \subseteq S$ is known as fuzzy closed if D^C is fuzzy open then the fuzzy closure of D, $\overline{D}$ is defined to be the smallest fuzzy closed set contains D.

Definition 2.10: [18]
If $(S, m, \otimes)$ is algebra fuzzy metric space then $D \subseteq S$ is known as fuzzy dense in S whenever $\overline{D}$=S.

Theorem 2.11: [18]
If $fb(s, j)$ is open fuzzy ball in algebra fuzzy metric space $(S, m, \circledcirc)$ then it is a fuzzy open set.

Proposition 2.12: [18]
In algebra fuzzy metric space $(S, m, \otimes)$ $s_n \to s$ if and only if $m(s_n, s) \to 0$.

Definition 2.13: [18]
In algebra fuzzy metric space $(S, m, \otimes)$ a sequence (s_n) is fuzzy Cauchy if for each r∈(0, 1) then we can find N such that $m(s_n, s_m) < r$, for each m, n ≤ N.
Definition 2.14: [18]
An algebra fuzzy metric space $(S, m, \otimes)$ is known as fuzzy complete if (s_n) is fuzzy Cauchy sequence then $s_n \to s \in$ S.

Theorem 2.15: [18]
In algebra fuzzy metric space $(S, m, \otimes)$ $if\ s_n \to s \in S$ then (s_n) is fuzzy Cauchy sequence.

Definition 2.16: [18]
Anon empty set D in algebra fuzzy metric space (S, m, ⊗) is known as fuzzy bounded whenever we can find s∈(0, 1) with $D \subset fb(d, s)$ for some d ∈S. Also a sequence (d_n) in algebra fuzzy metric space $(S, m, \otimes)$ is fuzzy bounded if we can find s∈(0, 1) with $\{d_1, d_2, \dots, d_n, \dots\} \subseteq fb(d, s)$ for some d ∈S.

Lemma 2.17:[18]
In algebra fuzzy metric space $(S, m, \otimes)$ If the sequence (s_n) ∈S with $s_n \to s$ ∈S. Then (s_n) is fuzzy bounded.

Lemma 2.18: [18]
In algebra fuzzy metric space $(S, m, \otimes)$ if $(s_n) \in$ S with $s_n \to$s ∈S and $s_n \to$ d ∈S as n→ ∞. Then s=d.

Theorem 2.19: [18]
In algebra fuzzy metric space $(S, m, \otimes)$ when D⊂S then d∈$\overline{D}$ if and only if there is $(d_n) \in$ D with $d_n \to$ d.

Definition 2.20: [18]
If $(S, m_S, \otimes)$ and $(V, m_V, \otimes)$ are two algebra fuzzy metric spaces and W ⊆ S. Then a function $T: S \to V$ is called fuzzy continuous at w∈W. If for every $0 < r < 1$, we can find some $0 < t < 1$, with $m_V[T(w), T(s)] < r$ as s∈W and $m_S(w, s) < t$.
Also f is said to be fuzzy continuous on W if it is fuzzy continuous at every point of W.

Theorem 2.21: [18]
If $(S, m_S, \otimes)$ and $(V, m_V, \otimes)$ are two algebra fuzzy metric spaces and $W \subseteq S$. Then a function $T: S \to V$ is fuzzy continuous at w∈W if and only if whenever $w_n \to w$ in W then $T(w_n) \to T(w)$ in V.

Theorem 2.22: [18]
The function $T: S \to V$ is fuzzy continuous on S if and only if $T^{-1}(D)$ is fuzzy open in S for all fuzzy open subset D of V where $(S, m_S, \otimes)$ and $(V, m_V, \otimes)$ are algebra fuzzy metric spaces.

3.Fixed Point Theorem

Definition 3.1:
If $(U, m, \otimes)$ is algebra fuzzy metric space then the function $S: U \to U$ is known as a fuzzy contraction on U if we can find r∈(0, 1) with $m[S(u), S(v)] \leq r\, m(u, v)$ for all u, v ∈U. The constant r is called the fuzzy contraction constant.
The proof of the next result is clear and hence is omitted.

Theorem 3.2:
Suppose that $(U, m, \otimes)$ is algebra fuzzy metric space. If the function $S: U \to U$ is a fuzzy contraction on U then S is fuzzy continuous.
The following theorem is the key of all results in this section
Theorem 3.3:
Suppose that $(U, m, \otimes)$ is fuzzy complete algebra fuzzy metric space where $U \neq \emptyset$, $a \otimes b = a + b - ab$ for all a, b∈I and assume that the function $S: U \to U$ is a fuzzy contraction on U that is we can find r∈(0, 1) with $m[S(u), S(v)] \leq r\, m(u, v)$ for all u, v ∈U. Then S has exactly one fixed point.

Proof: The construction of the iterative sequence (u_k) follows by Choosing u_0 ∈U and define
$S(u_0) = u_1, S(u_1) = S^2(u_0) = u_2, \dots, S^k(u_0) = u_k, \dots$ (1)
Now (u_k) is a fuzzy Cauchy sequence follows from the next steps

$$m(u_{n+1}, u_n) = m[S(u_n), S(u_{n-1})] \leq r\, m(u_n, u_{n-1}) = r\, m[S(u_{n-1}), S(u_{n-2})]$$
$$\leq r^2\, m(u_{n-1}, u_{n-2}) = r^2\, m[S(u_{n-2}), S(u_{n-3})]$$

And so on we have
$m(u_{n+1}, u_n) \leq r^n\, m(u_1, u_0)$ (2)
Therefore if we take n>j ≥N for some N ∈ ℕ we have

$$m(u_j, u_n) \leq m(u_j, u_{j+1}) \otimes m(u_{j+1}, u_{j+2}) \otimes, \dots, \otimes m(u_{n-1}, u_n)$$
$$\leq m(u_j, u_{j+1}) + m(u_{j+1}, u_{j+2}) +, \dots, m(u_{n-1}, u_n) - [m(u_j, u_{j+1}) m(u_{j+1}, u_{j+2}) \dots m(u_{n-1}, u_n)]$$
$$\leq [r^j + r^{j+1} + \dots + r^{n-j}]\, m(u_0, u_1) - [r^j\, r^{j+1} \dots r^{n-j}]\, m(u_0, u_1)$$

$m(u_j, u_n) \leq [(r^j \frac{1-r^{n-j}}{1-r}) - (r^{[(n-j)j+(n-j)]})]\, m(u_0, u_1)$ (3)

Now choose t ∈(0, 1) so that $[(r^j \frac{1-r^{n-j}}{1-r}) - (r^{[(n-j)j+(n-j)]})]\, m(u_0, u_1) < t$.
Thus $m(u_j, u_n) < t$ for all n>j ≥N that is (u_k) is a fuzzy Cauchy sequence but U is fuzzy complete so we can find u∈U such that (u_k) is fuzzy converges to u.
The proof of u is a fixed point of S follows from the following steps

$$m(u, S(u)) \leq m(u, u_n) \otimes m(u_n, S(u))$$
$$\leq m(u, u_n) + m(u_n, S(u)) - m(u, u_n)\, m(u_n, S(u))$$
$$\leq m(u, u_n) + r\, m(u_{n-1}, u) - m(u, u_n)\, r\, m(u_{n-1}, u)$$

By taking limit to both sides as n→ ∞ and using u_k →u getting $m(u, S(u)) = 0$ which implies that S(u)=u.
Finally, to show that u is the only fixed point of S. Assume that S(u)=u and S(y) = y that is S has two fixed points u and s. Now
$m(u, y) = m(S(u), S(y)) \leq r\, m(u, y)$. Thus $m(u, y) = 0$ since r ∈(0, 1). Hence u=y.

Corollary 3.4:

In Theorem 3.3 the iterative sequence (u_k) where u_0 is arbitrary fuzzy converges to the unique fixed point u of S. Error estimates are the prior

$$m(u_j, u) \leq [\frac{r^j}{1-r}]\, m(u_0, u_1) \quad (4)$$

and the posterior estimates

$$m(u_j, u) \leq [\frac{r}{1-r}]\, m(u_{j-1}, u_j) \quad (5)$$

Proof: The inequality (4) follows from inequality (3)

$m(u_j, u_n) \leq [(r^j \frac{1-r^{n-j}}{1-r}) - (r^{(n-j)j+(n-j)})]$ m(u_0, u_1). Since r ∈(0, 1) we have $(1 - r^{n-j}) \in (0, 1)$ hence by letting n→ ∞ we have inequality (4)

$$m(u_j, u) \leq [\frac{r^j}{1-r}]\, m(u_0, u_1).$$

Now we derive (5) by taking j=1 and writing y_0 for u_0 and y_1 for u_1 we have from (4) m$(y_1, u) \leq [\frac{r}{1-r}]$ m(y_0, y_1). Putting $y_0 = u_{j-1}$ we have $y_1 = S(y_0) = u_j$thus we obtain (5).

Theorem 3.5:
Suppose that $S: U \to U$ is a function where $(U, m, \otimes)$ is algebra fuzzy metric space and $a \otimes b = a + b - ab$ for all a, b∈I. Assume that $m(u_0, S(u_0)) < (1 - r)t$ and S is a fuzzy contraction on the closed fuzzy ball $fb[u_0, t]$ that is we can find r∈(0, 1) with $m[S(u), S(v)] \leq r\, m(u, v)$ for all u, v ∈ $fb[u_0, t]$. Then the iterative sequence (u_k) fuzzy converges to $u \in fb[u_0, t]$, this u is fixed point of S and it is the only fixed point of S in $fb[u_0, t]$.

Proof:
$(u_k) \in fb[u_0, t]$ follows from the next step. In inequality (3) put j=0 and use $m(u_0, S(u_0)) < (1 - r)t$ we have

$$m(u_0, u_n) \leq [\frac{1}{(1-r)} - r^n] m(u_0, u_1)$$
$$= [\frac{1}{(1-r)}]\, m(u_0, u_1) - r^n m(u_0, u_1)$$
$$< t - (1 - r)\, r^n t < t.$$

Hence $(u_k) \in fb[u_0, t]$ also $u \in fb[u_0, t]$ since (u_k) is fuzzy converges to u and $fb[u_0, t]$ is closed. Now from the proof of Theorem 3.3 the other assertion of the theorem follows.

Definition 3.6:
Let ℝ be the field of real numbers and ⊗ be a continuous t-norm. A fuzzy set $a_{\mathbb{R}}$ is a function from ℝ to I is called algebra fuzzy absolute value on ℝ if it satisfies the following conditions for all r, s ∈ ℝ**;**
(1) $a_{\mathbb{R}}(r) \in I$
(2) $a_{\mathbb{R}}(r) = 0$ if and only if r=0
(3) $a_{\mathbb{R}}(sr) \leq a_{\mathbb{R}}(s) \cdot a_{\mathbb{R}}(r)$
(4) $a_{\mathbb{R}}(s + r) \leq a_{\mathbb{R}}(s) \otimes a_{\mathbb{R}}(r)$
Then the triple $(\mathbb{R}, a_{\mathbb{R}}, \otimes)$ is called algebra fuzzy absolute value space.

Example 3.7:
Let $U=C[a, b]$ and $t \otimes s = t + s - ts$ for all t, s ∈I. Define $m(f, g) = max_{t \in [a,b]}\, a_{\mathbb{R}}[f(t) - g(t)]$ then $(U, m, \otimes)$ is algebra fuzzy metric space.

Proof:
(1)Since $a_{\mathbb{R}}[f(t) - g(t)] \in (0, 1)$ for all t∈[a, b] it is clear that m(f, g) ∈(0, 1)

(2)m(f, g) = 0 if and only if $max_{t\in[a,b]}a_{\mathbb{R}}[f(t)-g(t)] = 0$ if and only if $a_{\mathbb{R}}[f(t)-g(t)] = 0$ for all t ∈ [a, b] if and only if f(t) –g(t) =0 for all t ∈ [a, b] if and only if f(t) =g(t) for all t ∈ [a, b] if and only if f=g.
(3)it is clear that $m(f,g) = m(g,f)$.

$$(4)m(f,g) = max_{t\in[a,b]}\, a_{\mathbb{R}}[f(t)-h(t)+h(t)-g(t)]$$
$$\leq max_{t\in[a,b]}\, a_{\mathbb{R}}[f(t)-h(t)] \otimes max_{t\in[a,b]}\, a_{\mathbb{R}}[h(t)-g(t)]$$
$$\leq m(f,h)\otimes m(h,g)$$

For all f, g, h ∈U. Hence (U, m, ⊗) is algebra fuzzy metric space.

Theorem 3.8:
If $a\otimes b = a + b - ab$ for all a, b ∈I define m: $\mathbb{R}^2$ →I by $m(u,v) = a_{\mathbb{R}}(u-v)$ for all u, v∈ ℝ. Then $(\mathbb{R},m,\otimes)$ is algebra fuzzy metric space.

Proof:
(1)it is clear that m(u, v) ∈I for all u, v∈ ℝ.
(2) $m(u,v) = 0$ if and only if $a_{\mathbb{R}}$(u−v)=0 if and only if u−v=0 if and only if u=v.
(3)it is clear that $m(u,v) = m(v,u)$

$$(4)m(u,z) = a_{\mathbb{R}}(u-z) = a_{\mathbb{R}}(u-v+v-z)$$
$$\leq a_{\mathbb{R}}(u-v)\otimes a_{\mathbb{R}}(v-z)$$
$$\leq m(u,v)\otimes m(v,z)$$

Hence $(\mathbb{R},m,\otimes)$ is algebra fuzzy metric space

Theorem 3.9:
If $s\otimes r = s + r - sr$ for all s, r ∈I then $(\mathbb{R},m,\otimes)$ is a fuzzy complete where $m(u,v) = a_{\mathbb{R}}(u-v)$ for all u, v∈ ℝ.

Proof:
Let (r_n) be a fuzzy Cauchy sequence in ℝ then (r_n) has a monotonic subsequence (r_{n_j}) but (r_n) is a fuzzy bounded hence (r_{n_j}) is a fuzzy bounded thus (r_{n_j}) fuzzy approaches to r∈ ℝ that is every s∈(0, 1) we can find N ∈ ℕ with $a_{\mathbb{R}}(r_{n_k} - r_k) \leq s$. Since (r_n) is a fuzzy Cauchy sequence in ℝ so $a_{\mathbb{R}}(r_m - r_n) \leq s$ for all m, n ≥N. That is for k ≥N,
$a_{\mathbb{R}}(r_{n_k} - r_k) \leq s$. Now for all k≥N

$$a_{\mathbb{R}}(r_k - r) \leq a_{\mathbb{R}}(r_k - r_{n_k} + r_{n_k} - r)$$
$$\leq a_{\mathbb{R}}(r_k - r_{n_k})\otimes a_{\mathbb{R}}(r_{n_k} - r)$$
$$\leq s\otimes s$$

Now we can find t∈(0, 1) with s ⊗ s <t that is $a_{\mathbb{R}}(r_k - r) \leq$ t. Thus (r_n) approaches to r∈ ℝ. Hence (ℝ, m, ⊗) is a fuzzy complete.

Example 3.10:
If $s\otimes t = s + t - st$ for all s, t ∈I define m: $\mathbb{R}^n \to I$ by $m(u,v) = max_j\, a_{\mathbb{R}}(\alpha_j - \beta_j)$ for all $u = (\alpha_1,\alpha_2,\dots,\alpha_n)$, $v = (\beta_1,\beta_2,\dots,\beta_n) \in \mathbb{R}^n$. Then $(\mathbb{R}^n,m,\otimes)$ is algebra fuzzy metric space.

Proof:
(1)it is clear that m(u, v) ∈I for all u, v∈ $\mathbb{R}^n$.
(2) $m(u,v) = 0$ if and only if max_j $a_{\mathbb{R}}(\alpha_j - \beta_j)$ if and only if $a_{\mathbb{R}}(\alpha_j - \beta_j)$ for all j=1, 2, …,n if and only if $\alpha_j - \beta_j$=0 for all j=1, 2, …,n if and only if $\alpha_j = \beta_j$ for all j=1, 2, …,n if and only if u=v.
(3)it is clear that $m(u,v) = m(v,u)$

$$(4)\, m(u,z) = max_j\, a_{\mathbb{R}}(\alpha_j - \gamma_j)$$
$$= max_j\, a_{\mathbb{R}}(\alpha_j - \beta_j + \beta_j - \gamma_j)$$

$$\leq max_j\ a_{\mathbb{R}}(\alpha_j - \beta_j)\ \otimes\ max_j\ a_{\mathbb{R}}(\beta_j\ - \gamma_j)$$
$$\leq m(u,v)\ \otimes\ m(v,z)$$

Where $z\ = (\gamma_1, \gamma_2, \dots, \gamma_n)\ \in \mathbb{R}^n$.
Hence $(\mathbb{R}^n, m, \otimes)$ is algebra fuzzy metric space

Example 3.11:
If $s \otimes t = s\ +\ t\ - st$ for all s, t ∈I then $(\mathbb{R}^n, m, \otimes)$ is fuzzy complete where m: $\mathbb{R}^n \to$I is defined by $m(u,v) =\ max_j\ a_{\mathbb{R}}(\alpha_j\ - \beta_j)$ for all $u = (\alpha_1, \alpha_2, \dots, \alpha_n),\ v\ = (\beta_1, \beta_2, \dots, \beta_n)\ \in\ \mathbb{R}^n$.

Proof:
Consider a fuzzy Cauchy sequence (u_k) in $\mathbb{R}^n$ putting $u_k = (r_{1k}, r_{2k}, \dots r_{nk})$. Since (u_k) is fuzzy Cauchy so for any s∈ (0, 1) we can find N∈ ℕ with
$m(u_k, u_j) =\ max_i\ a_{\mathbb{R}}(r_{ik} - r_{ij})\ <\ s$ (6)
for all k, j ≥N and i=1, 2, …, n. This implies that $a_{\mathbb{R}}(r_{ik} - r_{ij}) < r$.
This shows that for any fixed i, 1≤ i ≤n the sequence $(r_{i1}, r_{i2}, \dots)$is a fuzzy Cauchy sequence in $(\mathbb{R}, m, \otimes)$. But $(\mathbb{R}, m, \otimes)$ is fuzzy complete by Theorem 3.10 so it fuzzy converges that is $r_{ik} \to r_i$ as k→ ∞. Now we use these n limits to define u=$(r_1, r_2, \dots, r_n)$ it is clear that u∈ $\mathbb{R}^n$. From (6) by letting j→ ∞ we have

$$m(u_k, u) = m(u_k, \lim_{j\to\infty} u_j) =\ max_i\ a_{\mathbb{R}}(r_{ik} - r_i)\ <\ s$$

Thus (u_k) is fuzzy converges to u. Hence $(\mathbb{R}^n, m, \otimes)$ is fuzzy complete.

Example 3.12:
Let $U = C[a,b]$ and $t \otimes s = t\ +\ s\ - ts$ for all t, s ∈I. then $(U, m, \otimes)$ is fuzzy complete where

$$m(f,g)\ =\ max_{t\in[a,b]}\ a_{\mathbb{R}}[f(t) - g(t)]$$

Proof:
Let (f_k) be a fuzzy Cauchy sequence in *C[a, b]*. Then for any s ∈ (0, 1)we can find N∈ ℕ such that for m, n ≥N we have
$m(f_k, f_n)\ =\ max_{t\in[a,b]}\ a_{\mathbb{R}}[f_k(t) - f_n(t)]\ <\ s$ (7)
Hence for fixed t=t_0 ∈[a, b], $a_{\mathbb{R}}[f_k(t_0) - f_n(t_0)] < s$. This shows that $(f_1\ (t_0),\ f_2(t_0), \dots)$ is fuzzy Cauchy sequence in $(\mathbb{R}, m, \otimes)$. But $(\mathbb{R}, m, \otimes)$ is fuzzy complete by Example 3.9 so it is fuzzy converge to f(t_0). In this way we can associate with each t ∈[a, b] a unique f(t) ∈ ℝ. This defines a function f on [a, b] and we show that f ∈C[a, b] and (f_k) fuzzy converges to f. From (7) with n→ ∞ we have $max_{t\in[a,b]} a_{\mathbb{R}}[f_{k(t)} - f(t)] < s$ for all k≥N. Hence for every t∈[a, b],
$a_{\mathbb{R}}[f_k(t) - f(t)]\ <\ s$ for all k≥N.
This shows that $(f_k(t))$ fuzzy converge to f(t) uniformly on [a, b]. Since all members of (f_k) are fuzzy continuous on [a, b] and the fuzzy convergence is uniform the limit function f is fuzzy continuous on [a, b]. Hence $f\ \in C[a,b]$. Also (f_k) fuzzy converges to f. Hence $(C[a,b], m, \otimes)$ is fuzzy complete.

4.Application of Fixed Point Theorem

The following result is an application of Theorem 3.3 to system of linear equations

Theorem 4.1:
If the system of n linear equations
$u\ =\ Cu\ +\ b$ $(C = (c_{jk}), b$ given) (8)
in n unknowns $\alpha_1, \alpha_2, \dots, \alpha_n$, (the component of u) satisfies
$\sum_{k=1}^{n} a_{\mathbb{R}}(c_{jk}) < 1, (j = 1, 2, \dots, n)$ (9)
It has only one solution u. This solution can be obtained as the limit of the iterative sequence $(u^{(0)}, u^{(1)}, u^{(2)}, \dots)$ where $u^{(j)}$ is arbitrary and

$u^{(j+1)} = Cu^{(j)} + b, (\ j = 0, 1, , , ,)$ (10)

Error bounds are

$$m(u^{(j)}, u) \ \leq \ [(\frac{r}{1-r})]m(u^{(j-1)}, u^{(j)}) \ \leq \ [(\frac{r^j}{1-r})]m(u^{(0)}, u^{(1)})$$

Proof:

Let $v = (\beta_1, \beta_2, \dots, \beta_n), w = (\gamma_1, \gamma_2, \dots, \gamma_n) \ \in \ \mathbb{R}^n$. From Example 3.10 and Example 3.11, $(\mathbb{R}^n, m, \otimes)$ is fuzzy complete algebra fuzzy metric space.

Now define S: $\mathbb{R}^n \to \mathbb{R}^n$by v= S(u)=Cu+b where C=$(c_{jk})$ is a fixed n×n real matrix and b∈ $\mathbb{R}^n$. First we will show that S is a fuzzy contraction $\beta_j = \sum_{k=1}^{n} c_{jk}\, \alpha_j + \sigma_j$ where b=(σ_1, σ_2, …, σ_n). Putting S(w)=z where z=(δ_1, δ_2, …, δ_n). Now

$$m(v,z) = m(S(u), S(w)) = max_j a_{\mathbb{R}}(\beta_j \ - \ \delta_j) \ = \ max_j a_{\mathbb{R}}(\sum_{k=1}^{n} c_{jk}\ (\alpha_j - \delta_j))$$
$$\leq \ max_j[a_{\mathbb{R}}(\alpha_j \ - \ \delta_j)\ a_{\mathbb{R}}(c_{jk})] \ \leq \ max_j a_{\mathbb{R}}(\alpha_j \ - \ \delta_j)\ max_j a_{\mathbb{R}}(c_{jk})$$

Thus $m(v,z) \ \leq \ r\ m(u,w)$ where $r = max_j a_{\mathbb{R}}(c_{jk})$.

Now the assertion of the theorem follows from the proof of Theorem 3.3.

Definition 4.2:

Suppose that $(\mathbb{R}, a_{\mathbb{R}}, \otimes)$ is algebra fuzzy absolute value space. The function $f: \mathbb{R} \to \mathbb{R}$ is said to be satisfying a fuzzy Lipschitz condition if $a_{\mathbb{R}}$[f(t) – f(s)] ≤ k $a_{\mathbb{R}}$(t – s) for all t, s ∈ $\mathbb{R}$ where the constant k is called fuzzy Lipschitz constant.

The next result is an application of Theorem 3.3 to differential equations.

Theorem 4.3:

Let f be fuzzy continuous function on the rectangle $D = \{(t,u): |t - t_0| \leq a, |u - u_0| \leq b\}$and fuzzy bounded on D that is $a_{\mathbb{R}}(f(t,u)) \leq c$ for all (t, u)∈D**.** Suppose that f satisfies a fuzzy Lipschitz condition on D with respect to its second argument, that is there is a constant k such that for (t, u), (t, v) ∈D, $a_{\mathbb{R}}(f(t,u) - f(t,v)) \leq k a_{\mathbb{R}}(u - v)$. Then the initial value problem $\frac{du}{dt} = f(t,u),\ u(t_0) = u_0$ has a unique solution. This solution exists on an interval $[t_0 - \beta, t_0 + \beta]$ where β <min{a, $\frac{b}{c}$, $\frac{1}{k}$}

Proof:

Let $C(J)$ be the algebra fuzzy metric space of all real-valued continuous functions on the interval $J = [t_0 - \beta, t_0 + \beta]$ with fuzzy metric defined by $m(f,g) = \ max_{t \in J} a_{\mathbb{R}}[f(t) - g(t)]$. Then by Example 3.7 and Example 3.12 (C(J), m, ⊗) is fuzzy complete algebra fuzzy metric space. Let $\acute{C}$ be the subspace of C(J) consisting of all those functions u ∈C(J) that satisfy $a_{\mathbb{R}}$(u(t)− u_0) ≤ cβ, It is clear that $\acute{C}$ is closed in C(J). $\acute{C}$ is fuzzy complete.

By integration we see that $\frac{du}{dt}$=f(t, u) can be written u=S(u) where S: $\acute{C} \to \acute{C}$ is defined by $S(u(t)) = \ u_0 \ + \ \int_{t_0}^{t} f(\tau, u(\tau))d\tau$. S is defined for all u ∈ $\acute{C}$ since cβ <b so that if u ∈ $\acute{C}$ then τ ∈J and (τ, u(τ))∈ D and the integration exists since f is fuzzy continuous on D. To see S maps $\acute{C}$ into itself

$$a_{\mathbb{R}}[S(u(t)) - u_0] \leq \ a_{\mathbb{R}}[\int_{t_0}^{t} f(\tau, u(\tau)d\tau] \leq c a_{\mathbb{R}}[t - t_0] \leq c\beta.$$

Now we will show that S is a fuzzy contraction on $\acute{C}$. By the fuzzy Lipschitz condition, we have

$$a_{\mathbb{R}}[S(u(t)) - \ S(v(t)] \ = a_{\mathbb{R}}[\int_{t_0}^{t} [f(\tau, u(\tau)) - f(\tau, v(\tau)]d\tau$$
$$\leq a_{\mathbb{R}}[t - t_0]\ max_{\tau \in J} k\ a_{\mathbb{R}}[u(\tau) - \ v(\tau)]$$
$$\leq k\beta m(u,v)$$

But the last expression does not depends on t. we can take the maximum on the left and have $m[S(u), S(v)] \leq r\, m(u, v)$ where r=kβ. Thus S is a fuzzy contraction on $\acute{C}$. Then Theorem 3.3 implies that S has a unique fixed point u ∈ $\acute{C}$ that is a fuzzy continuous function u on J satisfying $u = S(u)$. Or

$$u(t) = u_0 + \int_{t_0}^{t} f(\tau, u(\tau) d\tau \quad (11)$$

Since $(\tau, u(\tau))$ ∈D where f is fuzzy continuous (8) may be differentiated.

Hence u is even differentiable and satisfies $\frac{du}{dt}$=f(t, u), u(t_0)= u_0.

Conversely every solution of $\frac{du}{dt}$=f(t, u), u(t_0)= u_0 must satisfy (11).

The next result is an application of Theorem 3.3 to integral equations

Theorem 4.4:

Suppose k and v in the Fredholm integral equation

$$u(t) - \mu \int_a^b k(t, \tau) u(\tau) d\tau = v(t) \quad (12)$$

are fuzzy continuous on J×J where J=[a, b] respectively and assume that μ satisfies

$$a_{\mathbb{R}}(\mu) < \frac{1}{c(b-a)} \quad (13)$$

Where c is defined in

$$a_{\mathbb{R}}(k(t, \tau)) \leq c \text{ for all } (t, \tau) \in G \quad (14)$$

Then (12) has a unique solution u on J. This function u is the limit of the iterative sequence (u_0, u_1, …) where u_0 is any fuzzy continuous function on J for n=0, 1, …

$$u_{n+1}(t) = v(t) + \mu \int_a^b k(t, \tau) u_n(\tau) d\tau \quad (15)$$

Proof:

The kernel function k of (12) is a given function on the square G=J×J and v is a given function on J. We assume that v∈C[a, b] and k is fuzzy continuous on G. Then k is fuzzy bounded on G by (14). Now (12) can be written S(u)=u where

$$S(u) = v(t) + \mu \int_a^b k(t, \tau) u(\tau) d\tau \quad (16)$$

Formula (16) defines an operator $S: C[a, b] \to C[a, b]$. Now

$$m(S(u), S(y)) = max_{t \in J}\, a_{\mathbb{R}}[Su(t) - Sy(t)]$$

$$= a_{\mathbb{R}}(\mu) \max_{t \in J} a_{\mathbb{R}}[\int_a^b k(t, \tau)[u(\tau) - y(\tau)] d\tau$$

$$\leq a_{\mathbb{R}}(\mu) max_{t \in J} \int_a^b a_{\mathbb{R}}\{k(t, \tau)[u(\tau) - y(\tau)]\} d\tau$$

$$\leq a_{\mathbb{R}}(\mu) max_{t \in J} \int_a^b a_{\mathbb{R}}\{k(t, \tau)\} a_{\mathbb{R}}\{[u(\tau) - y(\tau)]\} d\tau$$

$$\leq a_{\mathbb{R}}(\mu) c max_{\sigma \in J} a_{\mathbb{R}}[u(\sigma) - y(\sigma)] \int_a^b d\tau$$

$$\leq a_{\mathbb{R}}(\mu)\, c\, m(u, y)(b - a)$$

This can be written $m(S(u), S(y)) \leq r\, m(u, y)$ where $r = a_{\mathbb{R}}(\mu)\, c(b - a)$

We see that S becomes a fuzzy contraction from (13). Then Theorem 3.3 implies that S has a unique fixed point u on J. This function u is the limit of the iterative sequence (u_0, u_1, …) where u_0 is any fuzzy continuous function on J for n=0, 1, … $u_{n+1}(t) = v(t) + \mu \int_a^b k(t, \tau) u_n(\tau) d\tau$.

Theorem 4.5:

Suppose that v in Volterra integral equation

$$u(t) - \mu \int_a^t k(t, \tau) u(\tau) d\tau = v(t) \quad (17)$$

is fuzzy continuous on J and the kernel k is fuzzy continuous on the

triangular region D in the tτ-plane by a$\leq \tau \leq$t, a$\leq$t$\leq$b. Then equation (17) has a unique solution u on J for every μ.

Proof:
We see that equation (16) can be written u=S(u) with $S: C(J) \to C(J)$defined by

$$S(u(t)) = v(t) + \mu \int_a^t k(t,\tau)u(\tau)d\tau \quad (18)$$

since k is fuzzy continuous on R and R is fuzzy closed also k is fuzzy bounded function on D so

$$a_{\mathbb{R}}(k(t,\tau)) \leq c \text{ for all } (t,\tau) \in D \quad (19)$$

Now for all u, v ∈C(J) we have

$$a_{\mathbb{R}}[Su(t) - Sv(t)] = a_{\mathbb{R}}(\mu)a_{\mathbb{R}}[\int_a^t k(t,\tau)(u(\tau) - v(\tau))d\tau]$$

$$a_{\mathbb{R}}[Su(t) - Sv(t)] \leq a_{\mathbb{R}}(\mu)c\, m(u,v) \int_a^t d\tau = a_{\mathbb{R}}(\mu)\, c\, m(u,v)\, (t-a) \quad (20)$$

We show by induction that

$$a_{\mathbb{R}}[S^m u(t), S^m v(t)] \leq a_{\mathbb{R}}(\mu)\, {}^m c^m \frac{(t-a)^m}{m!} m(u,v) \quad (21)$$

For m=1 this is (20). Assume that (21) holds for any m we obtain

$$a_{\mathbb{R}}\,[S^{m+1}u(t), S^{m+1}v(t)] = a_{\mathbb{R}}(\mu)a_{\mathbb{R}}[\int_a^t k(t,\tau)(S^m u(\tau) - S^m v(\tau))d\tau]$$

$$\leq \mathrm{a}_{\mathbb{R}}(\mu)c \int_a^t \mathrm{a}_{\mathbb{R}}(\mu)\, {}^m c^m\, \frac{(t-a)^m}{m!} d\tau\, m(u,v)$$

$$\leq \mathrm{a}_{\mathbb{R}}(\mu)\, {}^{m+1}c^{m+1} \frac{(t-a)^{m+1}}{(m+1)!} m(u,v)$$

Which complete the inductive proof of (21). Using (t−a) ≤(t−b) on the right hand of (21) then taking the maximum over t∈J on the left we obtain from (20)

m(S^mu, S^mv) ≤ r_mm(u, v) where $r_m = \mathrm{a}_{\mathbb{R}}(\mu)\, {}^m c^m \frac{(t-a)^m}{m!}$

For any fixed μ and sufficiently large m we have r_m <1. Hence the corresponding S^m is a fuzzy contraction on *C(J)*. The assertion of our theorem now follows from Theorem 3.3.

Lemma 4.6:
Let $S: U \to U$ be a function where $(U, m, \otimes)$ is a fuzzy complete algebra fuzzy metric spaces. Suppose that S^m is a fuzzy contraction on U for some m∈ ℕ. Then S has a unique fixed point.

Proof:
By assumption S^m=T is a fuzzy contraction on U by Theorem 3.3 this function T has a unique fixed point y that is T(y)=y. Hence T^n(y)=y. Now Theorem 3.3 also implies that for every u∈U T^n(u) →y as n→ ∞. For the particular u=S(y) since $T^n = S^{nm}$ we obtain

$$y = \lim_{n\to\infty} T^n Sy = \lim_{n\to\infty} ST^n y = \lim_{n\to\infty} Sy = Sy.$$

This shows that y is a fixed point of S. Since every fixed point of S is also a fixed point of T we see that S cannot have more than one fixed point.

Abstract: In this paper, we study the convergence and$\Delta-$convergence results of $K-$iteration process for Lipschizian self-mapping with $L \geq 1$in $CAT(H)$ spaces , $H > 0$.

1 −Introduction

Let D a positive number . A metric space (E,d) is said to be a$D-$geodesic space if any two points of E with the distance less than D are joined by a geodesic .If $H > 0$,then E is said to be a $CAT(H)$ space if and only if it is D_H- geodesic and any geodesic triangle$\Delta(x,y,w)$ in $E$with$d(x,y)+d(y,w)+d(w,x) < 2\,D_H$ satisfies the $CAT(H)$ inequality .If $H < 0$,then E is said to be a$CAT(H)$ space if and only if it is a geodesic space such that all of its geodesic triangle satisfy the $CAT(H$ inequalitysee ([1]). He et al .[2]definedMann iteration in$CAT(H)$spaces ,$H > 0$ for self mapping V as follows , for any $x_1 \in E$

$$x_{n+1} = (1-\gamma_n)x_n \oplus \gamma_n V x_n \;; n \geq 0 \quad \ldots(i)$$

Where $\{\gamma_n\}$is sequence in $(0,1)$ and proved the sequencedefined by (i) converges in $CAT(H)$ spaces.

Kifayat U., Kashif I. and Muhammed A. [3] introdused$K-$ iteration in $CAT(0)$, space for Suzuki generalized nonexpansive self mapping V as follows , for any $x_1 \in E$

$$\begin{aligned} x_{n+1} &= Vy_n \\ y_n &= V(1-\sigma_n)Vx_n \oplus \sigma_n V z_n \\ z_n &= (1-\gamma_n)x_n \oplus \gamma_n V x_n \;; n \geq 0 \end{aligned} \quad \ldots(ii)$$

Where $\{\sigma_n\}$and$\{\gamma_n\}$ are sequences in $(0,1)$ and proved the sequence defined by (ii) converges in $CAT(0$ space .

Raweerots S . [4] denote the set of fixed points of the mapping V by $F(V) = \{x \in E; Vx = x\}$.

On the other hand A sequence $\{y_n\}$ in the space A is said to be $\Delta-$ converges to y if y is the unique asymptotic center of $\{v_n\}$for everysubsequence $\{v_n\}$of $\{y_n\}$. we write $\Delta-\lim_{n\to\infty} y_n = y$. where the asymptotic center $C(\{y_n\})$of $\{y_n\}$is the set

$C(\{y_n\}) = \{x \in A: r(\{y_n\}) = r(y,\{y_n\})\}$ .see ([5])

Das and Debata [6]introdused Ishikawa iteration in $CAT(0)$ space for two nonexpansiveself mappings V and Was follows, forany$x_1 \in E$

$$\begin{aligned} x_{n+1} &= (1-\sigma_n)x_n \oplus \sigma_n W y_n \\ y_n &= (1-\gamma_n)x_n \oplus \gamma_n V x_n \;; n \geq 0 \end{aligned} \quad \ldots(iii)$$

Where $\{\sigma_n\}$and $\{\gamma_n\}$ are sequences in (0,1) and proved the sequence defined by $(iii)\Delta-$ converges in $CAT(0)$ space . Jun[7]defined Ishikawa iteration in$CAT(H), H>0$ space for self mapping Vas follows , for any $x_1 \in E$

$$x_{n+1} = (1-\sigma_n)x_n \oplus \sigma_n V y_n$$
$$y_n = (1-\gamma_n)x_n \oplus \gamma_n V x_n \ ; n \geq 0 \quad \ldots(v)$$

Where $\{\sigma_n\}$and$\{\gamma_n\}$ are sequences in (0,1) and proved the sequencedefined by $(v)\Delta-$ converges to a fixed point of$V$ in $CAT(H)$ space .

2- Preliminaries

In this section ,we provide some definitions and lemmas which will be used Lemma (2.1)[8]: Let $H>0$ and(E,d) is a complete $CAT(H)$ spacewith diam (E) $=\frac{\pi/2-\mu}{\sqrt{H}}$for some $\mu \in (0,\pi/2)$. Then

$$d\big((1-\sigma)x \oplus \sigma y, w\big) \leq (1-\sigma)d(x,w) + \sigma d(y,w)$$
for all $x,y,w \in E$ and $\sigma \in (0,1)$.

Definition (2.2)[3]: Let G be a non−empty and convex subset of a CAT(H)spaceand $V: G \to G$ is a mapping for any $x_1 \in E$, the sequence $\{x_n\}$ define by

$$x_{n+1} = Vy_n$$

$$y_n = V((1-\sigma_n)Vx_n \oplus \sigma_n V z_n)$$

$$z_n = (1-\gamma_n)x_n \oplus \gamma_n V x_n \ ; n \geq 0 \quad \ldots(1)$$

is said to be $K-$ iteration sequence$CAT(H)$space,$\{\sigma_n\}$and $\{\gamma_n\}$ are sequences in (0,1).

Definition (2.3)[9]: Let G be a non−empty and convex subset of $CAT(H)$. A mapping $V: G \to G$ is said to be
(i) Lipschizian if $d(Vx,Vy) \leq L\, d(x,y)$ ... (2)
for all $x,y \in G$ and $L \geq 1$

Definition (2.4)[4]: A point $y \in E$ is a $\Delta-$ cluster point of $\{y_n\}$ if there exist asubsequence of $\{y_n\}$that $\Delta-$ converges to$y$,for a sequence$\{y_n\}$in A .

Lemma(2.5), [2] : Let(E,d) is a complete $CAT(H)$space . $q \in E$
Suppose that a sequence$\{y_n\}$ in A $\Delta-$ converges to$y$such that $r(q,y_n) < \frac{D_H}{2}$. Then $d(y,q) \leq \lim_{n\to\infty} \inf d(y_n, q)$

Definition (2.6)[4] : Let (E,d) be a complete metric space and Gbe a non−empty subset of E . Then a sequence $\{y_n\}$ in E isFej é r monotone with respect to G . If $d(y_{n+1}, q) \leq d(y_n, q)$, $n \geq 0$ andfor all $q \in G$.

Lemma(2.7), [2] :Let $H>0$ and(E,d) is a complete $CAT(H)$ space , G is a nonempty subset of E . Suppose that the sequence $\{y_n\}$ in EisFejér monotone with respect to G and the asymptotic radius $r(\{y_n\})$ of$\{y_n\}$ is less than $\frac{\pi}{2}$ .If any$\Delta-$cluster point of$\{x_n\}$ in G. Then$\{y_n\}$ $\Delta-$ converges to a point in G .

Definition (2.8)[1]: Let G be a non−empty and convex subset of $CAT(H)$space. A sequence$\{y_n\}$inG issaid to be an approximate fixed point sequence for G if $\lim_{n\to\infty} d(y_n, Vy_n) = 0$.

3 −Main Theorem

In this section , The convergence and $\Delta-$convergenceresults of $K-$ iteration process has been proved .

Theorem(3.1): Let $H>0$ and(E,d) is acomplete $CAT(H)$ space with diam (E) $=\frac{\pi/2-\mu}{\sqrt{H}}$for some$\mu\in(0,\pi/2)$, G is a nonempty and convex subset of E and $V:G\to G$is Lipschizian mapping with$L\geq 1$, $F\neq\emptyset$.Let$\{x_n\}$define by condition (1) withγ_n and$\sigma_n\in(0,1)$. If G is complete and $\lim_{n\to\infty}\inf d(x_n,F)=0$ or $\lim_{n\to\infty}\sup d(x_n,F)=0$, then $\{x_n\}$converges to a unique point in F .

Proof: Let $q\in F$, from lemma (2.1), condition(1)and(2),

$$\begin{aligned} d(z_n,q)=\ d((1-\gamma_n)x_n\ \oplus\gamma_n Vx_n,q) &\leq(1-\gamma_n)d(x_n,q)+\gamma_n d(Vx_n,q)\\ &\leq(1-\gamma_n)d(x_n,q)+\gamma_n\ L\ d(x_n,q)\\ &=(1-\gamma_n+\gamma_n\ L)d(x_n,q)\\ &\leq(1+\gamma_n\ L)d(x_n,q)\ldots(3)\end{aligned}$$

From lemma (2.1), condition(1), (2)and(3), we get

$$\begin{aligned} d(y_n,q)=\ d(V(1-\sigma_n)Vx_n\ \oplus\sigma_n Vz_n,q) &\leq L\ d((1-\sigma_n)Vx_n\ \oplus\sigma_n Vz_n,q)\\ \leq\ L[(1-\gamma_n)d(Vx_n,q)+\sigma_n d(Vz_n,q)] &\leq L[(1-\sigma_n)\ L\ d(x_n,q)+\sigma_n\ L\ d(z_n,q)]\\ &=[L^2+\sigma_n\gamma_n\ L^3]d(x_n,q)\\ &=L^2[1+\sigma_n\gamma_n\ L]d(x_n,q)\ldots(4)\end{aligned}$$

From lemma (2.1), condition(1), (2), (3)and(4), we get

$$\begin{aligned} d(x_{n+1},q)=d(Vy_n,q) &\leq L\ d(y_n,q)\\ &=\ L^3[1+\sigma_n\gamma_n\ L]d(x_n,q)\end{aligned}$$

Hence , for all$n,m\ \epsilon\ N$ and every $q\in F$, there exists $W>0$ such that,

$$d(x_{n+m},q)\leq W\ d(x_n,q).$$

Now we show that$\{x_n\}$ is acaushysequence in G,since $\lim_{n\to\infty}d(x_n,F)=0$, so for each $\delta>0$, $there\ e\ n_1\in N$ such that

$d(x_n,F)<\frac{\delta}{W+1}$for all $n>n_1$

Thus , there exists $\rho\in F$ such that

$d(x_n,\rho)<\frac{\delta}{W+1}$for all $n>n_1$, we get

$$\begin{aligned} d(x_{n+m},x_n)\leq\ d(x_{n+m},\rho)+d(x_n,\rho)&\leq\ Wd(x_n,\rho)+d(x_n,\rho)\\ &\leq(W+1)d(x_n,\rho)\\ &\leq(W+1)\frac{\delta}{W+1}=\delta,\end{aligned}$$

therefore$\{x_n\}$ is a caushysequence in G . From the completeness of G , we get $\lim_{n\to\infty}\{x_n\}$existsand equals$\rho\in G$, thereforefor all$\delta_1>0$

$$\text{there exists } n_1\in N\text{such that } d(x_n,\rho)<\frac{\delta_1}{3(2+3\vartheta_1)}$$

Now , $\lim_{n\to\infty}\inf d(x_n,F)=0$ or $\lim_{n\to\infty}\sup d(x_n,F)=0$

gives that$\lim_{n\to\infty}d(x_n,F)=0$.So there exists $n_2\in N$with$n_2>n_1$

$d(x_n,\rho)<\frac{\delta_1}{3(2+3\vartheta_1)}$.

Thus there exists $\theta\in F$ such that

$d(x_{n_2}, \theta) < \frac{\delta_1}{3(4+3\vartheta_1)}$, we obtain

$$d(V\rho, \rho) \le d(V\rho, \theta) + d(\theta, x_{n_2}) + d(x_{n_2}, \rho)$$
$$\le L\, d(\rho, \theta) + d(\theta, x_{n_2}) + d(x_{n_2}, \rho)$$
$$\le \frac{\delta_1}{3(4+3\vartheta_1)\mathrm{L}} + \frac{\delta_1}{3(4+3\vartheta_1)} + \frac{\delta_1}{3(2+3\vartheta_1)}$$
$$\le L\,(4+3\vartheta_1)\frac{\delta_1}{3(4+3\vartheta_1)\mathrm{L}} + (4+3\vartheta_1)\frac{\delta_1}{3(4+3\vartheta_1)}$$
$$+(2+\vartheta_1)\delta_1/3(2+\vartheta_1)$$
$$= \frac{\delta_1}{3} + \frac{\delta_1}{3} + \frac{\delta_1}{3} = \delta_1$$

Since δ_1 is arbitrary so $d(V\rho, \rho)$, so thus$V\rho = \rho$, there fore$\rho \in F$.

Corollary (3.2) Let (E, d) is a complete $CAT(0)$ space , G is a nonempty and convex subset of E and $V: G \to G$ is Lipschizian mapping with $L \ge 1$, $F \neq \emptyset$. Let $\{x_n\}$define by condition(1) with $\gamma_n$and$\sigma_n \in (0,1)$. If G is complete and $\liminf_{n\to\infty} d(x_n, F) = 0$ or $\limsup_{n\to\infty} d(x_n, F) = 0$, the$\{x_n\}$converges to a unique point in F.

Corollary(3.3) Let E, G, V and$\{x_n\}$ be as in theorem(3.1) with $F(V) \neq \emptyset$ if

$(i)\{x_n\}$ is an approximate fixed point sequence for V
(ii)there exists a function $\tau: [0,\infty[\to [0,\infty[$ which is right continuous at 0, $\tau(0) = 0$ and$\tau(d(x_n, Vx_n) \ge d(x_n, F)$, for all $n \in N$
then $\{x_n\}$converges to a unique point in F .

proof ;From (i) and (ii) , we get

$$\lim_{n\to\infty} d(x_n, F) \le \lim_{n\to\infty} \tau(d(x_n, Vx_n)$$
$$= \tau \lim_{n\to\infty} (d(x_n, Vx_n)$$
$$= \tau(0) = 0$$

Thus $\lim_{n\to\infty} d(x_n, F) = 0$.

$$\text{Thus } \liminf_{n\to\infty} d(x_n, F) = 0 \text{ and } \limsup_{n\to\infty} d(x_n, F) = 0 .$$

By theorem(3.1) , $\{x_n\}$converges to a unique point in$F$.

Corollary (3.4) Let E, G, V and $\{x_n\}$ be as inCorollary(3.2) with $F(V) \neq \emptyset$ if
$(i)\{x_n\}$ is approximate fixed point sequence for V
(ii)there exists a function $\tau: [0,\infty[\to [0,\infty[$ which is right continuous at 0, $\tau(0) = 0$ and$\tau(d(x_n, Vx_n) \ge d(x_n, F)$, for all $n \in N$
then $\{x_n\}$ converges to a unique point in F .

Theorem(3.5)Let E, G, V and$\{x_n\}$ be as in theorem(3.1) with $F(V) \neq \emptyset$if
(i) $d(x_0, F) < \frac{T_H}{4}$ for $x_0 \in G$. $(ii)\{x_n\}$ is Fej é r monotone with respect to G. $(iii)\{x_n\}$ is an approximate fixed point sequence for V. then$\{x_n\}$ $\Delta-$converges to a point in F .

proof :Set $F_0 = F \cap B_{\frac{\pi}{2}}(x_0)$.

Let $\{x_n\}$ is Fejér monotonewith respect to $F_0$and$q \in F$ such that $d(x_0, q) < \frac{\pi}{4}$. Then $q \in F_0$we get

$$d(x_{n+1}, q) \leq d(x_n, q) \leq d(x_0, q) < \frac{\pi}{4} \quad \text{, for all } n \geq 0. \qquad \ldots (5)$$

Hence $r(\{x_n\}) < \frac{\pi}{4}$

from lemma (2.7) ,let$\overline{q} \in G$be a $\Delta -$ cluster point of $\{x_n\}$, then there exists asubsequence $\{x_{n_l}\}$of$\{x_n\}$ which $\Delta -$ converges to $\overline{q}$. By (5) , we obtain $r(q, \{x_{n_l}\}) \leq d(x_0, q) < \frac{\pi}{4}$.

Using lemma (2.5) , we get

$d(\overline{q}, x_0) \leq d(\overline{q}, q) + d(x_0, q) \leq \lim_{l\to\infty} \inf d(x_{n_l}, q) + d(x_0, q) < \frac{\pi}{4}$.

That is $\overline{q} \in B_{\frac{\pi}{2}}(x_0)$. From condition (iii), we obtain

$$\lim_{l\to\infty} \sup d(V\overline{q}, x_{n_l}) \leq \lim_{l\to\infty} \sup d(V\overline{q}, Vx_{n_l}) + \lim_{l\to\infty} \sup d(Vx_{n_l}, x_{n_l})$$
$$\leq \lim_{l\to\infty} \sup d(\overline{q}, x_{n_l})$$

Hence $V\overline{q} \in C(\{x_{n_l}\})andV\overline{q} = \overline{q}$. Then$\overline{q} \in F_0$ and using lemma (2.7) , we get$\{x_n\}$ $\Delta -$ converges to a point in F .

Corollary (3.6) Let E, G, V and$\{x_n\}$ be as in corollary(3.2) with $F(V) \neq \emptyset$ if
(i) $d(x_0, F) < \frac{T_H}{4}$ for $x_0 \in G$. $(ii)\{x_n\}$is Fejér monotone with respect to H. $(iii)\{x_n\}$ is an approximate fixed point sequence for$V$. then$\{x_n\}$ $\Delta -$ converges to a point in F .

4- Conclusions

The convergence and $\Delta -$convergenceresults of $K -$ iteration process has been proved when used Lipschizian self mapping with $L \geq 1$ in $CAT(H)$, $H > 0$ spaces . alsoe stablished the convergence and $\Delta -$convergence results has been in $CAT(0)$spaces .

5- Suggestion

$1 -$ we can useuniformly Lipschizian mapping to established the convergence and $\Delta -$ convergesresults of$K -$ Iteration .

$2 -$ we can use another iteration to established the convergence and $\Delta -$ convergesresults .

Abstract. This study emphasizes the flow phenomenon of trapped bolus traveling along the interior walls of asymmetric inclined channels contains a non-Newtonian Ree-Eyring. The flow was exposed to influenced by inclined MHD field, thermal heat radiative, and porous media. Further, no slip and convective thermal conditions are considered. Mathematical expression for governing equations are reformulated and in accordance with lubrication approximations, nonlinear partial differential equations of the flow reduced into a system of ordinary differential equations associated with boundary conditions an approximate solution is deduced by implementing perturbation strategy for tiny A Ree-Eyring fluid parameter. Finally, a graphical description is presented to figure out the elevation behavior of flow quantities i.e. velocity profile, temperature distribution, pressure rise, and streamlines formulation due to variation of emerging involved parameters. The study analyzed that the velocity profile reveals mixed behavior via increment of Ree-Eyring parameters η, A as well as Hartman number H and Darcy number Da. whereas the thermal radiative parameter Rn accelerates the temperature distribution profile. The study calculations are made by the "Mathematica 11.3" package.

1. Introduction

Peristaltic pumping is a type of fluid motion that appears when a progressive wave of area clasping and compressing propagates along the wall of a distensible channel. Bolus development through the esophagus, movement of blood in small vessels, intrauterine fluid motion, lymph transport, and embryo motion through the uterine cavity are the biological applications of the peristaltic mechanism. Moreover, it is an inherent property of many modern industrial applicable such as the ceramic and porcelain industry, nuclear industry, pharmaceutical industry, and heart-lung machines [1]. After the first attempt on peristaltic transport given by Latham [2]. Fung and Yih [3] introduced the peristaltic mechanism in the laboratory frame. Nowadays many pieces of literature are available on peristalsis considering different fluids models and flow configurations see Refs. [4,5,6].

Incited by the fact that enormous fluids in nature have an immense impact in modern industry, science, and technology is non-Newtonian like paints, cosmetic products, colloidal fluids, certain oils, and shampoo known by their behavior cannot be predicted by a single constitutive equation [7,6]. Inspired by the aforementioned applicable literature survey, many researchers presented various models to visualize the non-Newtonian fluid models. Recently the most considerable non-Newtonian fluid

gained the attraction of many researchers due to its wide medical and scientific application. Furthermore, its constitutive equation is derived from the kinetic theory of liquids, not from empirical relations alike the power-law model, and it properly reduced into the Newtonian fluid model at high shear stress known by Ree-Eyring fluid [8,9]. numerous scientific literature outlined the peristaltic transport of Ree-Eyring with different effects and flow situations in Refs. [10-12].

On other hand, a flow through magneto hydrodynamic (MHD) field has vigorous attention in recent years via its vastly applicable in metallurgy processes, engineering, geophysics, and industry. Plasma confinement, nuclear reactor, bleeding reduction during surgeries, stirring, crystal growth process, and MRI (magnetic resonance imaging) to diagnose the disease are several utilization of electrically fluid flows in the presence of (MHD) field [13]. In view of these diverse, many studied considering the peristaltic transport of MHD various fluid models are mentioned through the studies [7,14-16].

Thermal radiation can control the excess heat generation inside the body since high temperatures pose serious stresses for the human body which leads to injury or even death. This effect occurs in many physiological, technological, and industrial processes like plasma tissue heat conduction, MHD generators, laser surgery, destruction of cancer tumors, polymer processing industry, etc. However, the rate of heat or energy transfer between two bodies via thermal radiation essentially depends on the absolute temperature difference this means that the influence of thermal radiation on fluid flow has major coverage at high temperatures. Motivated by these developments some modern attempts have been devoted to investigating the influence of thermal radiation on the peristaltic mechanism for different non-Newtonian fluid. Nikiforov [17] elevate an electromagnetic hyperthermia technique in which the undesired cancer cells are exposed to a higher temperature field of more than 41 °C with aid of thermal radiation. In such a technique, a magnetic liquid is injected into the malignant tissues and then exposing the framework to an alternating current. So, the temperature is produced in the infused magnetic fluid and hence the cancer cells will be destroyed see also [14]. Hayat et al. [18] analyzed numerically heat transfer due to viscous dissipation and radiation on peristaltic flow of Sutter by fluid in a vertical channel. While Bhatti et al. [19] explored theoretically nonlinear thermal radiation impact on EMHD peristaltic propulsion of non-Newtonian fluid-particle (dusty) suspensions in a planar channel including a homogenous porous media. Naveed Imrana et al. [20] discuss the influence of heterogeneous-homogenous effect in the peristaltic flow of non-Newtonian Rabinowitsch fluid considering thermal radiation effects and viscous dissipation for more knowledge in this aspect see Refs.[21-26].

From the aforementioned survey, we conclude that no attempt has been made to examine the combined impact of heat radiative, and inclined (MHD) on peristaltic transport of Non-Newtonian Ree-Eyring fluid yet and the current study will fill this gap. In this article, we explore the peristaltic transport of Ree-Eyring fluid past through inclined asymmetric porous channel subjected to the combined influence of thermal radiation and inclined (MHD) field. Velocity no-slip and convective boundary conditions are taken into account. The flow is illustrated in the laboratory frame which is transformed into a wave frame. The flow mathematical system was simplified by considering the assumption of infinite wave length and low Reynolds number. Analytical solution for stream function and temperature distribution function is evaluated by implementing the regular perturbation method. The impact of impeded physical parameters on the flow quantities is discussed in detail through figures.

2. Mathematical Model

Reconsidering the peristaltic transport of an incompressible electrically conducting Ree-Eyring fluid in asymmetric an inclined channel at an angle (α_1) and width $(d_1 + d_2)$ through porous media see Figure 1. The flow is incident to inclined uniform magnetic field of strength $\vec{B} = (\beta_0\, Sin\alpha_2, \beta_0\, Cos\alpha_2)$. The induced magnetic field is neglected by taken a small magnetic Reynolds number. The flow is propagating by the sinusoidal waves of length λ with different amplitudes and phases moving with a constant speed (c) along the walls of the channels.

The geometry of the walls surfaces is given by [4]

$$Y_1 = H_1(X,t) = d_1 + a_1 Cos\left(\frac{2\pi(X-ct)}{\lambda}\right), \quad (1)$$

$$Y_2 = H_2(X,t) = -d_2 - a_2 Cos\,(2\pi(X-ct)/\lambda + \emptyset), \quad (2)$$

Where Y_1, Y_2 are the upper and lower wall respectively a_1, a_2 are the wave amplitudes, t is the time, and (X,Y) the Cartesian coordinates in a fixed frame. $\emptyset$ is the phase different and $\emptyset \in [0,\pi]$ such that when $(\emptyset = 0)$ corresponds to asymmetric channel with waves out of phase, while $(\emptyset = \pi)$, the waves in phase. Further a_1, a_2, d_1, d_2 *and* $\emptyset$ satisfy the condition.

$$a_1{}^2 + a_2{}^2 + a_1 a_2 d_1 d_2\, cos\emptyset \le (d_1 + d_2)^2, \quad (3)$$

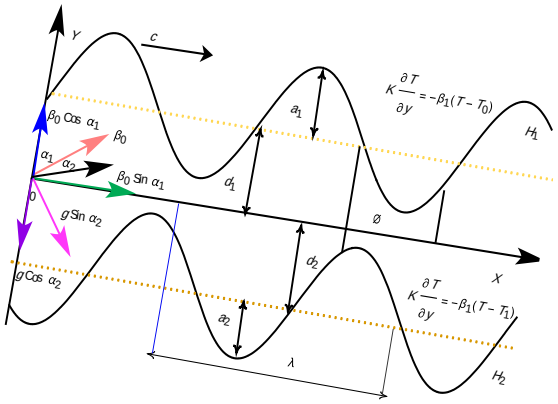

Figure 1. The geometry of the Inclined Asymmetric Channel [4]

To calculate the Lorentz force applying the following Ohm's formula [27] as below

$$\vec{F} = \sigma[\vec{V} \times \vec{B}] \times \vec{B}, \quad (4)$$

We have

$$\vec{F} = \left(-\sigma\beta_0{}^2 Cos\alpha_1(\bar{U}Cos\alpha_1 - \bar{V}Sin\alpha_1), \sigma\beta_0{}^2 Sin\alpha_1(\bar{U}Cos\alpha_1 - \bar{V}Sin\alpha_1)\right), \quad (5)$$

$\vec{F}$ is the magnetic force, $\vec{J}$ is the current density vector, $\vec{V} = (\bar{U}, \bar{V}, 0)$ the velocity field, σ the electrical conductivity.

The governing equations of continuity, motion, and energy can be constructed as

$$\frac{\partial \bar{U}}{\partial X} + \frac{\partial \bar{V}}{\partial Y} = 0, \quad (6)$$

$$\rho\left(\frac{\partial \bar{U}}{\partial t} + \bar{U}\frac{\partial \bar{U}}{\partial X} + \bar{V}\frac{\partial \bar{U}}{\partial Y}\right) = -\frac{\partial \bar{P}}{\partial X} + \frac{\partial \check{S}_{XX}}{\partial X} + \frac{\partial \check{S}_{XY}}{\partial Y} - \sigma\beta_0{}^2 Cos\alpha_1(\bar{U}Cos\alpha_1 - \bar{V}Sin\alpha_1) - \frac{\mu}{\kappa_0}\bar{U} + \rho g Sin\alpha_2, \quad (7)$$

$$\rho\left(\frac{\partial \bar{V}}{\partial t} + \bar{U}\frac{\partial \bar{V}}{\partial X} + \bar{V}\frac{\partial \bar{V}}{\partial Y}\right) = -\frac{\partial \bar{P}}{\partial Y} + \frac{\partial \check{S}_{XY}}{\partial X} + \frac{\partial \check{S}_{YY}}{\partial Y} + \sigma\beta_0{}^2 Sin\alpha_1(\bar{U}Cos\alpha_1 - \bar{V}Sin\alpha_1) - \frac{\mu}{\kappa_0}\bar{V} - \rho g Cos\alpha_2, \quad (8)$$

$$\rho c_P\left(\frac{\partial T}{\partial t} + \bar{U}\frac{\partial T}{\partial X} + \bar{V}\frac{\partial T}{\partial Y}\right) = K\left(\frac{\partial^2 T}{\partial X^2} + \frac{\partial^2 T}{\partial Y^2}\right) + \check{S}_{XX}\frac{\partial \bar{U}}{\partial X} + \check{S}_{YY}\frac{\partial \bar{V}}{\partial Y} + \check{S}_{XY}\left(\frac{\partial \bar{U}}{\partial Y} + \frac{\partial \bar{V}}{\partial X}\right) - \frac{\partial q_r}{\partial Y} + \sigma\beta_0{}^2(\bar{U}Cos\alpha_1 - \bar{V}Sin\alpha_1)^2, \quad (9)$$

Where σ is the electrical conductivity, K is thermal conductivity, κ_0 posity parameter, ρ density, c_P specific heat, T is the temperature vector, $\bar{P}$ the pressure.

Using Rosseland approximation for radiation, the radiative heat flux $q_r$is given by

$$q_r = -\frac{4\sigma_1}{3k_1}\frac{\partial T^4}{\partial Y}, \quad (10)$$

σ_1 is the Stefan-Boltzman constant and $k_1$is the mean absorption coefficient. By assuming a sufficiently small temperature difference in the flow, the term

the Taylor series approximation for T^4in terms of T_0 take the following form

$$T^4 \cong 4{T_0}^3 T - 3{T_0}^4, \tag{11}$$

placement of equation (10) and equation (11) into equation (9), the energy equation will take the form

$$\rho c_P \left(\frac{\partial T}{\partial t} + \bar{U}\frac{\partial T}{\partial X} + \bar{V}\frac{\partial T}{\partial Y}\right) = K\left(\frac{\partial^2 T}{\partial X^2} + \frac{\partial^2 T}{\partial Y^2}\right) + \check{S}_{XX}\frac{\partial \bar{U}}{\partial X} + \check{S}_{YY}\frac{\partial \bar{V}}{\partial Y} + \check{S}_{XY}\left(\frac{\partial \bar{U}}{\partial Y} + \frac{\partial \bar{V}}{\partial X}\right) + \frac{16{T_0}^3\sigma_1}{3k_1}\frac{\partial T}{\partial Y} + \sigma{\beta_0}^2\left(\bar{U}Cos\alpha_1 - \bar{V}Sin\alpha_1\right)^2, \tag{12}$$

With the boundary conditions

$$\left.\begin{aligned} &\bar{U} = 0, \quad \psi = \frac{F}{2}, \quad K\frac{\partial T}{\partial y} = -\beta_1(T - T_0), at\ Y = H_1 \\ &\bar{U} = 0, \quad \psi = -\frac{F}{2}, \quad K\frac{\partial T}{\partial y} = -\beta_1(T - T_1), at\ Y = H_2 \end{aligned}\right\} \tag{13}$$

The stress tensor for Ree-Eyring fluid is given as follows [28]:

$$\check{S}_{ij} = \mu\frac{\partial \bar{V}_i}{\partial X_j} + \frac{1}{\beta}Sinh^{-1}\left(\frac{1}{c}\frac{\partial \bar{V}_i}{\partial X_j}\right) \quad i,j = 1,2 \tag{14}$$

$$Sinh^{-1}\left(\frac{1}{c}\frac{\partial \bar{V}_i}{\partial X_j}\right) \approx \frac{1}{c}\frac{\partial \bar{V}_i}{\partial X_j} - \frac{1}{6}\left(\frac{1}{c}\frac{\partial \bar{V}_i}{\partial X_j}\right)^3, \ \left|\frac{1}{c}\frac{\partial \bar{V}_i}{\partial X_j}\right| \ll 1, \tag{15}$$

Then

$$\check{S}_{ij} = \mu\frac{\partial \bar{V}_i}{\partial X_j} + \frac{1}{\beta c_1}\frac{\partial \bar{V}_i}{\partial X_j} - \frac{1}{6\beta{c_1}^3}\left(\frac{\partial \bar{V}_i}{\partial X_j}\right)^3 \tag{16}$$

Where $\bar{V}_1 = \bar{U}, \bar{V}_2 = \bar{V}$, $x_1 = X$, $x_2 = Y$.

$\check{S}_{ij}$ represents the extra stress tensor, β, c_1 are the fluid parameter, and μ is the dynamic viscosity.

In view of equation (16), the laboratory frame components of extra stress tensor become

$$\left.\begin{aligned} \check{S}_{XX} &= \mu\frac{\partial \bar{U}}{\partial X} + \frac{1}{\beta c_1}\frac{\partial \bar{U}}{\partial X} - \frac{1}{6\beta{c_1}^3}\left(\frac{\partial \bar{U}}{\partial X}\right)^3 \\ \check{S}_{XY} &= \mu\frac{\partial \bar{U}}{\partial Y} + \frac{1}{\beta c_1}\frac{\partial \bar{U}}{\partial Y} - \frac{1}{6\beta{c_1}^3}\left(\frac{\partial \bar{U}}{\partial Y}\right)^3 \\ \check{S}_{YX} &= \mu\frac{\partial \bar{V}}{\partial X} + \frac{1}{\beta c_1}\frac{\partial \bar{V}}{\partial X} - \frac{1}{6\beta{c_1}^3}\left(\frac{\partial \bar{V}}{\partial X}\right)^3 \\ \check{S}_{YY} &= \mu\frac{\partial \bar{V}}{\partial Y} + \frac{1}{\beta c_1}\frac{\partial \bar{V}}{\partial Y} - \frac{1}{6\beta{c_1}^3}\left(\frac{\partial \bar{V}}{\partial Y}\right)^3 \end{aligned}\right\}, \tag{17}$$

By the following transformations, we furnished the relationship between laboratory frame (X, Y) and wave frame $(\check{x}, \check{y})$ coordinates

$$\check{x} = X - c\bar{t}\ ,\ \check{y} = Y\ ,\bar{u} = \bar{U} - c\ ,\bar{v} = \bar{V}, \bar{p}(\check{x},\ \check{y}) = \bar{P}(X, Y, t), \tag{18}$$

Employing the above equation, we transform equations (1), (2) and (6) - (17) in wave frame and then normalize the resulting equations by considering the following dimensionless quantities [25,27]

$$x = \frac{\check{x}}{\lambda}\ , y = \frac{\check{y}}{d_2}\ ,\ u = \frac{\bar{U}}{c}\ , v = \frac{\bar{V}}{c}\ , h_1 = \frac{H_1}{d_2}, h_2 = \frac{H_2}{d_2}\ , p = \frac{{d_2}^2\bar{p}}{\lambda\mu c}, \delta = \frac{d_2}{\lambda}\ , u = \frac{\partial\psi}{\partial y}\ , v = -\delta\frac{\partial\psi}{\partial x}, S = \frac{d_2\check{S}(\check{x})}{\mu c}\ , Re = \frac{\rho c d_2}{\mu},\ \theta = \frac{T - T_0}{(T_1 - T_0)}, Pr = \frac{\mu c_P}{k}\ , H = \beta_0 d_2\sqrt{\frac{\sigma}{\mu}}\ , E_c = \frac{c^2}{c_P(T_1 - T_0)}\ , Br = E_c Pr\ ,\ Fr = \frac{c}{\sqrt{g d_2}}\ , a = \frac{a_1}{d_2}\ , b = \frac{a_2}{d_2}\ , d = \frac{d_1}{d_2}, Da = \frac{\kappa_0}{{d_2}^2}, \eta = \frac{1}{\mu\beta c_1}, A = \frac{\eta}{6}\left(\frac{c}{c_1 d}\right)^2, Rn = \frac{16\sigma_1{T_0}^3}{3k_1\mu c_P}, \omega_1 = \frac{\beta_1}{K}, \tag{19}$$

Where Re is Renolds number, δwave number, Pr Prandtl number, H Hartman number, E_c Eckret number, Br Brinkman number, Fr Froude number, Da Darcy number, Rn is the thermal radiation parameter, η, A are the Ree- Eyring fluid parameters, ω_1 is the heat Biot number a, b the amplitude ratio of the upper and lower wall, and $\psi(x, y, t)$ is the stream function.

Using the assumptions of long wavelength and low Renolds number approximation and equation (19), the flow equations reduced and simplified to the forms

$$Re\ \delta\left(\psi_y\psi_{xy} - \psi_x\psi_{yy}\right) = -p_x + \delta\frac{\partial}{\partial x}S_{xx} + \frac{\partial}{\partial y}S_{xy} - H^2 Cos\alpha_1\left(\psi_y Cos\alpha_1 - \delta\psi_x Sin\alpha_1\right) - \frac{1}{Da}\psi_y + \frac{Re}{Fr}Sin\alpha_2, \tag{20}$$

$$Re\,\delta^3(-\psi_y\psi_{xx}-\psi_x\psi_{xy}) = -p_y+\delta^2\frac{\partial}{\partial x}S_{xy}+\delta\frac{\partial}{\partial y}S_{yy}-\delta H^2 Sin\alpha_1(\psi_y Cos\alpha_1+\ \delta\psi_x Sin\alpha_1)-\frac{\delta}{Da}\psi_x-\delta\frac{Re}{Fr}Cos\alpha_2, \quad (21)$$

$$PrRe\,\delta(\psi_y\theta_x-\psi_x\theta_y) = (\delta^2\theta_{xx}+\theta_{yy})+\mathrm{Pr}\,Rn\,\theta_{yy}+\delta S_{xx}\psi_{yx}+S_{xy}(-\delta^2\psi_{xy}+\psi_{yy})-\delta S_{yy}\psi_{xy}+H^2Br(\psi_y Cos\alpha_1+\delta\psi_x Sin\alpha_1)^2, \quad (22)$$

By applying($Re \ll 0, \delta \to 0$) we finally get

$$0 = -p_x+\frac{\partial}{\partial y}S_{xy}-H^2\psi_y(Cos\alpha_1)^2-\frac{1}{Da}\psi_y+\frac{Re}{Fr}Sin\alpha_2, \quad (23)$$

$$0 = -p_y, \quad (24)$$

$$(1+\mathrm{Pr}\,Rn)\,\theta_{yy}+S_{xy}\psi_{yy}+H^2Br(\psi_y Cos\alpha_1)^2 = 0, \quad (25)$$

Eliminating p from equations (23) and (24), we have the following equation

$$0 = \frac{\partial^2}{\partial y^2}S_{xy}-H^2\psi_{yy}(Cos\alpha_1)^2-\frac{1}{Da}\psi_{yy}, \quad (26)$$

Where $S_{xy} = (1+\eta)\psi_{yy}-A(\psi_{yy})^3$.

Associated with the following dimensionless boundary conditions

$$\left.\begin{array}{l}\psi_y = 0,\ \ \psi = \frac{F}{2},\quad \theta_y = -\omega_1\theta,\quad at\ y = h_1\\ \psi_y = 0,\ \ \psi = -\frac{F}{2},\quad \theta_y = -\omega_1(\theta-1),\quad at\ y = h_2\end{array}\right\}, \quad (27)$$

In which $y = h_1 = d + a\,Cos(x)$ and $y = h_2 = -1 - b\,Cos(x+\emptyset)$ dimensionless upper and lower walls and F is the non-dimensional mean flow which related to the non-dimensional time- mean flow ϑ by following dimensionless relationship

$$F = \vartheta - 1 - d, \quad (28)$$

And the pressure rise per wavelength is

$$\Delta p_\lambda = \int_0^1 \frac{dp}{dx}dx, \quad (29)$$

3. Methodology of solution

Dimensionless equations (25) and (27) are highly complicated, non-linear and thus the closed form solution for arbitrary values of all parameters is impossible hence we adopt the perturbation method for the analytical solution of the problem. Inserting the following expressions

$$\psi = \psi_0 + A\,\psi_1 + O(A)^2, \quad (30)$$

$$\theta = \theta_0 + A\,\theta_1 + O(A)^2, \quad (31)$$

$$F = F_0 + A\,F_1\ + O(A)^2, \quad (32)$$

Substituting equations (30) - (32) into equations (25) - (28) and then comparing the coefficients of the same power of A up to the first order we obtain the following systems

3.1. Zeroth order system

The general form of the zeroth-order system is

$$(1+\eta)\psi_{0yyyy}-\left(H^2(Cos\alpha_1)^2+\frac{1}{Da}\right)\psi_{0yy} = 0, \quad (33)$$

$$(1+Pr\,Rn)\,\theta_{0yy}+(1+\eta)(\psi_{0yy})^2+H^2(Cos\alpha_1)^2Br{\psi_{0y}}^2 = 0, \quad (34)$$

the boundary conditions are

$$\left.\begin{array}{l}\psi_{0y} = 0,\ \ \psi_0 = \frac{F_0}{2}, \theta_{0y} = -B_1\theta_0,\ at\ y = h_1\\ \psi_{0y} = 0, \psi_0 = -\frac{F_0}{2},\ \theta_{0y} = -B_1(\theta_0-1), at\ y = h_2\end{array}\right\}, \quad (35)$$

3.2. First order system

The first- order system is

$$(1+\eta)\psi_{1yyyy}-\left(H^2(Cos\alpha_1)^2+\frac{1}{Da}\right)\psi_{1yy}-\frac{\partial^2}{\partial y^2}(\psi_{1yy})^3 = 0, \quad (36)$$

$$(1 + Pr\,Rn)\,\theta_{1yy} + Br(1+\eta)\left((\psi_{1yy})^2 - \left(\psi_{0yy}\right)^4\right) + BrH^2(Cos\alpha_1)^2 Br{\psi_{1y}}^2 = 0, \quad (37)$$

With the respect to the boundary conditions

$$\left.\begin{array}{l} \psi_{1y} = 0, \quad \psi_1 = \frac{F_1}{2}, \quad \theta_{1y} = -\omega_1\theta_1, \quad at\ y = h_1 \\ \psi_{1y} = 0, \quad \psi_1 = -\frac{F_1}{2}, \quad \theta_{1y} = -\omega_1(\theta_1 - 1), \quad at\ y = h_2 \end{array}\right\}, \quad (38)$$

Solving both systems using Mathematica program, the closed form for stream function ψ, and temperature field θ will be obtained

$$\psi = \frac{e^{-\frac{vy}{\sqrt{1+\eta}}}(1+\eta)(e^{\frac{2vy}{\sqrt{1+\eta}}}\mathrm{c}_1+\mathrm{c}_2)}{v^2} + \mathrm{c}_3 + yc_4 + A\left(\frac{A_1+A_2+A_3}{8v(1+\eta)^{3/2}} + c_7 + yc_8\right),$$

$$\theta_0 = \mathrm{r}_1 + y\,\mathrm{r}_2 - \frac{Br(A_4+A_5+A_6)}{2(v+PrRnv)},$$

$$\theta_1 = r_3 + yr_4 + \frac{\mathrm{Br}}{128(1+PrRn)v(1+\eta)^2}\left(A_7 - A_8 - 4e^{\frac{2vy}{\sqrt{1+\eta}}}(-18c1^4c2^2vy^2(1+\eta) - \frac{A_9+A_{10}+A_{11}}{v} + 4e^{-\frac{2vy}{\sqrt{1+\eta}}}(-18\mathrm{c}1^2\mathrm{c}2^4vy^2(1+\eta) - \frac{A_{12}+A_{13}}{v}) + A_{14} + A_{15} - A_{16}\right),$$

$$A_1 = \frac{{c_2}^3 e^{-\frac{3vy}{\sqrt{1+\eta}}}(1+\eta)^{3/2}}{v} + \frac{{c_1}^3 e^{\frac{3vy}{\sqrt{1+\eta}}}(1+\eta)^{3/2}}{v},$$

$$A_2 = 2e^{\frac{vy}{\sqrt{1+\eta}}}(6{c_1}^2c_2y(1+\eta) + \frac{(1+\eta)^{3/2}(-15{c_1}^2c_2+4*c_5+4\eta*c_5)}{v}),$$

$$A_3 = e^{-\frac{vy}{\sqrt{1+\eta}}}(-12c_1{c_2}^2y(1+\eta) + \frac{2(1+\eta)^{3/2}(-15c_1{c_2}^2+4*c_6+4\eta*c_6)}{v}),$$

$$v = \left(H^2(Cos\alpha_1)^2 + \frac{1}{Da}\right)^{1/2},$$

$$A_4 = \frac{c2^2e^{-\frac{2vy}{\sqrt{1+\eta}}}(1+\eta)^2}{2v} + \frac{c1^2e^{\frac{2vy}{\sqrt{1+\eta}}}(1+\eta)^2}{2v},$$

$$A_5 = -\frac{2c2e^{-\frac{vy}{\sqrt{1+\eta}}}H^2(1+\eta)^{3/2}Cos[\alpha_1]^2}{v^2} + \frac{2c1e^{\frac{vy}{\sqrt{1+\eta}}}H^2(1+\eta)^{3/2}Cos[\alpha_1]^2}{v^2},$$

$$A_6 = \frac{1}{2}vy^2(c_4H^2 + 4c_1c_2(1+\eta) + c_4H^2Cos[2\alpha_1]),$$

$$A_7 = (48c1^3c2^3v^3y^4 + 64c1c2(c2c5 - c1c6)v^2y^3(1+\eta)^{3/2} - \frac{9c2^6e^{-\frac{6vy}{\sqrt{1+\eta}}}(1+\eta)^2}{2v} - \frac{9c1^6e^{\frac{6vy}{\sqrt{1+\eta}}}(1+\eta)^2}{2v} + c1^3e^{\frac{4vy}{\sqrt{1+\eta}}}(1+\eta)(-27c1^2c2y\sqrt{1+\eta} + \frac{(1+\eta)(8c1+27c1^2c2-18c5+8c1\eta-18c5\eta)}{v}),$$

$$A_8 = c2^3e^{-\frac{4vy}{\sqrt{1+\eta}}}(1+\eta)(-27c1c2^2y\sqrt{1+\eta} - \frac{(1+\eta)(8c2+27c1c2^2-18c6+8c2\eta-18c6\eta)}{v}),$$

$$A_9 = (1+\eta)^2(-32c1^3c2 + 63c1^4c2^2 - 36c1^2c2c5 + 8c5^2 + 18c1^3c6 - 32c1^3c2\eta,$$

$$A_{10} = -36c1^2c2c5\eta + 16c5^2\eta + 18c1^3c6\eta + 8c5^2\eta^2),$$

$$A_{11} = 3y(-27c1^4c2^2v\sqrt{1+\eta} + 8c1^2c2c5v\sqrt{1+\eta} - 27c1^4c2^2v\eta\sqrt{1+\eta} + 16c1^2c2c5v\eta\sqrt{1+\eta} + 8c1^2c2c5v\eta^2\sqrt{1+\eta}),$$

$$A_{12} = (1+\eta)^2(-32c1c2^3 + 63c1^2c2^4 + 18c2^3c5 - 36c1c2^2c6 + 8c6^2 - 32c1c2^3\eta + 18c2^3c5\eta - 36c1c2^2c6\eta + 16c6^2\eta + 8c6^2\eta^2),$$

$A_{13} = 3y(-27c1^2c2^4v\sqrt{1+\eta} + 8c1c2^2c6v\sqrt{1+\eta} - 27c1^2c2^4v\eta\sqrt{1+\eta} + 16c1c2^2c6v\eta\sqrt{1+\eta} + 8c1c2^2c6v\eta^2\sqrt{1+\eta})$,

$A_{14} = \frac{16c2^3 e^{-\frac{3vy}{\sqrt{1+\eta}}} H^2(1+\eta)^{5/2}Cos[\alpha_1]^2}{3v^2} - \frac{16c1^3 e^{\frac{3vy}{\sqrt{1+\eta}}} H^2(1+\eta)^{5/2}Cos[\alpha_1]^2}{3v^2}$,

$A_{15=} -\frac{32e^{\frac{vy}{\sqrt{1+\eta}}} H^2(1+\eta)(6c1^2c2y(1+\eta)+\frac{(1+\eta)^{3/2}(-21c1^2c2+4c5+4c5\eta)}{v})Cos[\alpha_1]^2}{v}$,

$A_{16=}\frac{32e^{-\frac{vy}{\sqrt{1+\eta}}} H^2(1+\eta)(-6c1c2^2y(1+\eta)+\frac{(1+\eta)^{3/2}(-21c1c2^2+4c6+4c6\eta)}{v})\mathrm{Cos}[\alpha_1]^2}{v}$,

$A_{17=}2vy^2(1+\eta)(117c1^3c2^3 - 48c1c2^2c5(1+\eta) - 48c1^2c2(4c2+c6)(1+\eta) + 16(1+\eta)(c8H^2 + 4c5c6(1+\eta)) + 16c8H^2(1+\eta)Cos[2\alpha_1]))$,

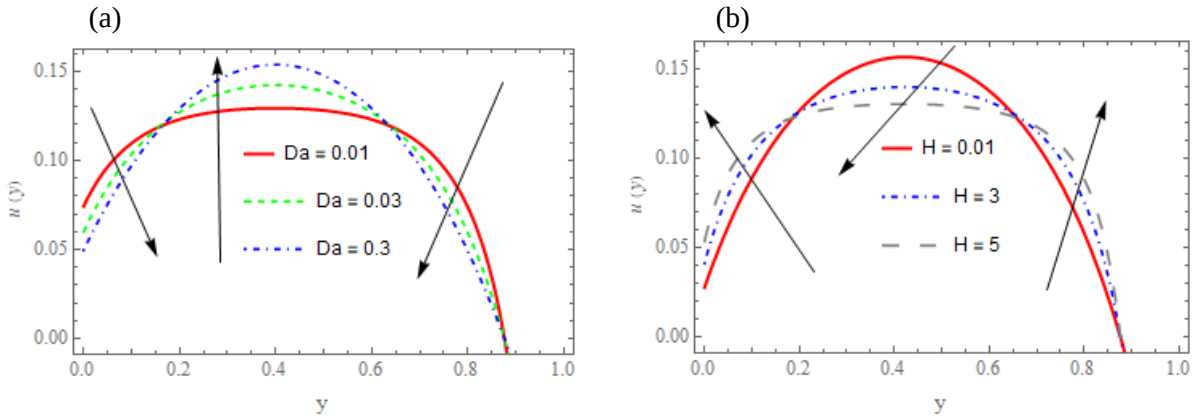
Where $c_1, c_2, c_3, c_4, c_5, c_6, c_7, c_8, r_1, r_2, r_3, r_4$ can be found using simple calculations.

4. Result and discussions

In this part of the work, graphical results are illustrated in order to figure out the impact of various emerging parameters such as $\kappa, H, \eta,$ and A on velocity, temperature profiles, pressure rise, and trapping phenomenon.

4.1. Velocity profile

The effect of Darcy number Da , Hartman number H , Ree-Eyring fluid parameters η, A , phase difference parameter ϕ, and lower wall amplitude parameter b respectively on the velocity curve quantifies in figure 2(a)-(f). we attributed an enhancement in the velocity field at the center of the channel due to the rise in Darcy number Da, whereas it decreases over the rest of the channel cross-section by increasing Darcy number Da via figure 2(a). However, ascending values of Hartman number H directly related to Lorentz force that resists the fluid flow and consequently decreases its velocity see figure 2(b). Whereas From figures 2(c) and (d) two opposite behaviors are seen for the higher magnitude of Ree-Eyring fluid parameters η and A respectively on velocity profile i.e. the magnitude of velocity is an increment in η resulted in an increase of $u(y)$ in the central part of the channel and decreases toward the walls whereas this result is revers with A impact. In figures, 2(e) and (f) two opposite reactions are noticed on the velocity profile via increment of ϕ magnitude. It depicts $u(y)$ decays at the region($0 \leq y \leq 0.22$), while it reflects increasing behavior for the rest channel. Larger values of b parameter lead to a reduction in velocity profile at the central part of the channel while this result is reversed toward the boundaries.



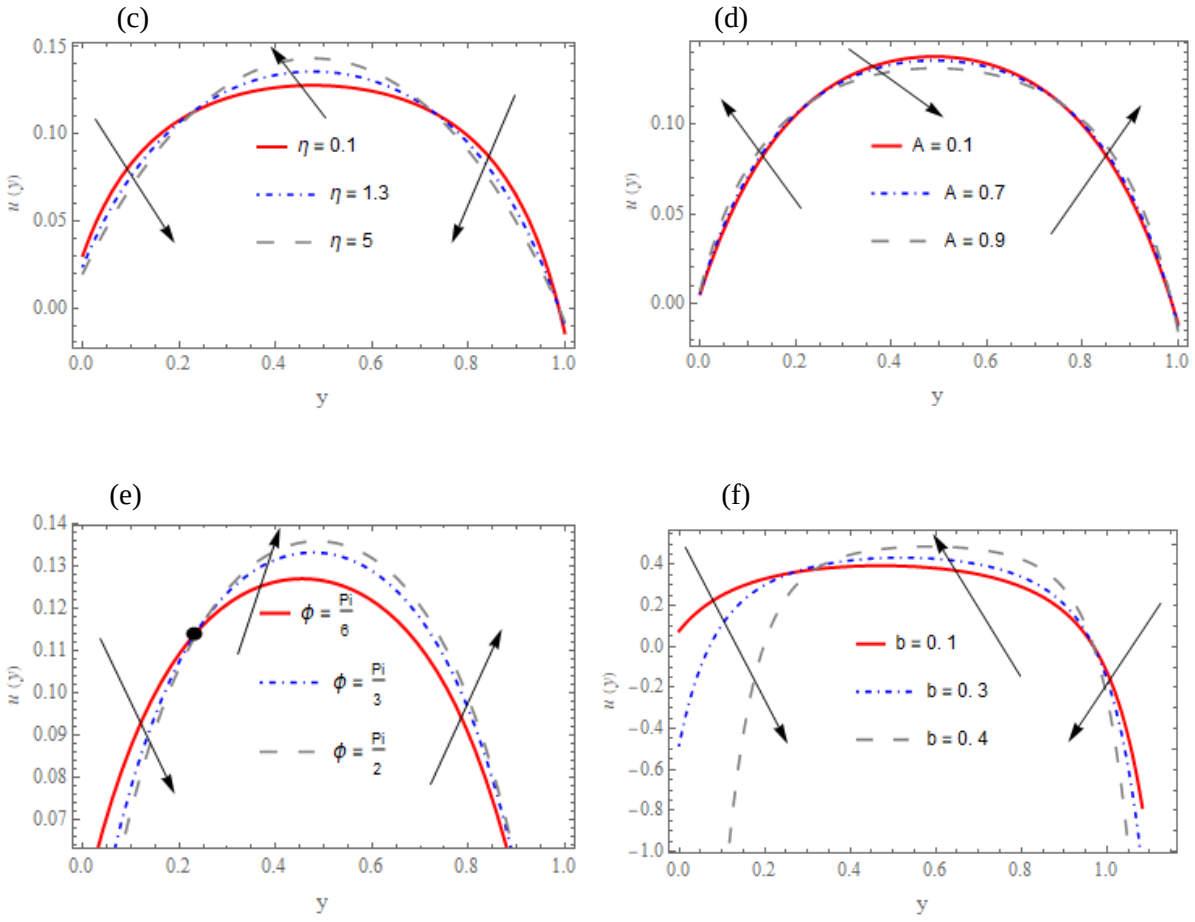


Figure 2. Velocity profile for different values of (a) permeability parameter κ (b) Hartman number H (c) Ree- Eyring parameter η (d) Ree- Eyring parameter A (e) phase difference parameter ϕ (f) lower wall amplitude parameter b and for fixed values of parameters$\{a = 0.04, d = 0.3, \vartheta = 1.4, x = 0.3, \alpha_1 = \frac{\pi}{6}\}$

4.2. Temperature distribution

In this part, we characterize graphical behavior of temperature distribution profile against variation of Prandtl number Pr, Brinkman number Br, thermal radiation parameter Rn, Hartman number H, Darcy number Da, heat generation parameter B_1. figure 3(a) reveals the direct reaction of Pr on temperature profile $\theta(y)$. Whereas increment of Br tends to drop in $\theta(y)$ field see figure 3(b). The impression of $\theta(y)$ against the ascending value of Rn is considered in figure 3(c). We observed that $\theta(y)$ behaves as an increasing function upon Rn rises since it increases the surface heat flux so $\theta(y)$ is developed. It reveals from figure 3(d) that increment of Hartman number causes markedly resistance to temperature distribution profile. Due to enhancement in Darcy number,$\theta(y)$ tends to raise near the boundary regions whereas fluid temperature remains stable in the central part of the channel see figure 3(e). It is visualized from figure 3(f) that the heat generation parameter $B_1$is directly proportional to the temperature distribution profile.

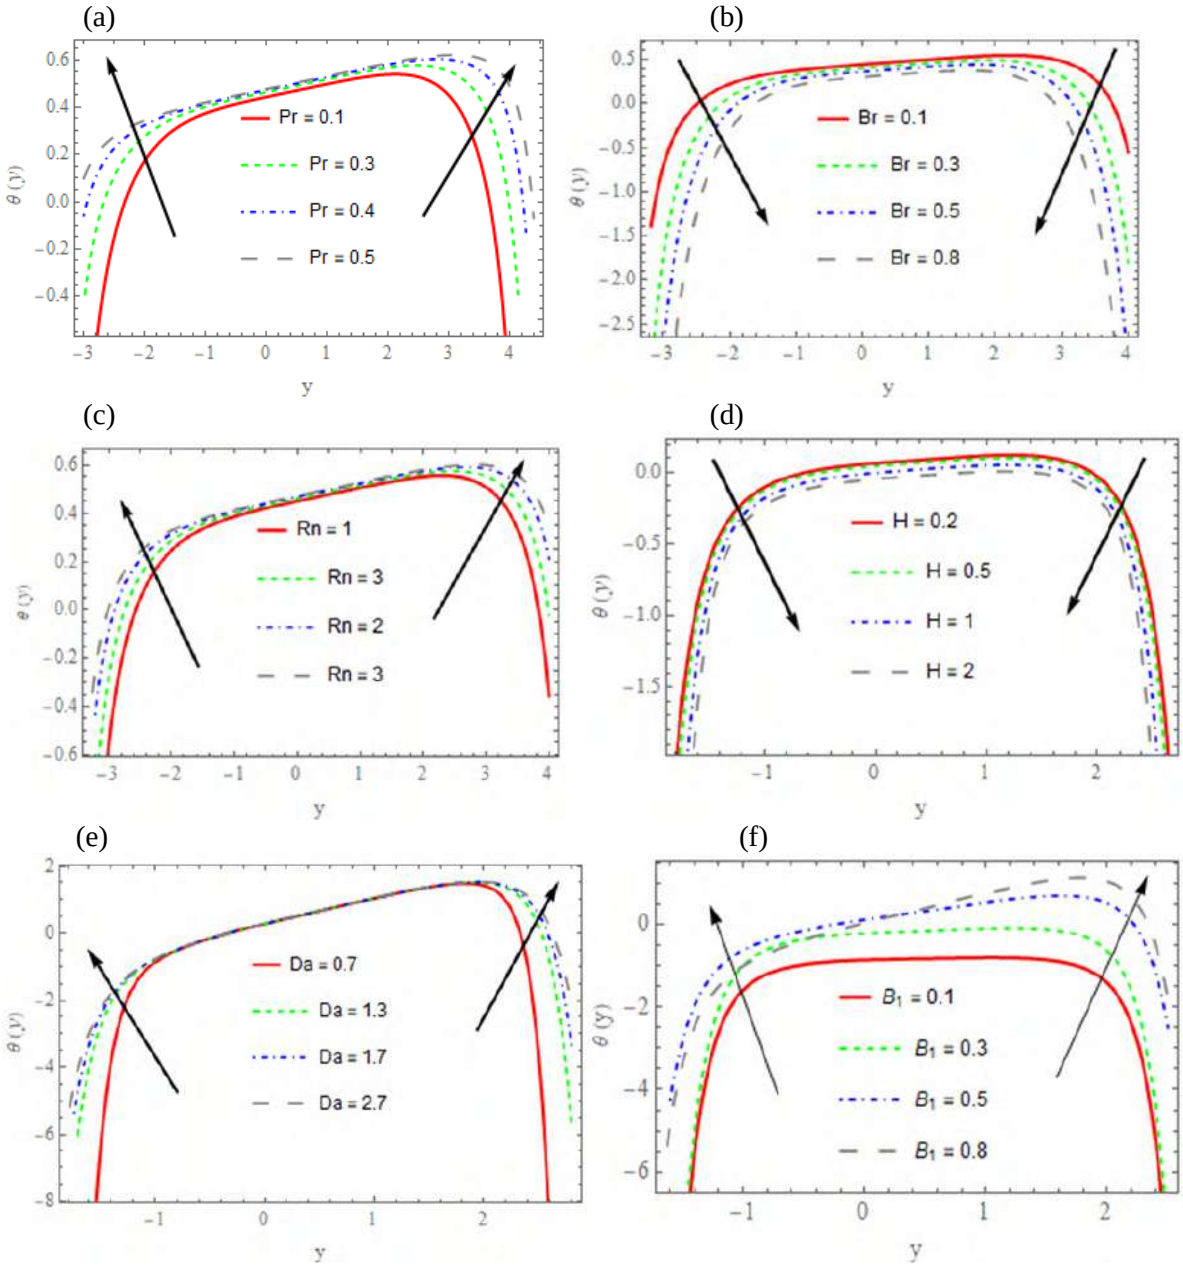

Figure 3. Temperature profile for different values of (a) Prandtl number Pr (b) Brinkman number Br (c) Thermal radiative number Rn (d) Hartman number H (e) Darcy number Da (f) Heat generation parameter B_1 and for fixed parameters $\{a = 0.3, b = 0.1, d = 0.3, \phi = \frac{\pi}{2}, x = 0.1, \eta = 0.2, A = 0.02, \vartheta = 0.71, \alpha_1 = \frac{\pi}{2}\}$.

4.3. Pumping phenomenon

The most interesting phenomenon that is used to visualize the physiological behavior of fluids in the peristaltic mechanism is characterized by pumping phenomena. figure 4 illustrates the consequence of pressure rise Δp_λ against the averaged flow rate ϑ via variation of the following pertinent parameters Hartman number H , Darcy number Da, Ree- Eyring parameters η, and A. The figures portrayed the parabolic behavior for Δp_λ profile. Furthermore, we noticed that the whole pumping region varied into four regions, the peristaltic pumping where$(\Delta p_\lambda > 0, \vartheta > 0)$, augmented pumping where $(\Delta p_\lambda < 0, \vartheta > 0)$ and $(\Delta p_\lambda < 0, \vartheta < 0)$ and retrograde pumping where $(\Delta p_\lambda > 0, \vartheta < 0)$ while free pumping

is recognized for($\Delta p_\lambda = 0$). Figure 4(a) prepared to visualize the variation of Δp_λ against ϑ for various values of H. It is obvious that higher values of H cause the augmented and retrograde pumping regions to decreases whereas growth in peristaltic pumping is witnessed. However, the completely opposite response on pumping flow is appeared due to enhance Da magnitude which means the flow can pass easily without imposing higher pressure shown in figure 4(b). One can contemplate from figures 4(c) and 4(d), the dissimilar action for η, and A parameters respectively on pumping characteristic i.e. η is developing the augmented and retrograde pumping regions while the peristaltic pumping has a depressing function whereas this situation is absolutely reversed for enhancing A parameter further free pumping is recognized where ($\vartheta > 0.55$).

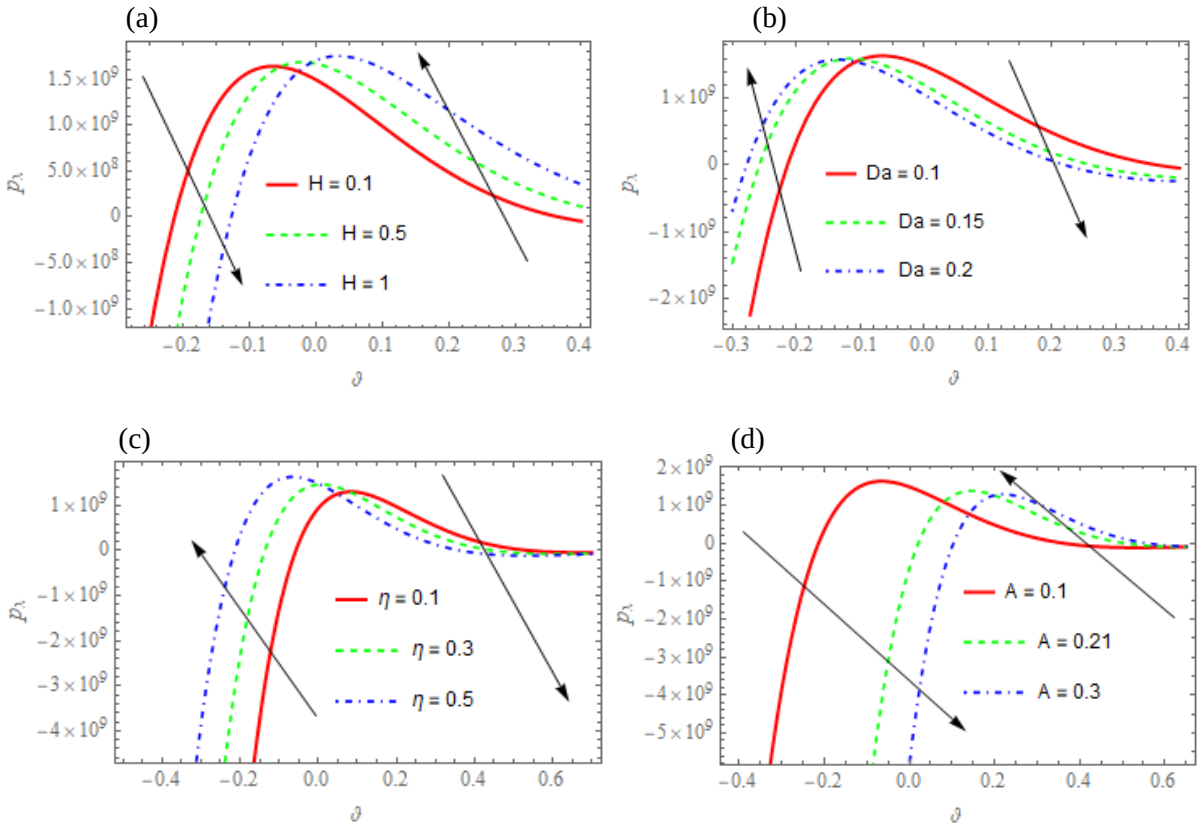

Figure 4. Pressure rise ΔP_λ versus ϑ via various values of (a) Hartman number$H$ (b) Darcy number Da (c) Ree- Eyring parameter η (d) Ree- Eyring parameter A with $\{a = 0.1, b = 0.3, d = 0.3, \phi = \frac{\pi}{2}, y = 0.1, t = 0.1, \alpha_1 = \frac{\pi}{6}, \alpha_2 = \frac{\pi}{2}, \mathrm{Re} = 0.1, \mathrm{Fr} = 0.1\}$.

4.4. Trapping characteristic

Formation of a circular path or bolus interior the flow streamlines along the peristaltic wave is known by trapping, we highlighted in this subsection upon the influences of some interesting pertinent parameters like Hartman number H, Darcy number Da, angle inclination parameter α_1, phase difference parameter ϕ, Ree-Eyring parameters η and A , and time flow rate parameter ϑ with respect to fixed parameters $\{a = 0.3, b = 0.1, d = 0.3, t = 0.1\}$ on the trapping phenomenon. figure 5 captured the diminished behavior for the streamlines contours in size and number due to a rise in H magnitude which leads to enhance Lorentz force that opposite the flow in return. Whereas figure 6 identifies the direct influences of Darcy's number on the magnitude and number of moving trapping bolus. No remarkable

changes on the streamlines pattern were seen for ascending variation in α_1 values i.e. the trapping bolus developed very slowly with α_1 see figure 7. The significant impact of emerging parameter ϕ on trapping bolus is outlined in figure 8, it is noticed that the size and number of trapped bolus declines for higher values of ϕ . Figures 9 and 10 recorded enhancement impact for the two Ree- Eyring embedded parameters η and A on trapping bolus phenomenon. An elevation of flow rate parameter ϑ produces more bolus as well as their size enhance see figure 11.

5. conclusions

In this investigation, several effects like inclined MHD, convective conditions, porous media, and radiative thermal on the peristaltic transport of Ree-Eyring fluid through the asymmetric channel are presented. The dimensionless nonlinear partial differential equations are simplified by adopting the restriction of infinite wavelength and small Renold numbers and then solved exactly using the perturbation technique. Some major outcomes from the graphical analysis of this study are listed below:

1.The velocity profile showed mixed responses throughout the channel via increasing all pertinent interesting physical parameters $H, Da, \emptyset, \eta, A, b$.
2. The Effect of Hartman number$H$, Ree-Eyring fluid parameter$A$, and lower wall amplitude parameter b on the velocity distribution is totally same and completely opposite $Da, \emptyset, \eta$ impact.
3. It is noticed from figures that Brinkman number oppositely affected on temperature distribution profile whereas Prandtl number directly affected on $\theta(y)$.
4. Hartman number H shows a decreasing behavior on temperature profile while $\theta(y)$ is increasing function with radiative thermal parameter Rn .
5. The temperature distribution axial greatly affected by risen up heat generation parameter B_1 however, one can be noticed that $\theta(y)$ enhanced near the walls and remains stable in the central part of the channel due to increasing Darcy number Da .
6. The pressure rise profile shows a parabolic nature moreover growth in peristaltic pumping is noticed for H whereas the opposite result is found via ascending magnitude of Da.
7. The graphical discussion portrayed totally opposite behavior for Ree-Eyring parameters η and A on pressure rise.
8. Two asymmetric regions observed for the trapping phenomenon as well as the figures pretend to increase the trapped bolus magnitude and the number of circulation with Da, η, A, ϕ , and flow rate parameter ϑ, in other hands a diminished function for H on trapped bolus is seen.
9. No remarkable effect of α_1 on trapping, phenomena is noticed.

A reduction of Dynamic Fault Tree to a Simple Form

A reduction of Dynamic Fault Tree to a Simple Form

Ali Salman Abdulkadhim

Babylon Education Directorate

E-mail: alisalmanabudalk77@gmail.com

Abstract. The dynamic fault tree expands fault tree by giving the design of complex system components' actions and crossings. Because DFT is high grade design and simple to use it is proving a rising not fail through reliability researchers. Unluckily, an issue of problems as yet stays when we using DFT These problems are (1) There are no formalities, (2) restriction in symbolic analysis and thus sensitiveness to increasing the trouble, and (3) there is a few of modular type- structure. Chain of Markov (I/O-IMC) input/output formularization are used to analyse DFT. I/O-IMC have accurate semantics and are expansion of uninterrupted-time Markov chains with output and input conducts.

1. Introduction

There are many diverse items of the dynamic fault tree analysis which are: dynamic gates, static gates and basic event. The determining the gates on dynamic fault tree analysis we become strong analysis of action and reaction through member of complex system which produce a dynamic fault tree analysis more developed than static fault tree analysis. Through figuring a DFT three major dynamic gates: stand by (spare) gate, primacy (priority) gate (PAND) and functional dependency gate which are usually used. FT were evolved to accelerate unreliability analysis of the minuteman skyrocket system, which stock a precise, schematic, conjectural procedure to construe reliability. Conventional FT used Boolean gates to illustrate how the component fiascos fuse together make system fiasco which are analyze utilizing cut sets (or Boolean algebraic technique) or Monte Carlo emulation.

2. Preliminaries

In this Section some definitions about fault tree, dynamic fault tree, static fault trees are given

2.1 Definition [8]: A fault tree is formulation fugue impersonation of certain relationships which effect a system hazard backwards to search for all its possible causes.

2.2 Definition [5]: Static Fault Trees (briefly SFT or FT) are consisting of gates OR, AND, and K-out-of-N, they are combinatorial or fixed (static) gates.

2.3 Definition [5]: Dynamic Fault Trees (briefly DFT) consisting of in addition to the static gates (OR, AND, and K-out-of-N), basic events, and dynamic gates (PAND, FDEP, WSP, and SEQ).

2.4 Definition [7**]:** A fault tree is a figural exemplification of specific connections which effect a system hazard back terms for all its potential causes.

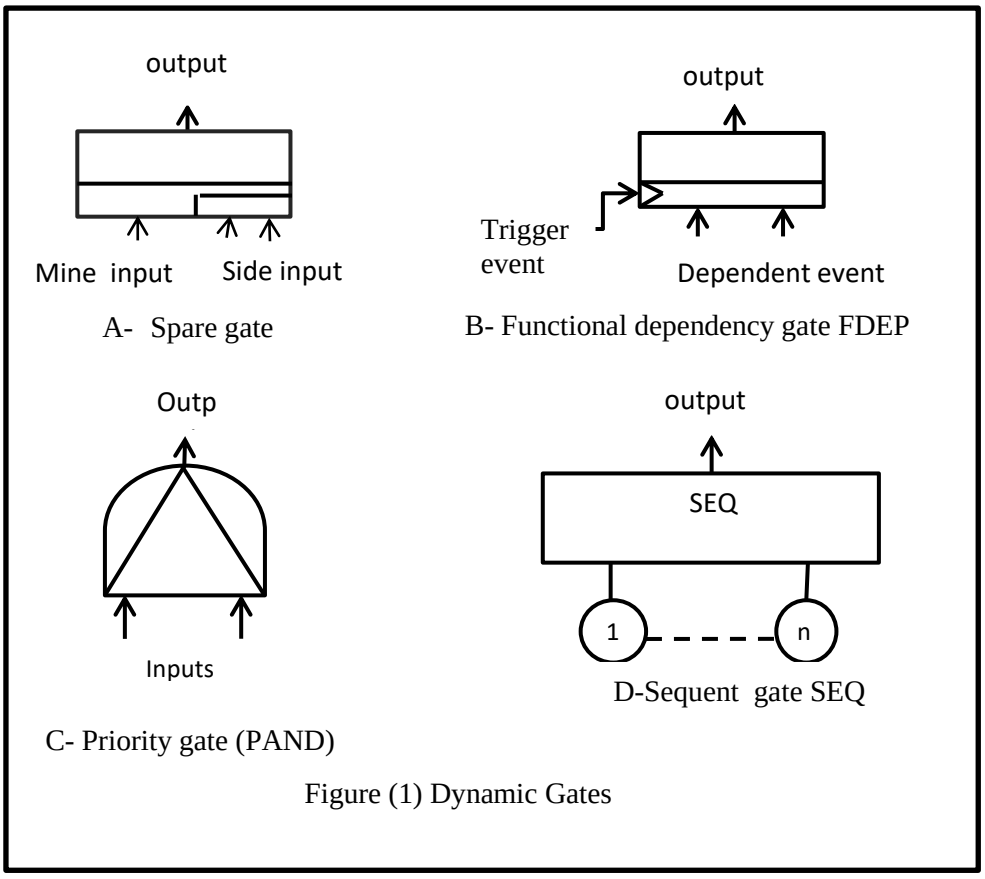
2.5 Definition [7]: A path set is a collection of fault tree commences which if none of them exist will surety that the top event not exist.

2.6 Definition [8]: A cut set is collection of synthesizes which that when the synthesizes in the cut are taken away the system there is no route from one station to the other.

2.7 Definition [8]: A minimal cut set is a least set of fault tree commences which if all happen, will give rise to the top event to happen

3. Dynamic gates

Pictorial display and explications of most usually used dynamic gates are presented in figure (1). Spare gates have one mine and one or several stand by (spare) inputs. When initial input event was fail, spare input substitutes it. Stand by gates make output when elementary and all stand by events fail. There are many kinds of spare gates: cool gates(CSP), snug (warm) gates (WSP) and spicy (hot) gates (HSP). If the amount of fault eventuality of particular component is equal to γ, in state when component actions as stand by, value of failure probability equal to $\delta\gamma$, if $\delta = 0$, gate is cool(CSP) and it is inactive (quiescent) state. If $\delta = 1$, gate is spicy (HSP). In other hands if $0 < \delta < 1$ gate is snug (WSP). Functional dependency gate(FDEP) contains of causative event (basic event or output for rational gate) and vassal events. All vassal (dependent) events rely on causative (trigger) event. When causative event occurs, all vassal events have occur. Output of gate (FDEP) is not taking into reckoning in computation of fiasco likelihood. Primacy gate (PAND) which has two input A and B, both of them can be basic or outputs of other logical gates. Primacy gates unsuccessful if all input components failure in the coincided row.



A- Spare gate

B- Functional dependency gate FDEP

C- Priority gate (PAND)

D-Sequent gate SEQ

Figure (1) Dynamic Gates

4. Reduction method:

In this section we introduce a method to calculate the failure of some systems once in fault tree and in dynamic fault tree.

4.1 Reduction fault tree: Consider that the fault tree in the figure (2):

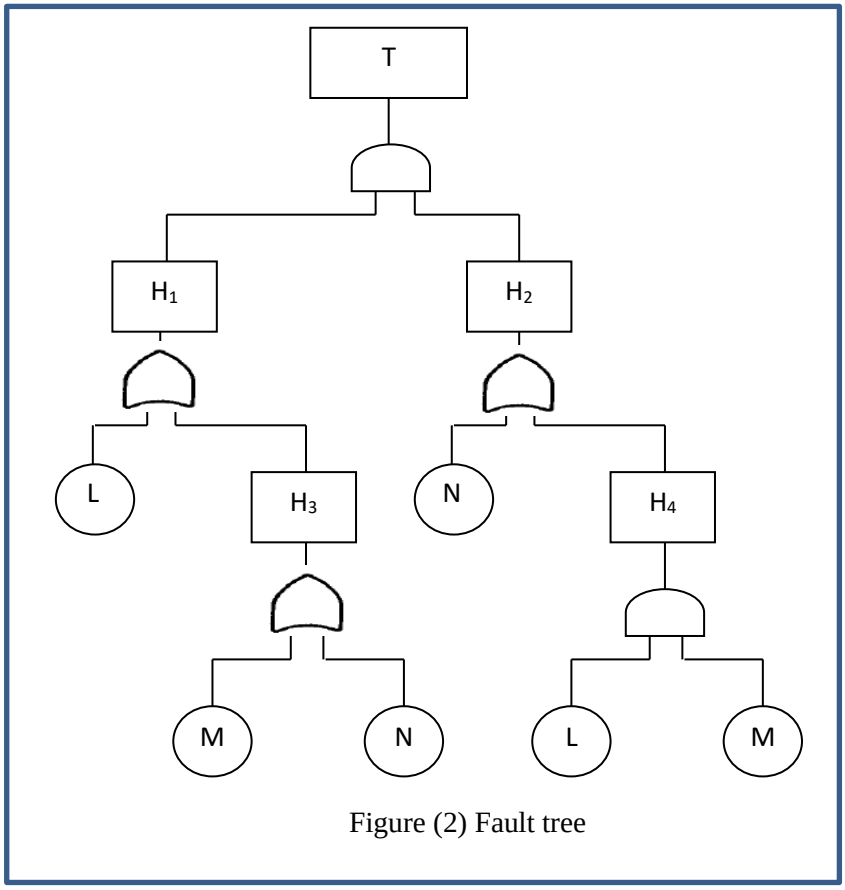


Figure (2) Fault tree

By using Boolean algebra:

$T = H_1 . H_2$, $H_1 = L + H_3$, $H_2 = N + H_4$, $H_3 = M + N$, $H_4 = L . M$

$T = H_1 . H_2$

$= [L + H_3] [N + H_4]$

Substitute H_3 by $M + N$

$= [L + (M + N)] [N + H_4]$

$= L . N + L H_4 + N . H_3 + H_3 . H_4$

$= L . N + L . H_4 + N . M + N . N + M . H_4 + N . H_4$

$= (L . N + N . M + N + N . H_4) + L . H_4 + M . H_4$

$= N + L . H_4 + M . H_4$ $= N + L (L . M) + (L . M) = N + L . M + L . M$

$= N + L . M$

New the equivalent fault tree is:

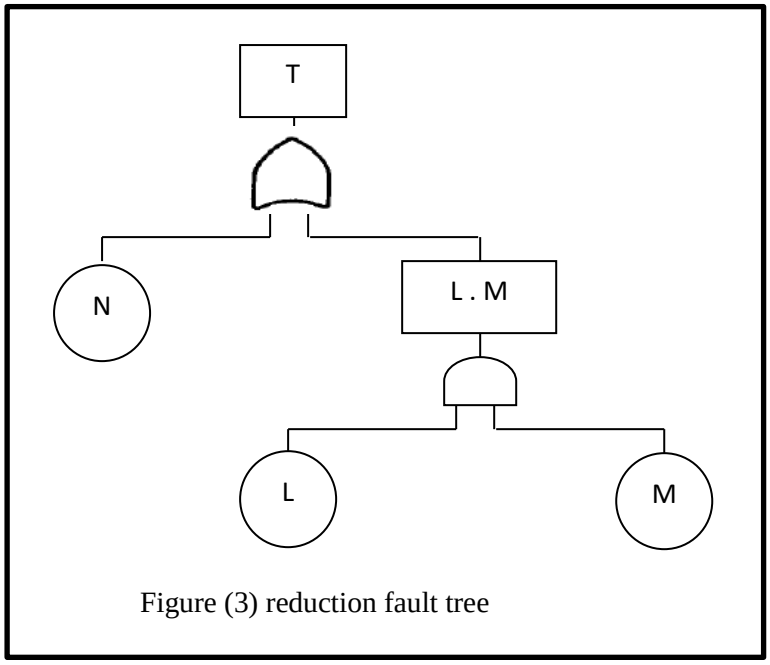

Figure (3) reduction fault tree

4.2 Example (1):
Suppose that the fault tree in the figure (2) and assume that each component (L, M and N) has reliability (0.9) then the reliability of a system is as follow:
T = H_1. H_2 ,then from 5.1 we get that :$T = N + L.M$

$$T = 0.9 + (0.9 * 0.9) = 0.729$$

4.3 Reduction dynamic fault tree:
Assume that dynamic fault tree as showing in figure (4):

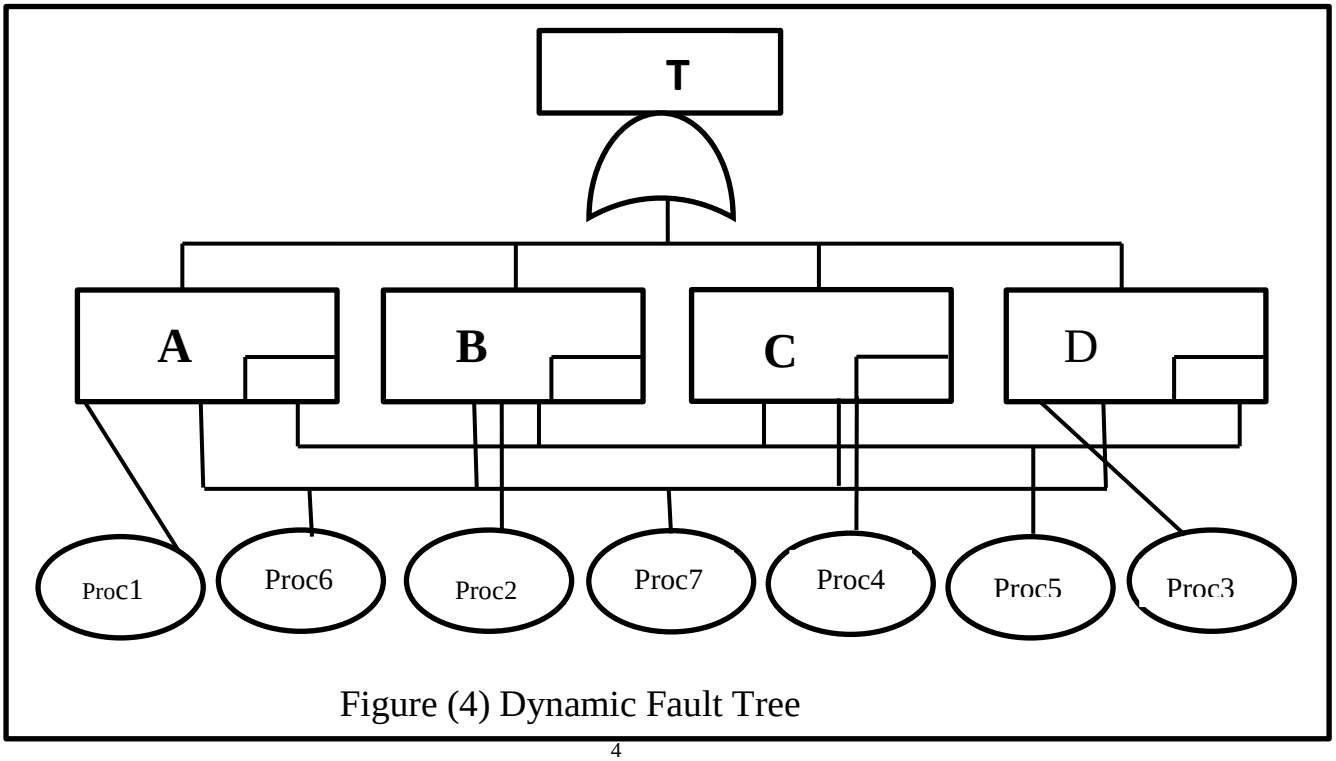

Figure (4) Dynamic Fault Tree

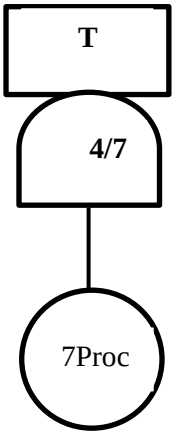

Figure (5)

The Dynamic fault tree (DFT) in figure (4) can be consider as a Fault tree of type k-out-of –n or (4 out-of 7) as in figure (5) by replacing a set of OR gates one for each basic event instead of the functional dependency gate (FDFP) which easier in calculation of system reliability.
The fault tree in figure (5) can be represented as a parallel series system contains (35) paths since the combination $\frac{7!}{(7-4)!\ 4!} = \frac{7\times6\times5\times4!}{3!\ \times\ 4!} = 35$
We get the same numerical results for the two fault trees in figure (4) and (5).

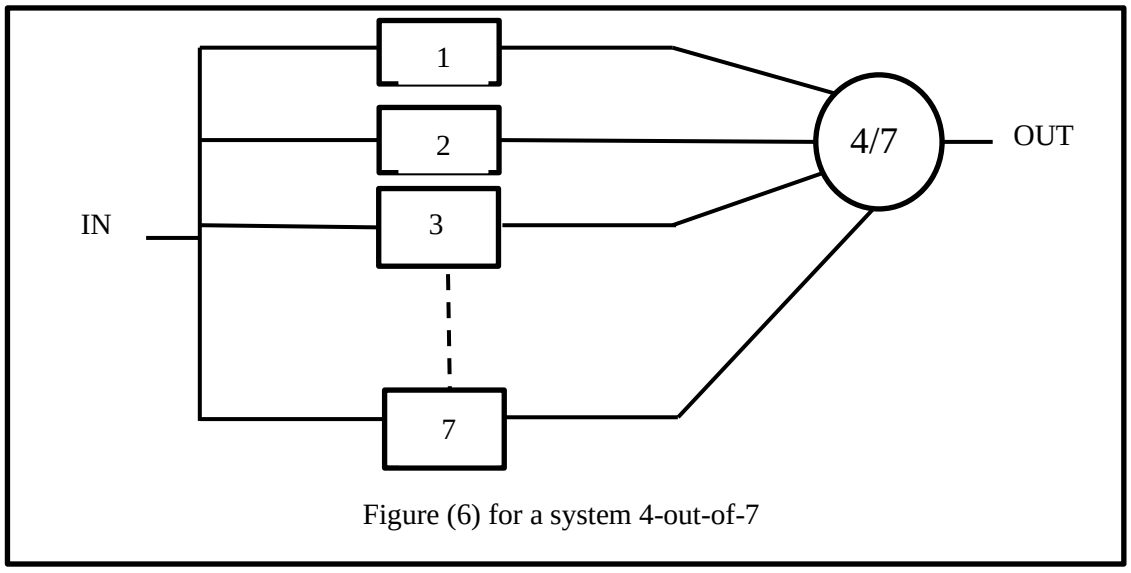

Figure (6) for a system 4-out-of-7

For simplicity to engineers and technologists we can change DFT into equivalent SFT via replacing a set of OR gates one for each basic event instead of the dynamic gate (FDEP) i.e.$M_i, i = 1,2,3,4,5,6,7$ as shown in Figure (7) below :

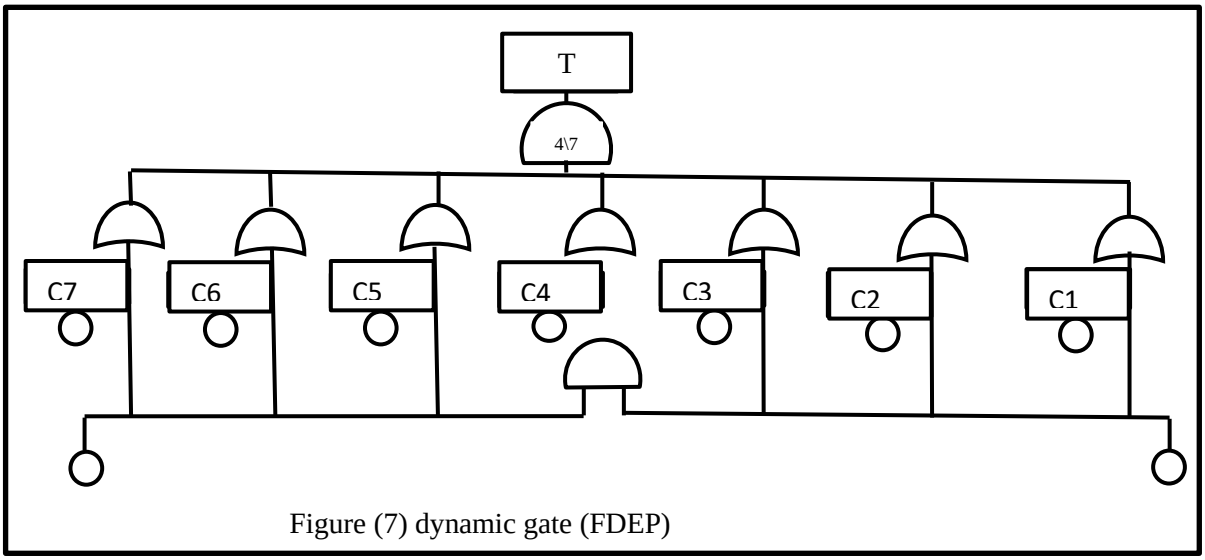

Figure (7) dynamic gate (FDEP)

For getting r successes out of n trials the reliability of $r-out-of-n$ system R_S is :

$$R_S = \sum_{x=r}^{n} \binom{n}{r} (R)^r (1-R)^{n-r}$$

4.4 Example (2):

A space vehicle need three out of four engines to operate to achieve orbit. If every engine has a reliability of 0.97, then to calculate the reliability of achieving orbit.

Sol:

$$R_S = \binom{4}{3}(0.97)^3(0.03)^{4-3} + \binom{4}{4}(0.97)^4(0.03)^{4-4}$$
$$= 4(0.97)^3(0.03) + (0.97)^4$$
$$= 4(0.912673)(0.03) + (0.88529281)$$
$$= 0.10952076 + 0.88529281$$
$$Then \quad R_S = 0.99481357$$

Conclusion

In this study a reduction method is used for a dynamic fault tree (DFT) to a simpler fault tree and we get the same numerical result since the DFT is an important too in reliability of complex system for the analysis is of two cases quantitative and qualitative which have a great role to determine the system failure.

E-mail: balqees.khaleel1003a@ihcoedu.uobaghdad.edu.iq

Abstract. This paper presents the concepts of prepaths, paths, and cycles in α-topological spaces and studies them in orderable spaces. Also, many relationships are proved with their equivalences using some properties in topological spaces like compactness and locally connectedness.

1. Introduction

Graph theory is an important part of mathematics, so many sciences are interested in the applications of graphs in multiple aspects [1]. Paths and cycles are some of basic combinatorial properties of graphs which are defined in [2, 3, 4] in addition in general topology in [5, 6, 7]. Cyclically orderable spaces are defined and studied in [8], and some new concepts are presented in [9].

Many years ago, many concepts had been studied in topological spaces, like α-open (α-closed) sets [10] and they have generalized and developed to get another new concept with new relationships to extend the mathematics knowledges [11, 12, 13].

In this paper, we introduce the concepts of prepaths, paths, and cycles with the topological viewpoint in α-topological space. Also, we study their equivalence relationships with convexity and intervals in an orderable space. In addition compactness, order-complete, and locally connectedness.

2. Preliminaries and basic definitions

Through this section, any graph G contains the set of vertices V_G and the set of edges E_G. The non-empty set $X = V_G \cup E_G$ used to define a topology τ on it which satisfied the general topological conditions, and for simplest (X, τ) refers to the topological space that we constructed it. For $A \subseteq X$, the interior and the closure of A in X with respect to τ are denoted by Int(A) and Cl(A). A sub set A is said to be an α-open set, if it satisfied $A \subseteq Int(Cl(Int(A)))$ for all $A \subseteq X$, and the complement of A in X is an α-closed set. It is clear that every open set is α-open, but in general the reverse is not true. We obtain an α-topology τ_α by taking all α-open sets, and (X, τ_α) is an α-topological space. Furthermore, the interior of A in this space with respect to τ_α is denoted by $\alpha\text{-Int}(A) = \cup \{ B \mid B \subseteq A, B \text{ is } \alpha\text{-open}\}$, while the closure of A denoted by $\alpha\text{-Cl } A) = \cap \{ B \mid A \subseteq B, B \text{ is } \alpha\text{-closed}\}$.

We recall some basic definitions, remarks and facts in topology and graph.

Definition 2.1: Let X be a topological space, then:

1) X is called connected space if there do not exist two disjoint, nonempty, open sets A and B such that $X = A \cup B$. Otherwise, X is disconnected [7].

2) X is called separated space if there are two unordered disjoint subsets of X such that each one is the complement of the other [7].

3) if A is a subset of X, then the intersection of Cl(A) and Cl(X - A) is called the boundary points of A [5].
4) the component of X is the largest connected subspace of X, and an adherent component denoted as K(x) \ {x} is the component of X contains x without x itself [3].
5) X is said to be S_1-space if every singleton is either open or closed [3].
6) an α-topological space X is called an α-separated space if there are two unordered disjoint subsets of X, such that each one is the complement of the other [9].
7) any family of X has the finite intersection property if the intersection is non-empty of any finite subfamily [7].
8) if B ⊆ X , then the intersection of all α-open sets contained B is called α-surrounding set of B, and denoted by $B^{\alpha\diamond}$ [9].

Definition 2.2 [3]: If x is any point in a connected topological space X, and X \ {x} is not connected, then x is called a cutpoint of X . Otherwise x is a non-cutpoint (that is an endpoint).

Theorem 2.3 [3]: Let X be a topological space, then the next statements are equivalence:
(A) ∀ x, y, z ∈ X: x < y < z, there exists a total order ≤ on X such that y disconnects x from z.
(B) for each triple of points S in X, there exists a point in S which disconnects the other two.
(C) ∀ x ∈ X, every adherent component of x denoted by K(x) \ {x}, has at most one endpoint, also any cutpoint is strongly cutpoint.

Corollary 2.4 [3]: Let X be a connected topological space has at least four points, then X is S_1-space, and any two non-incident points disconnect the others, but no one do.

Definition 2.5 [3]: Let X be a connected topological space, then :
1) X is a prepath denoted by P if |X| ≤ 2 with any topology except the indiscrete one, otherwise, X satisfies theorem (2.3) when |X| ≥ 3.
2) a prepath is called a path if it is locally connected.
3) X is a precycle if it satisfies corollary (2.4).
4) a locally connected precycle is called a cycle.

Facts 2.6 [3,7]:
A) Let A be a connected subset of a connected topological space X, and K a component of X \ A. Then X \ K is connected.
B) Let Y be a subspace of a topological space X, then any component of Y is contained in a component of X.
C) let X be a topological space with exactly two components, then $\{K_1, K_2\}$ is a separation of X if and only if K_1, K_2 are the components of X.
D) If C is a connected subset of a topological space, and A is a subset such that C ⊆ A ⊆ Cl(C), then A is connected.
E) A topological space X is locally connected if and only if each component of each open set is open.

Definition 2.7 [3]: If P is a prepath, then the interval topology on P is the collection of intervals of P which is a base for a this topology on P.

Theorem 2.8 [3]: A prepath is locally connected if and only if the topology concurs with the interval topology.

Definition 2.9 [3]: Let ≤ be a binary relation on X with a ∈ X, then ω(x) = {x ∈ X | x > a}, Ω (x) = {x ∈ X | x ≥ a}, δ(x) = {x ∈ X | x < a} and Δ(x) = {x ∈ X | x ≤ a}.

Definition 2.10 [11]: Let $\leq$ be a total order on X, a subset of X of the form $L \cap U$ is an interval where U and L are taking one of the following forms:
1. X.
2. $\omega(a)$, for some $a \in X$ and ($\delta(b)$, for some $b \in X$).
3. $\Omega(a)$, for some $a \in X$ and ($\Delta(b)$, for some $b \in X$).

Definition 2.11 [3]: Let X be a totally ordered space. A subset S of X is said to be convex if for all a, b $\in$ S, and $a < x < b$, then $x \in S$ for all $x \in X$.

Theorem 2.12 [3]: Let S be a subset of a complete totally ordered set, then it is convex if and only if S is an interval.

Definition 2.13 [3]: A convex subset containing exactly two points is called a jump.

Definition 2.14 [3]: A convex subset S of a totally ordered space X is said to be a chain, if S is order isomorphic onto a convex subset of Z.

Corollary 2.15 [3]: Every chain in a totally ordered space is contained in a maximal one.

Corollary 2.16 [3]: Any two maximal chains in a totally ordered set are disjoint.

Definition 2.17 [3]: Let X be any set, $S \subseteq X$ with a binary relation on X, S is said to be strongly upper-bounded (lower-bounded) if S has a maximum (respectively, minimum) M (respectively, m), where M (respectively, m) is strictly bounded from above (respectively, below). Also, S is strongly bounded if it is both strong (upper-bounded and lower-bounded). However, S is partially strongly bounded if it satisfies one of them.
We notice that a chain is finite if it has both minimum and maximum.

Corollary 2.18 [9]: Let X be an α-topological space, and x, y, z $\in$ X. If y α-separates x and z, then y α-disconnects x and z.

Corollary 2.19 [9]: Let X be an α-connected topological space, x is an α-cutpoint of X, then only one of the next statements are holding for any α-separation $\{B_1, B_2\}$of $X \setminus \{x\}$:
1. $\{x\}$ is α-closed, B_i is α-open in X, and $\alpha\text{-Cl}(B_i) = B_i \cup \{x\}$ is α-closed, for i = 1,2
2. $\{x\}$ is α-open, B_i is α-closed in X, and $B_i^{\alpha\diamond} = B_i \cup \{x\}$ is α-open, for i = 1, 2.

Theorem 2.20 [9]: Let X be an α-connected topological space, x be an α-cutpoint of X, then there exist two nonempty α-closed sets F_1, F_2 in X, such that $F_1 \cup F_2 \cup \{x\} = X$, $\{F_1 \setminus \{x\}, F_2 \setminus \{x\}\}$ is an α-separation of $X \setminus \{x\}$ and only one of the following statements are holding:
1. $\{x\} = (F_1 \cap F_2)$ with $\{x\}$ is an α-closed.
2. $\{F_1, F_2, \{x\}\}$ is a partition of X with $\{x\}$ is an α-open.

Theorem 2.21 [9]: If X is an α-connected topological space, h is an α-hyperedge of X with finite number of α-boundary points, then each α-component of $X \setminus \{h\}$ includes an α-boundary point of h. Specifically, $X \setminus \{h\}$ contains at most two α-connected components, when h is an edge.

Corollary 2.22 [9]: Let X be an α-connected topological space, x is a cutedge, then an α-adherent component $K_\alpha(x) \setminus \{x\}$ contains exactly two α-connected components, each α-component consisting of one α-boundary point of x.

Definition 2.23 [3]: An ordered pair (A, B) is said to be a gap, if A and B have no maximum and no minimum respectively.

Fact 2.24 [3]: Any total order has no gaps if and only if it is order-complete.

Definition 2.25 [3]: Let X be any set, a triplex relation $S \subseteq X^3$ is said to be a cyclic order on X if:
* (a, b, c) $\notin$ S where a $\neq$ b $\neq$ c $\neq$ a if and only if (c, b, a) $\in$ S
* if (a, b, c) $\in$ S, then (b, c, a) $\in$ S
* if (a, b, c) $\in$ S and (a, c, d) $\in$ S, then (a, b, d) $\in$ S

If S is a cyclic order on X and Y is a subset of X, then there exists a cyclic order $S^* = S \cap Y^3$ inherited on Y by the classes contains all its elements in Y.
Furthermore, the ordered space S^* is called a cyclic subsequence of S, where S is finite.

3. Prepaths in Alpha Topological Spaces

In this section, we introduce some concepts of α-topological spaces and investigate the relationships between them.

The first important theorem can be proven in the same way as in [3], we need it here to define an α-prepath and in the proof of theorem (3.4).

Theorem 3.1: Let X be a topological space, then the next statements are equivalents:
(A) $\forall$ x, y, z $\in$ X: x $<$ y $<$ z, there exists a total order $\leq$ on X such that y α-disconnects x from z.
(B) For each triple of points S in X, there exists a point in S which α-disconnects the other two.
(C) $\forall$ x $\in$ X, every α-adherent component of x denoted as $K_\alpha(x) \setminus \{x\}$, has at most one endpoint, also any α-cutpoint is strongly α-cutpoint.
(*) if X is an α-connected in this theorem, then the 3rd statement means that for all x $\in$ X, $X \setminus \{x\}$ has mostly two α-component contains one endpoint in each one.

Definition 3.2: An an α-connected topological space X is said to be an α-prepath denoted by P_α if $|X| \leq 2$ with any α-topology except the indiscreet one, otherwise $|X| \geq 3$ and X satisfies the conditions of theorem (3.1).

Definition 3.3: An α-topological space X is said to be α-topologized graph if:
* any singleton is either α-open or α-closed.
* X has at most two α-boundary points, for all x $\in$ X.

The next theorem shows that an α-prepath is always an α-topologized graph.

Theorem 3.4: Let X be an α-connected topological space, if X is an α-prepath then:
1. X is an α-topologized graph.
2. Every edge in X is a cutedge or a loop which is an endpoint.

Proof: Suppose X is an α-prepath, then X has many cases. Firstly, X is trivially an α-topologized graph if it is an empty set because it is α-clopen . Secondly, When X is a singleton element, so it has a unique point and it is α-open and α-closed. Thirdly, when X have two points, we can get exactly two α-connected topologies, the first one is the indiscrete α-topology which excepted in definition (3.2) and the second one is an α-topologized graph with exactly one vertex with one loop.
Finally, when X has at least three points, we must prove it is an α-topologized graph by satisfying the conditions of definition (3.3). Now, we discuss being x is an α-cutpoint or an α-endpoint. Suppose that x is an α-cutpoint, it is either α-open or α-closed by corollary (2.19). Furthermore, all α-cutpoints are strong α-cutpoints by theorem (3.1 part C). Thus, when x is an α-open, we have that an α-boundary of

x contains exactly two points by theorem (2.21). So, x is a proper edge, that is a cutedge because x is an α-cutpoint.

Now, suppose that x is an endpoint, so X must has at least one α-cutpoint, and mostly two endpoints because it has at least three points. Let y be any α-cutpoint in X, and A_y, B_y be the α-connected components of X \ {y}. Define C as the set of all α-cutpoints, and $= \bigcap_{y \in C} \overline{A_y}$, so $x \in A_y$ implies that $x \in W$.

Now, assume that y is another endpoint in W, such that $y \neq x$, and take another point to be an α-cutpoint like w. Since y ∈ W, we have that $y \in \overline{A_w}$, by theorem (2.20) which leads to either $y \in A_w$ or y = w. That means x and y lie in the same α-connected component of X \ {w}, that is a contradiction with (*) of theorem (3.1) since the component contains two endpoints together. Also the second choice impossibly hold, because y an endpoint and w is an α-cutpoint. Hence, W does not contain any endpoints excepting x.

Suppose that $y_1 \neq y_2$ are two α-cutpoints in W. Clearly, x cannot α-disconnect y_1 and y_2 because it is an endpoint. So, for the three elements {x, y_1, y_2}, if y_1 α-disconnects x with y_2, then $y_2 \notin A_{y_1}$ implies $y_2 \notin W$ (otherwise if y_2 α-disconnects x with y_1, then $y_1 \notin A_{y_2}$ implies $y_1 \notin W$), by using (3.1B) is a contradiction. So, W contains mostly one element besides x, and it is an α-cutpoint. If W = {x}, then {x} is α-closed, since it is the intersection of α-closed sets. Otherwise, when W = {x, y} for some α-cutpoint y, $y \in A_y$. Hence A_y = {x} is α-open and α-Cl(x) = {x, y} by corollary (2.19), (that is a loop).

Corollary 3.5: Let X be an α-connected topological space, x, y, z ∈ X, then only one of them α-disconnects the others.
Proof: Suppose that y α-disconnect x and z, and assume that $K_\alpha(x)$ define the α-component of X \ {y} which contains x. So X \ $K_\alpha(x)$ is an α-connected set containing y and z without x by (2.6A). So x can not α-disconnect y from z. By the same way, z cannot α-disconnect x from y.
The next theorem is proved in [9], and it is very useful in our proofs.

Theorem 3.6: If X be an α-connected topological space, x is an α-cutpoint of X. If {A, B} is an α-separation of X \ {x}, then A ∪ {x} is an α-connected (so as B).
The next theorem shows that α-disconnected and α-separated are equivalent in α-connected prepaths.

Theorem 3.7: Let X be an α-connected topological space, then the following statements are equivalent:
(1) ∀ x, y, z ∈ X, there exists a total order ≤ on X such that, if x < y < z, then y is a strong α-cutpoint and α-disconnects x from z.
(2) ∀ x, y, z ∈ X, there exists a total order ≤ on X such that, if x < y < z, then y α-separates x from z.
(3) ∀ x, y, z ∈ X, there exists a total order ≤ on X such that, if x < y < z, then y α-disconnects x from z.
(4) For any three disjoint points, there exists exactly one of them that α-disconnects the others.
(5) For any three disjoint points, there exists exactly one of them that α-separates the others.
(6) For any three disjoint points, there exists exactly one strong α-cutpoint of them that α-disconnects the others.

Proof: Firstly, we should prove the equivalent of the first three statements, and later we should prove the last three of them.
(1) ⇒ (2) ⇒ (3) ⇒ (1)
(1) ⇒ (2); Let x < y < z, then X \ {y} has exactly two α-connected components, K_x, K_z such that x ∈ K_x, z ∈ K_z. So we obtain that $\{K_x, K_z\}$ is an α-separation of X \ {y}, and y α-separates x and z by facts (2.6C)
(2) ⇒ (3); This prove is coming immediately from corollary (2.18).

(3) ⇒ (1); Since y α-disconnects x from z by (3), implies that y is an α-cutpoint, and a strong α-cutpoint by using theorem (3.1).
(6) ⇒ (5) ⇒ (4) ⇒ (6)
(6) ⇒ (5); Take any three disjoint points such that one of them is strong α-cutpoint, so it α-disconnects the others. Also it α-separetes them.
(5) ⇒ (4); This prove is coming immediately from corollary (2.18).
(4) ⇒ (6); Since there exists one point that α-disconnects the others, implies that it is an α-cutpoint, and a strong α-cutpoint by using theorem (3.1).
Now to prove the equivalent between the two sets of statements, we shall prove that (3) and (4) are coincides.
(3) ⇔ (4): This proves is direct from conditions of theorem (3.1).

Corollary 3.8: Let X be an α-connected topological space, and the total order $\leq$ on X is satisfying the 2nd condition of theorem (3.7). If y α-separates x from z, then either $x < y < z$, otherwise $z < y < x$.
Proof: Since y α-separates x from z, then there exists an α-separation {H, K} of X \ {y} such that $x \in H$ and $z \in K$. So $x < y < z$. But, if the result not hold, assume that $y < x < z$, ($x < z < y$). Then x should α-separate y and z (z should α-separate x and y). But by theorem (3.6) {y} ∪ K (H ∪{y}) is an α-connected subset containing y and z but not x (containing x and y but not z), this is contradiction.

Definition 3.9: Let P_α be any α-prepath, then every total order defined on P_α is said to be α-compatible with $P_\alpha$when it is satisfying conditions of theorem (3.7).

Theorem 3.10: Any subset B of an α-prepath P_α is an α-connected if and only if B is an α-prepath. Moreover, any compatible total order of an α-connected subset of P_α is exactly this one inherits from P_α.

Proof: Let B be an α-prepath subset of an α-prepath X, if B is an α-disconnected, then that is contradiction with theorem (3.1), so B is an α-connected.
Conversely, let B is an α-connected subset, and $\leq_B$ is inherited total order by B from a compatible one $\leq$ on P_α. Let x, y, z ∈ B and $x <_B y <_B z$, implies that $x < y < z$ and y α-disconnects x from z, that is mean, each of x and z belong to different α-components of X \ {y}, so they belong to different α-connected components of B \ {y}. Hence $\leq_B$ on B satisfies the 3rd condition of the theorem (3.7).

Definition 3.11: Let P_α be an α-prepath, a point $x \in P_\alpha$ is internal if it is not extremum with respect to a compatible total order, and terminal otherwise, so the α-cutpoints are the internal points, and the endpoints are the terminal.

Definition 3.12: An α-prepath is said to be α-bounded, if the compatible total orders are α-bounded. That means, it is an α-prepath with two terminal points. Moreover, some compatible total order is α-bounded from above (respectively, below) but not from below (respectively, above), the α-prepath is said to be one-sided.

Definition 3.13: Let X be an α-topological space, a, b ∈ X, a subset P_α of X is said to be an ab- α-prepath if it is a (bounded) α-prepath with two terminal points a minimum point and b maximum point.

Definition 3.14: Let X be an α-topological space, X is said to be an ab-α-prepath connected space, if X contains an α-prepath for every a, b ∈ X.

Theorem 3.15: Let P_α be α-prepath, then a point $x \in P_\alpha$ is an endpoint if and only if it is an extremum with respect to a compatible total order. Furthermore, very α-prepath has at most two endpoints.

Proof: Let x ∈ P_α be an endpoint, to prove x is extremum. Assume that x is not extremum (not minimum nor maximum) with respect to a compatible total order ≤, then there exist two points a, b such that a < x < b, so we obtain that x is an α-cutpoint. That is a contradiction, hence every non α-cutpoint is a maximum or a minimum. Conversely, if x is not an endpoint, it is an α-cutpoint, then there exists at least two points a, b such that x α-separates them. So we get a < x < b (b < x < a) by corollary (3.8), implies that x is not maximum nor minimum (not extremum). That is contradicting the hypothesis, hence X is an endpoint.

Let P_α be α-prepath, and has three distinct endpoints a, b, c in X. Then any two of them must be α-disconnected by the third one, which became an α-cutpoint. That is contradiction. Therefore, P_α must has at most two endpoints.

The next corollary shows that if x is an α-cutpoint, then either δ(x) or Δ(x)((ω(x) or Ω(x)) is α-open.

Corollary 3.16: Let P_α be α-prepath, x ∈ P_α be an internal point with a fixed compatible total order. Then one of the following must satisfy:
(1) x is an edge, Δ(x) and Ω(x) are α-open, δ(x) and ω(x) are α-closed, $(\delta(x))^{\alpha\diamond}$ = Δ(x) and $(\omega(x))^{\alpha\diamond}$ = Ω(x).
(2) x is a vertex, Δ(x) and Ω(x) are α-closed, δ(x) and ω(x) are α-open, α-Cl(δ(x)) = Δ(x) and α-Cl(ω(x)) = Ω(x).

Proof: Assume x is an internal point, and fixed ≤ as a compatible order, then x is an α-cutpoint and a strong α-cutpoint by theorem (3.1). Suppose that K_1, K_2 are the two α-components of P_α\ {x}. So we can prove that {K_1, K_2} = {δ(x), ω(x)}, by using definition (2.17). But, if not, then there exist two points a ∈ K_1, b ∈ K_2 such that a < x < b. Hence x is α-disconnected a from b. This is contradiction, since K_1, K_2 are two α-connected sets containing a and b respectively but not x.

Definition 3.17: Let P_α be an α-prepath with a fix compatible order, and let a ∈ P_α. The α-open tail from a upwards (respectively, downwards) is the largest α-open subset of P_α contained in Ω(a) (Δ(a)).
- If a is a terminal point, we have two cases: when a is maximum then the α-open tail from a upwards is P_α, and when a is minimum the α-open tail from a downwards is {a} where {a} is α-open or equal ∅ if not.
- If a is an α-cutpoint, the α-open tail from a upwards (downwards) is ω(x) (δ(x)) or Ω(x) (Δ(x)) depending on what condition is satisfied from corollary (3.16).

Definition 3.18: Let x_1, x_2 be any two points in an α-topologized hypergraph H, then{x_1, x_2} is said to be an edge-vertex incident pair if any one of them is a vertex and the other is an incident edge.

Theorem 3.19: If P_α is an α-prepath, then:
1. {x, y} is an edge-vertex incident pair if and only if it is a jump with respect to a compatible total order.
2. any terminal edge exactly has one endvertex, and any internal edge has exactly two endvertices.

Proof: Suppose that e is an edge with an incident vertex v, and {e, v} is not a jump. If e < v or (v < e), this leads to the existence of a point x such that e < x < v or (v < x < e) . So we obtain y is an α-cutpoint, by using theorem (3.15), and (x,∞) is an α-open set containing v but not e, by corollary (3.16) and definition (3.17).That is a contradiction, since e and v are incident.
Conversely, Let ≤ be an compatible total order, and {x, y} a jump. Assume that x < y or (y < x), then P_α = Δ(x) ∪ Ω(y), where they are disjoint. If x, y are both edges, then both these sets are α-open, but if they are both vertices, then both these sets are α-closed, by corollary (3.16). Hence, {Δ(x), Ω(x)} is an α-separation of P_α, which contradiction with being P_α is α-connected.

Since every edge is a cutedge or a loop from theorem (3.4). So an internal edge is a cutedge, by theorem (3.15). Therefore, it has exactly two endvertices by corollary (2.22), and since terminal points are not α-cutpoints, then they are loops. Therefore, they are incident with exactly one vertex.

Corollary 3.20: Let P_α be an α-prepath, A be a convex subset of P_α with at least two points. If a $\in A \backslash A^{\alpha^\circ}$, then a is an extremum point for A, but not for P_α.

Proof: Let $\leq$ be an compatible total order for P_α. Assume that there exist two points in A such that a between them, (that is $\exists$ x, y $\in$ A, where x $<$ a $<$ y). Then $\langle x, y\rangle$ is α-open contains a, but A is convex, then a is contained in A, so a $\in A^{\alpha^\circ}$, that is a contradiction. Therefore, a is an extremum point of A. To prove that a is not an extremum point of P_α let b be another point in A. By contradiction, let a be a minimum point of P_α, then [a, $b\rangle$ = (-∞, $b\rangle$ is an α-open subset of A containing a. That is contradiction, hence a cannot be a minimum for P_α. By the same way a can not be a maximum. Therefore, a is not an extremum for P_α.
The following theorem can be proven similarly as in [3], and we need it in the subsequence details of proofs.

Theorem 3.21: A subset of an α-prepath is an α-connected if and only if it is convex.
Corollary 3.22: If P_α is an α-prepath and $\leq$ a compatible total order, then $\leq$ is an order-complete.

Proof: By way of contradiction, we must prove that there are no gaps, let (A, B) be a gap, and A must be convex, since (A, B) is a cut. If A is not α-open, then there exists some point a $\in A \backslash A^{\alpha^\circ}$ by corollary (3.20). So a is an extremum for A, and the same as B, which is contradicting the definition of a gap definition (2.23). Therefore A and B are α-open, then {A, B} is an α-separation of the α-connected space P_α, that is contradiction.

Corollary 3.23: Let X be an α-prepath, M $\subseteq$ X, then the next statements are equivalent:
(1) M is α-connected.
(2) M is an α-prepath.
(3) M is convex.
(4) M is an interval.
Proof: We prove (1) $\leftrightarrow$ (2) by using theorem (3.10), and (2) $\leftrightarrow$ (3) by using theorem (3.21), and (3) $\leftrightarrow$ (4) by using theorem (2.12), so to prove (4) $\leftrightarrow$ (1) we use corollary (2.22) and corollary (3.22).

Theorem 3.24: Let X be an α-topological space, a, b $\in$ X, then the following statements are equivalent:
(1) For all x $\in$ X \ {a, b}, x α-disconnects a from b.
(2) For all S $\subset$ X, such that {a, b}$\subseteq$ S, S is α-disconnected.

Proof: Suppose that (1) satisfies, assume that S $\subset$ X contains {a, b}. Take x $\in$ X \ S, and define W = X \ {x}. Let a $\in S_a$, b $\in S_b$ be the α-connected components of S containing a, b. So a $\in W_a$, b $\in W_b$ is the α-connected components of W containing a, b. Since S $\subseteq$ W, we get that $S_a \subseteq W_a$ and $S_b \subseteq W_b$ by the fact that α-connected components form a partition of the point set of an α-topological space and facts (2.6B). But, W_a and W_b are different, then S_a and S_b are disjoint. So, S is α-disconnected, we get (2).
Now suppose that (2) holds, Assume that x $\in$ X \ {a, b}. So, if S = X \ {x} $\subset$ X contains a, b, then S is α-disconnected. Assume that a, b are in the same α-connected component K of X \ {x}. So K is a subset of X \ {x} containing a, b, and hence K is α-connected, that is a contradiction. So a and b must contain in a different α-connected components of X \ {x}.

4. Paths and Cycles in Alpha Topologica Spaces

In this section, we introduce some basic definitions and facts on α-topological spaces which we need it to define our new concepts. Moreover, we study some important relationships in α-space.

Definition 4.1: Let P_α be an α-prepath, we can define the interval α-topology on P_α by taking a subbase contains X and all open intervals $(-\infty, x)$, (x, ∞) on P_α for some vertex x and we can obtain (the base, the topology, and the α-topology) of P_α. We should refer to that the α-open sets in the interval α-topology are α-open sets in general topology on P_α.

Corollary 4.2: An α-topological space X is a locally α-connected if and only if each component of each α-open set in X is α-open.

Proof: Let K be a component of α-open set U in a locally α-connected space X, $x \in K$. So there is an α-open connected set V such that $x \in V \subset U$, and $V \subset K$, therefor K is α-open.
Conversely, assume that the components of every α-open set is α-open in X. Let U be any α-open neighborhood containing x in X, then there is an α-component K containing x of U which is an α-open connected neighborhood in U. That is, $x \in K \subset U$. Hence, X is locally α-connected.

Theorem 4.3: An α-prepath is locally α-connected if and only if the α-topology concurs with the interval α-topology.

Proof: Let P_α be an α-prepath, and let U be an α-open set in P_α containing x, assume that P_α is locally α-connected. We have to show that U contains an α-open interval containing x. By corollary (3.23), we obtain that $K_U(x)$ is an interval, because it is an α-connected of P_α. Since P_α is locally α-connected and U is α-open, the components $K(U)(x)$ is α-open by corollary (4.2).
Conversely, assume that P_α has the interval α-topology and $U \subseteq P_\alpha$ is α-open. Then the union of every α-open intervals is α-open, means, $\bigcup_{i\in I} J_i$ where the J_i are α-open intervals. Now, if $x \in K$, where K is any α-component of U, is an α-open interval. So we get $x \in J_i$ for some i. But J_i is an α-connected subset of U, therefore $J_i \subseteq K$. Hence, P_α is locally α-connected.

Definition 4.4: Let X be an α-connected topological space, an α-prepath is called an α-path if it is locally α-connected.
If we have an α-prepath say ab, we can express it by ab-α-prepath, and it is an ab-α-path if it is locally α-connected. If there exists an α-topology on X such that X is an α-prepath(α-path) with a total order $\leq$ is compatible with X, then $\leq$ on X is an α-prepath(α-path) compatible.

Theorem 4.5: Let X be an α-connected topological space with the interval α-topology ${\tau_\alpha}^*$, and X is an α-prepath, then X is an α-path with compatible orders, and it has the same α-connected subsets.

Proof: Let ${\tau_\alpha}^*$ be the interval α-topology on X, then any α-separation in ${\tau_\alpha}^*$ should be an α-separation in τ_α, Since ${\tau_\alpha}^* \subseteq \tau_\alpha$. Hence, X is α-connected with respect to ${\tau_\alpha}^*$.
Assume that $\leq$ is a compatible total order on X with respect to τ_α. Let x, y, z be any three points on X such that $x < y < z$. If y is a vertex, then we have an α-separation $\{(-\infty, y), (y, \infty)\}$ of $X \setminus \{y\}$, and y α-separates x from z. But, if y is an edge (not external), then it has a previous vertex a and a latter vertex b. So we have an α-separation $\{(-\infty, b) \setminus \{y\}, (a, \infty) \setminus \{y\}\}$ of $X \setminus \{y\}$. Hence, X is an α-prepath compatible with the same total order $\leq$ with respect to ${\tau_\alpha}^*$. That is implying that the intervals with respect to the orders compatible with ${\tau_\alpha}^*$ are exactly the intervals with respect to the original α-topology τ_α. Hence, X is locally α-connected with respect to ${\tau_\alpha}^*$, by (4.3), that is, $(X, {\tau_\alpha}^*)$ is an α-path.
The next definition was introduced in [13].

Definition 4.6: An α-topological space X is said to be α-compact if every α-open cover has a finite subcover.

Corollary 4.7: If X is an α-topological space, then the following statements are equivalent:
(1) X is α-compact.
(2) If every family of α-closed sets has the finite intersection property, then it has a non-empty intersection.
Proof: (1) → (2) Let X be an α-compact space, by contradiction, let $\{F_i | \ i \in I\}$ be a collection of α-closed sets such that $\bigcap_{i\in I} F_i = \emptyset$. Then we have an α-open cover $\{X - F_i | \ i \in I\}$. Since X is α-compact, then there exists a finite subcover $\{X - F_i\}_{i=1}^{n}$, and $\bigcap_{i=1}^{n} F_i = \emptyset$. That is contradicting with the finite intersection property, hence $\bigcap_{i\in I} F_i \neq \emptyset$.
(2) → (1) Let $\{U_i | \ i \in I\}$ be an α-open cover of X such that $X = \cup \{U_i | \ i \in I\}$ and does not have a finite subcover, then $X - \{U_i | \ i \in I\} = \{F_i | \ i \in I\}$ is a nonempty α-closed sets. Hence $\bigcap_{i=1}^{n} F_i \neq \emptyset$ when $\bigcap_{i\in I} F_i \neq \emptyset$ because of the finite intersection property by (2). So $X - \cap \{F_i | \ i \in I\} = \cup \{U_i | i \in I\}$, moreover $X - \bigcap_{i=1}^{n} F_i = \bigcup_{i=1}^{n} U_i$ which is a finite subcover of $\{U_i | \ i \in I\}$. Hence, X is an α-compact.
The next theorem is very important because it shows the relation between compactness and locally connectedness in α-topological spaces. Therefore, we take it here without proof, so we can write its proof in another place.

Theorem 4.8: If P_α is an α-bounded prepath, then P_α is α-compact if and only if it is locally α-connected.
From the above theorem, we can conclude the next corollary.

Corollary 4.9: Let P_α be an α-bounded prepath, then the next statements are equivalent:
(1) P_α is α-compact.
(2) P_α is locally α-connected.
(3) The α-topology of P_α concurs with the interval α-topology.

Proof: we can see the equivalence the above statements directly by using theorem (4.8) and theorem (4.3).

Definition 4.10: An α-topological space X is said to be α-S_1 space if every singleton is either α-open or α-closed.
We introduced the next theorem to use it when we define precycle and cycle.

Theorem 4.11: If X is an α-connected topological space with at least four points, then the following statements are equivalent:
1. For every four points, no one α-disconnects the remaining, however, some two α-disconnect, and are α-disconnected by the others.
2. There exists a cyclic order on X such that for every four points a, b, c, d, we have that a, c α-separate(α-disconnect) b and d if and only if $\langle w, x, y, z\rangle$ is a cyclic subsequence for some choice of w, $y \in \{a, c\}$ and $x, z \in \{b, d\}$.
3. X is α-S_1, and for every finite subset A, the complement of A and A have the same number of α-connected components.
4. X is α-S_1 and every two non-incident points α-disconnects, but no one point do.

Proof: (1) → (2) Let S be a cyclic order on X, and a, b, c, d, be disjoint points with a, c α-separate(α-disconnect) b and d. Now suppose that $Y \subseteq X$, then Y inherits a cyclic order $S^* = S \cap Y^4$ such that all quadruple with entries in Y. Since S is finite, then the obtaining ordered space is a cyclic subsequence of S. By (1), since a, c α-separate(α-disconnect) b and d, that means they are belong to different component. So, there is four points w, x, y, z in Y such that $\{w, y\} = \{a, c\} \cap Y$, and $\{x, z\} = \{b, d\} \cap$

Y, since Y is a subspace of X. That leads to w, y ∈ {a, c} and x, z ∈ {b, d}, because they belong to the intersection.
(2) → (3) from (2) we have a cyclic subsequence ordered space such that w, y ∈ {a, c} and x, z ∈ {b, d} which makes an α-separation any four points into two disjoint finite sets. Each one of them is being the complement of the other by definition (2.1). Hence, any one of these sets have the same number of α-connected components by facts (2.6A).
(3) → (4) X is α-S_1space, and A is a finite subset that has the same number of α-component with its complement. So there is an α-separation of X into two α-connected subsets by facts (2.6C). If A contains only one elemen, t then it is an α-open(α-closed) connected which can not α-disconnect the other points in X. However, if it contains two elements, it is a jump. So, it is an edge-vertex incident pair by theorem (3.19). Therefore, the two points can not α-separate the two others points. Hence, they are non-incident to α-separate the others.
(4) → (1) we have X is α-S_1space, for every four points on X, any two points which non-incident are α-disconnect the other two, so they are α-disconnected. Since X is α-S_1 and α-connected, then there has not any point that α-disconnect the other three points in X.

Definition 4.12: An α-connected topological space X is said to be an α-precycle, if |X| = 2, and X is an α-topolgized graph contains one vertex and one edge (a loop) only. Otherwise, If |X| ≥ 4, and X satisfies the statements of theorem (4.11).

Definition 4.13: An α-precycle is called an α-cycle if it is locally α-connected.
The following simple example shows the idea of precycles and cycles by using the above definitions.

Example 4.14: Let $X = V_G \cup E_G = \{v, e\}$ be a set consists of one vertex and one edge (loop), with $\tau_X = \{\emptyset, X, \{v\}\}$, then (X, τ) is a topological space such that the elements of τ are open sets and their complements are closed sets. So the α-topology of X is $\tau_{\alpha X} = \{\emptyset, X, \{\mathrm{v}\}\}$ which contains an α-open sets and their complements are α-closed set. We can see that X is an α-connected space, therefore it is an α-precycle by definition (4.12). Moreover, it is an α-cycle since it is locally α-connected by definition (4.13).

5. Conclusion

Through this paper, alpha-prepaths, alpha-paths, and alpha-cycles have been formulated and some relationships have been discussed. Moreover, several theorems and corollaries have been proved to continuum the future searches and works to define a new concepts which are related with them like cycle spaces.

Abstract. The Transmuted Topp Leone Flexible Weibull distribution was developed in this paper using the Transmuted Topp Leone family of distributions and its basic statistical properties were established. Estimation of model parameters was considered using the maximum likelihood estimation (MLE) method and three real life applications were provided. The TTLFW distribution is a promising model as its performance relative to other compounds probability models like the Exponentiated Flexible Weibull, Weibull Flexible Weibull, Kumaraswamy Flexible Weibull, Beta Flexible Weibull, Gamma Flexible Weibull, and Exponentiated Generalized Flexible Weibull distributions is quite credible.

1 Introduction

Probability models have played important roles in many areas of study like finance, biology, engineering, and so on. Many of these probability models have been modelled extended and/or generalized using families of distributions; these families of distributions give room for the introduction of additional shape parameters into the existing probability models. Examples of the existing families of distributions include Kumaraswamy-G family of distribution [1], Gompertz family of distribution [2], Weibull-G family of distribution [3], and a host of others which are mentioned in [4 - 7], and the references therein. However, developing families of distributions have taken a new dimension where two families of distributions are combined to produce a more robust family. For instance, Kumaraswamy Transmuted-G family of distribution [8], exponentiated Weibull-H family of distribution [9], Beta Transmuted {H family of distribution [10], Generalized Transmuted-G family of distribution [11], Transmuted Topp-Leone G family of distribution [12], Marshall-Olkin Topp Leone-G family of distributions [13], and some other ones are notable examples. These families have been used in the literature to extend several existing standard probability models and their potentials have been recorded. The performance of these families is impressive when fitted to real-life events, and this is a major motivation for this present research.

This research aims to explore the work of [12] who combined the Topp Leone family of distributions [14] and Transmuted family of distributions [15]. Particularly, this research considered extending the Flexible Weibull distribution using the Transmuted Topp-Leone G family of distributions. Flexible Weibull (FW) distribution is one of the medications of the well-known Weibull distribution which caters for the disadvantage of not being able to model datasets with a non-monotonic failure rate. The FW distribution exhibits increasing, decreasing, or bathtub shaped failure rate, it has also received

consideration in clinical studies, life testing experiments, reliability analysis and applied statistics ([16], [17], and [18]). In the next section, the Transmuted Topp-Leone Flexible Weibull distribution is developed and its basic statistical properties are explicitly derived including estimation of model parameters while real life applications are provided in section 3.

2. The Transmuted Topp Leone Flexible Weibull (TTLFW) Distribution

For a random variable y, the Transmuted Topp-Leone family of distribution is defined by the following densities:

$$F(y) = (1+\lambda)\{1-[1-G(y)]^2\}^{\alpha} - \lambda\{1-[1-G(y)]^2\}^{2\alpha} \quad (1)$$

and

$$f(y) = 2\alpha g(y)[1-G(y)]\{1-[1-G(y)]^2\}^{\alpha-1}\{1+\lambda-2\lambda\{1-[1-G(y)]^2\}^{\alpha}\} \quad (2)$$

where y ≥ 0. $\alpha > 0$ and $|\lambda| \leq 1$ are shape parameters, $F(y)$ and $f(y)$ are regarded as the cumulative distribution function (c.d.f) and probability density function (p.d.f) respectively.

Also, the densities of the Flexible Weibull distribution are:

$$G(y) = 1 - exp\left(-e^{\beta y-\frac{\theta}{y}}\right) \quad ; y>0, \beta>0, \theta>0 \quad (3)$$

and

$$g(y) = \left(\beta+\frac{\theta}{y^2}\right)e^{\beta y-\frac{\theta}{y}} exp\left(-e^{\beta y-\frac{\theta}{y}}\right) \quad ; y>0, \beta>0, \theta>0 \quad (4)$$

To derive the c.d.f of the Transmuted Topp-Leone Flexible Weibull distribution, equation (3) is substituted into equation (1) as follows:

$$F(y) = (1+\lambda)\left\{1-\left[exp\left(-e^{\beta y-\frac{\theta}{y}}\right)\right]^2\right\}^{\alpha} - \lambda\left\{1-\left[exp\left(-e^{\beta y-\frac{\theta}{y}}\right)\right]^2\right\}^{2\alpha} \quad (5)$$

Similarly, the corresponding pdf is obtained by substituting equations (3) and (4) into equation (2) as follows:

$$f(y) = 2\alpha\left(\beta+\frac{\theta}{y^2}\right)e^{\beta y-\frac{\theta}{y}}\left[exp\left(-e^{\beta y-\frac{\theta}{y}}\right)\right]^2\left\{1-\left[exp\left(-e^{\beta y-\frac{\theta}{y}}\right)\right]^2\right\}^{\alpha-1}$$

$$\times\left((1+\lambda)\left\{-2\lambda\left\{1-\left[exp\left(-e^{\beta y-\frac{\theta}{y}}\right)\right]^2\right\}^{\alpha}\right\}\right) \quad (6)$$

for y ≥ 0. $\alpha > 0$ and $|\lambda| \leq 1$, $\beta > 0, \theta > 0$.

The plots for the p.d.f and c.d.f of TTLFW distribution are presented in figures 1 and 2 respectively.

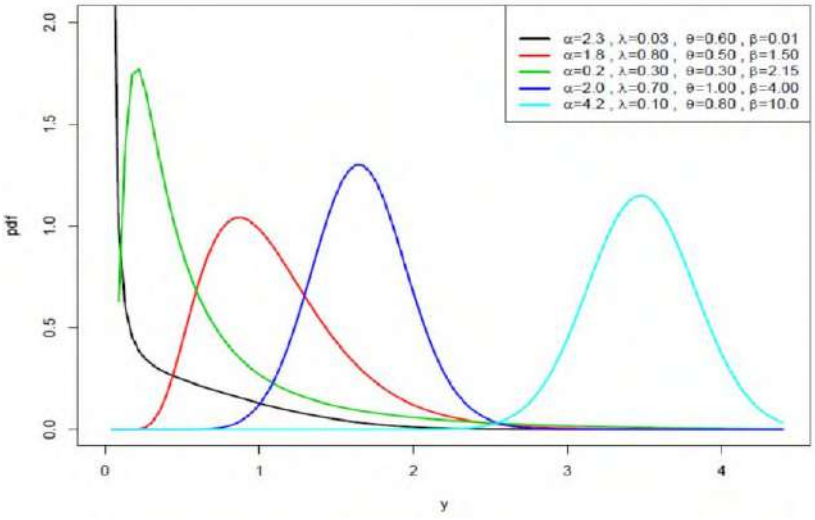

Figure 1: PDF of Transmuted Topp Leone Flexible Weibull Distribution

The plot in figure 1 suggests that the shape of the TTLFW distribution is decreasing and unimodal

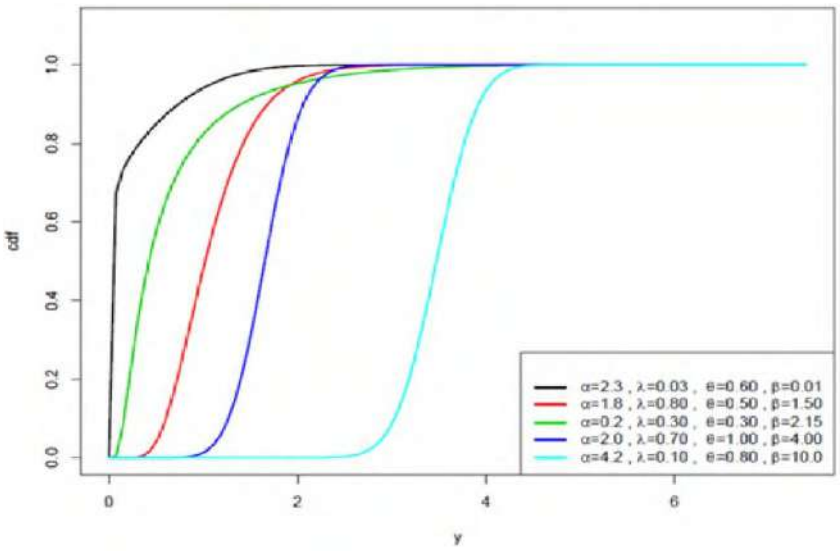

Figure 2: The c.d.f plot for the TTLFW Distribution

2.1 Reliability Analysis

Survival Function is obtained as:

$$S(y) = 1 - F(y)$$

Thus, the survival function for TTLFW distribution is:

$$S(y) = 1 - \left((1+\lambda)\left\{1 - \left[exp\left(-e^{\beta y - \frac{\theta}{y}}\right)\right]^2\right\}^{\alpha} - \lambda\left\{1 - \left[exp\left(-e^{\beta y - \frac{\theta}{y}}\right)\right]^2\right\}^{2\alpha} \right) \quad (7)$$

The Failure rate is obtained as:

$$h(y) = f(y)/S(y)$$

Thus, the failure rate for TTLFW distribution is:

$$h(y) = 2\alpha\left(\beta + \frac{\theta}{y^2}\right)e^{\beta y - \frac{\theta}{y}}\left[exp\left(-e^{\beta y - \frac{\theta}{y}}\right)\right]^2\left\{1 - \left[exp\left(-e^{\beta y - \frac{\theta}{y}}\right)\right]^2\right\}^{\alpha-1} \times \frac{\left((1+\lambda)\left\{-2\lambda\left\{1-\left[exp\left(-e^{\beta y - \frac{\theta}{y}}\right)\right]^2\right\}^{\alpha}\right\}\right)}{\left[1-\left((1+\lambda)\left\{1-\left[exp\left(-e^{\beta y - \frac{\theta}{y}}\right)\right]^2\right\}^{\alpha} - \lambda\left\{1-\left[exp\left(-e^{\beta y - \frac{\theta}{y}}\right)\right]^2\right\}^{2\alpha}\right)\right]} \quad (8)$$

$$For\ y > 0, \alpha > 0, |\lambda| \leq 1, \beta > 0, \theta > 0$$

The plot for the failure rate of TTLFW distribution is presented in figure 3.

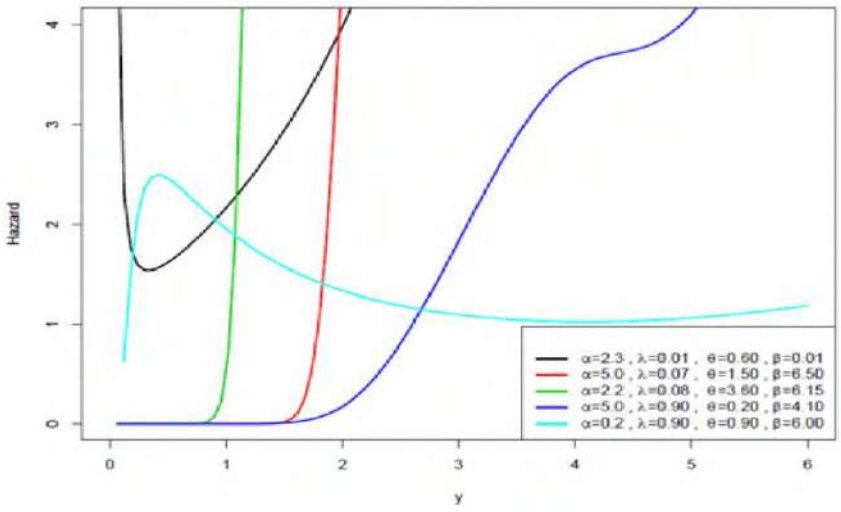

Figure 3: Plot for the failure rate of the TTLFW Distribution

Figure 3 suggests that the shape for the failure rate of TTLFW distribution is uni-antimodal, unimodal, and increasing.

2.2 Quantile Function

The quantile function of the TTLFW distribution can be obtain by find the inverse equation (5) with some algebra. The quantile function is obtained as:

$$Q(u) = F^{-1}(u)$$

$$Q(u) = \frac{ln\ ln\ [-\ ln\ ln\ (\rho)\ ] + \sqrt{\{ln[-ln(\rho)]\}^2 + u\beta\theta}}{2\beta} \quad (9)$$

where

$$\rho = \left\{1 - \left[\frac{1+\lambda-\sqrt{(1+\lambda)^2 - u\lambda u}}{2\lambda}\right]^{\frac{1}{2}}\right\}^{\frac{1}{2}}$$

and $U \sim Uniform(0,1)$

The median can be obtained when 'u' is set at 0.5. Random samples are generated from the TTLFW distribution using:

$$y = \frac{ln \mid -ln(\rho)] + \sqrt{\{ln \mid -ln(\rho)]\}^2 + u\beta\theta}}{2\beta} \quad (10)$$

2.3 Estimation of Parameter

Let $y_1, y_2, \ldots, y_n$ represent random samples from the TTLFW distribution. By the method of maximum likelihood estimation (MLE), the likelihood function of the TTLFW distribution is:

$$f(y_i \mid \alpha, \beta, \lambda, \theta) = \prod_{i=1}^{n}[f(y_1, y_2, \ldots, y_n; \alpha, \beta, \lambda, \theta)]$$

$$f(y_i \mid \alpha, \beta, \lambda, \theta) = \prod_{i=1}^{n} 2\alpha\left(\beta + \frac{\theta}{y_i^2}\right)e^{\beta y_i - \frac{\theta}{y}}\left[exp\left(-e^{\beta y_i - \frac{\theta}{y_i}}\right)\right]^2$$

$$\times\left\{1 - \left[exp\left(-e^{\beta y_i - \frac{\theta}{y_i}}\right)\right]^2\right\}^{\alpha-1}\left\{1 + \lambda - 2\lambda\left\{1 - \left[exp\left(-e^{\beta y - \frac{\theta}{y}}\right)\right]^2\right\}^{\alpha}\right\}$$

The log-likelihood function say; $l(\alpha, \beta, \lambda, \theta|y_i)$= log $[f(y_i|\alpha, \beta, \lambda, \theta)]$ is then given as:

$$l(\alpha, \beta, \lambda, \theta \mid y_i) = nlog(2) + nlog(\alpha) + \sum_{i=1}^{n} log\left(\beta + \frac{\theta}{y_i^2}\right) + \beta\sum_{i=1}^{n} y_i - \theta\sum_{i=1}^{n}\left(\frac{1}{y_i}\right) -$$

$$2e^{\beta\sum_{i=1}^{n} y_i - \theta\sum_{i=1}^{n}\left(\frac{1}{y_i}\right)} + (\alpha-1)\sum_{i=1}^{n} log\left\{1 - \left[exp\, exp\left(-e^{\beta y_i - \frac{\theta}{y_i}}\right)\right]^2\right\} + \sum_{i=1}^{n} log\left\{1 + \lambda -$$

$$2\lambda\left\{1 - \left[exp\, exp\left(-e^{\beta y_i - \frac{\theta}{y_i}}\right)\right]^2\right\}^{\alpha}\right\} \quad (11)$$

The partial derivatives of $l(\alpha, \beta, \lambda, \theta|y_i)$ for each of the model parameters are equated to zero; $\frac{dl(\alpha,\beta,\lambda,\theta|y_i)}{d\alpha} = 0, \frac{dl(\alpha,\beta,\lambda,\theta|y_i)}{d\beta} = 0, \frac{dl(\alpha,\beta,\lambda,\theta|y_i)}{d\lambda} = 0$, and $\frac{dl(\alpha,\beta,\lambda,\theta|y_i)}{d\theta} = 0$.

The expressions are solved simultaneously to give the maximum likelihood estimates of the parameters. Since the solutions cannot be obtained in closed forms, numerical methods can be used to obtain the estimates using software like R, MAPLE, and so on. In particular, R software was used in this research to obtain the parameter estimates using iterative methods and with the aid of datasets.

3. Applications

To demonstrate the potentials of the TTLFW distribution, two different datasets are used and models like the Exponentiated Flexible Weibull (EFW), Weibull Flexible Weibull (WFW), Kumaraswamy Flexible Weibull (KuFW), Beta Flexible Weibull (BFW), Gamma Flexible Weibull (GaFW) and Exponentiated Generalized Flexible Weibull (EGFW) distributions are used as the basis for comparison.

The following selection criteria; Negative Likelihood function (NLL), Bayesian Information Criteria (BIC), Akaike Information Criteria (AIC), Consistent Akaike Information Criteria (CAIC), Hannan and Quinn Information Criteria (HQIC) are used to determine the model with the best fit. The Saphiro Wilk (W) statistic, Kolmogorov Smirnov (KS) statistic, and the Anderson Darling statistic are also obtained. It is preferable to have low values for these selection criteria; therefore, the probability model with the lowest value for these criteria is selected as the distribution with the best fit. R software was used for all the analyses.

First Data: The dataset on time to failure for 40 suits of turbochargers in diesel engines was considered. [19] has previously used the dataset, the observations are:

1.6, 2.0, 2.6, 3.0, 3.5, 3.9, 4.5, 4.6, 4.8, 5.0, 5.1, 5.3, 5.4, 5.6, 5.8, 6.0, 6.0, 6.1,
6.3, 6.5, 6.5, 6.7, 7.0, 7.1, 7.3, 7.3, 7.3, 7.7, 7.7, 7.8, 7.9, 8.0, 8.1, 8.3, 8.4, 8.4,
8.5, 8.7, 8.8, 9.0

The result corresponding to the time to failure dataset is presented in table 1.

Table 1: Estimates, NLL, AIC, CAIC, BIC, and HQIC for the time-to-failure data

Model	Estimates	NLL	AIC	CAIC	BIC	HQIC
TTLFW	$\hat{\alpha} = 0.1517$ $\hat{\lambda} = 0.577$ $\hat{\theta} = 0.6165$ $\hat{\beta} = 48.938$	**78.95826**	**165.9165**	**167.0594**	**172.672**	**168.3591**
EFW	$\hat{\alpha} = 14.49$ $\hat{\lambda} = 0.182$ $\hat{\theta} = 0.0806$	83.300	172.601	173.268	177.668	174.433
WFW	$\hat{\alpha} = 1.6144$ $\hat{\lambda} = 10.67$ $\hat{\theta} = 0.361$ $\hat{\beta} = 1.425$	79.790	167.584	168.724	174.336	170.024
KuFW	$\hat{\alpha} = 17.774$ $\hat{\lambda} = 24.933$ $\hat{\theta} = 0.086$ $\hat{\beta} = 0.1653$	81.100	170.200	171.343	176.955	172.642
BFW	$\hat{\alpha} = 34.432$ $\hat{\lambda} = 6.397$ $\hat{\theta} = 0.1019$ $\hat{\beta} = 0.0187$	82.714	173.425	174.564	180.181	175.686
GaFw	$\hat{\alpha} = 4.7806$ $\hat{\lambda} = 0.2434$ $\hat{\theta} = 0.3497$	81.339	168.675	169.346	173.746	170.511
EGFW	$\hat{\alpha} = 0.1022$ $\hat{\lambda} = 1.9209$ $\hat{\theta} = 0.4057$ $\hat{\beta} = 0.9977$	80.706	169.412	170.555	176.162	171.855

The result for the goodness of fit test is presented in table 2.

Table 2: The W, A, KS Statistics, and p-value using the time-to-failure data

Models	**W − Statistic**	**A − Statistic**	**KS − Statistic**	**K S p − value**
TTLFW	**0.0222**	**0.1880**	**0.0942**	**0.8690**

KuFW	0.1153	0.8482	0.0959	0.5217
BFW	0.1242	0.9098	0.0966	0.5119
GaFW	0.1396	1.0033	0.0989	0.4808
EGFW	0.1245	0.9124	0.0969	0.5084

The histogram plot for the data set with the competing models is displayed in figure 6 while the empirical cdf (ecdf) plot is presented in figure 7.

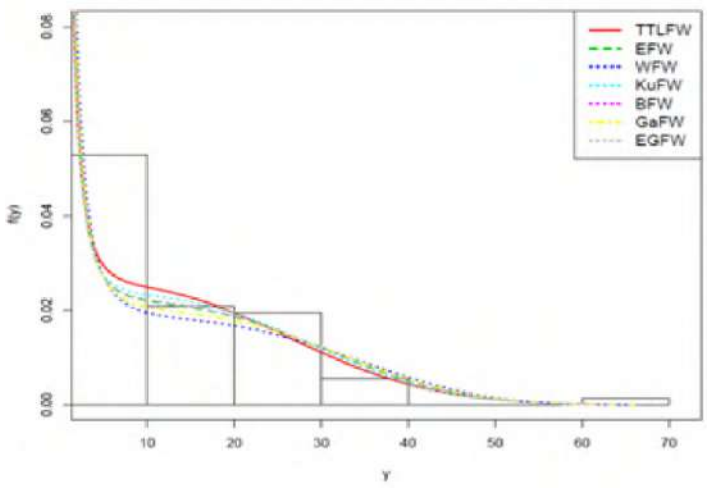

Figure 6: Histogram of the exceedances of the Wheatson river dataset with the competing models

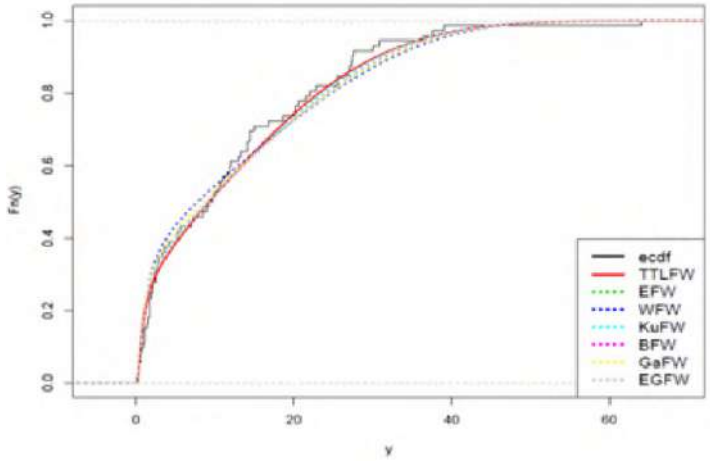

Figure 7: The ecdf plot of the exceedances of the Wheatson river dataset with the competing models

Clearly, all the two applications provided indicate that the TTLFW distribution is better than the other models based on the values of the criteria used. It has lower values for the NLL, AIC, CAIC, BIC, and HQIC. The histogram and ecdf plots also support all the results presented in tables 1 to 4.

4. Conclusion

The Transmuted Topp-Leone Flexible Weibull (TTLFW) distribution has been successfully derived in this research. It's properties have been established and applications to two real datasets have been provided. The TTLFW distribution exhibits decreasing and unimodal shapes while its failure rate exhibits increasing, unimodal and uni-antimodal shapes. The applications provided reveal that the TTLFW distribution is a good competitor as it performs creditably well than the Exponentiated Flexible Weibull, Weibull Flexible Weibull, Kumaraswamy Flexible Weibull, Beta Flexible Weibull, Gamma Flexible Weibull, and Exponentiated Generalized Flexible Weibull distributions under the considered selection criteria.

Estimate the Parallel System Reliability in Stress-Strength Model Based on Exponentiated Inverted Weibull Distribution

Estimate the Parallel System Reliability in Stress-Strength Model Based on Exponentiated Inverted Weibull Distribution

Eman A Abdulateef [1,*], Abbas N Salman[1] and Adil Abdulkadhim Hussein[1]

E-mail: eman.a.al@ihcoedu.uobaghdad.edu.iq

Abstract. In this paper, we employ the maximum likelihood estimator in addition to the shrinkage estimation procedure to estimate the system reliability (R_k) contain K^{th} parallel components in the stress- strength model, when the stress and strength are independent and non-identically random variables and they follow two parameters Exponentiated Inverted Weibull Distribution (EIWD). Comparisons among the proposed estimators were presented depend on simulation established on mean squared error (MSE) criteria.

1. Introduction

The parallel stress-strength model occurs when a system has a mixture of k independent component with the strengths $X_1, X_2, \dots\dots, X_k$ and each component of this system is subject to a common stress Y. the system works successfully if at least one of the components survives, it is termed parallel in the analogy with electric circuits [4].

The reliability of the above system denoted by R_k take the attention in this work and the formula of such stress - strength reliability when the stress and strength are independent random variable can be expressed as follow:

$$R_k = P(Y < \max(X_1, X_2, \dots\dots, X_k) \quad (1)$$

In (2006), Mokhlis estimated the reliability system contains two parallel components via four different methods based bivariate exponential distribution [1]. In (2013), Ali estimated the reliability of the parallel stress-strength system with a non-identical component using Lomax distribution using estimation methods namely: MLE, LS, PCE and MOM [2]. In (2017), Fatima estimated three types of system reliability (one component, k^{th} parallel component and multicomponent in the stress-strength model for Exponentiated Weibull distribution using; MLE, MOM, and three shrinkage methods and made a comparison among them [3]. And in (2018) Cheng estimated the system reliability in S-S models based on Exponentiated Pareto distribution using different estimation methods [4].

The aim of the present paper is to estimate the reliability (R_k) of the system contain K^{th} parallel components have strengths $(X_1, X_2, \dots\dots, X_k)$ subjected to common stress Y (stress-strength model) based on Exponentiated Inverted Weibull distribution with unknown shape parameter θ and known shape β (β =4) via different estimation methods like MLE, as well as some shrinkage estimation methods and

make a comparison among the proposed estimator methods using simulation depends on mean squared error.

The probability density function pdf of a r.v. X distributed as Exponentiated Inverted Weibull distribution (EIWD) is as below [5].

$$f(x;\theta,\beta) = \beta\theta x^{-(\beta+1)}\left(e^{-x^{-\beta}}\right)^{\theta};\ x>0,\theta>0 \quad (2)$$

And the cumulative distribution function (c.d. f.) of X will be:

$$F(x;\theta,\beta) = \left(e^{-x^{-\beta}}\right)^{\theta};\ x>0,\theta>0 \quad (3)$$

Assume $X_1,X_2,\ldots,X_k$ arises strength have (EIWD) with parameter α_i, i=1,2,..., k and Y refer to common stress follow (EIWD) with parameter α_{k+1}.

The system reliability R_k of the K^{th} parallel in pre mentioned stress-strength model can be obtained as the following [6].

$$R_{(k)} = P(y < \max(x_1, x_2, \ldots\ldots, x_k))$$
$$R_k = \int_o^{\infty} \overline{F}_z(y)\, f(y)\, dy$$

Where, $z = \max(x_1, x_2, \ldots\ldots, x_k)$

$$F_z(z) = P(Z<z) = \left(e^{-z^{-\beta}}\right)^{\sum_{i=1}^{k}\theta_i}$$

$$Rk = \int_o^{\infty}\left[1-\left(e^{-y^{-\beta}}\right)^{\sum_{i=1}^{k}\theta_i}\right]\theta_{k+1}\beta y^{-(\beta+1)}\left(e^{-y^{-\beta}}\right)^{\theta_{k+1}} dy$$

$$Let\ w = e^{-y^{-\beta}} \rightarrow dy = \frac{1}{\beta w}(-lnw)^{-\frac{1}{\beta}-1}dw$$

$$Rk = \int_o^1 \theta_{k+1}\left(1-w^{\sum_{i=1}^{k}\alpha_i}\right)(w)^{\theta_{(k+1)}-1}dw$$
$$= \int_o^1 \theta_{k+1}(w)^{\theta_{(k+1)}-1}dw - \int_o^1 \theta_{k+1}(w)^{\sum_{i=1}^{k+1}\theta_i-1}dw$$
$$= \theta_{k+1}B(\theta_{k+1},1) - \theta_{k+1}B(\sum_{i=1}^{k+1}\theta_i,1)$$

Where, $B(.,.)$ denote to Beta function.

And by simplification, R_k became:

$$R_k = \frac{\sum_{i=1}^{k}\theta_i}{\sum_{i=1}^{k+1}\theta_i} \quad (4)$$

2. Estimation Methods of R_k

2.1. Maximum Likelihood Estimator (MLE)

Let $x_{11},x_{12},\ldots,x_{1n}$; $x_{21},x_{22},\ldots,x_{2n}$; $x_{k1},x_{k2},\ldots,x_{kn}$ form EIWD(θ_i,β), respectively, for i=1,2,..,k and $y_1, y_2,\ldots, y_m$ follows EIWD (θ_{k+1},β). Then the likelihood functions:

$$l = l(\alpha_i,\lambda;x_i,y) = \prod_{i=1}^{n_i}\left(\prod_{i=1}^{k} f(x_{ij})\right)\prod_{t=1}^{m} g(y_t)$$

$$= \prod_{j=1}^{n_i}\prod_{i=1}^{k}\beta\theta_i x_{ij}^{-(\beta+1)}\left(e^{-x_{ij}^{-\beta}}\right)^{\theta_i}\prod_{t=1}^{m}\beta\theta_{k+1}\,y_t^{-(\beta+1)}\left(e^{-y_t^{-\beta}}\right)^{\theta_{k+1}}$$

$$\ln(l) = \sum_{i=1}^{k} n_i ln\theta_i + \sum_{i=1}^{k} n_i ln\beta - (\beta-1)\sum_{i=1}^{k}\sum_{j=1}^{n_i} lnx_{ij} - \sum_{i=1}^{k}\sum_{j=1}^{n_i}\theta_i x_{ij}^{-\beta} + mln\beta + mln\beta + mln\theta_{k+1} - (\beta-1)\sum_{t=1}^{m} ln\, y_t - \theta_{k+1}\sum_{t=1}^{m} y_t^{-\beta}$$

$$\frac{d\ln(l)}{d\theta_i} = \frac{n_i}{\theta_i} - \sum_{j=1}^{n_i} x_{ij}^{-\beta} = 0 \quad ;\ i=1,2,\ldots,k$$

$$\frac{d\ln(l)}{d\theta_{k+1}} = \frac{m}{\theta_{k+1}} - \sum_{t=1}^{m} y_t^{-\beta} = 0$$

Thus, the maximum likelihood estimator of the parameters θ_i, $i=1,2,\ldots,k,k+1$ will be as follows:

$$\widehat{\theta_i}_{mle} = \frac{n_i}{\sum_{j=1}^{n_i} x_{ij}^{-\beta}} \quad ;\ i=1,2,\ldots,k \quad (5)$$

$$\hat{\theta}_{k+1mle} = \frac{m}{\sum_{t=1}^{m} y_t - \beta} \tag{6}$$

Noted that, $\hat{\theta}_{\iota_{mle}}$ is biased estimator for all i , i=1,2,…,k+1, since $E(\hat{\theta}_{\iota\text{mle}}) \neq \theta_i = \frac{\mathfrak{Z}}{\mathfrak{Z}-1}$

Hence, $\hat{\theta}_{\iota\text{ub}} = \frac{\mathfrak{Z}-1}{\mathfrak{Z}}\hat{\theta}_{\iota_{mle}}$ will be unbiased estimators of θ_i, i=1,2,..,k+1, and $\mathfrak{Z}$ may refers to n_i , i=1,…,k or refer to m .

Also, it is known that the $Var(\hat{\theta}_{i_{ub}}) = \frac{(\theta_i)^2}{\mathfrak{Z}-2}$; $i = 1, \dots, k+1$

By substituting $\hat{\theta}_{\iota\text{mle}}$; i=1,2….,k+1 in equation (4), we get the reliability estimation $\hat{R}_{k_{mle}}$model as bellow:

$$\hat{R}_{k_{mle}} = \frac{\sum_{i=1}^{k} \hat{\theta}_{\iota_{mle}}}{\sum_{i=1}^{k+1} \hat{\theta}_{\iota_{mle}}} \tag{7}$$

2.2. Shrinkage Estimation Method

Thompson in 1968, proposed the problem of shrink a usual estimator $\hat{\theta}$ of the parameter θ to prior information θ_0 using shrinkage weight factor $k(\hat{\alpha})$, such that $0 \leq k(\hat{\alpha}) \leq 1$. He believes that θ_0 is closed to the true value of θ or θ_0 maybe near the true value of θ. Thus, the form of Thompson - Type shrinkage estimator of θ_i say $\hat{\theta}_{i\,sh}$ will be [7].

$$\hat{\theta}_{i\,sh} = k\hat{\theta}_{ub} + (1-k)\theta_0 \tag{8}$$

One of the most important methods of finding the value of k it can be made by minimizing of MSE($\hat{\theta}_{sh}$).[11]

$$\begin{aligned}
MSE(\hat{\theta}_{i\,sh}) &= E(\hat{\theta}_{i\,sh} - \theta)^2 \\
&= E(k_i\hat{\theta}_{i_{ub}} + (1-k_i)\theta_{i_0} - \theta)^2 \\
&= E\big(k_i(\hat{\theta}_{i_{ub}} - \theta_{i_0}) - (\theta - \theta_{i_0})\big)^2 \\
\frac{dMSE(\hat{\theta}_{i\,sh})}{dk_i} &= 2k_iE(\hat{\theta}_{i_{ub}} - \theta_{i_0})^2 - 2(1-k_i)(\hat{\theta}_{i_{ub}} - \theta_{i_0})^2 \\
0 &= 2k_iE(\hat{\theta}_{i_{ub}} - \theta_{i_0})^2 - 2(1-k_i)(\hat{\theta}_{i_{ub}} - \theta_{i_0})^2 \\
0 &= k_iVar(\hat{\theta}_{i_{ub}}) - (\hat{\theta}_{i_{ub}} - \theta_{i_0})^2 + k_i(\hat{\theta}_{i_{ub}} - \theta_{i_0})^2 \\
k_i &= \frac{(\hat{\theta}_{i_{ub}} - \theta_{i_0})^2}{(\hat{\theta}_{i_{ub}} - \theta_{i_0})^2 + var(\hat{\theta}_{i_{ub}})}
\end{aligned} \tag{9}$$

Then, by compensating in an equation (7), we get $\hat{\theta}_{i_{sh}}$ it also comes:

$$\hat{\theta}_{i_{sh}} = \frac{(\hat{\theta}_{i_{ub}} - \theta_{i_0})^2}{(\hat{\theta}_{i_{ub}} - \theta_{i_0})^2 + var(\hat{\theta}_{i_{ub}})}\hat{\theta}_{i_{ub}} + \left(1 - \frac{(\hat{\theta}_{i_{ub}} - \theta_{i_0})^2}{(\hat{\theta}_{i_{ub}} - \theta_{i_0})^2 + var(\hat{\theta}_{i_{ub}})}\right)\theta_{i_0} \text{ ; for i=1,2,....,k+1}$$

Thus, based on equation (4), the reliability estimation of k components parallel system in (S-S) model using shrinkage estimation methods will be:

$$\hat{R}_{k_{sh}} = \frac{\sum_{i=1}^{k} \hat{\theta}_{\iota_{sh}}}{\sum_{i=1}^{k+1} \hat{\theta}_{\iota_{sh}}} \tag{10}$$

2.3. Preliminary Test Single Stage Shrinkage Estimator

The preliminary test single stage shrinkage estimator (SS) introduced in this article as an estimator of the level of significance (Δ) for test the hypotheses H_0: $\theta = \theta_0$ vs. H_1: $\theta \neq \theta_0$ if H_0 accepted we use the shrinkage estimator. However; if H_0 rejected, we choose $\hat{\theta}_{i_{ub}}$, then the form of preliminary test single stage shrinkage estimator as below [8].

$$\hat{\theta}_{i_{ss}} = \begin{cases} \Psi(\hat{\theta}_i)\,\hat{\theta}_{i_{ub}} + \left(1 - \Psi(\hat{\theta}_i)\right)\theta_0 & ,if \;\; H_0 \in R \\ \hat{\theta}_{i_{ub}} & ,if \;\; H_0 \notin R \end{cases} \tag{11}$$

Assume that: $\Psi(\hat{\theta}_i) = e^{-n_i}$ and $\Psi(\hat{\theta}_{k+1}) = e^{-m}$; i=1,…k. (12)

Where, R is the preliminary test region for acceptance of size Δ for testing the hypothesis H_0: θ = θ_0 against the hypothesis H_A: θ ≠ θ_0 using the test statistic $T(\hat{\theta}/\theta) = {2n\theta_0}/{\hat{\theta}_i}$.

$$R = \left[\chi^2_{\frac{\Delta}{2},2n} \leq \frac{2n\theta_0}{\hat{\theta}_i} \leq \chi^2_{1-\frac{\Delta}{2}}\right]$$

where, $\chi^2_{\frac{\Delta}{2},2n}$ and $\chi^2_{1-\frac{\Delta}{2}}$ are respectively the lower and upper 100(Δ/2) percentile point of Chi-square distribution with (2n) degree of freedom [9].

Hence, via equation (4), the reliability estimation of k components parallel system in (S-S) models using single stage shrinkage estimator become:

$$\hat{R}_{k\,ss} = \frac{\sum_{i=1}^{k}\hat{\theta}_{i_{ss}}}{\sum_{i=1}^{k+1}\hat{\theta}_{i_{ss}}} \quad (13)$$

3. Simulation Experiments

In this section, numerical results were studied to compare the performance of the different estimators of reliability using different sample sizes (20, 60 and 100) based on 1000 replication via MSE criteria. For this purpose, Monte Carlo simulation was employed by generating the random sample from the continuous uniform distribution defined on the interval (0,1) as $u_{i1}, u_{i2}, \ldots, u_{in_i}$;i=1,2, and $v_1, v_2, \ldots, v_m$. Transform uniform random samples to follows some distributions special case of n using (c. d. f.) [10,11].

$$F(x_{i_t}) = \left(e^{-x_{i_t}{}^{-\beta}}\right)^{\theta_i}$$

$$U_{i_t} = \left(e^{-x_{i_t}{}^{-\beta}}\right)^{\theta_i}$$

$$x_{it} = -(ln(U_i)^{\frac{1}{\theta_i}})^{-\frac{1}{\beta}}, \text{ i=1,2}$$

And, by the same method, we get y_j, $y_j = -(ln(V_j)^{\frac{1}{\theta_{k+1}}})^{-\frac{1}{\beta}}$

The following steps, Compute the real value of R_k in equation (4) and the value of estimation methods of all proposal methods $\hat{R}_{k_{mle}}$, $\hat{R}_{k_{sh}}$, $\hat{R}_{kss}$ in equations (6), (10), and (13) respectively.

Based on (L=1000) replication, we calculate the MSE for all proposed estimation methods of $\hat{R}_k$ as follows:

$$MSE = \frac{1}{L}\sum_{i=1}^{L}\left(\hat{R}_{k_i} - R_k\right)^2$$

At this instant, the estimation of reliability parallel system of stress- strength model for some different assumption parameters $of\ \theta_1, \theta_2, \theta_3$and $\beta = 4$ through the following tables:

Table1.Values of the $\hat{R}_k$when $R_k = 0.700000000$, $\theta_1 = 1, \theta_2 = 2.5, \theta_3 = 1.5$ and $\beta = 4$.

4. Results Analysis

From the tables above, for all n_1= (20,60,100), n_2= (20,60,100) and m=(20,60,100), we conclude that when Δ=0.05 ,the minimum (MSE) for $\hat{R}$kss held using single stage shrinkage estimator (SS) so it is the best for all $n_i, i = 1,2$ and m, follow by the shrinkage methods using $\hat{R}$ksh and finally by the Maximum

Likelihood estimator $\hat{R}$kMLE , but in case, when $(n_1, n_2, m) = (20,20,60), (20,20,100), (60,60,100)$ and $(\theta_1, \theta_2, \theta_3) = (1,2.5,1.5)$, $(2.5,1.5,1)$ and $(3,2,1.5)$ seen that the second best methods using Maximum Likelihood estimator and follows the shrinkage methods and seen that the MSE for the preliminary test single stage shrinkage estimator (SS) is equal for all n_1, n_2 and m , when we used $K = e^{-n_i}$.

5. Conclusion

The simulation results exhibited that, the preliminary test single stage shrinkage estimator (SS) is the best way. Then the resulting estimator $\hat{R}_{k_{SS}}$ perform well and will be the best estimator than the other in the sense of MSE, and the shrinkage estimator using in this paper near on the Maximum Likelihood estimator.

Abstract. The goal of this article is to give the concepts of Regular space and Normal space in the topological graph space also generalize α and β that to Regular space and Normal space where the relationship between these concepts were given. Finally, some characteristics of these concepts were investigated.

1. Introduction

Graph theory [3] is one of the fundamental topics of modern mathematics. This theory is also used in most branches of knowledge, as it has applications and uses of great benefits in topics of scientific and economic importance such as game theory, mathematical programming, connection theory and electrical networks in addition to its use in physics, organic chemistry, economics, civil engineering, biology and many other fields.

Kosterlitz [5] given the relationship between graph theory and topology. The topology is created by graph theory and the study of topological properties in graph theory. Some researchers make the relationship only on the vertices of the graph, while others make it on the edges. But the process is to create a schematic diagram of a particular topology that was not interested before ([6] and [8].

2. Preliminaries

Definition 2.1 [3]: A graph H is a set $l \neq \emptyset$ of elements called vertices graph with a family L from unarranged pairs of vertices a graph is called an edge. It is called set vertices graph l(H) and family edge m(H) and We express a graph of ordered pairs H(l, M).

Definition 2.2 [7]: A directed graph or digraph D as set w that is non-empty of elements called vertices I and edges M with a family of ordered pairs of vertices denoted by (l, M).
A directed graph is expressed as an ordered pair (l, D) and denoted set vertices l(D) and family directed edge M(D).

Definition 2.3 [6]:
Let H(l, m) be a graph, we call K is a sub graph from H and can write by $K \subseteq H$ if

$l(K) \subseteq l(H), m(K) \subseteq m(H)$. The spanning sub graph from a graph is a sub graph acquired by edge deletions only.

Definition 2.4 [4]: A topological space (S,σ) is called regular space if for every non-empty closed set F and a point m which does not belong to F, there are open sets U_1, U_2 s.t. $m \in U_1$ $F \notin U_2$ and $U_1 \cap U_2 = \emptyset$.

Definition 2.5 [4]: A topological space (S,σ) is called normal space iff for every non-empty closed set F_1 , F_2 , there is a pair U_1, U_2 of open set s.t. $F_1 \subseteq U_1$ $F_2 \subseteq U_2$ and $U_1 \cap U_2 = \emptyset$.

Definition 2.6: A subset K of a space S is called:
(4) α-open [2] if K ⊆int(cl(int(K))).
(5) β-open [9] if K ⊆cl(int(cl(K))).

Definition 2.7[1]: Let (L, H) be a graph, $l \in L(H)$ then we define the post stage is the set of all vertices which is not a neighborhood of l. QH is the collection of (lR) is called sub basis of graph $B_H = \cap^{n}_{j=1} QH_j$ is called bases of the graph. Then the union of $B_H$is form a topology on H and $(L(H), \sigma_H)$ is called a topological graph.

Example 2.8[1]: Let (L, H) be a graph, We'll create a topology via graph as follows:
$l_1(H) = \{l_1, l_2\}, l_2(H) = \{l_3, l_4\}, l_3(H) = \{l_1\}, l_4(H) = \{l_2\}, l_5(H) = \{l_2, l_5\}$. Then a subbase is a topology is $S_H = \{\{l_1, l_2\}, \{l_3, l_4\}, \{l_1\}, \{l_2\}, \{l_2, l_5\}\}$. The base is $B_H = \{L(H), \emptyset, \{l_1, l_2\}, \{l_3, l_4\}, \{l_3\}, \{l_1\}, \{l_2\}, \{l_2, l_5\}\}$. Therefore, the topological graph of H is $\sigma_H = \{L(H), \emptyset, \{l_1, l_2\}, \{l_3, l_4\}, \{l_3\}, \{l_1\}, \{l_2\}, \{l_2, l_5\}, \{l_1, l_3\}, \{l_1, l_2, l_3, l_4\}, \{l_1, l_2, l_3\}, \{l_1, l_3, l_4\}, , \{l_2, l_3, l_4\}, \{l_1, l_2, l_5\}, \{l_3, l_2, l_5\}, \{l_3, l_4, l_2, l_5\}\}$

3- Regular and Normal Space on Topological Graph Space

In this section, we give new definitions of Regular and Normal space on topological graph space with relation among them.

Definition 3.1: A topological graph $(L(H), \sigma_H)$ is called H-Regular space if for any vertices l from L(H) and F is closed set vertices s.t, $l \notin F$, there exist post two stages from any vertices U_1, U_2 s.t. $l \in U_1$ $F \notin U_2$ and $U_1 \cap U_2 = \emptyset$.

Definition 3.2: A topological graph $(L(H), \sigma_H)$ is called H-Normal space if for any two closed vertices F_1, F_2 from L(H), there exists two post stage from any vertices U_1, U_2 s.t. $F_1 \in U_1$ $F_2 \notin U_2$ and $U_1 \cap U_2 = \emptyset$.

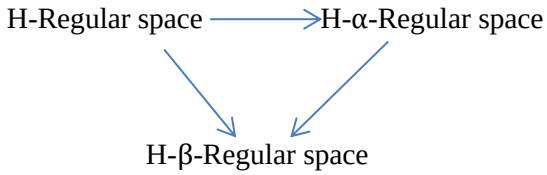
Definition 3.3: A topological graph $(L(H), \sigma_H)$ is called H-α-Regular space if for any vertices l from L(H) and F is α-closed vertices s.t, $l \notin F$, there exist α-post two stages from any vertices U_1, U_2 s.t. $l \in U_1$ $F \notin U_2$ and $U_1 \cap U_2 = \emptyset$.

Definition 3.4: A topological graph $(L(H), \sigma_H)$ is called H-β-Regular space if for any vertices l from L(H) and F is is β-closed set vertices s.t, $l \notin F$, there exist two β-post stage from any vertices U_1, U_2 s.t. $l \in U_1$ $F \notin U_2$ and $U_1 \cap U_2 = \emptyset$.

Definition 3.5: A topological graph $(L(H), \sigma_H)$ is called H-α-Normal space if for any two α-closed vertices F_1, F_2 there exist two α-post stage from any vertices U_1, U_2 s.t. $F_1 \in U_1$ $F_2 \notin U_2$ and $U_1 \cap U_2 = \emptyset$.

Definition 3.6: A topological graph $(L(H), \sigma_H)$ is called H-β-Normal space if for any two β-closed vertices F_1, F_2 , there exist two β-post stage from any vertices U_1, U_2 s.t. $F_1 \in U_1$ $F_2 \notin U_2$ and $U_1 \cap U_2 = \emptyset$.

Theorem 3.7. Let $(L(H), \sigma_H)$ be a topological graph space. Then L(H) is satisfied following:

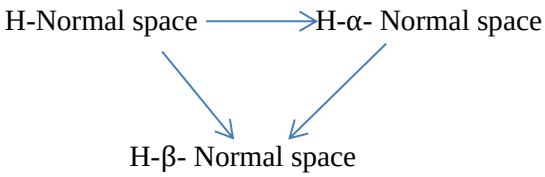


Proof: H-regular space $\Longrightarrow$ H-α-Regular space: Let $(L(H), \sigma_H)$ be H-Regular space and let each of l is vertices and F is closed vertices s.t, $l \notin F$, since $(L(H), \sigma_H)$ be H-Regular space, then F is α-closed vertices (every closed vertices are α-closed vertices). Thus, there exist α-post two stages from any α vertices U_1, U_2 s.t. $l \in U_1$ $F \notin U_2$ and $U_1 \cap U_2 = \emptyset$. Therefore $(L(H), \sigma_H)$ is H-α-Regular space.
H-regular space $\Longrightarrow$ H-β-Regular space: It is clear.
H-regular space $\Longrightarrow$ H-β-Regular space: Let $(L(H), \sigma_H)$ be H-α-Regular space and let each of l is vertices and F is α-closed vertices s.t, $l \notin F$, since $(L(H), \sigma_H)$ be H-α-Regular space, then F is β-closed vertices (every α - closed vertices is β-closed vertices). Thus, there exist β-post two stages from any β vertices U_1, U_2 s.t. $l \in U_1$ $F \notin U_2$ and $U_1 \cap U_2 = \emptyset$. Therefore $(L(H), \sigma_H)$ is H-β-Regular space.

Example 3.8: Let $(L(H), \sigma_H)$ be a topological graph space. We'll create a topology via a graph.
We take $l_1(H) = \{l_1, l_2\}, l_2(H) = \{l_3, l_4\}, l_3(H) = \{l_1\}, l_4(H) = \{l_2\}, l_5(H) = \{l_2, l_3\}$.
Then a subbase is a topology is $S_H = \{\{l_1, l_2\}, \{l_3, l_4\}, \{l_1\}, \{l_2\}, \{l_2, l_3\}\}$. The base is $B_H = \{L(H), \emptyset, \{l_1, l_2\}, \{l_3, l_4\}, \{l_3\}, \{l_1\}, \{l_2\}, \{l_2, l_3\}\}$. Therefore, the topological graph on H is $\sigma_H = \{L(H), \emptyset, \{l_1, l_2\}, \{l_3, l_4\}, \{l_3\}, \{l_1\}, \{l_2\}, \{l_2, l_3\}, \{l_1, l_3\}, \{l_1, l_2, l_3, l_4\}, \{l_1, l_2, l_3\}, \{l_1, l_3, l_4\}, , \{l_2, l_3, l_4\}, \}$.
Then $(L(H), \sigma_H)$ is H-α-Regular space, but $(L(H), \sigma_H)$ is not H-Regular space, because there is not exist disjoint post two stages for any vertices and closed set vertices in this graph.

Example 3.9: Let $(L(H), \sigma_H)$ be a topological graph space We'll create a topology via a graph.
We take $l_1(H) = \{l_1, l_2\}, l_2(H) = \{l_3, l_4\}$. Then a sub base is a topology is $S_H = \{\{l_1, l_2\}, \{l_3, l_2\}\}$. The base is $B_H = \{L(H), \emptyset, \{l_1, l_2\}, \{l_3, l_4\}, \{l_2\}\}$. Therefore, the topological graph on H is $\sigma_H = \{L(H), \emptyset, \{l_1, l_2\}, \{l_3, l_4\}, \{l_2\}, \{l_2, l_3, l_4\}\}$.
Then $(L(H), \sigma_H)$ is H-β-Regular space, but $(L(H), \sigma_H)$ is not H- α-Regular space, because there is not exist disjoint post two stages for any vertices and α-closed set vertices in this graph. Also $(L(H), \sigma_H)$ is not H-Regular space, because there is not exist disjoint post two stages for any vertices and closed set vertices in this graph.

Proposition 3.10. Let $(L(H), \sigma_H)$ be a topological graph space. Then L(H) is satisfied the following:



Proof: H-Normal space $\Longrightarrow$ H-α- Normal space: Let $(L(H),\sigma_H)$ be H-normal space and let and two αclosed vertices F_1, F_2 , since $(L(H),\sigma_H)$ then F is α-closed vertices (every closed vertices are α-closed vertices). Thus, there exist α-post two stages from any vertices U_1, U_2 s.t. $F_1 \in U_1$ $F_2 \notin U_2$ and $U_1 \cap U_2 = \emptyset$. Therefore $(L(H),\sigma_H)$ is H-α-Normal space.
H-Normal space $\Longrightarrow$ H-β-Normal space: it is same above.
H- α-Normal space $\Longrightarrow$ H-β-Normal space: it is same above.

Example 3.11: Let $(L(H),\sigma_H)$ be a topological graph space. We'll create a topology via a graph. We take

$$l_1(H) = \{l_1\}, l_2(H) = \{l_2, l_4\}, l_3(H) = \{l_3\}, l_4(H) = \{l_4\}.$$

Then a subbase is a topology is $S_H = \{\{l_2, l_4\}, \{l_1, l_3\}, \{l_3\}, \{l_4\}\}$. The base is $B_H = \{L(H), \emptyset, \{l_2, l_4\}, \{l_1, l_3\}, \{l_3\}, \{l_4\}\}$. Therefore, the topological graph on H is $\sigma_H = \{L(H), \emptyset, \{l_2, l_4\}, \{l_1, l_3\}, \{l_3\}, \{l_4\}, \{l_1, l_3, l_4\}, \{l_2, l_3, l_4\}, \{l_3, l_4\}\}$.
Then $(L(H),\sigma_H)$ is H-αnormal space, but $(L(H),\sigma_H)$ is not H- normal space, because there is not exist disjoint post two stages contain two closed vertices for any two vertices in this graph.

Example 3.12: Let $(L(H),\sigma_H)$ be a topological graph space . We'll create a topology via a graph.
We take $l_1(H) = \{l_1\}, l_2(H) = \{l_2, l_4\}, l_3(H) = \{l_1, l_3\}$.Then a sub base is a topology
$S_H = \{\{l_1\}, \{l_2, l_4\}, \{l_2, l_3\}\}$. The base is $B_H = \{L(H), \emptyset, \{l_1\}, \{l_2, l_4\}, \{l_2, l_3\}, \{l_2\}\}$.
Therefore, the topological graph on L(H) is $\sigma_H = \{L(H), \emptyset, \{l_1\}, \{l_2, l_4\}, \{l_2, l_3\}, \{l_2\}, \{l_1, l_2, l_4\}, \{l_1, l_2, l_3\}, \{l_1, l_2\}, \{l_2, l_3, l_4\}\}$.
Then $(L(H),\sigma_H)$ is H- β-Normal space, but $(L(H),\sigma_H)$ is not H- α-Normal space, because there is not exist disjoint post two stages contain two β-closed vertices for two α-vertices in this graph.

Remark 3.13. The relation between H-Normal space with H-Regular space (H-α-Normal space with H-α-Regular space, and H-β-Normal space with H-β-Regular space) are independent relations. We show this following:
1- Recall Example 3.8.We see that $(L(H),\sigma_H)$ is H-α-Regular space, but it is not H-α-Normal space.
2- Recall Example 3.11.We see that $(L(H),\sigma_H)$ is H- β-Regular space, but it is not H-β-Normal space.
3- Recall Example 3.8.We see that $(L(H),\sigma_H)$ is H- H-α-Normal space, but it is not H-α-Regular space.
4- Recall Example 3.8.We see that $(L(H),\sigma_H)$ is H- β-Normal space, but it is not H-β-Regular space.

Example 3.14: Let $(L(H),\sigma_H)$ be a topological graph space. We'll create a topology via a graph.
We take $l_1(H) = \{l_1\}, l_2(H) = \{l_2, l_3\}$. Then a sub base is a topology is
$S_H = \{\{l_1\}, \{l_2, l_3\}\}$. The base is $B_H = \{L(H), \emptyset, \{l_1\}, \{l_2, l_3\}\}$. Therefore, the topological graph on L(H) is $\sigma_H = \{L(H), \emptyset, \{l_1\}, \{l_2, l_3\}\}$. Then $(L(H),\sigma_H)$ is H-Normal space, but $(L(H),\sigma_H)$ is not H-Regular space, because there is not exist disjoint post two stages for any two α-vertices in this graph.

Example 3.15: Let $(L(H),\sigma_H)$ be a topological graph space. We'll create a topology via a graph.
We take $l_1(H) = \{l_2\}, l_2(H) = \{l_2, l_3\}, l_2(H) = \{l_3\}$.
Then a sub base is a topology is $S_H = \{\{l_2\}\{l_2, l_3\}, \{l_3\}\}$. The base is $B_H = \{L(H), \emptyset, \{l_2\}, \{l_2, l_3\}, \{l_3\}\}$.
Therefore, the topological graph on L(H) is $\sigma_H = \{L(H), \emptyset, \{l_2\}\{l_2, l_3\}, \{l_3\}\}$. Then $(L(H),\sigma_H)$ is H-

regular space, but $(L(H), \sigma_H)$ is not H- normal space, because there is not exist disjoint post two stages for any two α-vertices contain two closed vertices in this graph.

4-Some Properties of Regular and Normal Space on Topological Graph

In the section, we introduce some properties of Regular and Normal Space on Topological Graph. We start by the following proposition:

Proposition 4.1. Let $(L(H), \sigma_H)$ be a topological graph space. Then the following are equivalents:
1) L(H) is H-Regular space.
2) For each $l \in l(H)$, F is closed a post stage and $F \subseteq M(F)$, there exists a post stage K s.t, $l \in l(H) \subseteq cl_H(l(H)) \subseteq M(F)$.

Proof: (1) $\Longrightarrow$ (2) Assume that L(H) is H-Regular space, F is closed a post stage and $l \in M(F)$, then there exists a post stage K s.t, $l \in l(H) \subseteq cl_H(l(H))$,so that $M\left(cl_H(l(H))\right)$ and $cl_H(l(H)) \subseteq M(F)$. Thus $l \in l(H) \subseteq cl_H(l(H)) \subseteq M(F)$.
(2) $\Longrightarrow$ (1) Assume that F is closed a post stage, $l \in M(F)$, so that there exists a post stage K s.t. $l \in l(H) \subseteq cl_H(l(H)) \subseteq M(F)$. Thus $l \in l(H) \subseteq cl_H(l(H)) \subseteq M(F)$, so $F \subseteq M\left(cl_H(l(H))\right)$ which is a disjoint post stage. Thus L(H) is H-Regular space.

Remark 4.2. The converse of above Proposition is not true. The following example shows that the opposite of the above theorem is incorrect.

Example 4.3. Let (L, H) be a graph, We'll create a topology via graph as follows:
$l_1(H) = \{l_1\}, l_2(H) = \{l_3\}, l_3(H) = \{l_2\}$. Then a sub base is a topology is
$S_H = \{\{l_1\}, \{l_3\}, \{l_2\}\}$. The base is $B_H = \{L(H), \emptyset, \{l_1, l_2\}, \{l_1, l_3\}, \{l_3, l_2\}, \{l_3\}, \{l_1\}, \{l_2\}\}$. Therefore, the topological graph on H is $\sigma_H = \{L(H), \emptyset, \{l_1, l_2\}, \{l_1, l_3\}, \{l_3, l_2\}, \{l_3\}, \{l_1\}, \{l_2\}\}$
Then $\{l_1, l_2\}$ is closed a post stage and $\{l_1, l_2\} \subseteq M(\{l_1, l_2\})$, there exists a post stage K s.t, $\{l_1, l_2\} \in l(H) \subseteq cl_H(\{l_1, l_2\}) \subseteq M(\{l_1, l_2\})$, but L(H) is not H-Regular space.

Proposition 4.4. Let $(L(H), \sigma_H)$ be a topological graph space. Then the following are equivalents:
1) L(H) is H-α-Regular space.
2) For each $l \in l(H)$, F is α-closed a post stage and $F \subseteq M(F)$, there exists a post stage αK s.t. $l \in l(H) \subseteq \alpha cl_H(l(H)) \subseteq M(F)$.

Proof: it is obvious.

Remark 4.5 the converse of above Proposition is not true. The following example shows that the opposite of the above theorem is incorrect.

Example 4.6: Recall Example 3.3. Then $\{l_1\}$ is α-closed a post stage and $\{l_1\} \subseteq M(\{l_1\})$, there exists a post stage K s.t, $\{l_1\} \in l(H) \subseteq cl_H(\{l_1\}) \subseteq M(\{l_1\})$, but L(H) is not H-α-Regular space.

Proposition 4.7. Let $(L(H), \sigma_H)$ be a topological graph space. Then the following are equivalents:
1) L(H) is H- β regular space.
2) For each $l \in l(H)$, F is β -closed a post stage and $F \subseteq M(F)$, there exists a post stage βK s.t, $l \in l(H) \subseteq \beta cl_H(l(H)) \subseteq M(F)$.

Proof: it is obvious.

Remark 4.8 the converse of above Proposition is not true. The following example shows that the opposite of the above theorem is incorrect.

Example 4.9: Recall Example 3.3. Then $\{l_1, l_3\}$ is β-closed a post stage and $\{l_1, l_3\} \subseteq M(\{l_1, l_3\})$, there exists a post stage K s.t, $\{l_1, l_3\} \in l(H) \subseteq cl_H(\{\{l_1, l_3\}\}) \subseteq M(\{\{l_1, l_3\}\})$, but L(H) is not H-β-Regular space.

Proposition 4.10. Let $(L(H), \sigma_H)$ be H-Regular topological graph space and $l_1, l_2 \in l(H), l_1 = l_2$. Then $cl_H(l_1) = cl_H(l_2)$.

Proof: Assume that $(L(H), \sigma_H)$ be H-Regular and $l_1, l_2 \in l(H), l_1 = l_2$. Suppose that $cl_H(l_1) \neq cl_H(l_2)$. Then $l_1 \notin cl_H(l_2)$ and $l_2 \notin cl_H(l_1)$, since $l_1 \notin cl_H(l_2)$
then there exists a post K s.t, $cl_H(l_1) \subseteq K$, so $l_1 \in M(cl_H(l_2))$ and $l_1 \in M(K)$,
which is a closed post stage. So $cl_H(l_1) \subseteq M(K)$. Thus$cl_H(l_1) = cl_H(l_2)$.

Proposition 4.11. Let $(L(H), \sigma_H)$ be H- α-Regular topological graph space and $l_1, l_2 \in l(H), l_1 = l_2$. Then $\alpha cl_H(l_1) = \alpha cl_H(l_2)$.

Proof: it is clear.

Proposition 4.12. Let $(L(H), \sigma_H)$ be H- β-Regular topological graph space and $l_1, l_2 \in l(H), l_1 = l_2$. Then $\beta cl_H(l_1) = \beta cl_H(l_2)$.

Proof: it is clear.

Proposition 4.13. Let $(L(H), \sigma_H)$ be a topological graph space. Then the following are equivalents:
1) L(H) is H-Normal space.
2) For each $l \in l(H)$, F is closed a post stage and $F \subseteq M(F)$, there exists a post stage K s.t, $l \in l(H) \supseteq int_H(l(H)) \subseteq M(F)$.

Proof: (1) $\Longrightarrow$ (2) Assume that L(H) is H-Regular space, F is closed a post stage and
$l \in M(F)$, then there exists a post stage K s.t, $l \in l(H) \supseteq int_H(l(H))$, so that
$M\left(int_H(l(H))\right)$ and $int_H(l(H)) \subseteq M(F)$. Thus $l \in l(H) \supseteq int_H(l(H)) \subseteq M(F)$.
(2) $\Longrightarrow$ (1) Assume that F is closed a post stage, $l \in M(F)$,so that there exists a post stage K s.t, $l \in l(H) \supseteq int_H(l(H)) \subseteq M(F)$ .Thus $l \in l(H) \supseteq int_H(l(H)) \subseteq M(F)$, so $F \subseteq M\left(int_H(l(H))\right)$ which is a disjoint post stage.Thus L(H) is H-Normal space.

Remark 4.14 the converse of above Proposition is not true. The following example shows that the opposite of the above theorem is incorrect.

Example 4.15: Recall Example 3.15. Then $\{l_1\}$ is closed a post stage and $\{l_1\} \subseteq M(\{l_1\})$, there exists a post stage K s.t, $\{l_1\} \in l(H) \subseteq cl_H(\{\{l_1\}\}) \subseteq M(\{\{l_1\}\})$, but L(H) is not H- Normal space.

Proposition 3.16. Let $(L(H), \sigma_H)$ be a topological graph space. Then the following are equivalents:
1) L(H) is H-α-Normal space.
2) For each $l \in l(H)$, F is α-closed a post stage and $F \subseteq M(F)$, there exists a post stage αK s.t, $l \in l(H) \supseteq \alpha int_H(l(H)) \subseteq M(F)$.

Proof: it is obvious.

Remark 4.17 the converse of above Proposition is not true. The following example shows that the opposite of the above theorem is incorrect.

Example 4.18: Recall Example 3.8. Then $\{l_2\}$ is α-closed a post stage and $\{l_2\} \subseteq M(\{l_2\})$, there exists a post stage K s.t, $\{l_2\} \in l(H) \subseteq cl_H(\{\{l_2\}\}) \subseteq M(\{\{l_2\}\})$, but L(H) is not H-α-Regular space.

Proposition 4.19. Let $(L(H), \sigma_H)$ be a topological graph space. Then the following are equivalents:
1) L(H) is H- β-Normal space.
2) For each $l \in l(H)$, F is β-closed a post stage and $F \subseteq M(F)$, there exists a post stage βK s.t. $l \in l(H) \supseteq \beta\, int_H(l(H)) \subseteq M(F)$.

Proof: it is obvious.

Remark 4.20 the converse of above Proposition is not true. The following example shows that the opposite of the above theorem is incorrect.

Example 4.21: Recall Example 3.11. Then $\{l_1, l_2\}$ is β-closed a post stage and $\{l_1, l_2\} \subseteq M(\{l_1, l_2\})$, there exists a post stage K s.t. $\{l_1, l_2\} \in l(H) \subseteq cl_H(\{\{l_1, l_2\}\}) \subseteq M(\{\{l_1, l_2\}\})$, but L(H) is not H-β-Regular space.

Proposition 4.22. Let $(L(H), \sigma_H)$ be H- normal topological graph space and $l_1, l_2 \in l(H), l_1 = l_2$. Then $int_H(l_1) = int_H(l_2)$.

Proof: Assume that $(L(H), \sigma_H)$ be H-Normal and $l_1, l_2 \in l(H), l_1 = l_2$. Suppose that $int_H(l_1) \neq int_H(l_2)$.Then $l_1 \notin int_H(l_2)$ and $l_2 \notin int_H(l_1)$, since $l_1 \notin int_H(l_2)$
then there exists a post K s.t, $int_H(l_1) \supseteq K$, so $l_1 \in M(int_H(l_2))$ and $l_1 \in M(K)$,
which is a closed post stage. So $int_H(l_1) \supseteq M(K)$. Thus $int_H(l_1) = int_H(l_2)$.

Proposition 4.23. Let $(L(H), \sigma_H)$ be H- α-Normal topological graph space and $l_1, l_2 \in l(H), l_1 = l_2$. Then $\alpha int_H(l_1) = \alpha int_H(l_2)$.

Proof: it is clear.

Proposition 4.24. Let $(L(H), \sigma_H)$ be H- β-Normal topological graph space and $l_1, l_2 \in l(H), l_1 = l_2$. Then $\beta int_H(l_1) = \beta int_H(l_2)$.

Proof: it is clear.

5. Conclusion

The regular space and the normal space were generalized to the space of the topological graph statement, as well as the α and β were generalized to both spaces, and we studied the relationships among these generalizations and gave us opposite examples of cases in which the opposite is not valid. We also obtained cases for all these generalizations.

Abstract. The concepts 𝔾-g-closedness and 𝔾-g-openness were used to popularize presented modern classes of separation axioms in grill topological spaces. Many relationships between multiple kinds of these classes are summarized, too.

1. Introduction

A nonempty collection 𝔾 of nonempty subsets of a topological space 𝕏 is named a Grill if

i. $\mathcal{A} \in \mathbb{G}$ and $\mathcal{A} \subseteq \mathcal{B} \subseteq \mathbb{X}$ then $\mathcal{B} \in \mathbb{G}$

ii. $\mathcal{A}, \mathcal{B} \subseteq \mathbb{X}$ and $\mathcal{A} \cup \mathcal{B} \in \mathbb{G}$ then $\mathcal{A} \in \mathbb{G}$ *or* $\mathcal{B} \in \mathbb{G}$ [1]. Let 𝕏 be a nonempty set. Then the following families are grills on 𝕏. [1-3]

- $\{\emptyset\}$ and $P(\mathbb{X})\backslash\{\emptyset\}$ are trivial examples of grills on 𝕏.
- $\mathbb{G}_{\infty}$ the grill of all infinite subsets of 𝕏.
- $\mathbb{G}_{co}$ the grill of all uncountable subsets of 𝕏.
- $\mathbb{G}_p = \{ \Lambda : \Lambda \in P(\mathbb{X}), p \in \Lambda \}$ is a specific point grills on 𝕏.
- $\mathbb{G}_{\mathcal{A}} = \{ \mathcal{B} : \mathcal{B} \in P(\mathbb{X}), \mathcal{B} \cap \mathcal{A}^c \neq \emptyset \}$, and

If $(\mathbb{X},\mathfrak{t})$ is a topological space, then the family of all non-nowhere dense subsets called $\mathbb{G}_{\varsigma} = \{ \mathcal{A} \subseteq \mathbb{X} : \mathrm{int}_{\mathfrak{t}}\, \mathrm{cl}_{\mathfrak{t}}(\mathcal{A}) \neq \emptyset \}$. Is the one of kinds of grill on 𝕏.

Let 𝔾 be a grill on a topological space$(\mathbb{X},\mathfrak{t})$. The operator $\varphi: P(\mathbb{X}) \to P(\mathbb{X})$ was defined by $\varphi(\mathcal{A}) = \{x \in \mathbb{X} \setminus U \cap \mathcal{A} \in \mathbb{G}$, for all $U \in \mathfrak{t}(x)\}$, $\mathfrak{t}(x)$ denotes the neighborhood of x. A mapping $\Psi: P(\mathbb{X}) \to P(\mathbb{X})$ is defined as $\Psi(\mathcal{A}) = \mathcal{A} \cup \varphi(\mathcal{A})$ for all $\mathcal{A} \in P(\mathbb{X})$ [4-6].

The map Ψ satisfies Kuratowski closure axioms: [3,4]

(i) $\Psi(\emptyset) = \emptyset$,
(ii) If $\mathcal{A} \subseteq \mathcal{B}$, then $\Psi(\mathcal{A}) \subseteq \Psi(\mathcal{B})$,
(iii) If $\mathcal{A} \subseteq \mathbb{X}$, then $\Psi(\Psi(\mathcal{A})) = \Psi(\mathcal{A})$,
(iv) If $\mathcal{A}, \mathcal{B} \subseteq \mathbb{X}$, then $\Psi(\mathcal{A} \cup \mathcal{B}) = \Psi(\mathcal{A}) \cup \Psi(\mathcal{B})$.

In this research, we presented 𝔾-g-closed set and it is complement 𝔾-g-open set some notions have been presented by new kinds of separation axioms like: 𝔾-g-$\mathbb{T}_0$-space, 𝔾-g-$\mathbb{T}_1$-space, 𝔾-g-$\mathbb{T}_2$-space. ■

2. Separation Axioms with Grill-Topological Open Set

Definition 2. 1: In grill topological space $(\mathbb{X}, \mathbb{t}, \mathbb{G})$, let $\mathbb{D} \subseteq \mathbb{X}$. $\mathbb{D}$ is said to be grill-g-closed set denoted by "$\mathbb{G}$-g-closed", if $(\mathbb{D} - \mathbb{U}) \notin \mathbb{G}$ then, $(cl(\mathbb{D}) - \mathbb{U}) \notin \mathbb{G}$ where every, $\mathbb{U} \subseteq \mathbb{X}$ and $\mathbb{U} \in \mathbb{t}$.
Now, D^c is a grill-g-open set denoted by "$\mathbb{G}$-g-open" .The family of all "$\mathbb{G}$-g-closed" sets denoted by $\mathbb{G}\mathbf{g}C(\mathbb{X})$. The family of all "$\mathbb{G}$-g-open" sets denoted by $\mathbb{G}\mathbf{g}O(\mathbb{X})$.

Example 2. 2: Consider the space $(\mathbb{X}, \mathbb{t}, \mathbb{G})$, where $\mathbb{X} = \{ \mathbb{f}_1, \mathbb{f}_2, \mathbb{f}_3\}$, $\mathbb{t} = \{\mathbb{X}, \emptyset, \{ \mathbb{f}_1\}, \{ \mathbb{f}_2\}, \{ \mathbb{f}_1, \mathbb{f}_2\}\}$, and $\mathbb{G} = \{\mathbb{X}, \{ \mathbb{f}_1\}, \{ \mathbb{f}_1, \mathbb{f}_2\}, \{ \mathbb{f}_1, \mathbb{f}_3\}\}$. So,
$P(\mathbb{X}) = \{ \mathbb{X}, \emptyset, \{ \mathbb{f}_1\}, \{ \mathbb{f}_2\}, \{ \mathbb{f}_3\}, \{ \mathbb{f}_1, \mathbb{f}_2\}, \{ \mathbb{f}_1, \mathbb{f}_3\}, \{ \mathbb{f}_2, \mathbb{f}_3\}\}$
$\mathbb{G}gC(\mathbb{X}) = \{ \mathbb{X}, \emptyset, \{ \mathbb{f}_1\}, \{ \mathbb{f}_2\}, \{ \mathbb{f}_3\}, \{ \mathbb{f}_1, \mathbb{f}_2\}, \{ \mathbb{f}_1, \mathbb{f}_3\}, \{ \mathbb{f}_2, \mathbb{f}_3\}\}$, $\mathbb{G}gO(\mathbb{X}) = \{ \mathbb{X}, \emptyset, \{ \mathbb{f}_1\}, \{ \mathbb{f}_2\}, \{ \mathbb{f}_3\}, \{ \mathbb{f}_1, \mathbb{f}_2\}, \{ \mathbb{f}_1, \mathbb{f}_3\}, \{ \mathbb{f}_2, \mathbb{f}_3\}\}$.

Remark 2. 3: For any $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ then
i. Every closed set is a $\mathbb{G}$-g-closed set.
ii. Every open set is a $\mathbb{G}$-g-open set.
The converse of Remark 2. 3 is not true. See Example 2. 2.
$\{\mathbb{f}_1\}$ is a $\mathbb{G}$-g-closed set, but $\{\mathbb{f}_1\}$ is not closed set.
$\{\mathbb{f}_1, \mathbb{f}_3\}$ is a $\mathbb{G}$-g-open set, but $\{\mathbb{f}_1, \mathbb{f}_3\}$ is not open set.

Definition 2. 4: The space $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ is a $\mathbb{G}$-g-$\mathbb{T}_0$-space shortly "$\mathbb{G}g$-$\mathbb{T}_0$-space" if for each $\mathbb{m} \neq \mathbb{n}$ and $\mathbb{m}, \mathbb{n} \in \mathbb{X}$, there exist $\mathbb{U} \in \mathbb{G}g\text{-}o(\mathbb{X})$ whenever, $\mathbb{m} \in \mathbb{U}$ and $\mathbb{n} \notin \mathbb{U}$ or $\mathbb{m} \notin \mathbb{U}$ and $\mathbb{n} \in \mathbb{U}$.

Example 2. 5: Consider the space $(\mathbb{X}, \mathbb{t}, \mathbb{G})$, where $\mathbb{X} = \{ \mathbb{f}_1, \mathbb{f}_2 \}$, $\mathbb{t} = \{\mathbb{X}, \emptyset, \{ \mathbb{f}_1\}\}$ and $\mathbb{G} = \{\mathbb{X}, \{ \mathbb{f}_2\}\}$. $\mathbb{G}gC(\mathbb{X}) = \{ \mathbb{X}, \emptyset, \{ \mathbb{f}_2\}\}$, $\mathbb{G}gO(\mathbb{X}) = \{ \mathbb{X}, \emptyset, \{ \mathbb{f}_1\}\}$. Hence $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ is a $\mathbb{G}g$-$\mathbb{T}_0$-space.

Proposition 2. 6: If $(\mathbb{X}, \mathbb{t})$ is a $\mathbb{T}_0$-space then $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ is a $\mathbb{G}g$-$\mathbb{T}_0$-space.
Proof: By Remark 2. 3. (ii).For each $\mathbb{U} \in \mathbb{t}$, then $\mathbb{U}$ is a $\mathbb{G}g$-open set ,so the proof is over.

Definition 2. 7: The space $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ is a $\mathbb{G}$-g-$\mathbb{T}_1$-space shortly "$\mathbb{G}g$-$\mathbb{T}_1$-space" if for each $\mathbb{m}, \mathbb{n} \in \mathbb{X}$ and $\mathbb{m} \neq \mathbb{n}$. Then there are $\mathbb{G}g$-open sets $\mathbb{U}_1, \mathbb{U}_2$ whenever $\mathbb{m} \in \mathbb{U}_1$, $\mathbb{n} \notin \mathbb{U}_1$ and $\mathbb{n} \in \mathbb{U}_2$, $\mathbb{m} \notin \mathbb{U}_2$.

Example 2. 8: A space $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ when $\mathbb{X} = \mathbb{N}$, where $\mathbb{N}$ is the set of all natural numbers, $\mathbb{t} = \mathbb{t}_{cof} = \{ \mathbb{U} \subseteq \mathbb{N}, \mathbb{U}^c$ is a finite set$\} \cup \emptyset$ *and* $\mathbb{G} = P(\mathbb{X})\backslash\{\emptyset\}$. So $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ is a $\mathbb{G}g$-$\mathbb{T}_1$-space. Since for each $\mathbb{m}, \mathbb{n} \in \mathbb{X}$ and $\mathbb{m} \neq \mathbb{n}$. Then there are $\mathbb{G}g$-open sets $(\mathbb{N} - \{\mathbb{n}\})$, $(\mathbb{N} - \{\mathbb{m}\})$ whenever $\{\mathbb{n}\}$ and $\{\mathbb{m}\}$ are two finite sets such that $(\mathbb{m} \in (\mathbb{N} - \{\mathbb{n}\}))$, $(\mathbb{n} \notin (\mathbb{N} - \{\mathbb{n}\}))$ and $(\mathbb{m} \notin (\mathbb{N} - \{\mathbb{m}\}))$, $(\mathbb{n} \in (\mathbb{N} - \{\mathbb{m}\}))$.

Proposition 2. 9**:** If $(\mathbb{X}, \mathbb{t})$ is a $\mathbb{T}_1$-space then $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ is a $\mathbb{G}g$-$\mathbb{T}_1$-space.
Proof: By Remark 2. 3.(ii).For each $\mathbb{U} \in \mathbb{t}$, then $\mathbb{U}$ is a $\mathbb{G}g$-open set ,so the proof is over.

Proposition 2. 10: If $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ is a $\mathbb{G}g$-$\mathbb{T}_1$-space then it is a $\mathbb{G}g$-$\mathbb{T}_0$-space.

Proof: Let $\mathbb{m}, \mathbb{n} \in \mathbb{X}$ such that $\mathbb{m} \neq \mathbb{n}$ since $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ is a $\mathbb{G}g$-$\mathbb{T}_1$-space, then there exists $\mathbb{U}_1, \mathbb{U}_2 \in \mathbb{G}g\text{-}o(\mathbb{X})$ such that, $\mathbb{m} \in \mathbb{U}_1$, $\mathbb{n} \notin \mathbb{U}_1$ and $\mathbb{n} \in \mathbb{U}_2$, $\mathbb{m} \notin \mathbb{U}_2$. Then there exist $\mathbb{U} \in \mathbb{G}g\text{-}o(\mathbb{X})$ whenever, $\mathbb{m} \in \mathbb{U}$, $\mathbb{n} \notin \mathbb{U}$ and $\mathbb{m} \notin \mathbb{U}$, $\mathbb{n} \in \mathbb{U}$.
The converse of proposition 2. 10 is not true for example 2. 11.

Example 2. 11: The grill topological space $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ is a $\mathbb{G}g$-$\mathbb{T}_0$-space, where $\mathbb{X} = \{\mathbb{f}_1, \mathbb{f}_2\}$, $\mathbb{t} = \{\mathbb{X}, \emptyset, \{ \mathbb{f}_2\}\}$ and $\mathbb{G} = \{\mathbb{X}, \{ \mathbb{f}_1\}\}$. $\mathbb{G}gC(\mathbb{X}) = \{ \mathbb{X}, \emptyset, \{ \mathbb{f}_1\}\}$, $\mathbb{G}gO(\mathbb{X}) = \{ \mathbb{X}, \emptyset, \{\mathbb{f}_2\}\}$. The grill topological space $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ is not $\mathbb{G}g$-$\mathbb{T}_1$-space, since for any elements $\mathbb{f}_1 \neq \mathbb{f}_2$, there is no $\mathbb{G}g$-open set $\mathbb{U}$ containing $\mathbb{f}_1$ which does not contain $\mathbb{f}_2$.

Definition 2. 12: The space $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ is a $\mathbb{G}$-g-$\mathbb{T}_2$-space shortly "$\mathbb{G}$g-$\mathbb{T}_2$-space" if for each $\mathbb{m} \neq \mathbb{n}$. There are $\mathbb{G}$g-open sets $\mathbb{U}'_1, \mathbb{U}'_2$ whenever $\mathbb{m} \in \mathbb{U}'_1$, $\mathbb{n} \in \mathbb{U}'_2$ and $\mathbb{U}'_1 \cap \mathbb{U}'_2 = \emptyset$.

Example 2. 13: Consider the space $(\mathbb{X}, \mathbb{t}, \mathbb{G})$, where $\mathbb{X} = \{ \mathbb{f}_1, \mathbb{f}_2, \mathbb{f}_3\}$, $\mathbb{t} = \{\mathbb{X}, \emptyset, \{ \mathbb{f}_1\}, \{\mathbb{f}_2\}, \{ \mathbb{f}_1, \mathbb{f}_2\}\}$, and $\mathbb{G} = \{\mathbb{X}, \{ \mathbb{f}_1\}, \{ \mathbb{f}_1, \mathbb{f}_2 \}, \{ \mathbb{f}_1 , \mathbb{f}_3\}\}$. So, $\mathbb{G}gC(\mathbb{X}) = P(\mathbb{X}) = \mathbb{G}gO(\mathbb{X})$. Hence $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ is a $\mathbb{G}$g-$\mathbb{T}_2$-space.

Proposition 2. 14: If $(\mathbb{X}, \mathbb{t})$ is a $\mathbb{T}_2$-space then $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ is a $\mathbb{G}$g-$\mathbb{T}_2$-space.

Proof: By Remark 2. 3. (ii).For each $\mathbb{U}' \in \mathbb{t}$, then $\mathbb{U}'$ is a $\mathbb{G}$g-open set ,so the proof is over.

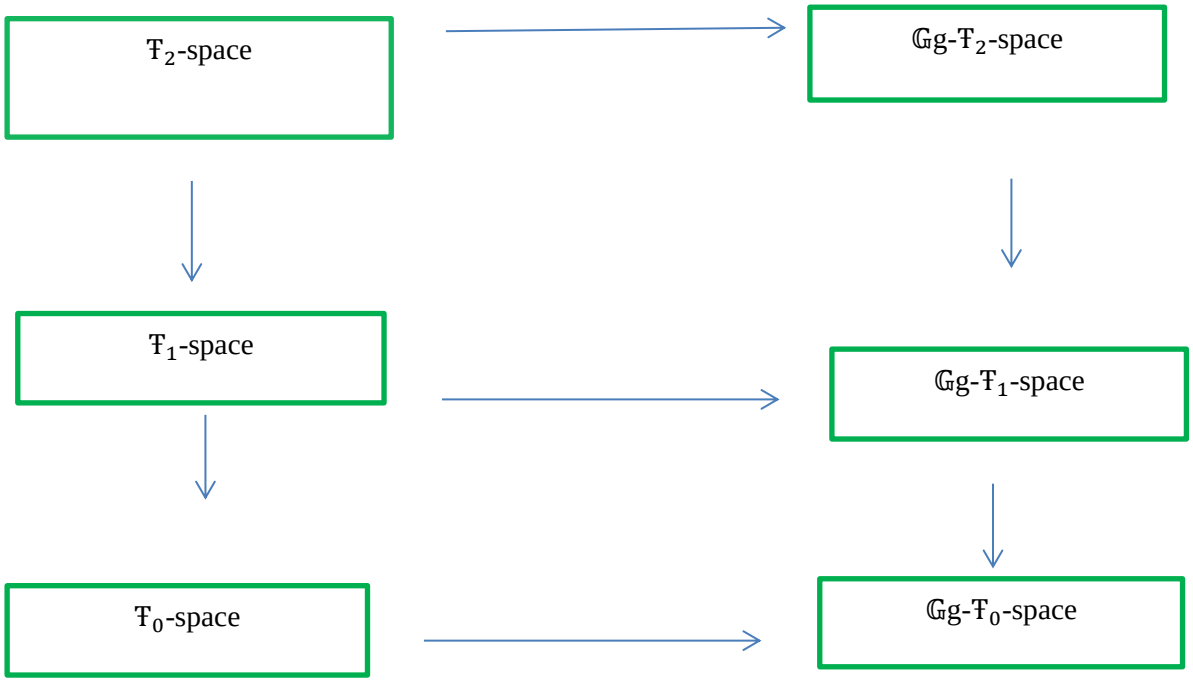
Proposition 2. 15: If $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ is a $\mathbb{G}$g-$\mathbb{T}_2$-space then it is a $\mathbb{G}$g-$\mathbb{T}_1$-space.

Proof: Let $\mathbb{m}, \mathbb{n} \in \mathbb{X}$ whenever, $\mathbb{m} \neq \mathbb{n}$ since $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ is a $\mathbb{G}$g-$\mathbb{T}_2$-space, then there are $\mathbb{G}$g-open sets $\mathbb{U}'_1, \mathbb{U}'_2$ such that $\mathbb{m} \in \mathbb{U}'_1$, $\mathbb{n} \in \mathbb{U}'_2$ and $\mathbb{U}'_1 \cap \mathbb{U}'_2 = \emptyset$. Implies $\mathbb{m} \in \mathbb{U}'_1$ and $\mathbb{n} \notin \mathbb{U}'_1$ or $\mathbb{n} \in \mathbb{U}'_2$ and $\mathbb{m} \notin \mathbb{U}'_2$.
The converse of proposition 2. 15 is not true see example 2. 8.
A space $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ is a $\mathbb{G}$g-$\mathbb{T}_1$-space. Which is not $\mathbb{G}$g-$\mathbb{T}_2$-space, since there is no two $\mathbb{G}$g-open sets, $\mathbb{U}'_1, \mathbb{U}'_2$ such that $\mathbb{U}'_1 \cap \mathbb{U}'_2 = \emptyset$.

Remark 2. 16: We have formerly noted that $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ is a $\mathbb{G}$g-$\mathbb{T}_i$-space whenever, it is a $\mathbb{T}_i$-space (for every $i \in \{ 0, 1, 2 \}$).
The converse of Remark 2. 16 is not true in general for example 2. 17.

Example 2. 17: Consider the space $(\mathbb{X}, \mathbb{t}, \mathbb{G})$, where $\mathbb{X} = \{ \mathbb{f}_1, \mathbb{f}_2, \mathbb{f}_3\}$, $\mathbb{t} = \{\mathbb{X}, \emptyset\}$, and $\mathbb{G} = P(\mathbb{X})\backslash\{\emptyset\}$. So, $\mathbb{G}gC(\mathbb{X}) = P(\mathbb{X}) = \mathbb{G}gO(\mathbb{X})$. Then the space $(\mathbb{X}, \mathbb{t}, \mathbb{G})$ is a $\mathbb{G}$g-$\mathbb{T}_i$-space (for every $i \in \{ 0, 1, 2 \}$). But the space $(\mathbb{X}, \mathbb{t})$ is not $\mathbb{T}_i$-space (for every $i \in \{ 0, 1, 2 \}$).
The following diagram shows the relations between the various kinds of concepts of our formerly mentioned.

Diagram (2. 1)



Relationships among $\mathcal{T}_i$-space and $\mathcal{G}$g-$\mathcal{T}_i$-space

3. Separation Axioms with Some Types of Open Functions

Definition 3. 1: The function $\mathcal{F}$: ($\mathcal{X}$, $\mathcal{t}$, $\mathcal{G}$) →($\mathcal{Y}$, $\mathcal{t}$, $\mathcal{G}$) is called
i. $\mathcal{G}$-g-open function, shortly "$\mathcal{G}$go-function" if $\mathcal{F}$ ($\mathcal{U}$) ∈ $\mathcal{G}$g-o($\mathcal{Y}$) whenever, $\mathcal{U}$ ∈ $\mathcal{G}$g-o($\mathcal{X}$).
ii. $\mathcal{G}^*$-g-open function, shortly "$\mathcal{G}^*$go-function" if $\mathcal{F}$ ($\mathcal{U}$) ∈ $\mathcal{G}$g-o($\mathcal{Y}$) whenever, $\mathcal{U}$ ∈ $\mathcal{t}$.
iii. $\mathcal{G}^{**}$-g-open function, shortly "$\mathcal{G}^{**}$go-function" if $\mathcal{F}$ ($\mathcal{U}$) ∈ $\mathcal{t}$ whenever, $\mathcal{U}$ ∈ $\mathcal{G}$g-o($\mathcal{X}$).

Proposition 3. 2: If ($\mathcal{X}$, $\mathcal{t}$, $\mathcal{G}$) is a $\mathcal{G}$g-$\mathcal{T}_i$-space and $\mathcal{F}$ is an onto, $\mathcal{G}$go-function from ($\mathcal{X}$, $\mathcal{t}$, $\mathcal{G}$) to ($\mathcal{Y}$, $\mathcal{t}$, $\mathcal{G}$) then $\mathcal{Y}$ is a $\mathcal{G}$g-$\mathcal{T}_i$-space (for every $i \in \{ 0, 1, 2 \}$).

Proof: If $i = 0$: Let $\mathcal{m}$, $\mathcal{n} \in \mathcal{Y}$ such that $\mathcal{m} \neq \mathcal{n}$. Since $\mathcal{F}$ is an onto function, then $\mathcal{F}^{-1}(\mathcal{m}) \neq \emptyset \neq \mathcal{F}^{-1}(\mathcal{n})$ and $\mathcal{F}^{-1}(\mathcal{m})$, $\mathcal{F}^{-1}(\mathcal{n}) \in \mathcal{X}$ and $\mathcal{F}^{-1}(\mathcal{m}) \neq \mathcal{F}^{-1}(\mathcal{n})$. Since ($\mathcal{X}$, $\mathcal{t}$, $\mathcal{G}$) is a $\mathcal{G}$g-$\mathcal{T}_0$-space, then there exist $\mathcal{U} \in \mathcal{G}$g-o($\mathcal{X}$) whenever $\mathcal{F}^{-1}(\mathcal{m}) \in \mathcal{U}$, $\mathcal{F}^{-1}(\mathcal{n}) \notin \mathcal{U}$ or $\mathcal{F}^{-1}(\mathcal{m}) \notin \mathcal{U}$, $\mathcal{F}^{-1}(\mathcal{n}) \in \mathcal{U}$. Since $\mathcal{F}$ is a $\mathcal{G}$go-function, then $\mathcal{F}(\mathcal{U})$ is a $\mathcal{G}$g-open set such that $\mathcal{m} \in \mathcal{F}(\mathcal{U})$ and $\mathcal{n} \notin \mathcal{F}(\mathcal{U})$ or $\mathcal{m} \notin \mathcal{F}(\mathcal{U})$ and $\mathcal{n} \in \mathcal{F}(\mathcal{U})$. Hence $\mathcal{Y}$ is a $\mathcal{G}$g-$\mathcal{T}_0$-space. If $i = 1$: Let $\mathcal{m}$, $\mathcal{n} \in \mathcal{Y}$ such that $\mathcal{m} \neq \mathcal{n}$. Since $\mathcal{F}$ is an onto function, then $\mathcal{F}^{-1}(\mathcal{m}) \neq \emptyset \neq \mathcal{F}^{-1}(\mathcal{n})$ and $\mathcal{F}^{-1}(\mathcal{m})$, $\mathcal{F}^{-1}(\mathcal{n}) \in \mathcal{X}$ and $\mathcal{F}^{-1}(\mathcal{m}) \neq \mathcal{F}^{-1}(\mathcal{n})$. So ($\mathcal{X}$, $\mathcal{t}$, $\mathcal{G}$) is a $\mathcal{G}$g-$\mathcal{T}_1$-space, then there exists $\mathcal{U}_1, \mathcal{U}_2 \in \mathcal{G}$g-o($\mathcal{X}$) such that $\mathcal{F}^{-1}(\mathcal{m}) \in \mathcal{U}_1$, $\mathcal{F}^{-1}(\mathcal{n}) \notin \mathcal{U}_1$and $\mathcal{F}^{-1}(\mathcal{n}) \in \mathcal{U}_2$, $\mathcal{F}^{-1}(\mathcal{m}) \notin \mathcal{U}_2$. By the condition $\mathcal{F}$ is a $\mathcal{G}$go-function, $\mathcal{F}(\mathcal{U}_1)$, $\mathcal{F}(\mathcal{U}_2)$ are $\mathcal{G}$g-open sets in $\mathcal{Y}$ such that $\mathcal{m} \in \mathcal{F}(\mathcal{U}_1)$, $\mathcal{n} \notin \mathcal{F}(\mathcal{U}_1)$ and $\mathcal{n} \in \mathcal{F}(\mathcal{U}_2)$, $\mathcal{m} \notin \mathcal{F}(\mathcal{U}_2)$. Hence ($\mathcal{Y}$, $\mathcal{t}$, $\mathcal{G}$) is a $\mathcal{G}$g-$\mathcal{T}_1$-space.
If $i = 2$: The same proof above , but $\mathcal{F}(\mathcal{U}_1) \cap \mathcal{F}(\mathcal{U}_2) = \emptyset$. Hence ($\mathcal{Y}$, $\mathcal{t}$, $\mathcal{G}$) is a $\mathcal{G}$g-$\mathcal{T}_2$-space.

Corollary 3. 3: If ($\mathcal{X}$, $\mathcal{t}$) is a $\mathcal{T}_i$-space and $\mathcal{F}$ is an onto, $\mathcal{G}^*$go-function from ($\mathcal{X}$, $\mathcal{t}$, $\mathcal{G}$) to ($\mathcal{Y}$, $\mathcal{t}$, $\mathcal{G}$) then ($\mathcal{Y}$, $\mathcal{t}$, $\mathcal{G}$) is a $\mathcal{G}$g-$\mathcal{T}_i$-space, where $i \in \{ 0, 1, 2 \}$.

Proof: Follows from $\mathcal{F}(\mathcal{U})$ is a $\mathcal{G}$g-open in ($\mathcal{Y}$, $\mathcal{t}$, $\mathcal{G}$) for all open set $\mathcal{U}$ in $\mathcal{X}$.

Corollary 3. 4: If ($\mathcal{X}$, $\mathcal{t}$, $\mathcal{G}$) is a $\mathcal{G}$g-$\mathcal{T}_i$-space and $\mathcal{F}$ is an onto, $\mathcal{G}^{**}$go-function from ($\mathcal{X}$, $\mathcal{t}$, $\mathcal{G}$) to ($\mathcal{Y}$, $\mathcal{t}$, $\mathcal{G}$) then $\mathcal{Y}$ is a $\mathcal{T}_i$-space, where $i \in \{ 0, 1, 2 \}$.

Proof: Follows from $\mathcal{F}(\mathcal{U})$ is an open set in $\mathcal{Y}$ for all $\mathcal{G}$g-open set $\mathcal{U}$ in ($\mathcal{X}$, $\mathcal{t}$, $\mathcal{G}$).

Corollary 3. 5: If $\mathcal{F}$ is an onto and open function from ($\mathcal{X}$, $\mathcal{t}$) to ($\mathcal{Y}$, $\mathcal{t}$) and ($\mathcal{X}$, $\mathcal{t}$) is a $\mathcal{T}_i$-space, then ($\mathcal{Y}$, $\mathcal{t}$, $\mathcal{G}$) is a $\mathcal{G}$g-$\mathcal{T}_i$-space, where $i \in \{ 0, 1, 2 \}$, for any grill $\mathcal{G}$ on ($\mathcal{Y}$, $\mathcal{t}$, $\mathcal{G}$).

Definition 3. 6: The function $\mathcal{F}$: ($\mathcal{X}$, $\mathcal{t}$, $\mathcal{G}$) →($\mathcal{Y}$, $\mathcal{t}$, $\mathcal{G}$) is called
i. $\mathcal{G}$-g-continuous function, shortly "$\mathcal{G}$g-continuous function" if $\mathcal{F}^{-1}(\mathcal{U}) \in \mathcal{G}$g-o($\mathcal{X}$) for all $\mathcal{U} \in \mathcal{t}$.
ii. Strongly-$\mathcal{G}$-g-continuous function, shortly "Strongly-$\mathcal{G}$g-continuous function" if $\mathcal{F}^{-1}(\mathcal{U}) \in \mathcal{t}$ for every, $\mathcal{U} \in \mathcal{G}$g-o($\mathcal{Y}$).
iii. $\mathcal{G}$-g-irresolute function, shortly "$\mathcal{G}$g-irresolute function" if $\mathcal{F}^{-1}(\mathcal{U}) \in \mathcal{G}$g-o($\mathcal{X}$) for every, $\mathcal{U} \in \mathcal{G}$g-o($\mathcal{Y}$).

Proposition 3. 7: If ($\mathcal{Y}$, $\mathcal{t}$) is a $\mathcal{T}_i$-space and $\mathcal{F}$: ($\mathcal{X}$, $\mathcal{t}$, $\mathcal{G}$) → ($\mathcal{Y}$, $\mathcal{t}$, $\mathcal{G}$) is an injective, $\mathcal{G}$g-continuous function then ($\mathcal{X}$, $\mathcal{t}$, $\mathcal{G}$) is a $\mathcal{G}$g-$\mathcal{T}_i$-space, where $i \in \{ 0, 1, 2 \}$.

Proof: If $i = 0$: Let $\mathcal{m}$, $\mathcal{n} \in \mathcal{X}$ such that $\mathcal{m} \neq \mathcal{n}$. Since $\mathcal{F}$ is an injective function, then $\mathcal{F}(\mathcal{m}) \neq \mathcal{F}(\mathcal{n})$, where, $\mathcal{F}(\mathcal{m})$, $\mathcal{F}(\mathcal{n}) \in \mathcal{Y}$. So, ($\mathcal{Y}$, $\mathcal{t}$) is a $\mathcal{T}_0$-space, then there exist $\mathcal{U} \in \mathcal{t}$ whenever, $\mathcal{F}(\mathcal{m}) \in \mathcal{U}$, $\mathcal{F}(\mathcal{n}) \notin \mathcal{U}$ or $\mathcal{F}(\mathcal{m})$

$\notin U'$, $\mathfrak{f}(\mathfrak{n}) \in U'$. By $\mathfrak{f}$ is a $\mathbb{G}$g-continuous function, then $\mathfrak{f}^{-1}(U') \in \mathbb{G}$g-o($\mathbb{X}$) whenever, $\mathfrak{m} \in \mathfrak{f}^{-1}(U')$, $\mathfrak{n} \notin \mathfrak{f}^{-1}(U')$ or $\mathfrak{m} \notin \mathfrak{f}^{-1}(U')$, $\mathfrak{n} \in \mathfrak{f}^{-1}(U')$. Hence ($\mathbb{X}, \mathfrak{t}, \mathbb{G}$) is a $\mathbb{G}$g-$\mathbb{T}_0$-space.
If i = 1: Let $\mathfrak{m}, \mathfrak{n} \in \mathbb{X}$ such that $\mathfrak{m} \neq \mathfrak{n}$. Since $\mathfrak{f}$ is an injective function, then $\mathfrak{f}(\mathfrak{m}) \neq \mathfrak{f}(\mathfrak{n})$, where, $\mathfrak{f}(\mathfrak{m})$, $\mathfrak{f}(\mathfrak{n}) \in \mathbb{Y}$. So, ($\mathbb{Y}, \mathfrak{t}$) is a $\mathbb{T}_1$-space, then there exists U'_1, $U'_2 \in \mathfrak{t}$ whenever, $\mathfrak{f}(\mathfrak{m}) \in U'_1$, $\mathfrak{f}(\mathfrak{n}) \notin U'_1$ and $\mathfrak{f}(\mathfrak{n}) \in U'_2$, $\mathfrak{f}(\mathfrak{m}) \notin U'_2$. Since $\mathfrak{f}$ is a $\mathbb{G}$g-continuous function, then $\mathfrak{f}^{-1}(U'_1)$ and $\mathfrak{f}^{-1}(U'_2)$ are $\mathbb{G}$g-open sets whenever, $\mathfrak{m} \in \mathfrak{f}^{-1}(U'_1)$, $\mathfrak{n} \notin \mathfrak{f}^{-1}(U'_1)$ and $\mathfrak{n} \in \mathfrak{f}^{-1}(U'_2)$, $\mathfrak{m} \notin \mathfrak{f}^{-1}(U'_2)$. Hence ($\mathbb{X}$, $\mathfrak{t}$, $\mathbb{G}$) is a $\mathbb{G}$g-$\mathbb{T}_1$-space.
If i = 2: The same proof above but $\mathfrak{f}(U'_1) \cap \mathfrak{f}(U'_2) = \emptyset$. Hence ($\mathbb{Y}$, $\mathfrak{t}$, $\mathbb{G}$) is a Gg-$\mathbb{T}_2$-space.

Remark 3. 8: Let $\mathfrak{f}$: ($\mathbb{X}, \mathfrak{t}, \mathbb{G}$) →($\mathbb{Y}$, $\mathfrak{t}$, $\mathbb{G}$) is a function
If $\mathfrak{f}$ is a continuous function, then $\mathfrak{f}$ is a $\mathbb{G}$g- continuous function

Corollary 3. 9: If ($\mathbb{Y}$, $\mathfrak{t}$) is a $\mathbb{T}_i$-space and $\mathfrak{f}$: ($\mathbb{X}, \mathfrak{t}, \mathbb{G}$) →($\mathbb{Y}$, $\mathfrak{t}$, $\mathbb{G}$) is an injective continuous function, then ($\mathbb{X}, \mathfrak{t}, \mathbb{G}$) is a $\mathbb{G}$g-$\mathbb{T}_i$-space, where $i \in \{ 0, 1, 2 \}$.

Proof: Since every continuous function is a $\mathbb{G}$g-continuous function by Proposition 3. 7, then Corollary 3. 5, is applicable

Proposition 3. 10: If ($\mathbb{Y}$, $\mathfrak{t}$, $\mathbb{G}$) is a $\mathbb{G}$g-$\mathbb{T}_i$-space and $\mathfrak{f}$: ($\mathbb{X}, \mathfrak{t}, \mathbb{G}$) → ($\mathbb{Y}$, $\mathfrak{t}$, $\mathbb{G}$) is an injective strongly-$\mathbb{G}$g-continuous function then ($\mathbb{X}, \mathfrak{t}$) is a $\mathbb{T}_i$-space, where $i \in \{ 0, 1, 2 \}$.

Proof: Follows from, $\mathfrak{f}^{-1}(U') \in \mathfrak{t}$ for each $U' \in$ Gg-o($\mathbb{Y}$).

Proposition 3. 11: If ($\mathbb{Y}$, $\mathfrak{t}$, $\mathbb{G}$) is a $\mathbb{G}$g-$\mathbb{T}_i$-space and $\mathfrak{f}$: ($\mathbb{X}, \mathfrak{t}, \mathbb{G}$) → ($\mathbb{Y}$, $\mathfrak{t}$, $\mathbb{G}$) is an injective $\mathbb{G}$g-irresolute function then ($\mathbb{X}, \mathfrak{t}, \mathbb{G}$) is a $\mathbb{G}$g-$\mathbb{T}_i$-space, where $i \in \{ 0, 1, 2 \}$.

Proof: Since $\mathfrak{f}^{-1}(U') \in \mathbb{G}$g-o($\mathbb{X}$) for each $U' \in$ Gg-o($\mathbb{Y}$).

4. Gg-Convergence Sequence
Definition 4. 1: Let ($\mathbb{X}, \mathfrak{t}, \mathbb{G}$) be a grill topological space, where $\mathfrak{x}_0 \in \mathbb{X}$ and $(\mathfrak{S}_\mathfrak{n})_{\mathfrak{n} \in \mathbb{N}}$ be a sequence in $\mathbb{X}$. Then $(\mathfrak{S}_\mathfrak{n})_{\mathfrak{n} \in \mathbb{N}}$ is called Gg-Convergence to $\mathfrak{x}_0$ shortly $\mathfrak{S}_\mathfrak{n} \rightsquigarrow \mathfrak{x}_0$ if for every Gg-open set U' where, $\mathfrak{x}_0 \in U'$ there exist $\mathfrak{K} \in \mathbb{N}$ where, $\mathfrak{S}_\mathfrak{n} \in U'$ for every $\mathfrak{n} \geq \mathfrak{K}$. A sequence $(\mathfrak{S}_\mathfrak{n})_{\mathfrak{n} \in \mathbb{N}}$ is called Gg-divergence, if it is not Gg-Convergence.

Theorem 4. 2: If ($\mathbb{X}$, $\mathfrak{t}$, $\mathbb{G}$) is a $\mathbb{G}$g-$\mathbb{T}_2$-space then every Gg-Convergence sequence in $\mathbb{X}$ has a unique limit point.
Proof: Let $(\mathfrak{S}_\mathfrak{n})_{\mathfrak{n} \in \mathbb{N}}$ be a sequence in $\mathbb{X}$ where, $\mathfrak{S}_\mathfrak{n} \rightsquigarrow \mathfrak{x}_1$ and $\mathfrak{S}_\mathfrak{n} \rightsquigarrow \mathfrak{x}_2$; $\mathfrak{x}_1 \neq \mathfrak{x}_2$ where, $\mathfrak{x}_1, \mathfrak{x}_2 \in \mathbb{X}$. Since ($\mathbb{X}$, $\mathfrak{t}$, $\mathbb{G}$) is a $\mathbb{G}$g-$\mathbb{T}_2$-space then there exists $U'_1, U'_2 \in \mathbb{G}$go($\mathbb{X}$) such that $\mathfrak{x}_1 \in U'_1$ and $\mathfrak{x}_2 \in U'_2$ where $U'_1 \cap U'_2 = \emptyset$. Since $\mathfrak{S}_\mathfrak{n} \rightsquigarrow \mathfrak{x}_1$ and $\mathfrak{x}_1 \in U'_1 \in \mathbb{G}$go($\mathbb{X}$) implies there exist $\mathfrak{K}_1 \in \mathbb{N}$; $\mathfrak{S}_\mathfrak{n} \in U'_1$ for all $\mathfrak{n} \geq \mathfrak{K}_1$. So, $\mathfrak{S}_\mathfrak{n} \rightsquigarrow \mathfrak{x}_2$ and $\mathfrak{x}_2 \in U'_2 \in \mathbb{G}$go($\mathbb{X}$) implies there exist $\mathfrak{K}_2 \in \mathbb{N}$; $\mathfrak{S}_\mathfrak{n} \in U'_2$ for all $\mathfrak{n} \geq \mathfrak{K}_2$. Hence, $U'_1 \cap U'_2 \neq \emptyset$, that is contradiction.
The prerequisite that a space $\mathbb{X}$ is a $\mathbb{G}$g-$\mathbb{T}_2$-space is very necessary to make Theorem 4. 2 is proper.

Example 4. 3**:** Let ($\mathbb{X}$, $\mathfrak{t}$, $\mathbb{G}$) be a grill topological space, where, $\mathbb{X} = \{ \mathfrak{f}_1, \mathfrak{f}_2, \mathfrak{f}_3 \}$, $\mathfrak{t} = \{\mathbb{X}, \emptyset\}$, and $\mathbb{G} = \{\mathbb{X}, \{ \mathfrak{f}_3\}, \{ \mathfrak{f}_1, \mathfrak{f}_3 \}, \{ \mathfrak{f}_2, \mathfrak{f}_3\}\}$. Then $\mathbb{G}$gC($\mathbb{X}$) = $\{ \mathbb{X}, \emptyset, \{ \mathfrak{f}_3\}, \{ \mathfrak{f}_1, \mathfrak{f}_3\}, \{ \mathfrak{f}_2, \mathfrak{f}_3\}\}$, $\mathbb{G}$gO($\mathbb{X}$) = $\{ \mathbb{X}, \emptyset, \{ \mathfrak{f}_1\}, \{ \mathfrak{f}_2\}, \{ \mathfrak{f}_1, \mathfrak{f}_2\}\}$.The sequence $(\mathfrak{S}_\mathfrak{n})_{\mathfrak{n} \in \mathbb{N}}$ in $\mathbb{X}$, where $\mathfrak{S}_\mathfrak{n} = \mathfrak{f}_3$ for all $\mathfrak{n} \in \mathbb{N}$. The sequence $(\mathfrak{S}_\mathfrak{n})_{\mathfrak{n} \in \mathbb{N}}$ has one limit point such that $\mathfrak{S}_\mathfrak{n} \rightsquigarrow \mathfrak{f}_3$, but ($\mathbb{X}$, $\mathfrak{t}$, $\mathbb{G}$) is not $\mathbb{G}$g-$\mathbb{T}_2$-space.

Proposition 4. 4: If a sequence $(\mathfrak{S}_\mathfrak{n})_{\mathfrak{n} \in \mathbb{N}}$ is a Gg-convergence to $\mathfrak{x}_0$ in ($\mathbb{X}, \mathfrak{t}, \mathbb{G}$), then it is a convergence to $\mathfrak{x}_0$.

Proof: Let U' be an open set in X where, $x_0 \in U'$. By Remark 2. 3. (ii). U' is a Gg-open set in X where, $x_0 \in U'$. Since $(S_n)_{n \in \mathbb{N}}$ is a Gg-convergent to x_0, then there exist $K \in \mathbb{N}$ where, $S_n \in U'$ for every $n \geq K$. Hence $(S_n)_{n \in \mathbb{N}}$ is a convergent to x_0.
The converse of Proposition 4. 4 is not true for example 4. 5.

Example 4. 5: Let (X, t, G) be a grill topological space, where, $X = \mathbb{N}$ set of all natural numbers $t = \{X, \emptyset\}$, and $G = P(X)\backslash\{\emptyset\}$, $GgC(X) = P(X) = GgO(X)$. The sequence $(S_n)_{n \in \mathbb{N}}$ where $S_n = n$ for all $n \in \mathbb{N}$ is a convergent to n for all $n \in \mathbb{N}$, which is not Gg-convergence for any element in $\mathbb{N}$.

Proposition 4. 6: Let $f: (X, t, G) \to (Y, t, G)$ be an injective and Gg-irresolute function and $(S_n)_{n \in \mathbb{N}}$ be a sequence in X. Then $f(S_n) \rightsquigarrow f(x_0)$ in (Y, t, G) whenever, $S_n \rightsquigarrow x_0$ in (X, t, G).

Proof: Let U' is a Gg-open set in Y where $f(x_0) \in U'$. Since f is a Gg-irresolute function, then $f^{-1}(U')$ is a Gg-open set where, $x_0 \in f^{-1}(U')$. Since $(S_n)_{n \in \mathbb{N}}$ is a Gg-convergent to x_0, then there exist $K \in \mathbb{N}$ where, $S_n \in f^{-1}(U')$ for all $n \geq K$. Since f is an injective function, then there exist $K \in \mathbb{N}$ where, $f(S_n) \in U'$ for all $n \geq K$. Hence $f(S_n)$ is a Gg-convergent to $f(x_0)$.

Theorem 4. 7: Let $f: (X, t, G) \to (Y, t, G)$ be an injective and Gg-continuous function and $(S_n)_{n \in \mathbb{N}}$ be a sequence in X. Then $f(S_n) \to f(x_0)$ in (Y, t, G) whenever, $S_n \rightsquigarrow x_0$ in (X, t, G).

Proof: Let U' is an open set in (Y, t, G) where, $f(x_0) \in U'$. Since f is a Gg- continuous function, then $f^{-1}(U')$ is a Gg-open set in (X, t, G) where, $x_0 \in f^{-1}(U')$. Since $(S_n)_{n \in \mathbb{N}}$ is a Gg-convergent to x_0, then there exist $K \in \mathbb{N}$ where, $S_n \in f^{-1}(U')$ for all $n \geq K$. Since f is an injective function, then there exist $K \in \mathbb{N}$ where, $f(S_n) \in U'$ for all $n \geq K$. Hence $f(S_n)$ is a convergent to $f(x_0)$.

Proposition 4. 8: Let $f: (X, t, G) \to (Y, t, G)$ be an injective and strongly-Gg-continuous function and $(S_n)_{n \in \mathbb{N}}$ be a sequence in X. Then $f(S_n) \rightsquigarrow f(x_0)$ in (Y, t, G) whenever, $S_n \to x_0$ in (X, t, G).

Proof: Let U' is a Gg-open set in (Y, t, G) where $f(x_0) \in U'$. Since f is a strongly-Gg-continuous function, then $f^{-1}(U')$ is an open set in X where, $x_0 \in f^{-1}(U')$. Since $(S_n)_{n \in \mathbb{N}}$ is a convergent to x_0, then there exist $K \in \mathbb{N}$ where, $S_n \in f^{-1}(U')$ for all $n \geq K$. Since f is an injective function, then there exist $K \in \mathbb{N}$ where, $f(S_n) \in U'$ for all $n \geq K$. Hence $f(S_n)$ is a Gg-convergent to $f(x_0)$.

Abstract. We present the notion of bipolar fuzzy k-ideals with thresholds (θ,λ) of a KU-algebra with semigroup and give some basic properties of this ideal. Also, we study some relations about a bipolar fuzzy k-ideal with thresholds (θ,λ) and a k-ideal of a KU-semigroup.

1.Introduction

The idea of a fuzzy set was initialed in 1965 by the author Zadeh [12]. Since, the fuzzy set has been applied to most mathematical fields and other sciences. The notion of fuzzy KU-ideals of ·KU-algebras was introduced by Mostafa et al [6] they given some properties related to fuzzy KU-ideals. In [4] Lee introduced an extension of ·fuzzy sets namely, bipolar fuzzy· sets. This concept is an extension of fuzzy sets from[0, 1] to [-1, 1]. Some authors introduced a bipolar fuzzy set on different algebraic structures, see [3], [5], [7] , [8],[10] and [11]. In this paper, the bipolar ·fuzzy set with· thresholds (θ,λ) to·k-ideal of KU-algebra with semigroup is introduced and some basic relations between a bipolar fuzzy k-ideal with thresholds (θ,λ) and a k-ideal are proved.

2. Basic concepts

To complete this work, we collect some essential definitions and properties related to KU-algebra with semigroup and bipolar fuzzy logic.

Definition2.1 [9]. Algebra$(\aleph,*,0)$ is called a KU-algebra if, for all$\chi,\gamma,\tau \in \aleph$,
$(\mathrm{k}u_1)\ (\chi*\gamma)*[(\gamma*\tau)*(\chi*\tau)]=0$
$(ku_2)\ \chi*0=0$
$(ku_3)\ \ 0*\chi=\chi$
$(ku_4)\chi*\gamma=0$ and$\gamma*\chi$ implies $\chi=\gamma$ and
$(ku_5)\chi*\chi=0$

A binary relation $\leq$on $\aleph$ is define by$\chi\leq\gamma \Leftrightarrow \gamma*\chi=0$. It follows that $(\aleph,\leq)$is a partially ordered set. It follows that $(\aleph,*,0)$ is satisfies the following statements. For all $\chi,\gamma,\tau\in\aleph$,

$(^{ku_{1}}) \ (\gamma * \tau) * (\chi * \tau) \leq (\chi * \gamma)$,
$(^{ku_{2}}) \ 0 \leq \chi$,
$(^{ku_{3}}) \ \chi \leq \gamma, \gamma \leq \chi$ implies $\chi = \gamma$
$(^{ku_{4}}) \ \gamma * \chi \leq \chi$.

Theorem2.2[6]. Let$(\aleph,*,0)$ be a KU-algebra. Then, for all$\chi,\gamma,\tau \in \aleph$,
(1) if $\chi \leq \gamma$ imply $\gamma * \tau \leq \chi * \tau$
(2) $\chi * (\gamma * \tau) = \gamma * (\chi * \tau)$
(3) $((\gamma * \chi) * \chi) \leq \gamma$.

Example 2.3 [9]. Let $\aleph = \{0, a, b, c\}$ be a set and $*$ a binary operation defined in the following table

$*$	0	a	b	c
0	0	a	b	c
a	0	0	0	b
b	0	b	0	a
c	0	0	0	0

It is easy to see that$(\aleph,*,0)$ is a KU-algebra.

Definition 2.4 [9]. Let$(\aleph,*,0)$ be a KU-algebra and I be a non- empty subset of $\aleph$. Then I is called an ideal of $\aleph$ if for any$\chi,\gamma \in \aleph$, then
(i) $0 \in I$and
(ii) If $\chi * \gamma \in I$ and $\chi \in I$ imply $\gamma \in I$.

Definition 2.5 [6]. Let I be a subset of a KU-algebra$(\aleph,*,0)$ and $I \neq \varphi$. Then I is named a *KU*-ideal of $\aleph$, if
(I_1) $0 \in I$ and
$(I_2)\forall \chi,\gamma,\tau \in \aleph$, if $(\chi * (\gamma * \tau)) \in I$, $\gamma \in I$, then $\chi * \tau \in I$.

Definition2.6[2]. A KU-semigroup is a nonempty set $\aleph$ with two binary operations $*,\circ$ and a constant 0 satisfying the following
(I) $(\aleph,*,0)$ is a KU-algebra
(II) $(\aleph,\circ)$is a semigroup
(III) The operation$\circ$is distributive (on both sides) over the operation$*$, i.e.
$\chi \circ (\gamma * \tau) = (\chi \circ \gamma) * (\chi \circ \tau) and (\chi * \gamma) \circ \tau = (\chi \circ \tau) * (\gamma \circ \tau)$, for all$\chi,\gamma,\tau \in X$

Example 2.7[2]. Let $\aleph = \{0,1,2,3\}$be a set. Define$*$ -operation and $\circ\odot$-operation by the following tables

*	0	1	2	3
0	0	1	2	3
1	0	0	0	2
2	0	2	0	1
3	0	0	0	0
| |	0	1	2	3
0	0	0	0	0
1	0	1	0	1
2	0	0	2	2
3	0	1	2	3

Then $(\aleph,*,\circ,0)$ is a KU - semigroup.

Definition 2.8[2]. A *sub*KU-*semigroup* is a non-empty subset A of a KU-semigroup $\aleph$ and it is satisfied $\chi * \gamma, \chi \circ \gamma \in A$, for all $\chi,\gamma \in A$.

Definition2.9[2]. Let $(\aleph,*,\circ,0)$ be a KU-semigroup and $\varphi \neq I\aleph$. Then

I is named an *S-ideal* of $\aleph$, if

(i) I is an ideal of a KU-algebra$(\aleph,*,0)$.
(ii) For all $\chi \in \aleph$, $a \in I$, we have$\chi \circ a \in I$ and $a \circ \chi \in I$.

Definition2.10[2]. Let $(\aleph,*,\circ,0)$ be a KU-semigroup and $\varphi \neq A\aleph$. Then$A$ is said to be a *k-ideal* of $\aleph$ X, if

i) A is an *KU*-ideal of a KU-algebra $(\aleph,*,0)$,
ii) For all$\chi \in X$,$a \in A$, we have $\chi \circ a \in A$ and $a \circ \chi \in A$.

Now, we review some concepts of fuzzy logic.

Let $\aleph$ be the collection of objects and a fuzzy set is a function $\mu : \aleph \to [0,1]$, then $\mu(\chi)$ is called the membership value of χ in $\aleph$ and $0 \le \mu(\chi) \le 1$.

The set $U(\mu,t) = \{\chi \in \aleph : \mu(\chi) \ge t\}$, where $0 \le t \le 1$ is said to be a level set of $\mu(\chi)$.

Defintion2.11[1]. Let $\mu(\chi)$ be a fuzzy set in $\aleph$, then $\mu(\chi)$ is called a fuzzy sub KU-semi group of $\aleph$, if for all $\chi,\gamma \in \aleph$. Then

i) $\mu(\chi * \gamma) \ge \min\{\mu(\chi), \mu(\gamma)\}$

ii) $\mu(\chi \square \gamma) \ge \min\{\mu(\chi), \mu(\gamma)\}$.

Defintion2.12[1]. A fuzzy set $\mu(\chi)$ in $\aleph$ is called a fuzzy *k*-ideal, if for all $\chi,\gamma,\tau \in \aleph$, the following conditions are satisfied

(k_1) $\mu(0) \geq \mu(\chi)$,

(k_2) $\mu(\chi * \tau) \geq \min\{\mu(\chi * (\gamma * \tau)), \mu(\gamma)\}$,

(k_3) $\mu(\chi \square \gamma) \geq \min\{\mu(\chi), \mu(\gamma)\}$.

Example2.13[1]. Let $\aleph = \{0, a, b, c, d\}$ be a set with two operations $*$ and $|$ $\odot$ are defined by the following tables

$*$	0	a	b	c	d
0	0	a	b	c	d
a	0	0	b	c	d
b	0	c	0	c	d
c	0	a	b	0	0
d	0	a	b	c	0

	0	a	b	c	d
0	0	0	0	0	0
a	0	0	0	0	0
b	0	0	0	0	b
c	0	0	0	b	c
d	0	a	b	c	d

Then $(\aleph, *, \circ, 0)$ is a KU-semigroup. Define a fuzzy set $\mu: \aleph \to [0,1]$ by $\mu(0) = \mu(a) = 0.4$, $\mu(b) = \mu(c) = 0.2$, $\mu(d) = 0.1$. Then $\mu(\chi), \forall \chi \in \aleph$ is a fuzzy *k*-ideal.
In the following, we recall some basic concepts about a bipolar fuzzy set.

Definition2.14[4]. The concept (a bipolar fuzzy set B) in a set $\aleph$ is an object having the form $\mathrm{B} = \{(\chi, \mu^-(\chi), \mu^+(\chi)) : \chi \in \aleph\}$, where $\mu^-(\chi): \aleph \to [-1,0]$ $\mu^-: \aleph \to [-1,0]$and $\mu^+(\chi): \aleph \to [0,1]$ are two fuzzy mappings. The two membership degrees $\mu^+(\chi)$ and $\mu^-(\chi)$ $\mu^+(\chi)$denotes the fulfillment degree ofχ $\aleph$ to the property corresponding of B and the fulfillment degree of χ $\aleph$ to some implicit counter-property of B, respectively. The symbol $B = (\chi, \mu^-, \mu^+)$ $\mathrm{B} = (\chi, \mu^-, \mu^+)$ is used instead of $B = \{(\chi, \mu^-(\chi), \mu^+(\chi) | \chi \in \aleph\}$ $\mathrm{B} = \{(\chi, \mu^-(\chi), \mu^+(\chi)) : \chi \in \aleph\}$ and the concept of a bipolar fuzzy set instead of the concept of bipolar-valued fuzzy set.

Definition2.15[4]. Let $B = (\chi, \mu^-, \mu^+)$ $\mathrm{B} = (\chi, \mu^-, \mu^+)$ be a bipolar fuzzy set. Then

(1) For any $(s,t)\in[-1,0]\times[0,1]$, $(s,t)\in[-1,0]\times[0,1]$. the set $B_s^- = \{\chi\in\aleph : \mu^-(\chi)\le s\}$ $B_S^- = \{\chi\in\aleph: \mu^-(\chi)\le s\}$ is named a negative s-cut of $B=(\chi,\mu^-,\mu^+)$ B and the set $\mathrm{B}_t^+ = \{\chi\in\aleph : \mu^+(\chi)\ge t\}$ $B_t^+ = \{\chi\in\aleph: \mu^+(\chi)\ge t\}$ is called the positive t-cut of B.

(2) The set $\aleph_B^{(t,s)} = \{\chi\in\aleph : \mu^-(\chi)\le s, \mu^+(\chi)\ge t\}$ is called a $(s,t)-$ level subset of B.

(3) The set $^{<}\mathrm{B}_s^- = \{\chi\in\aleph : \mu^-(\chi)< s\}$ is called a strong negative s-cut of B and $^{>}\mathrm{B}_t^+ = \{\chi\in\aleph : \mu^+(\chi)> t\}$ is named a strong positive t-cut of B.

(4) The set $^{\perp}\aleph_B^{(t,s)} = \{\chi\in\aleph : \mu^-(\chi)< s, \mu^+(\chi)> t\}$ is called a strong (s,t) -level subset of B.

Kareem and Hasan [3] introduced the bipolar fuzzy *k*-ideal of KU-semigroup as follows:

Definition2.16[3]. A fuzzy set μ in $\aleph$ is called a bipolar fuzzy sub KU-semi group of $\aleph$ if it is satisfies the following condition : for all $\chi,\gamma\in\aleph$ $\chi,\gamma\in\aleph$

i) $\mu^-(\chi*\gamma)\le\max\{\mu^-(\chi),\mu^-(\gamma)\}$ and $\mu^+(\chi*\gamma)\ge\min\{\mu^+(\chi),\mu^+(\gamma)\}$ $\mu^-(\chi*\gamma)\le\{\mu^-(\chi),\mu^-(\gamma)\}$.

ii) $\mu^-(\chi\square\gamma)\le\max\{\mu^-(\chi),\mu^-(\gamma)\}$ and $\mu^+(\chi\square\gamma)\ge\min\{\mu^+(\chi),\mu^+(\gamma)\}$.

Defintion2.17[3]. Let $(\aleph,*,\square 0)$ be a KU-semigroup. A set $B=(\chi,\mu^-,\mu^+)$ $\mathrm{B}=(\chi,\mu^-,\mu^+)$ of $\aleph$ is called a bipolar fuzzy *k*-ideal if, for all $\chi,\gamma,\tau\in\aleph$ $\chi,\gamma,\tau\in\aleph$. The following conditions are satisfied

(BF_1) $\mu^-(0)\le\mu^-(\chi)$ and $\mu^+(0)\ge\mu^+(\chi)$ $\mu^+(0)\ge\mu^+(\chi)$,

(BF_2) $\mu^-(\chi*\tau)\le\max\{\mu^-(\chi*(\gamma*\tau)),\mu^-(\gamma)\}$ $\mu^-(\chi*\tau)\le\{\mu^-(\chi*(\gamma*\tau)),\mu^-(\gamma)\},$, $\mu^+(\chi*\tau)\ge\min\{\mu^+(\chi*(\gamma*\tau)),\mu^+(\gamma)\}$.

(BF_3) $\mu^-(\chi\square\tau)\le\max\{\mu^-(\chi),\mu^-(\gamma)\}$, $\mu^+(\chi\square\tau)\ge\min\{\mu^+(\chi),\mu^+(\gamma)\}$ $\mu^-(\chi\gamma)\le\{\mu^-(\chi),\mu^-(\gamma)\}$, $\mu^+(\chi\gamma)\ge\{\mu^+(\chi),\mu^+(\gamma)\}$.

3. (BF) ideals with Thresholds (θ,λ) of a KU-semigroup

We will define the notion of bipolar fuzzy *k*-ideal with thresholds (θ,λ) of a KU-semigroup and proved some of its properties

In what follows, we denote a bipolar fuzzy by (BF) and let $\theta,\lambda\in[0,1]$ such that $0<\theta<\lambda<1$, where θ and λ are arbitrary values.

Definition 3.1. A (BF) subset $B=(\chi,\eta^-,\eta^+)$ in $\aleph$ is called a (BF) sub KU-semigroup with thresholds (θ,λ) if, for all $\chi,\gamma\in\aleph$,

(1) $\min\{\eta^-(\chi*\gamma),-\theta\}\le\max\{\eta^-(\chi),\eta^-(\gamma),-\lambda\}$ and $\max\{\eta^+(\chi*\gamma),\theta\}\ge\min\{\eta^+(\chi),\eta^+(\gamma),\lambda\}$.

(2) $\min\{\eta^-(\chi\square\gamma),-\theta\}\le\max\{\eta^-(\chi),\eta^-(\gamma),-\lambda\}$ and $\max\{\eta^+(\chi\square\gamma),\theta\}\ge\min\{\eta^+(\chi),\eta^+(\gamma),\lambda\}$

Remark 3.2. A (BF) sub KU-semigroup of $\aleph$ is a (BF) sub KU-semigroup with thresholds (θ,λ) with $\theta=0$ and $\lambda=1$.

Corollary 3.3. Every (BF) sub KU-semigroup of $\aleph$ is a (BF) sub KU-semigroup with thresholds (θ,λ).

The reverse of Corollary 3.3 is incorrect. The example 3.4 shows the reverse

Example 3.4. Let $\aleph$ = {0, 1, 2, 3} be a set with two operations $*$ and $|$ $\odot$ are defined by the following tables

$*$	0	1	2	3
0	0	1	2	3
1	0	0	0	2
2	0	2	0	1
3	0	0	0	0

	0	1	2	3
0	0	0	0	0
1	0	1	0	1
2	0	0	2	2
3	0	1	2	3

Then ($\aleph$, *, 0) is a KU-semigroup. Now, we define $\mathrm{B}=(\chi,\eta^-,\eta^+)$ by

$$\eta^+(\chi)=\begin{cases}0.29 & if \quad \chi=0\\ 0.26 & if \quad \chi=1\\ 0.25 & if \quad \chi=3\\ 0.20 & if \quad \chi=2\end{cases} \quad \text{and} \quad \eta^-(\chi)=\begin{cases}-0.30 & if \quad \chi=0\\ -0.25 & if \quad \chi=1\\ -0.24 & if \quad \chi=3\\ -0.22 & if \quad \chi=2\end{cases}$$

It is clear that $\mathrm{B}=(\chi,\eta^-,\eta^+)$ is a (BF) sub KU-semigroup with thresholds $(0.1,0.2)$ of $\aleph$ but not a (BF) sub KU-semigroup since $\eta^+(1*3)=\eta^+(2)=0.20\le\min\{\eta^+(1),\eta^+(3)\}=0.25$ and $\eta^-(1*3)=\eta^-(2)=-0.22\ge\max\{\eta^-(1),\eta^-(3)\}=-0.24$.

Defintion3.5. A (BF) set $B=(\chi,\mu^-,\mu^+)$ $\mathrm{B}=(\chi,\eta^-,\eta^+)$ in $\aleph$ is named a (BF) *S*-ideal with thresholds (θ,λ) of $\aleph$ if, for all $\chi,\gamma\in\aleph$ $\chi,\gamma\in\aleph$

(Bi$_1$) $\min\{\eta^-(0),-\theta\}\le\max\{\eta^-(\chi),-\lambda\}$ and $\max\{\eta^+(0),\theta\}\ge\min\{\eta^+(\chi),\lambda\}$

(Bi$_2$) $\min\{\eta^-(\gamma),-\theta\}\le\max\{\eta^-(\chi*\gamma),\eta^-(\chi),-\lambda\}$ and $\max\{\eta^+(\gamma),\theta\}\ge\min\{\eta^+(\chi*\gamma),\eta^+(\chi),\lambda\}$

(Bi$_3$)) $\min\{\eta^-(\chi\square\gamma),-\theta\}\le\max\{\eta^-(\chi),\eta^-(\gamma),-\lambda\}$ and $\max\{\eta^+(\chi\square\gamma),\theta\}\ge\min\{\eta^+(\chi),\eta^+(\gamma),\lambda\}$.

Definition 3.6. A (BF) set $B=(\chi,\eta^{-},\eta^{+})$ of $\aleph$ is named a (BF) *k*-ideal with thresholds (θ,λ), if, for all $\chi,\gamma,\tau\in\aleph$. Then

(BI$_1$) $\min\{\eta^{-}(0),-\theta\}\le\max\{\eta^{-}(\chi),-\lambda\}$ and $\max\{\eta^{+}(0),\theta\}\ge\min\{\eta^{+}(\chi),\lambda\}$,

(BI$_2$) $\min\{\eta^{-}(\chi*\tau),-\theta\}\le\max\{\eta^{-}(\chi*(\gamma*\tau)),\eta^{-}(\gamma),-\lambda\}$,

$\max\{\eta^{+}(\chi*\tau),\theta\}\ge\min\{\eta^{+}(\chi*(\gamma*\tau)),\eta^{+}(\gamma),\lambda\}$.

(BI$_3$) $\min\{\eta^{-}(\chi\square\gamma),-\theta\}\le\max\{\eta^{-}(\chi),\eta^{-}(\gamma),-\lambda\}$ and

$\max\{\eta^{+}(\chi\square\gamma),\theta\}\ge\min\{\eta^{+}(\chi),\eta^{+}(\gamma),\lambda\}$.

Example 3.7. Let $\aleph$ = {0, 1, 2, 3} be a set with the following tables

*	0	1	2	3
0	0	1	2	3
1	0	0	0	2
2	0	2	0	1
3	0	0	0	0

	0	1	2	3
0	0	0	0	0
1	0	1	0	1
2	0	0	2	2
3	0	1	2	3

Then ($\aleph$, *, 0) is a KU-semigroup. Define $B=(\chi,\eta^{-},\eta^{+})$ by

$$\eta^{+}(\chi)=\begin{cases}0.5 & if \quad \chi=0\\ 0.3 & if \quad \chi=1,2,3\end{cases}\qquad \eta^{-}(\chi)=\begin{cases}-0.6 & if \quad \chi=0\\ -0.4 & if \quad \chi=1,2,3\end{cases}$$ and

Then $B=(\chi,\eta^{-},\eta^{+})$ is a (BF) *k*-ideal with thresholds $(0.1,0.2)$ of $\aleph$.

Remark 3.8. If $\theta=0$ and $\lambda=1$, then a (BF) *k*-ideal of $\aleph$ is a (BF) *k*-ideal with thresholds (θ,λ).

Lemma 3.9. Every (BF) *k*-ideal of $\aleph$ is a (BF) *k*-ideal with thresholds (θ,λ).

Proof. Clear.

The reverse of Lemma3.9 is incorrect. The example 3.10 shows the reverse

Example 3.10. Let $\aleph=\{0,a,b,c\}$ $\aleph=\{0,1,2,3\}$ with $*$ defined as in Example (3.6), we can define $B=(\chi,\eta^{-},\eta^{+})$ by

$$\eta^{+}(\chi)=\begin{cases}0.8 & if \quad \chi=0\\ 0.7 & if \quad \chi=1\\ 0.6 & if \quad \chi=2\\ 0.3 & if \quad \chi=3\end{cases}\qquad \eta^{-}(\chi)=\begin{cases}-0.5 & if \quad \chi=0\\ -0.4 & if \quad \chi=1\\ -0.3 & if \quad \chi=2\\ -0.2 & if \quad \chi=3\end{cases}$$ and

It is clear that $B=(\chi,\eta^-,\eta^+)$ is a (BF) *k*-ideal with thresholds $(0.4,0.2)$ of $\aleph$ but it is not a (BF) *k*-ideal, since $\eta^+(0*3)=\eta^+(3)=0.3\le\min\{\eta^+(0*(2*3)),\eta^+(2)\}=0.6$ and $\eta^-(0*3)=\eta^-(3)=-0.2\ge\max\{\eta^-(0*(2*3)),\eta^-(2)\}=-0.3$.

Proposition 3.11. Let $B=(\chi,\eta^-,\eta^+)$ be a (BF) *k*-ideal with thresholds (θ,λ) of $\aleph$. If $\chi\le\gamma$, then $\min\{\eta^-(\chi),-\theta\}\le\max\{\eta^-(\gamma),-\lambda\}$ and $\max\{\eta^+(\chi),\theta\}\ge\min\{\eta^+(\gamma),\lambda\}$.

Proof. If $\chi\le\gamma$, then $\gamma*\chi=0$ and by (ku_3) $0*\chi=\chi$, since $B=(\chi,\eta^-,\eta^+)$ is a (BF) *k*-ideal with thresholds (θ,λ) of $\aleph$,we get

$$\min\{\eta^-(0*\chi),-\theta\}=\min\{\eta^-(\chi),-\theta\}\le\max\{\eta^-(0*(\gamma*\chi)),\eta^-(\gamma),-\lambda\}$$
$$=\max\{\eta^-(0*0),\eta^-(\gamma),-\lambda\}=\max\{\eta^-(0),\eta^-(\gamma),-\lambda\}=\max\{\eta^-(\gamma),-\lambda\}.$$

And

$$\max\{\eta^+(0*\chi),\theta\}=\max\{\eta^+(\chi),\theta\}\ge\min\{\eta^+(0*(\gamma*\chi),\eta^+(\gamma),\lambda\}$$
$$=\min\{\eta^+(0*0),\eta^+(\gamma),\lambda\}=\min\{\eta^+(0),\eta^+(\gamma),\lambda\}=\min\{\eta^+(\gamma),\lambda\}.$$

Proposition 3.12. Let $B=(\chi,\eta^-,\eta^+)$ is a (BF) *k*-ideal with thresholds (θ,λ) of $\aleph$. Then the following condition is hold, for all $\chi,\gamma\in\aleph$

$\min\{\eta^-(\chi*\gamma),-\theta\}\le\max\{\eta^-(\gamma),-\lambda\}$ and $\max\{\eta^+(\chi*\gamma),\theta\}\ge\min\{\eta^+(\gamma),\lambda\}$.

Proof.

Let $B=(\chi,\eta^-,\eta^+)$ be a (BF) *k*-ideal with thresholds (θ,λ) of $\aleph$. If we put $\gamma=\tau$ in (BI_2) and by using ku_2 and ku_5. We get:

$$\min\{\eta^-(\chi*\gamma),-\theta\}\le\max\{\eta^-(\chi*(\gamma*\gamma)),\eta^-(\gamma),-\lambda\}$$
$$=\max\{\eta^-(\chi*0),\eta^-(\gamma),-\lambda\}$$
$$=\max\{\eta^-(0),\eta^-(\gamma),-\lambda\}$$
$$=\max\{\eta^-(\gamma),-\lambda\}$$

And

$$\max\{\eta^+(\chi*\gamma),\theta\}\ge\min\{\eta^+(\chi*(\gamma*\gamma)),\eta^+(\gamma),\lambda\}$$
$$=\min\{\eta^+(\chi*0),\eta^+(\gamma),\lambda\}$$
$$=\min\{\eta^+(0),\eta^+(\gamma),\lambda\}$$
$$=\min\{\eta^+(\gamma),\lambda\}$$

Proposition 3.13. Let $B=(\chi,\eta^-,\eta^+)$ be a (BF) *k*-ideal with thresholds (θ,λ) of $\aleph$. If the inequality $\chi*\gamma\le\tau$ holds in $\aleph$, then $\min\{\eta^-(\gamma),-\theta\}\le\max\{\eta^-(\chi),\eta^-(\tau),-\lambda\}$ and $\max\{\eta^+(\gamma),\theta\}\ge\min\{\eta^+(\chi),\eta^+(\tau),\lambda\}$, for all $\chi,\gamma,\tau\in\aleph$.

Proof. Assume that the inequality $\chi*\gamma\le\tau$ holds in $\aleph$, then $\tau*(\chi*\gamma)=0$ and by (BI_2)

$$\min\{\eta^-(\chi*\gamma),-\theta\} \le \max\{\eta^-(\chi*(\tau*\gamma)),\eta^-(\tau),-\lambda\} =$$
$$\max\{\eta^-(\tau*(\chi*\gamma)),\eta^-(\tau),-\lambda\} = \max\{\eta^-(0),\eta^-(\tau),-\lambda\}...(1)$$

But

$$\min\{\eta^-(0*\gamma),-\theta\} = \min\{\eta^-(\gamma),-\theta\} \le \max\{\eta^-(0*(\chi*\gamma)),\eta^-(\chi),-\lambda\} =$$
$$\max\{\eta^-(\chi*\gamma),\eta^-(\chi),-\lambda\} \le \max\{\eta^-(\tau),\eta^-(\chi),-\lambda\}$$

by (1) i.e. $\min\{\eta^-(\gamma),-\theta\} \le \max\{\eta^-(\tau),\eta^-(\chi),-\lambda\}$ and

$$\max\{\eta^+((\chi*\gamma)),\theta\} \ge \min\{\eta^+(\chi*(\tau*\gamma)),\eta^+(\tau),\lambda\} = \min\{\eta^+(\tau*(\chi*\gamma)),\eta^+(\tau),\lambda\}$$
$$= \min\{\eta^+(0),\eta^+(\tau),\lambda\}...(2)$$

But

$$\max\{\eta^+(0*\gamma),\theta\} = \max\{\eta^+(\gamma),\theta\} \ge \min\{\eta^+(0*(\chi*\gamma)),\eta^+(\chi),\lambda\}$$
$$= \min\{\eta^+(\chi*\gamma),\eta^+(\chi),\lambda\} \ge \min\{\eta^+(\tau),\eta^+(\chi),\lambda\} \text{ by } (2)$$

i.e. $\max\{\eta^+(\gamma),\theta\} \ge \min\{\eta^+(\chi),\eta^+(\tau),\lambda\}$.

Theorem 3.14. Let $\aleph\aleph$ be a KU-semigroup, a (BF) set $B = (\chi,\mu^-,\mu^+)$ $B=(\chi,\eta^-,\eta^+)$ of $\aleph\aleph$ is a (BF) *k*-ideal with thresholds (θ,λ) of $\aleph$ if and only if B $B=(\chi,\eta^-,\eta^+)$ is a (BF) *S*-ideal with thresholds (θ,λ) of $\aleph$.

Proof. (⇒) Let $B = (\chi,\mu^-,\mu^+)$ $B=(\chi,\eta^-,\eta^+)$ be a (BF) *k*-ideal with thresholds (θ,λ) of $\aleph$. If we put $\chi = 0$ $\chi=0$ in (BI_2), then $\min\{\eta^-(0*\tau),-\theta\} \le \max\{\eta^-(0*(\gamma*\tau)),\eta^-(\gamma),-\lambda\}$ is $\min\{\eta^-(\tau),-\theta\} \le \max\{\eta^-(\gamma*\tau),\eta^-(\gamma),-\lambda\}$ and $\max\{\eta^+(\tau),\theta\} \ge \min\{\eta^+(\gamma*\tau),\eta^+(\gamma),\lambda\}$.

Also, since $B = (\chi,\mu^-,\mu^+)$ $B=(\chi,\eta^-,\eta^+)$ is a (BF) *k*-ideal with thresholds (θ,λ) of $\aleph$, then (BI_3) is true. Hence $B = (\chi,\mu^-,\mu^+)$ $B=(\chi,\eta^-,\eta^+)$ is a (BF) *S*-ideal with thresholds (θ,λ) of $\aleph$.

(⇐) Let $B = (\chi,\mu^-,\mu^+)$ $B=(\chi,\eta^-,\eta^+)$ be a (BF) *S*-ideal with thresholds (θ,λ) of $\aleph$, then $\min\{\eta^-(\chi*\tau),-\theta\} \le \max\{\eta^-(\gamma*(\chi*\tau)),\eta^-(\gamma),-\lambda\}$ and $\max\{\eta^+(\chi*\tau),\theta\} \ge \min\{\eta^+(\gamma*(\chi*\tau)),\eta^+(\gamma),\lambda\}$. And by Theorem (2.2)(2), we get $\min\{\eta^-(\chi*\tau),-\theta\} \le \max\{\eta^-(\chi*(\gamma*\tau)),\eta^-(\gamma),-\lambda\}$ and $\max\{\eta^+(\chi*\tau),\theta\} \ge \min\{\eta^+(\chi*(\gamma*\tau)),\eta^+(\gamma),\lambda\}$. Also, since $B = (\chi,\mu^-,\mu^+)$ $B=(\chi,\eta^-,\eta^+)$ is a (BF) *S*-ideal with thresholds (θ,λ) of $\aleph$, then (Bi_3) is true. Hence $B = (\chi,\mu^-,\mu^+)$ $B=(\chi,\eta^-,\eta^+)$ is a (BF) *k*-ideal with thresholds (θ,λ) of $\aleph$.

Theorem 3.15. The set $B=(\chi,\eta^-,\eta^+)$ of $\aleph$ is a (BF) *k*-ideal with thresholds (θ,λ) if and only if $\aleph_B^{(t,s)} \ne \phi$ is a *k*-ideal of $\aleph$. For any $(s,t) \in [-\lambda,-\theta]\times[\theta,\lambda]$

Proof. ($\Rightarrow$) Let $(s,t)\in[-\lambda,-\theta]\times[\theta,\lambda]$, $\aleph_B^{(t,s)}\neq\phi$ and $\chi,\gamma\in\aleph$ such that $\chi\in\aleph_B^{(t,s)}$, then $\eta^+(\chi)\geq t$ and $\eta^-(\chi)\leq s$, so by(BI$_2$),

$\max\{\eta^+(\gamma*0),\theta\}=\max\{\eta^+(0),\theta\}\geq\min\{\eta^+(\gamma*(\chi*0)),\eta^+(\chi),\lambda\}\geq\min\{\eta^+(0),\eta^+(\chi),\lambda\}$

$=\min\{\eta^+(0),t,\lambda\}=t$

and

$\min\{\eta^-(\gamma*0),-\theta\}=\min\{\eta^-(0),-\theta\}\leq\max\{\eta^-(\gamma*(\chi*0)),\eta^-(\chi),-\lambda\}\leq\max\{\eta^-(0),\eta^-(\chi),-\lambda\}$

$=\max\{\eta^-(0),s,-\lambda\}=s$, *which implies that* $\eta^+(0)\geq t$ *and* $\eta^-(0)\leq s$, *hence* $0\in\aleph_B^{(t,s)}$.

Let $\chi,\gamma,\tau\in\aleph$, and $(\chi*(\gamma*\tau)),\gamma\in\aleph_B^{(t,s)}$. Then $\eta^+(\chi*(\gamma*\tau))\geq t$ and $\eta^+(\gamma)\geq t$, also $\eta^-(\chi*(\gamma*\tau))\leq s$ and $\eta^-(\gamma)\leq s$. since $\mathrm{B}=(\chi,\eta^-,\eta^+)$ is a (BF) *k*-ideal with thresholds (θ,λ) of $\aleph$. Then

$\max\{\eta^+(\chi*\tau),\theta\}\geq\min\{\eta^+(\chi*(\gamma*\tau)),\eta^+(\gamma),\lambda\}\geq\min\{t,t,\lambda\}=t$ and

$\min\{\eta^-(\chi*\tau),-\theta\}\leq\max\{\eta^-(\chi*(\gamma*\tau)),\eta^-(\gamma),-\lambda\}\leq\max\{s,s,-\lambda\}=s$. This implies that, $\eta^+(\chi*\tau)\geq t$ and $\eta^-(\chi*\tau)\leq s$. Thus $\chi*\tau\in\aleph_B^{(t,s)}$. Also Let $\chi,\gamma\in\aleph_B^{(t,s)}$, then $\eta^+(\chi)\geq t$ and $\eta^+(\gamma)\geq t$, also $\eta^-(\chi)\leq s$ and $\eta^-(\gamma)\leq s$. As $\mathrm{B}=(\chi,\mu^-,\mu^+)$ is a (BF) *k*-ideal with thresholds (θ,λ) of $\aleph$, then $\min\{\eta^-(\chi\square\gamma),-\theta\}\leq\max\{\eta^-(\chi),\eta^-(\gamma),-\lambda\}=\max\{s,s,-\lambda\}=s$ and $\max\{\eta^+(\chi\square\gamma),\theta\}\geq\min\{\eta^+(\chi),\eta^+(\gamma),\lambda\}=\min\{t,t,\lambda\}=t$. Then $\eta^+(\chi\square\gamma)\geq t$ and $\eta^-(\chi\square\gamma)\leq s$. Thus $\chi\square\lambda\in\aleph_B^{(t,s)}$. Hence $\aleph_B^{(t,s)}$ is a *k*-ideal of $\aleph$.

($\Leftarrow$) Let $\chi,\gamma,\tau\in\aleph$ such that $\max\{\eta^+(\chi*\tau),\theta\}<\min\{\eta^+(\chi*(\gamma*\tau)),\eta^+(\gamma),\lambda\}$ and $\min\{\eta^-(\chi*\tau),-\theta\}>\max\{\eta^-(\chi*(\gamma*\tau)),\eta^-(\gamma),-\lambda\}$ then there exist $(s,t)\in[-\lambda,-\theta]\times[\theta,\lambda]$ such that $\max\{\eta^+(\chi*\tau),\theta\}<t\leq\min\{\eta^+(\chi*(\gamma*\tau)),\eta^+(\gamma),\lambda\}$ and $\min\{\eta^-(\chi*\tau),-\theta\}>s\geq\max\{\eta^-(\chi*(\gamma*\tau)),\eta^-(\gamma),-\lambda\}$. This shows that $\eta^+(\chi*(\gamma*\tau))\geq t$, $\eta^+(\gamma)\geq t$ and $\eta^+(\chi*\tau)<t$, also $\eta^-(\chi*(\gamma*\tau))\leq s$, $\eta^-(\gamma)\leq s$ and $\eta^-(\chi*\tau)>s$. Thus $\chi,\gamma,\tau\in\aleph_B^{(t,s)}$, since $\aleph_B^{(t,s)}$ is a *k*-ideal of $\aleph$. Then $\chi*\tau\in\aleph_B^{(t,s)}$, but this is a contradiction to $\eta^+(\chi*\tau)<t$ and $\eta^-(\chi*\tau)>s$. Thus

$\max\{\eta^+(\chi*\tau),\theta\}\geq\min\{\eta^+(\chi*(\gamma*\tau)),\eta^+(\gamma),\lambda\}$ and

$\min\{\eta^-(\chi*\tau),-\theta\}\leq\max\{\eta^-(\chi*(\gamma*\tau)),\eta^-(\gamma),-\lambda\}$. Also, suppose that $\max\{\eta^+(\chi\square\gamma),\theta\}<\min\{\eta^+(\chi),\eta^+(\gamma),\lambda\}$ and $\min\{\eta^-(\chi\square\gamma),-\theta\}>\max\{\eta^-(\chi),\eta^-(\gamma),-\lambda\}$, then there exist $(s,t)\in[-\lambda,-\theta]\times[\theta,\lambda]$ such that $\max\{\eta^+(\chi\square\gamma),\theta\}<t\leq\min\{\eta^+(\chi),\eta^+(\gamma),\lambda\}$ and $\min\{\eta^-(\chi\square\tau),-\theta\}>s\geq\max\{\eta^-(\chi),\eta^-(\gamma),-\lambda\}$. This shows that $\eta^+(\chi)\geq t$, $\eta^+(\gamma)\geq t$ and $\eta^+(\chi\square\gamma)<t$, also $\eta^-(\chi)\leq s$, $\eta^-(\gamma)\leq s$ and $\eta^-(\chi\square\gamma)>s$. Thus $\chi,\gamma\in\aleph_B^{(t,s)}$, and since $\aleph_B^{(t,s)}$ is a *k*-ideal of $\aleph$. Therefore $\chi\square\gamma\in\aleph_B^{(t,s)}$, but this is a contradiction to $\eta^+(\chi\square\gamma)<t$ and $\eta^-(\chi\square\gamma)>s$. Thus $\max\{\eta^+(\chi\square\gamma),\theta\}\geq\min\{\eta^+(\chi),\eta^+(\gamma),\lambda\}$ and

$\min\{\eta^-(\chi \square \gamma), -\theta\} \le \max\{\eta^-(\chi), \eta^-(\gamma), -\lambda\}$. The proof is completed

Theorem 3.16. If $\mathrm{B} = (\chi, \eta^-, \eta^+)$ is a (BF) *k*-ideal with thresholds (θ, λ) of $\aleph$, then $\mathrm{B}_\theta = ({}^{<}B^-_{-\theta}, {}^{>}B^+_\theta)$ is a *k*-ideal of $\aleph$, where ${}^{<}B^-_{-\theta} = \{\chi \in \aleph : \eta^-(\chi) < -\theta\}$ and ${}^{>}B^+_\theta = \{\chi \in \aleph : \eta^+(\chi) > \theta\}$.

Proof. Suppose that $\mathrm{B} = (\chi, \eta^-, \eta^+)$ is a (BF) *k*-ideal with thresholds (θ, λ) of $\aleph$, then $0 \in B_\theta$. Now, for all $\chi, \gamma, \tau \in \aleph$. Let $(\chi * (\gamma * \tau)) \in B_\theta$ and $\gamma \in B_\theta$. Then $\eta^+(\chi * (\gamma * \tau)) > \theta, \eta^+(\gamma) > \theta$ and $\eta^-(\chi * (\gamma * \tau) < -\theta, \eta^-(\gamma) < -\theta$. Since $\mathrm{B} = (\chi, \eta^-, \eta^+)$ is a (BF) *k*-ideal with thresholds (θ, λ) of $\aleph$, then $\max\{\eta^+(\chi * \tau), \theta\} \ge \min\{\eta^+(\chi * (\gamma * \tau), \eta^+(\gamma), \lambda\} > \min\{\theta, \theta, \lambda\} = \theta$ and $\min\{\eta^-(\chi * \tau), -\theta\} \le \max\{\eta^-(\chi * (\gamma * \tau), \eta^-(\gamma), -\lambda\} < \{-\theta, -\theta, -\lambda\} = -\theta$. Hence $\eta^+(\chi * \tau) > \theta$ and $\eta^-(\chi * \tau) < -\theta$. This show that $\chi * \tau \in B_\theta$. Also, for any $\chi \in B_\theta$ and $\gamma \in B_\theta$, then $\eta^+(\chi) > \theta, \eta^+(\gamma) > \theta$ and $\eta^-(\chi \square \gamma) \le -\lambda, \eta^-(\gamma) < -\theta$. Since $\mathrm{B} = (\chi, \eta^-, \eta^+)$ is a (BF) *k*-ideal with thresholds (θ, λ) of $\aleph$, then $\max\{\eta^+(\chi \square \gamma), \theta\} \ge \min\{\eta^+(\chi), \eta^+(\gamma), \lambda\} > \min\{\theta, \theta, \lambda\} = \theta$ and $\min\{\eta^-(\chi \square \gamma), -\theta\} \le \max\{\eta^-(\chi), \eta^-(\gamma), -\lambda\} < \{-\theta, -\theta, -\lambda\} = -\theta$. Hence $\eta^+(\chi \square \gamma) > \theta$ and $\eta^-(\chi \square \gamma) < -\theta$. Thus $\chi \square \gamma \in B_\theta$. Hence the set $\mathrm{B}_\theta = ({}^{<}B^-_{-\theta}, {}^{>}B^+_\theta)$ is a *k*-ideal of $\aleph$.

Theorem 3.17. A nonempty subset A of $\aleph$ is a *k*-ideal if and only if a (BF) subset $\mathrm{B} = (\chi, \eta^-, \eta^+)$ of $\aleph$ defined as follows:

$$\eta^+(\chi) = \begin{cases} \ge \lambda & if \quad \chi \in A \\ \theta & if \quad \chi \notin A \end{cases} \quad \text{and} \quad \eta^-(\chi) = \begin{cases} \le -\lambda & if \quad \chi \in A \\ -\theta & if \quad \chi \notin A \end{cases}$$ is a (BF) *k*-ideal with thresholds (θ, λ) of $\aleph$.

Proof. Since A is a *k*-ideal of $\aleph$, then $0 \in A$, hence $\eta^+(0) \ge \lambda$ and $\eta^-(0) \le -\lambda$.

Now, we have

$$\max\{\eta^+(\gamma * 0), \theta\} = \max\{\eta^+(0), \theta\} \ge \lambda = \min\{\eta^+(\gamma * (\chi * 0)), \eta^+(\chi), \lambda\}$$
$$= \min\{\eta^+(0), \eta^+(\chi), \lambda\} = \min\{\eta^+(\chi), \lambda\}$$

And

$$\min\{\eta^-(\gamma * 0), -\theta\} = \min\{\eta^-(0), -\theta\} \le -\lambda = \max\{\eta^-(\gamma * (\chi * 0)), \eta^-(\chi), -\lambda\}$$
$$= \max\{\eta^-(0), \eta^-(\chi), -\lambda\} = \max\{\eta^-(\chi), -\lambda\}$$

Hence $0 \in \mathrm{B} = (\chi, \eta^-, \eta^+)$

Let $\chi, \gamma, \tau \in \aleph$ be such that $(\chi * (\gamma * \tau)) \in A$ and $\gamma \in A$, then $(\chi * \tau) \in A$. Hence $\eta^+(\chi * \tau) \ge \lambda$ and $\eta^-(\chi * \tau) \le -\lambda$. Therefore $\max\{\eta^+(\chi * \tau), \theta\} \ge \lambda = \min\{\eta^+(\chi * (\gamma * \tau)), \eta^+(\gamma), \lambda\}$ and $\min\{\eta^-(\chi * \tau), -\theta\} \le -\lambda = \max\{\eta^-(\chi * (\gamma * \tau)), \eta^-(\gamma), -\lambda\}$. If $\chi \notin A$, $\gamma \notin A$ or $\tau \notin A$, then $\min\{\eta^+(\chi * (\gamma * \tau)), \eta^+(\gamma), \lambda\} = \theta$ and $\max\{\eta^-(\chi * (\gamma * \tau)), \eta^-(\gamma), -\lambda\} = -\theta$. Thus $\max\{\eta^+(\chi * \tau), \theta\} \ge \theta = \min\{\eta^+(\chi * (\gamma * \tau)), \eta^+(\gamma), \lambda\}$ and

$\min\{\eta^-(\chi*\tau),-\theta\} \le -\theta = \max\{\eta^-(\chi*(\gamma*\tau)),\eta^-(\gamma),-\lambda\}$. Also, let $\chi \in \aleph$ and $\gamma \in A$, then $(\chi \square \gamma) \in A$. Hence $\eta^+(\chi \square \gamma) \ge \lambda$ and $\eta^-(\chi \square \gamma) \le -\lambda$. Therefore $\max\{\eta^+(\chi \square \gamma),\theta\} \ge \lambda = \min\{\eta^+(\chi),\eta^+(\gamma),\lambda\}$ and $\min\{\eta^-(\chi*\tau),-\theta\} \le -\lambda = \max\{\eta^-(\chi*(\gamma*\tau)),\eta^-(\gamma),-\lambda\}$. If $\chi \notin A$, $\gamma \notin A$ or $\tau \notin A$, then $\min\{\eta^+(\chi*(\gamma*\tau)),\eta^+(\gamma),\lambda\} = \theta$ and $\max\{\eta^-(\chi*(\gamma*\tau)),\eta^-(\gamma),-\lambda\} = -\theta$. Thus $\max\{\eta^+(\chi \square \gamma),\theta\} \ge \theta = \min\{\eta^+(\chi),\eta^+(\gamma),\lambda\}$ and $\min\{\eta^-(\chi \square \gamma),-\theta\} \le -\theta = \max\{\eta^-(\chi),\eta^-(\gamma),-\lambda\}$. Consequently $\mathrm{B} = (\chi,\eta^-,\eta^+)$ is a (BF) *k*-ideal with thresholds (θ,λ) of $\aleph$.

Conversely, let $(\chi*(\gamma*\tau)) \in A$ and $\gamma \in A$. Then $\eta^+(\chi*(\gamma*\tau)) \ge \lambda$, $\eta^+(\gamma) \ge \lambda$ and $\eta^-(\chi*(\gamma*\tau)) \le -\lambda, \eta^-(\gamma) \le -\lambda$. As $\mathrm{B} = (\chi,\eta^-,\eta^+)$ is a (BF) *k*-ideal with thresholds (θ,λ) of $\aleph$. Therefore $\max\{\eta^+(\chi*\tau),\theta\} \ge \min\{\eta^+(\chi*(\gamma*\tau)),\eta^+(\gamma),\lambda\} \ge \min\{\lambda,\lambda,\lambda\} = \lambda$

And $\min\{\eta^-(\chi*\tau),-\theta\} \le \max\{\eta^-(\chi*(\gamma*\tau)),\eta^-(\gamma),-\lambda\} \le \{-\lambda,-\lambda,-\lambda\} = -\lambda$. This implies that $\eta^+(\chi*\tau) \ge \lambda$ and $\eta^-(\chi*\tau) \le -\lambda$. Hence $(\chi*\tau) \in A$. Also, let $\chi,\gamma \in A$, then $\mu^+(\chi) \ge \lambda$, $\mu^+(\gamma) \ge \lambda$ and $\mu^-(\chi) \le -\lambda, \mu^-(\gamma) \le -\lambda$. As $\mathrm{B} = (\chi,\eta^-,\eta^+)$ is a (BF) *k*-ideal with thresholds (θ,λ) of $\aleph$. Therefore $\max\{\eta^+(\chi \square \gamma),\theta\} \ge \min\{\eta^+(\chi),\eta^+(\gamma),\lambda\} \ge \min\{\lambda,\lambda,\lambda\} = \lambda$

And $\min\{\eta^-(\chi \square \gamma),-\theta\} \le \max\{\eta^-(\chi),\eta^-(\gamma),-\lambda\} \le \{-\lambda,-\lambda,-\lambda\} = -\lambda$. This implies that $\eta^+(\chi \square \gamma) \ge \lambda$ and $\eta^-(\chi \square \gamma) \le -\lambda$. Hence $(\chi \square \gamma) \in A$. It follows that A is a *k*-ideal of $\aleph$.

Abstract. In the present work, the new quartic trigonometric B-spline approach based on finite difference scheme is described to solve the one dimensional non-linear equation of (Benjamin – Bona-Mahony- Burger). Dirichlet boundary with the help of applying the von-Neumann stability analysis is also used in this description. While the time derivative part is discretized by using the finite difference scheme. In the space dimension, the quartic trigonometric B-spline is also used as an interpolation function. The execution of this method which is used in the present work showed that the quartic trigonometric B-spline method is a more efficient and effective tool and gives better results according to the comparisons that are made with the precise solution for a different time and some other published numerical methods.

1. Introduction

Nonlinear phenomena have important roles in physical and engineering issues in addition to that in applied mathematics they take different parameters depending on various factors. The mathematics model of propagation of small amplitude long waves in nonlinear dispersive media is described by the following (B-B-M-B) equation [3].

$$\frac{\partial \varpi}{\partial t}+\delta\frac{\partial \varpi}{\partial x}+\varpi\frac{\partial \varpi}{\partial x}-\lambda\frac{\partial \varpi}{\partial xx}-\frac{\partial \varpi}{\partial xxt}=0 \qquad x\in[\psi,\tau]\,,t\in[0,T] \tag{1}$$

For both δ and λ are constants, and applying the flowed initial and boundary conditions

$$u(x,0)=g(x) \qquad x\in[\psi,\tau] \tag{2}$$

$$u(\psi,t)=u(\tau,t)=0 \tag{3}$$

In the case of physical applications, the dispersive effect of Equation 1 same as (B-B-M-B) equation, while the dissipative effect is similar to Burgers equation that is an alternative sample for Korteweg-de Vries Burger's equation.

In the previous studies, many researchers are focused to solve same these equations by applying different numerical methods'. Arora et al. [1] solved the BBM-Burger by used the quartic B-spline approach, and he got good results as compared with the exact solution and the other researchers' solutions. Omrain & Ayadi [2] are used the Crank-Nicolson-type finite difference method to prove the stability and uniqueness of the corresponding approaches by the means of the discrete energy method. Salih et al. [3] presented the cubic trigonometric B-spline approach to solve (B-B-M-B) equations. They have obtained good results with high rate of accuracy and efficiency when they have compared the fining results with those ones obtained by Zarebnia & Parvaz [4], where they have used the cubic B-spline collection method to solve the same equation. Yin & Piao [5] solved the equation by using the

quadratic B-Spline finite element method. The predicted numerical solutions give that the scheme is efficient and feasible when compared with the exact solution.

Because of the effectiveness of the B-spline method in a numerical solution for different linear partial and non-linear differential equations, it has great attention on interest in its use in many previous works that are mentioned in the literature. It also has many geometric properties such as local support and the ability to deal with local phenomena, which makes it used in a solution of partial non-linear differential equations effortlessly and easily. The trigonometric B-spline (T-BS) gives more accurate results than the T-BS functions for solving the non-linear initial boundary value problems [6].

In the present work, the (QT-BS) method will represent to obtain the approximate solution of the (B-B-M-B) equation. Zin et al [7] used this approach to obtain a numerical solution to the Korteweg-de Vries equation. The detailed outline of this work deals with the following: In section2, discuss the (QT-BS) method will explain. In section 3, discussing the proposed numerical solution. In section 4, investigate the stability of the method. In section 5, the obtained results of approximate experiments will present and then compared with the obtained results for some of the previous methods. Finally, in section 6, the conclusions of the current work will write down.

QT-BS Method

In this section, we give the QT basis function based on [7, 8].

$$TB_{5,j}(x)=\frac{1}{z}\begin{cases}\eta^4(x_j), & x\in[x_j,x_{j+1})\\ \eta^3(x_j)\sigma(x_{j+2})+\eta^2(x_j)\sigma(x_{j+3}) & x\in[x_{j+1},x_{j+2})\\ +\eta(x_j)\sigma(x_{j+4})\eta^2(x_{j+1})+\sigma(x_{j+5})\eta^3(x_{j+1}),\\ \eta^2(x_j)\sigma^2(x_{j+3})+\eta(x_j)\sigma(x_{j+4})\eta(x_{j+1})\sigma(x_{j+3})\\ +\eta(x_j)\sigma^2(x_{j+4})\eta(x_{j+2})+\sigma(x_{j+5})\eta^2(x_{j+1})\sigma(x_{j+3}) & x\in[x_{j+2},x_{j+3})\\ +\sigma(x_{j+5})\eta(x_{j+1})\sigma(x_{j+4})\eta(x_{j+2})+\sigma^2(x_{j+5})\eta^2(x_{j+2}),\\ \eta(x_j)\sigma^3(x_{j+4})+\sigma(x_j+5)\eta(x_{j+1})\sigma^2(x_{j+4}) & x\in[x_{j+3},x_{j+4}]\\ +\sigma^2(x_{j+5})\eta(x_{j+2})\sigma(x_{j+4})+\sigma^3(x_{j+5})\eta(x_{j+3}),\\ \sigma^4(x_{j+5}), & x\in[x_{j+4},x_{j+5}]\\ 0 & otherwise\end{cases} \tag{4}$$

where $\eta(x_j)=\sin\left(\frac{x-x_j}{2}\right)$, $\sigma(x_j)=\sin\left(\frac{x_j-x}{2}\right)$ and $z=\sin\left(\frac{h}{2}\right)\sin(h)\sin\left(\frac{3h}{2}\right)\sin(2h)$

Due to the B-spline's domestic support characteristics, there are only four non-zero functions, $B_{5,j-4}(x_j), B_{5,j-3}(x_j), B_{5,j-2}(x_j)\ and\ B_{5,j-1}(x_j)$ over subinterval $[x_j, x_{j+1}]$.

Where $h=(\tau-\psi)/n$ and values of $TB_{5,j}(x)$ are tabulated in Table 1

Table 1: Values of $TB_i^4(x)$

x	x_{j-4}	x_{j-3}	x_{j-2}	x_{j-1}	x_j
$TB_{5,j}$	κ_1	κ_2	κ_2	κ_1	0
TB'_j	κ_3	κ_4	κ_4	κ_3	0
TB''_j	κ_5	κ_5	κ_5	κ_5	0

TB_j'''	κ_6	κ_7	κ_7	κ_6	0

Where

$$\kappa_1=\frac{\sin^3(\frac{h}{2})}{\sin(h)\sin(\frac{3h}{2})\sin(2h)} \quad ,\kappa_2=\frac{5+6\cos(h)}{8\cos^2(h)\cos(h)(1+2\cos(h))}$$

$$\kappa_3=\frac{1}{2\sin(h)\cos(h)(1+2\cos(h))} \quad ,\kappa_4=-\frac{1}{\sin(2\mathrm{h})},\kappa_5=\frac{1}{\sin(h)\sin(2h)}$$

$$\kappa_6=\frac{\cos(\frac{h}{2})(1-4\cos(h))}{\sin(h)\sin(\frac{3h}{2})\sin(2h)} \quad , \quad \kappa_7=\frac{1+2\cos(h)}{2\sin^2(\frac{h}{2})\sin(2h)}$$

3. Numerical Approach

The QT-BS method will be discussed in this section for solving the (B-B-M-B) equation numerically. The solution domain will be divided equally in the knots into subintervals. Our aim for (B-B-M-B) equation is using QT-BS to find an approximate solution like [8, 9].

$$\varpi_j=\sum_{j=-4}^{n-1}C_jTB_{5,j}(x) \tag{5}$$

where $C_j(t)$ is a time dependent unknown to be determined where $j=0,1,2,...,n$. In order to obtain approximate estimates of the solution, the values of $B_{5,j}(x)$ and its derivatives at the node points are required and these derivatives are tabulated by using approximate functions (4) and (5). The values at the U_i^j node and its derivatives up to second order are

$$\begin{cases}(\varpi)_j^i=\kappa_1C_{j-4}^i+\kappa_2C_{j-3}^i+\kappa_2C_{j-2}^i+\kappa_1C_{j-1}^i,\\(\varpi_x)_j^i=\kappa_3C_{j-4}^i+\kappa_4C_{j-3}^i-\kappa_4C_{j-2}^i-\kappa_3C_{j-1}^i\\(\varpi_{xx})_j^i=\kappa_5C_{j-4}^i-\kappa_5C_{j-3}^i-\kappa_5C_{j-2}^i+\kappa_5C_{j-1}^i\\(\varpi_{xxx})_j^i=\kappa_6C_{j-4}^i+\kappa_7C_{j-3}^i-\kappa_7C_{j-2}^i-\kappa_6C_{j-1}^i\end{cases} \tag{6}$$

The approximations for the solutions of (B-B-M-B) equation at t_{j+1} th time level can be as

$$[\frac{(\varpi-\varpi_{xx})^{n+1}-(\varpi-\varpi_{xx})^n}{\Delta t}]+\theta\kappa_j^{n+1}+(1-\theta)\kappa_j^n=0 \tag{7}$$

Where $\kappa_j^n=[-\lambda(\varpi_{xx})_j^n+(\varpi\varpi_x)_j^n+\delta(\varpi_x)_j^n]$ and the subscripts n and $n+1$ are successive time levels, $n=0,1,2,..$ and Δt is the time step. By using the following formula:

$$(\varpi\varpi_x)^{n+1}=\varpi^{n+1}\varpi_x^n+\varpi^n\varpi_x^{n+1}-\varpi^{n+1}\varpi_x^n \tag{8}$$

The scheme equation (7) with the placement of the nodal w and derivatives using (6) becomes the following difference equation with variable C_j, $j=-4,...,\mathrm{n}-1$ and noted the crank-Nicolson scheme when $\theta=0.5$

$$\dagger_1C_{j-4}^{n+1}+\dagger_2C_{j-3}^{n+1}+\dagger_3C_{j-2}^{n+1}+\dagger_4C_{j-1}^{n+1}=\lambda_1C_{j-4}^{n+1}+\lambda_2C_{j-3}^{n+1}+\lambda_3C_{j-2}^{n+1}+\lambda_4C_{j-1}^{n+1} \tag{9}$$

Where

$$\dagger_1 = (1+\frac{\Delta t}{2}\varpi_x^n)\kappa_1 + \frac{\Delta t}{2}(\varpi^n+\delta)\kappa_3 - (1+\frac{\alpha\,\Delta t}{2})\kappa_5$$
$$\dagger_2 = (1+\frac{\Delta t}{2}\varpi_x^n)\kappa_2 + \frac{\Delta t}{2}(\varpi^n+\delta)\kappa_4 + (1+\frac{\lambda\,\Delta t}{2})\kappa_5$$
$$\dagger_3 = (1+\frac{\Delta t}{2}\varpi_x^n)\kappa_2 - \frac{\Delta t}{2}(\varpi^n+\delta)\kappa_4 + (1+\frac{\lambda\,\Delta t}{2})\kappa_5$$
$$\dagger_4 = (1+\frac{\Delta t}{2}\varpi_x^n)\kappa_1 - \frac{\Delta t}{2}(\varpi^n+\delta)\kappa_3 - (1-\frac{\lambda\,\Delta t}{2})\kappa_5$$
$$\lambda_1 = \kappa_1 - \frac{\Delta t\delta}{2}\kappa_3 + (\frac{\Delta t}{2}\lambda - 1)\kappa_5 \qquad (10)$$
$$\lambda_2 = \kappa_2 - \frac{\Delta t\delta}{2}\kappa_4 + (1-\frac{\Delta t}{2}\lambda)\kappa_5$$
$$\lambda_3 = \kappa_2 - \frac{\Delta t\delta}{2}\kappa_4 + (1-\frac{\Delta t}{2}\lambda)\kappa_5$$
$$\lambda_4 = \kappa_1 + \frac{\Delta t\delta}{2}\kappa_3 + (\frac{\Delta t}{2}\lambda - 1)\kappa_5$$

On simplification (9) the system consists of a linear equation $(N+1)$ in $(N+4)$ unknown $C^n = [C_{j-4}^n, ..., C_{N-1}^n]$ at the time level $t = t_{i+1}$. In order to obtain the unique solution to the system, adds three equations obtained from the boundary conditions. The system consists $(N+4)\times(N+4)$ as follows:

$$\vartheta_{(N+4)\times(N+4)}\, C_{1xN+4}^{n+1} = \zeta_{(N+4)\times(N+4)}\, C_{1xN+4}^{n}$$

From the initial conditions and its derivatives, we will compute initial vector by use it get approximate solution

$$\begin{cases} (\varpi_j^0)_x = g'(x_j) & j = 0 \\ (\varpi_j^0)_{xx} = g''(x_j) & j = 0 \\ \varpi_j^0 = g(x_j) & j = 0,1,..N \\ (\varpi_j^0)_x = g'(x_j) & j = N \end{cases} \qquad (11)$$

From equation (11), we obtain the system consist $(N+4)\times(N+4)$ which can be solved by Gauss-Jordan elimination method [8].

4. Stability Analysis

In this section, the investigation was performed to stability analysis of the proposed scheme using the von Neumann method. The nonlinear term $\varpi\varpi_x$ is linearized as considering a constant as α in equation (1). Therefore, the equation that is got is the same as of [1].

$$\varpi_t + \delta\varpi_x + \alpha\varpi_x - \lambda\varpi_{xx} - \varpi_{xxt} = 0$$

The linearized form of proposed scheme as following:

$$\hbar_1 C_{j-4}^{n+1} + \hbar_2 C_{j-3}^{n+1} + \hbar_3 C_{j-2}^{n+1} + \hbar_4 C_{j-1}^{n+1} = \Omega_1 C_{j-4}^{n+1} + \Omega_2 C_{j-3}^{n+1} + \Omega_3 C_{j-2}^{n+1} + \Omega_4 C_{j-1}^{n+1} \qquad (12)$$

where

$$\hbar_1 = \kappa_1 + \frac{\Delta t}{2}(\alpha+\delta)\kappa_3 - (1+\frac{\lambda\Delta t}{2})\kappa_5 \ ,$$

$$\hbar_2 = \kappa_2 + \frac{\Delta t}{2}(\alpha+\delta)\kappa_4 + (1+\frac{\lambda\Delta t}{2})\kappa_5 \ ,$$

$$\hbar_3 = \kappa_2 - \frac{\Delta t}{2}(\alpha+\delta)\kappa_4 + (1+\frac{\lambda\Delta t}{2})\kappa_5 \ ,$$

$$\hbar_4 = \kappa_1 - \frac{\Delta t}{2}(\alpha+\delta)\kappa_3 - (1+\frac{\lambda\Delta t}{2})\kappa_5 \ ,$$

$$\Omega_1 = \kappa_1 - \frac{\Delta t}{2}(\alpha+\delta)\kappa_3 + (-1+\frac{\lambda\Delta t}{2})\kappa_5 \ ,$$

$$\Omega_2 = \kappa_2 - \frac{\Delta t}{2}(\alpha+\delta)\kappa_4 + (-1+\frac{\lambda\Delta t}{2})\kappa_5 \ ,$$

$$\Omega_3 = \kappa_2 + \frac{\Delta t}{2}(\alpha+\delta)\kappa_4 + (1-\frac{\lambda\Delta t}{2})\kappa_5 \ ,$$

$$\Omega_4 = \kappa_1 + \frac{\Delta t}{2}(\alpha+\delta)\kappa_3 + (-1+\frac{\lambda\Delta t}{2})\kappa_5 \ ,$$

Substitution of $D_j^n = \delta^n \exp(imh\eta)$ into equation (12) where $= \sqrt{-1}$, after simplifying the equation (12), we get

$$\xi = \frac{A_1 + iB_1}{A_2 + iB_2} \tag{13}$$

where

$$A_1 = (\kappa_2 + \frac{\Delta t}{2}(\alpha+\delta)\kappa_4) + (\kappa_1 - \frac{\Delta t}{2}(\alpha+\delta)\kappa_3 +)(\cos(2\eta h))$$

$$+((\kappa_2 - \frac{\Delta t}{2}(\alpha+\delta)\kappa_4 + 2(-1+\frac{\lambda\Delta t}{2})\kappa_5) + (\kappa_1 + \frac{\Delta t}{2}(\alpha+\delta)\kappa_3 +))(\cos(\eta h))$$

$$B_1 = (((\kappa_1 + \frac{\Delta t}{2}(\alpha+\delta)\kappa_3) - (\kappa_2 - \frac{\Delta t}{2}(\alpha+\delta)\kappa_4))(\sin(\eta h))$$

$$-(\kappa_1 - \frac{\Delta t}{2}(\alpha+\delta)\kappa_3 + (-1+\frac{\lambda\Delta t}{2})\kappa_5)(\sin(2\eta h))$$

$$A_2 = (\kappa_2 - \frac{\Delta t}{2}(\alpha+\delta)\kappa_4) + ((\kappa_1 + \frac{\Delta t}{2}(\alpha+\delta)\kappa_3)(\cos(2\eta h)))$$

$$+((\kappa_2 + \frac{\Delta t}{2}(\alpha+\delta)\kappa_4) + (\kappa_1 - \frac{\Delta t}{2}(\alpha+\delta)\kappa_3))(\cos(\eta h))$$

$$B_2 = (\kappa_1 - \frac{\Delta t}{2}(\alpha+\delta)\kappa_3 - 2(1+\frac{\lambda\Delta t}{2})\kappa_5) - \kappa_2 - \frac{\Delta t}{2}(\alpha+\delta)\kappa_4))(\sin(\eta h))$$

$$-(\kappa_1 + \frac{\Delta t}{2}(\alpha+\delta)\kappa_3 - (1+\frac{\lambda\Delta t}{2})\kappa_5)(\sin(2\eta h))$$

simplifying the equation (13), we obtain

$$0 \le \frac{g_5}{-2+g_5} \le \cos(\eta h) - 1$$

So the linear numerical diagram of the (B-B-M-B) equation is unconditionally stable.

5. Test problem and discussion

The efficiency and accurateness of the proposed method can be illustrated in the following two examples in this section with L_∞ and L_2 being the error criteria that are computed by $L_\infty = \max_i \left|\varpi_j^{exact} - \varpi_i^{num}\right|$ and $L_2 = \sqrt{h\left(\sum_i^n \left|\varpi_j^{exact} - \varpi_j^{num}\right|^2\right)}$

The conservation laws apply on equation (1) as follows [9].

$$C_1 = \int_\psi^\tau \varpi(x,t)dx,\ C_2 = \int_\psi^\tau \varpi(x,t)^2 dx,\ C_3 = \int_\psi^\tau [\varpi(x,t)^2 + \frac{1}{3}\varpi(x,t)^3]dx$$

Where C_1, C_2, C_3 match mass, momentum and energy, respectively.

Then for validation, the numerical solutions obtained by testing the QT-BS method of equation (B-B-M-B) (1) are compared with the precise solutions and with the results of numerical methods that have been found in the literature. It was noted that numerical results are expected at different time scales.

Example 5.1

Consider the (B-B-M-B) problem [3] with $\delta = 1.0$ and $\lambda = 1.0$,

$$\varpi_t + \varpi_x + \varpi\varpi_x - \varpi_{xxt} - \varpi_{xx} = 0 \qquad x \in [-12,12]\ , t \in [0,T]$$

with initial condition

$$\varpi(x,0) = g(x) = \sec h^2\left(x/4\right),\ -12 \le x \le 12$$

boundary conditions as follows:

$$\varpi(-12,t) = \sec h^2\left(-3 - t/3\right), \varpi(12,t) = \sec h^2\left(3 - t/3\right)$$

The precise solution of this problem is $\varpi(x,t) = \sec h^2\left(x/4 - t/3\right)$. The QT-BS method is employed to calculate the numerical solutions of this problem. For the purpose of comparison, the numerical results obtained in this paper are found to be more accurate as compared to CuBS [4]. The absolute errors at different time levels with $h = 1/200$ and $\Delta t = 0.01$ at different time levels in Table 2 and Table 3. Figuer1 shows a graph of approximate space-time and a good agreement with their precise solutions at $0.2 \le t \le 1$. Figuer2 depicts the error at T=2 and A=200.

6. Conclusions

The quartic trigonometric B-spline method is proposed to solve the BBM-Berger equation in the present work. Applying this method is occurred by taking two examples and then compare the results with cubic B-spline method as in example one. The obtained results from the proposed method are given more accuracy than the cubic B-spline method but in example two the comparison is made with both quartic B-spline and finite difference methods. Then, the founded results from the proposed methods give high accuracy and efficiency than both of quartic B-spline and finite difference methods. Finally, the obtained results from the proposed method are validated with the von Neumann method for the purpose of checking the stability and getting unconditionally stable.

Abstract. In this paper, a new class of non-convex functions called semi strongly (E, F)-convex functions are presented. This class represents a natural extension of semi strongly E-convex functions shown in the literature. Different properties of this class of functions are discussed. Optimality properties of constrained optimization problems in which the objective function or the inequality constraints functions are semi strongly (E, F)-convex are proved for this class.

1. Introduction and Preliminaries

Convex analysis studied and employed widely in applied mathematics, especially in optimization and optimal control (see e.g., [1-2]). Several attempts were made in the literature to generalize and extend convex sets and convex functions. For instance, the class of E-convex sets and E-convex functions, introduced first by Youness [3], that introduced as one class of generalized classical convex sets and convex functions in finite dimensional Euclidian space. Youness inspired many researchers to extend many concepts from convex analysis into E-convexity and applying E-convexity in optimization problems see (e.g., [4-12]). The class of E-convex sets and E-convex functions is extended into strongly E-convex sets and E-convex functions [13-14]. Moreover, E-convexity results extended to new classes such as semi E-convex functions [15-16] and semi strongly E-convex functions [17]. E-convex sets and functions are also extended to another class called (E, F)-convex sets and (E, F)-convex functions [18-19]. The results related to semi E-convexity mentioned earlier are also extended into semi (E, F)-convexity [20]. By combining semi strongly E-convexity and (E, F)-convexity, we introduce in this paper the class of semi strongly (E, F)-convex functions and studying some of their properties. In section 2, the definition of strongly (E, F)-convex functions are introduced, and some examples related to the new function are shown. In section 3, some important properties related to semi strongly (E, F)-convex functions are proved. Finally, section 4 discusses some optimality criteria of a constrained optimization problem are proved as an application of (E, F)-convexity to optimization problems in this section.

Denote by $\mathbb{R}^n$, the n-dimensional Euclidean space. Throughout the paper, the following assumption is required.

Assumption: Let $\emptyset \neq S \subseteq \mathbb{R}^n$ and $f: \mathbb{R}^n \to \mathbb{R}$ be a real valued function. Suppose that $E, F: \mathbb{R}^n \to \mathbb{R}^n$ are two mappings.

For the rest of the paper, S, f, E, and F are defined as in the Assumption. Next, some definitions and related concepts that are necessary in the sequel are recalled.

Definition 1.1 Let $S, f, E,$ and F are assumed as in the Assumption then, for each $x, y \in S$ and for each $\delta \in [0,1]$, S is called

1. E-convex if $\delta E(x) + (1-\delta)E(y) \in S$. [3]
2. Strongly E-convex set if $\delta(\alpha x + E(x))) + (1-\delta)(\alpha y + E(y)) \in S$. for all $\alpha \in [0,1]$. [13]
3. (E,F)-convex if $\delta E(x) + (1-\delta)F(y) \in S$. [18]
4. Strongly (E,F)-convex set if $\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy) \in S$. for all $\alpha \in [0,1]$. [21]

Remark 1.2

i. For the rest of the paper, $E(x)$ and $F(y)$ are written as Ex and Fy.
ii. In [18], the mappings E and F are considered as point to set maps. As a result, the set S is called (E,F)-convex if $\delta E(x) + (1-\delta)F(y) \subseteq S$. In this paper, we deal with E and F as point to point mappings.

Proposition 1.3 If $S_i \subseteq \mathbb{R}^n$, for $i = 1,2,\dots,m$, are strongly (E,F)-convex sets, then $\bigcap_{i=1}^{m} S_i$ is a strongly (E,F)-convex set.

Proof. Let $x, y \in \bigcap_{i=1}^{m} S_i$ and $\lambda, \alpha \in [0,1]$, this means $x, y \in S_i$, for each $i = 1,2,\dots,m$. From the assumption, S_i is strongly (E,F)-convex set, we get $\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy) \in S_i$ for all $i = 1,2,\dots,m$. This means, $\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy) \in \bigcap_{i=1}^{m} S_i$. Hence, $\bigcap_{i=1}^{m} S_i$ is strongly (E,F)-convex set.

Definition 1.4 Let $S, f, E,$ and F are assumed as in the Assumption then, for each $x, y \in S$ and for all $\delta, \alpha \in [0,1]$, f is called

1. E-convex function if S is E-convex and $f(\delta Ex + (1-\delta)Ey) \leq \delta f(Ex) + (1-\delta)f(Ey)$. [3]
2. Strongly E-convex function if S is strongly E-convex and $f(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Ey)) \leq \delta f(Ex) + (1-\delta)f(Ey)$. [13]
3. Semi strongly E-convex function if S is strongly E-convex and $f(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Ey)) \leq \delta f(x) + (1-\delta)f(y)$. [17]
4. (E,F)-convex function if S is (E,F)-convex and $f(\delta Ex + (1-\delta)Fy) \leq \delta f(Ex) + (1-\delta)f(Fy)$. [18]
5. Semi (E,F)-convex function if S is (E,F)-convex and $f(\delta Ex + (1-\delta)Fy) \leq \delta f(x) + (1-\delta)f(y)$. [20]
6. Strongly (E,F)-convex function on S, if S is strongly (E,F)-convex and $f\big(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy)\big) \leq \delta f(Ex) + (1-\delta)f(Fy)$. [21]

Definition 1.5 [1] The level set of f is denoted by H_γ and defined as $H_\gamma = \{x \in S : f(x) \leq \gamma\}$.

2. Semi strongly (E,F)-convex functions

In this section, we introduce the concepts of semi strongly (E,F)-convex and provide some related examples and properties.

Definition 2.1 Let S is a strongly (E,F)-convex set. A function f is called semi strongly (E,F)-convex function on S, if for each $x, y \in S$ and $\delta, \alpha \in [0,1]$,

$f\big(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy)\big) \le \delta f(x) + (1-\delta) f(y)$.
The function f is called strictly semi strongly (E,F)-convex if for each $x, y \in S$ $(x \ne y)$,
$f\big(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy)\big) < \delta f(x) + (1-\delta) f(y)$.

Remark 2.2 Every semi strongly (E,F)-convex function is semi (E,F)-convex function [21] (when $\alpha = 0$). The converse is not true as the following example shows.

Example 2.3 Let $S = \mathbb{R}$, $f: \mathbb{R} \to \mathbb{R}$, and $E, F: \mathbb{R} \to \mathbb{R}$ such that

$$f(x) = \begin{cases} 1 & \text{if } x = 0 \\ -3 & \text{otherwise} \end{cases}, \quad E(x) = \begin{cases} 0 & \text{if } x = 0 \\ 3 & \text{otherwise} \end{cases}$$

and $F(x) = \begin{cases} 0 & \text{if } x = 0 \\ 1 & \text{otherwise} \end{cases}$.

Let $x, y \in \mathbb{R}$ and $\delta \in [0,1]$. First, we show that

$$f(\delta Ex + (1-\delta)Fy) \le \delta f(x) + (1-\delta) f(y).$$

We consider four cases:
Case 1: If $x = y = 0$, then

$$f(\delta Ex + (1-\delta)Fy) = f(\delta E(0) + (1-\delta)F(0)) = f(0) = 1, \text{ and}$$
$$\delta f(x) + (1-\delta) f(y) = \delta f(0) + (1-\delta) f(0) = \delta(1) + (1-\delta)(1) = 1.$$

Case 2: If $x \ne 0$ and $y \ne 0$, then

$$f(\delta Ex + (1-\delta)Fy) = f\big(\delta(3) + (1-\delta)(1)\big) = f(2\delta + 1) = -3, \text{ and}$$
$$\delta f(x) + (1-\delta) f(y) = \delta(-3) + (1-\delta)(-3) = -3.$$

Case 3: If $x = 0$ and $y \ne 0$, then

$$f(\delta Ex + (1-\delta)Fy) = f(\delta(0) + (1-\delta)(1))$$
$$= f(1-\delta) = \begin{cases} 1 & if\ \delta = 1 \\ -3 & if\ \delta \ne 1 \end{cases},$$

On the other hand, $\delta f(x) + (1-\delta) f(y) = \delta f(0) + (1-\delta) f(y)$
$$= \delta(1) + (1-\delta)(-3) = 4\delta - 3$$

If $\delta = 1$, then $4\delta - 3 = 1$ and if $0 \le \delta < 1$, then $4\delta - 3 \ge -3$

Case 4: If $x \ne 0$ and $y = 0$, then

$$f(\delta Ex + (1-\delta)Fy) = f(\delta(3) + (1-\delta)(0))$$
$$= f(3\delta) = \begin{cases} 1 & if\ \delta = 0 \\ -3 & \text{otherwise} \end{cases},$$

and $\delta f(x) + (1-\delta) f(y) = \delta f(x) + (1-\delta) f(0)$
$$= \delta(-3) + (1-\delta)(1) = -4\delta + 1$$

If $\delta = 0$, then $-4\delta + 1 = 1$ and if $0 < \delta \le 1$, then $-4\delta + 1 \ge -3$.

All cases imply that, $f\big(\delta(Ex) + (1-\delta)(Fy)\big) \le \delta f(x) + (1-\delta) f(y)$.
Hence, f is semi (E,F)-convex function.
Now, let $\alpha = \frac{1}{2}$, $x = -6$, $y = 1$, $\delta = 1$, then

$$f\big(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy)\big) = f\big(-3 + E(-6)\big)$$
$$= f(-3 + 3) = 1. \qquad (2.1)$$

On the other hand, $\delta f(x) + (1-\delta)f(y) = f(-6) = -3.$ (2.2)
From (2.1) and (2.2),

$$f\big(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy)\big) > \delta f(x) + (1-\delta)f(y),$$

which shows that f is not semi strongly (E,F)-convex function.

Remark 2.4 A strongly (E,F)-convex function is not necessary semi strongly (E,F)-convex function as it is illustrated in the next example.

Example 2.5 Let $S = \mathbb{R}$ and $f, E, F: \mathbb{R} \to \mathbb{R}$ such that for each $x \in \mathbb{R}$

$$f(x) = \begin{cases} 2 & if\ x \in [0,2] \\ 1 & otherwise \end{cases},$$

$E(x) = 0$ and $F(x) = \frac{1}{2}$. From [21, Example 2.9], f is a strongly (E,F)-convex function. Now, let $\alpha = \frac{1}{2}$, $x = 2$, $y = -1$, $\delta = 0$, then $f\big(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy)\big) = f(0) = 2.$ (2.3)
And, $\delta f(x) + (1-\delta)f(y) = (1-0)f(-1) = 1.$ (2.4)
From (2.3) and (2.4), $f\big(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy)\big) > \delta f(x) + (1-\delta)f(y)$.
This yield, f is not semi strongly (E,F)-convex function.

Proposition 2.6 If f is a semi strongly (E,F)-convex function on a strongly (E,F)-convex set S, then $f(\alpha x + Ex) \le f(x)$ and $f(\alpha y + Fy) \le f(y)$, for each $x, y \in S$ and $\alpha \in [0,1]$.
Proof. Suppose that f is a semi strongly (E,F)-convex function on a strongly (E,F)-convex set S, then for each $x, y \in S$ and $\alpha, \delta \in [0,1]$, we have $\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy) \in S$ and $f\big(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy)\big) \le \delta f(x) + (1-\delta)f(y)$. Thus for $\delta = 1$, $f(\alpha x + Ex) \le f(x)$ and for $\delta = 0$, we obtain $f(\alpha y + Fy) \le f(y)$.

Next proposition shows the relation between strongly (E,F)-convex function and semi strongly (E,F)-convex function.

Proposition 2.7 Let S be a strongly (E,F)-convex set. Then, a strongly (E,F)-convex function f on S is semi strongly (E,F)-convex function if and only if $f(Ex) \le f(x)$ and $f(Fy) \le f(y)$, for any $x, y \in S$.
Proof. From assumptions f is a strongly (E,F)-convex function on S and $f(Ex) \le f(x)$ and $f(Fy) \le f(y)$, for all $x, y \in S$ and $\alpha, \delta \in [0,1]$, we get

$$\begin{aligned} f\big(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy)\big) &\le \delta f(Ex) + (1-\delta)f(Fy) \\ &\le \delta f(x) + (1-\delta)f(y) \end{aligned}$$

Thus, f is semi strongly (E,F)-convex function on S. Assume now f is semi strongly (E,F)-convex function, so from Proposition 2.6, we have
$f(\alpha x + Ex) \le f(x)$ and $f(\alpha y + Fy) \le f(y)$ for each $x, y \in S$ and $\alpha \in [0,1]$.
Take $\alpha = 0$ to obtain the required conclusion.

3. Some Properties of Semi Strongly (E,F)-convex Functions

In this section, some basic properties of semi strongly (E,F)-convex functions such as closedness, supremum and composite are discussed.

Proposition 3.1 If $f_i: \mathbb{R}^n \to \mathbb{R}$, $i = 1,2,\dots,m$ are semi strongly (E,F)-convex functions on the strongly (E,F)-convex set S such that $f(x) = \sum_{i=1}^{m} a_i f_i(x)$, then f is semi strongly (E,F)-convex function on S for each $a_i \geq 0, i = 1,\dots,n$.

Proof. From the hypothesis, for each $x, y \in S$ and for all $\delta, \alpha \in [0,1]$, we have $\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy) \in S$ and

$$\begin{aligned} f\big(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy)\big) &= \sum_{i=1}^{m} a_i f_i(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy)) \\ &\leq \delta \textstyle\sum_{i=1}^{m} a_i f_i(x) + (1-\delta)\sum_{i=1}^{m} a_i f_i(y) \\ &= \delta f(x) + (1-\delta) f(y) \end{aligned}$$

This implies, f is semi strongly (E,F)-convex function on S.

Proposition 3.2 Let I be an index set and $f_i: \mathbb{R}^n \to \mathbb{R}$ for each $i \in I$ be a family of bounded above and semi strongly (E,F)-convex functions on the strongly (E,F)-convex set S. Then, $f(x) = \sup_{i \in I} f_i(x)$ is semi strongly (E,F)-convex on S.

Proof. From the assumptions, for each $x, y \in S$ and for each $\delta, \alpha \in [0,1]$, we have $\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy) \in S$ and

$$\begin{aligned} f\big(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy)\big) &= \sup_{i \in I}\big\{f_i\big(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy)\big)\big\} \\ &\leq \sup_{i \in I}\{\delta f_i(x) + (1-\delta) f_i(y)\} \end{aligned}$$

where in the last inequality we used the fact that f_i is semi strongly (E,F)-convex for each $i \in I$ and f_i is bounded above for all $i \in I$. The inequality above yields

$$= \delta \sup_{i \in I} f_i(x) + (1-\delta)\sup_{i \in I} f_i(y) = \delta f(x) + (1-\delta) f(y).$$

This means f is a semi strongly (E,F)-convex on S.

Proposition 3.3 Let f be a semi strongly (E,F)-convex function on the strongly (E,F)-convex set S. Let $G: \mathbb{R} \to \mathbb{R}$ be a non decreasing convex function, then $G \circ f$ is semi strongly (E,F)-convex function on S.

Proof. Let $x, y \in S$ and $\delta, \alpha \in [0,1]$. From the assumptions on S and f, we get $\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy) \in S$ and

$$f\big(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy)\big) \leq \delta f(x) + (1-\delta) f(y)$$

From the assumptions on G, the last inequality yields

$$\begin{aligned} (G \circ f)(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy)) &\leq G(\delta f(x) + (1-\delta) f(y)) \\ &\leq \delta\,(G \circ f)(x) + (1-\delta)(G \circ f)(y) \end{aligned}$$

This implies, $G \circ f$ is semi strongly (E,F) −convex function on S.

Proposition 3.4 Suppose f is a semi strongly (E,F)-convex function on a strongly (E,F)-convex set M, then for all $\gamma \in \mathbb{R}$ the level set H_γ is strongly (E,F)-convex set.

Proof. From the assumptions, for any $x, y \in H_\gamma$ and for each $\alpha, \lambda \in [0,1]$, $f(x) \leq \gamma$ and $f(y) \leq \gamma$. Since f is a semi strongly (E,F)-convex function on S, then $\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy) \in S$ and

$$f\big(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy)\big) \le \delta f(x) + (1-\delta) f(y)$$
$$\le \delta\gamma + (1-\delta)\gamma = \gamma$$

This means, $\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy) \in H_\gamma$. Hence, H_γ is a strongly (E,F)-convex set.

4. Optimality Properties of Semi Strongly (E,F)-convex Functions

In this section, some optimality criteria of constrained optimization problems, in which the objective function or the inequality constraints functions are semi strongly (E,F)-convex, are discussed. First, denote by (P), the following constrained optimization problem.

$$\min\ f(x)$$
$$\text{subject to}\quad x \in S,$$

where S and f are assumed as in the Assumption. Let $g_i: \mathbb{R}^n \to \mathbb{R}$ for each $i = 1, \dots, m$ such that $S = \{x \in \mathbb{R}^n : g_i(x) \le 0 \text{ for each } i = 1, \dots, m\}$.

Definition 4.1 In the Problem (P)**,** the set of optimal solutions is denoted by $argmin_S f$ and is defined as $argmin_S f = \{x^* \in S : f(x^*) \le f(x), for\ each\ x \in S\}$.

The next theorem, introduced in [21], is needed in the sequel.

Theorem 4.2 In Problem (P), let S be a strongly (E,F)-convex set and $f(\alpha x + Fx) \le f(x)$ for each $x \in S$, $\alpha \in [0,1]$. If $x^* \in S$ is a solution of the following problem denoted by (P_1)

$$\min f(\alpha x + Ex)$$
$$\text{subject to}\ x \in S$$

Then $\alpha x^* + Ex^*$ is an optimal solution of Problem (P).

Because of Proposition 2.6 and the proceeding theorem, we have the following result.

Corollary 4.3 Consider problem (P) such that S be strongly (E,F)-convex set and f is semi strongly (E,F)-convex function. If $x^* \in S$ is solution of the following problem denoted by (P_1)

$$\min f(\alpha x + Ex)$$
$$\text{subject to}\ x \in S.$$

Then $\alpha x^* + Ex^*$ is an optimal solution of problem (P).

Proof. Since f is semi strongly (E,F)-convex function on M, then from Proposition 2.6**,** $f(\alpha x + Fx) \le f(x)$. Now, from Theorem 4.2, we obtain the required result.

Next, we prove that, under simple condition, the constraint set S of Problem (P) is strongly (E,F)-convex set.

Theorem 4.4 If g_i are semi strongly (E,F)-convex functions for each $i = 1,2, \dots, m$, then M is strongly (E,F)-convex set.

Proof. By Proposition 3.4, we have $S_i = \{x \in \mathbb{R}^n : g_i(x) \le 0\}$ is strongly (E,F)-convex set for each $i = 1,2, \dots, m$. Thus, using Proposition 1.3, $S = \bigcap_{i=1}^m S_i$ is strongly (E,F)-convex set.

The following three result provides sufficient condition under which $argmin_S f$ is strongly (E,F)-convex.

Theorem 4.5 Let S be strongly (E,F)-convex set. If f is semi strongly (E,F)-convex function on S. Then, $argmin_S f$ of problem (P) is strongly (E,F)-convex set.

Proof. Let $x, y \in argmin_S f$ such that $x \ne y$. From Definition 4.1, $f(x) = f(y) = P^*$. If f is semi strongly (E,F)-convex function on S, then for each $\alpha, \delta \in [0,1]$, we have
$\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy) \in S$ and

$$f\big(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy)\big) \le \delta f(x) + (1-\delta) f(y) = P^*$$

Since $\inf_{x\in S} f(x) = P^*$, this fact with the last inequality forces
$\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy) \in argmin_S f$. Hence, $argmin_S$ is strongly (E,F)-convex set.

Theorem 4.6 Let S is strongly (E,F)-convex set. If f is strictly semi strongly (E,F)-convex function on S, then $argmin_S f$ is unique.
Proof. On the contrary, let $x, y \in S$ two different optimal solutions of problem (P), i.e., $f(x) = f(y)$. Since S is strongly (E,F)-convex set and f is strictly semi strongly (E,F)-convex function on S, we have for $x \neq y$ and $\alpha, \delta \in (0,1)$,

$$\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy) \in S \text{ and}$$
$$f\big(\delta(\alpha x + Ex) + (1-\delta)(\alpha y + Fy)\big) < \delta f(x) + (1-\delta) f(y) = f(x),$$

which is contradiction. Thus, $argmin_S f$ of problem (P) is unique.

Abstract. In this paper, we suggest a new method for the numerical solution of fuzzy nonlinear equations in parametric form using a new Conjugate Gradient Technique. Table of the numerical solution is given to show the efficiency of the proposed method and which is compared with classical algorithms such as (Fletcher and Reeves (FR), Polak and Ribiere (PRP), and Fletcher (CD)) techniques.

1.Introduction

Recently, Systems of simultaneous nonlinear equations have been played a major role in various areas of science such as mathematics, statistic, engineering social sciences, robotics, and medicines. The idea of fuzzy numbers and mathematic activity with these numbers were first presented and researched by[1][2][3][4][5]. One of the significant utilization of fuzzy number-crunching is nonlinear systems whose parameters are all or partially represented by fuzzy numbers [6- 8]. Standard analytical methods like Buckley and Qu method [9][10], cannot be suitable for resolving the equations such as

i- $cx^5 + bx^4 + cx^3 + dx - e = f,$

ii- $x - \sin(x) = g,$

Where x, a, b, c, d, e, f and g are fuzzy numbers. In this way, we need to build up the numerical techniques to find the roots of such equations. Here, we think about these conditions, as a rule, as $F(x) = c.$

whose parameters are all or partially represented by fuzzy numbers, [11] research the performance of Newton's scheme for getting the solve of the fuzzy nonlinear equations and reached out to the systems of fuzzy nonlinear equations by [12]. Newton's technique converges quickly if the initial point is picked near the solution point. The primary downside of Newton's strategy is figuring the Hessian matrix in each epoch. Probably the easiest variation of Newton's technique was considered by[13] for solution the double fuzzy nonlinear equations. Another type of Newton's technique known as Levenberg-Marquardt alteration was used to fathom fuzzy nonlinear equations by[14]. Authors in [15] applied also the Broyden's technique to solve the fuzzy nonlinear equations. Every one of these techniques is Newton-like which requires the calculation and storage of either Hessian matrix or approximate Hessian

matrix at every iterative of iterations. Newly, a diagonal update method for solving fuzzy nonlinear equations was proposed by[14]. A gradient based technique by [16] was applied to get the optimal value of variables of fuzzy nonlinear equations. This technique is simple and requires no Hessian matrix assessment during calculations. Be that as it may, method convergence is linear and very slow toward the optimal solution [17]. The steepest descent technique is additionally affected by ill-conditioning [18].

In this work, we developed a new conjugate gradient coefficient and applied it to solve fuzzy nonlinear equations. The conjugate gradient technique is known to be easy and high proficient in taking care of optimization problem. The plan in this work is to convert the parametric form of a fuzzy nonlinear Algebraic equation into an unconstrained optimization problem before applying the new conjugate gradient technique to get the optimal solution.

2. Preliminaries

Definition 1. A fuzzy number is a fuzzy set like $u: \mathbb{R} \longrightarrow I = [0,1]$ which satisfies[19][20],

1. u is upper semi continuous,
2. $u(x) = 0$ outside some interval $[c, d]$,
3. There are real numbers a, b such that $c \leq a \leq b \leq d$ and
   - i. $u(x)$ is monotonic increasing on $[c, a]$,
   - ii. $u(x)$ is monotonic decreasing on $[b, d]$,
   - iii. $u(x) = 1, a \leq x \leq b$.

The set of all these fuzzy numbers is denoted by E. An equivalent parametric is also given in[21] as follows.

Definition 2. A fuzzy number u in parametric form is a pair $(\underline{u}, \overline{u})$ of function $\underline{u}(r), \overline{u}(r), 0 \leq r \leq 1$, which satisfies the following requirements:

1- $\underline{u}(r)$is a bounded monotonic increasing left continuous function,

2- $\overline{u}(r)$is a bounded monotonic decreasing left continuous function,

3- $\underline{u}(r) \leq \overline{u}(r), 0 \leq r \leq 1$.

A popular fuzzy number is the trapezoidal fuzzy number $u = (x_0, y_0, \sigma, \beta)$ with interval defuzzifier $[x_0, y_0]$ and left fuzziness σ and right fuzziness β where the membership function is

$$u(x) = \begin{cases} \frac{1}{\sigma}(x - x_0 + \sigma), & x_0 - \sigma \leq x \leq x_0, \\ 1, & x \in [x_0, y_0], \\ \frac{1}{\beta}(y_0 - x + \beta), & y_0 \leq x \leq y_0 + \beta, \\ 0, & otherwise. \end{cases}$$

Its parametric form is

$\underline{u}(r) = x_0 - \sigma + r\sigma, \overline{u}(r) = y_0 + \beta + r\beta$.

Let $TF(\mathbb{R})$ be the set of all trapezoidal fuzzy numbers. The addition and scalar multiplication of fuzzy numbers are defined by the extension principle and can be equivalently represented as follows.

For arbitrary $u = (\underline{u}, \overline{u}), v = (v, \overline{v})$and $k > 0$ we define addition $(u + v)$and multiplication by scalar k as

$$\left(\underline{u} + \underline{v}\right)(r) = \underline{u} + \underline{v}, \quad (\overline{u} + \overline{v}) = \overline{u} + \overline{v}, \tag{1}$$

$$\left(\underline{ku}\right)(r) = ku(r), \quad \left(\overline{k\overline{u}}\right)(r) = k\overline{u}(r). \tag{2}$$

3. New conjugate gradient method for solving fuzzy nonlinear equations

In this section we will show some of the conjugate gradient methods and then suggest a new algorithm for conjugate gradient algorithm for solving fuzzy nonlinear equations

$$x_{k+1} = x_k + \alpha_k d_k, \quad k \geq 1 \tag{3}$$

Where α_k step-size that satisfy the standard wolfe conditions

$$f(x_k + \alpha_k d_k) \leq f(x_k) + \delta \alpha_k g_k^T d_k \tag{4}$$

$$d_k^T g(x_k + \alpha_k d_k) \geq \sigma d_k^T g_k \tag{5}$$

or strong wolfe conditions

$$f(x_k + \alpha_k d_k) \leq f(x) + \delta \alpha_k g_k^T d_k \tag{6}$$

$$|d_k^T g(x_k + \alpha_k d_k)| \leq -\sigma d_k^T g_k \tag{7}$$

$$d_{k+1} = \begin{cases} -g_1, & k = 1 \\ -g_{k+1} + \beta_k d_k, & k \geq 1 \end{cases} \tag{8}$$

The Fletcher and Reeves (FR) [22], Fletcher (CD) [23], Polak and Ribiere (PRP) [24] and β is scalar.

$\beta^{FR} = \frac{\|g_{k+1}\|^2}{\|g_k\|^2}$, see [22]

$\beta^{CD} = \frac{-\|g_{k+1}\|^2}{g_k^T d_k}$, see [23]

$\beta^{PRP} = \frac{g_{k+1}^T y_k}{\|g_k\|^2}$, see [24]

Where $g_k = \nabla f(x_k)$, and let $y_k = g_{k+1} - g_k$ $y_k = g_{k+1} - g_k$.

Now we suggest a new of conjugate gradient algorithm for solving fuzzy nonlinear equations depend basically on norm-1 instead of norm-2 in Fletcher-Reeves (FR) algorithm so we get new formula

$$d_{k+1} = -g_{k+1} + \beta_k^{NEW} d_k \tag{9}$$

$$\beta_k^{NEW} = \frac{\| g_{k+1} \|_1^2}{\| g_k \|_1^2} \tag{10}$$

4. The Descent property for a new Conjugate Gradient Method (CGM)

In this part, we have to show the descent property for our proposed new conjugate gradient method, denoted by β_k^{NEW}.

Theorem (1)

Consider the search direction given by equation (9) and (10) if α_k computed by strong wolfe condition (6) and (7) then $g_{k+1}^T d_{k+1} < 0$.

$d_{k+1} = -g_{k+1} + \beta_k^{NEW} d_k$, for all $k \geq 1$

Proof:-

The proof is by using mathematical inducement

1- If $k = 1$ then $g_1^T d_1 < 0$, $d_1 = -g_1 \rightarrow < 0$.

2- Let the relation $g_k^T d_k < -c|g_k|$ for all k where $0 < c < 1$.

3- We prove that the relation is true when $k = k + 1$ by multiplying the equation (9) in g_{k+1} we obtain

$d_{k+1} = -g_{k+1} + \beta_k^{NEW} d_k$

$\beta_k^{NEW} = \frac{\|g_{k+1}\|_1^2}{\|g_k\|_1^2}$

Multiply above equation by g_{k+1}

Using the following inequality$\| x \|_2 \leq \| x \|_1 \leq \sqrt{n} \| x \|_2$ We get

$$g_{k+1}^T d_{k+1} = -\|g_{k+1}\|^2 + \frac{\|g_{k+1}\|_1^2}{\|g_k\|_1^2} g_{k+1}^T d_k \leq -\|g_{k+1}\|^2 + \frac{\|g_{k+1}\|^2}{\|g_k\|^2} \left|g_{k+1}^T d_k\right|$$

$$\frac{g_{k+1}^T d_{k+1}}{\|g_{k+1}\|^2} \leq -1 + \frac{\left|g_{k+1}^T d_k\right|}{\|g_k\|^2}$$

By strong wolfe conditions $g_k^T d_k \leq -c|g_k|$

$$\frac{g_{k+1}^T d_{k+1}}{\|g_{k+1}\|^2} \leq -1 + \frac{\sigma\|g_k\|^2}{\|g_k\|^2} \leq -1 - \sigma c$$

$$\therefore\ g_{k+1}^T d_{k+1} \leq -(1+\sigma c)|g_{k+1}|$$

5. Global convergence study

We will display that CG method with β_k^{NEW} convergences globally. We need some assumption for the convergence of the proposed new algorithm.

Assumption (1)

1- Assume f is bound below in the level set $S = \{x \in R^n : f(x) \leq f(x_0)\}$; In some Initial point.

2- f is continuously differentiable and its gradient is Lipchitz continuous, that is there exist $L > 0$ such that [25]:

$\| g(x) - g(y) \| \leq L \| x - y \| \ \forall x, y \in N$.

On the other hand, under Assumption (1), it is clear that there exist positive constants B such

$$\|x\| \leq B, \forall x \in S \tag{11}$$

$$\| \nabla f(x) \| \leq \overline{\gamma}, \forall x \in S \tag{12}$$

Lemma (1)

Suppose that Assumption (1) and equation (11) hold. Take into consideration any conjugate gradient method in from (3) and (8), where d_k is a descent direction and α_k is obtained by the strong wolfe conditions if

$$\sum_{k>1} \frac{1}{\| d_{k+1} \|^2} \geq \infty$$

Then we have

$$\lim_{k\to\infty} inf \| g_k \| = 0$$

More details can be found in[26][27][28][29][30][31].

Theorem (2)

Assume that Assumption (1) and equation (11) and the descent condition hold. Consider a conjugate gradient scheme in the form

$$d_{k+1} = -g_{k+1} + \beta_k^{NEW} d_k$$

where α_k is computed from strong Wolfe line search condition for more details see[32][33][34] , If the objective function is uniformly on set S, then $\lim_{n\to\infty} (inf \| g_k \|) = 0$.

Proof

$$d_{k+1} = -g_{k+1} + \beta_k^{NEW1} d_k$$

$$\beta_k^{NEW1} = \frac{\| g_{k+1} \|_1^2}{\| g_k \|_1^2}$$

$$\| d_{k+1} \| = \| -g_{k+1} + \beta_k^{NEW1} d_k \|$$

$$\| d_{k+1} \| = \| -g_{k+1} + \frac{\| g_{k+1} \|_1^2}{\| g_k \|_1^2} d_k \|$$

$$\| d_{k+1} \| = \| -g_{k+1} + \frac{\| g_{k+1} \|_1^2}{\| g_k \|_1^2} d_k \|$$

$$\| d_{k+1} \| \leq \| g_{k+1} \| + \frac{\sqrt{n} \| g_{k+1} \|^2}{\| g_k \|_1^2} \| d_k \|$$

$$\| d_{k+1} \| \leq (1 + \frac{\sqrt{n} \| g_{k+1} \|}{\| g_k \|_1^2} \| d_k \|) \| g_{k+1} \|$$

Let $\omega = (1 + \frac{\sqrt{n}\|g_{k+1}\|}{\|g_k\|_1^2} \| d_k \|)$

$$\| d_{k+1} \| \leq \omega \| g_{k+1} \|$$

$$\sum_{k \geq 1} \frac{1}{\| d_{k+1} \|^2} \geq (\frac{1}{\omega^2}) \frac{1}{\gamma^2} \sum 1 = \infty$$

Therefore, we have contradiction

$\lim_{n \to \infty} (inf \| g_k \|) = 0.$

6. Numerical Examples

In this part, we present the numerical solution of some examples using the new proposed method for CG method for fuzzy nonlinear equations. All computations are carried out on MATLAB 9.0 using a double precision computer. We use the stop criterion $\| g_{k+1} \| < 10^{-6}$, and employ the new method to solve fuzzy nonlinear equations. Then, we compare with the other methods (Fletcher and Reeves (FR), Polak and Ribiere (PRP), and Fletcher (CD)).

Example 1: Consider the fuzzy nonlinear equation [9]

$(3,4,5)x^2 + (1,2,3)x = (1,2,3)$

Without any loss of generality, assume that x is positive, and then the parametric form of this equation is as follows:

$$\begin{cases} (3+r)\underline{x}^2(r) + (1+r)\underline{x}(r) - (1+r) = 0, \\ (5-r)\overline{x}^2(r) + (3-r)\overline{x}(r) - (3-r) = 0. \end{cases}$$

The above system needs initial values as follows. For $r = 1$

$$\begin{cases} 4\underline{x}^2(1) + 2\underline{x}(1) - 2 = 0, \\ 4\overline{x}^2(1) + 2\overline{x}(1) - 2 = 0, \end{cases}$$

For $r = 0$

$$\begin{cases} 3\underline{x}^2(0) + \underline{x}(0) - 1 = 0, \\ 5\overline{x}^2(0) + \overline{x}(0) - 3 = 0 \end{cases}$$

With initial values

$x_0 = (\underline{x}(0), \underline{x}(1), \overline{x}(1), \overline{x}(0)) = (0.434, 0.5, 0.5, 0.681)$

Example 2: Consider the fuzzy nonlinear equation [9]

$(4,6,8)x^2 + (2,3,4)\,x - (8,12,16) = (5,6,7)$

Without any loss of generality, assume that x is positive, and then the parametric form of this equation is as follows:

$$\begin{cases}(4+2r)\underline{x}^2(r) + (2+r)\underline{x}(r) - (3+3r) = 0,\\ (8-2r)\overline{x}^2(r) + (4-r)\overline{x}(r) - (9-3r) = 0.\end{cases}$$

The above system needs initial values as follows. For $r = 1$

$$\begin{cases}6\underline{x}^2(1) + 3\underline{x}(1) - 6 = 0,\\ 6\overline{x}^2(1) + 3\overline{x}(1) - 6 = 0,\end{cases}$$

For $r = 0$

$$\begin{cases}4\underline{x}^2(0) + 2\underline{x}(0) - 3 = 0,\\ 8\overline{x}^2(0) + 4\overline{x}(0) - 9 = 0,\end{cases}$$

With initial values

$$x_0 = (\underline{x}(0), \underline{x}(1), \overline{x}(1), \overline{x}(0)) = (0.651, 0.7808, 0.7808, 0.8397)$$

Example 3: Consider the fuzzy nonlinear equation [9]

$(1,2,3)x^3 + (2,3,4)x^2 + (3,4,5) = (5,8,13)$

Without any loss of generality, assume that x is positive, and then the parametric form of this equation is as follows:

$$\begin{cases}(1+r)\underline{x}^3(r) + (2+r)\underline{x}^2(r) - (2+2r) = 0,\\ (3-r)\overline{x}^3(r) + (4-r)\overline{x}^2(r) - (8-4r) = 0.\end{cases}$$

The above system needs initial values as follows. For $r = 1$

$$\begin{cases}2\underline{x}^3(1) + 3\underline{x}^2(1) - 4 = 0,\\ 2\overline{x}^3(1) + 3\overline{x}^2(1) - 4 = 0,\end{cases}$$

For $r = 0$

$$\begin{cases}\underline{x}^3(0) + 2\underline{x}^2(0) - 2 = 0,\\ 3\overline{x}^3(0) + 4\overline{x}^2(0) - 8 = 0.\end{cases}$$

With initial values

$x_0 = (\underline{x}(0), \underline{x}(1), \overline{x}(1), \overline{x}(0)) = (0.76, 0.91, 0.91, 1.06)$.

7.Conclusions

We presented in this research a new type conjugate gradient technique for solving fuzzy nonlinear equations, and the proposed algorithm has shown high efficiency in solving these problems with the least number of iterations and higher accuracy in reaching the approximate solution of the function.

Acknowledgements

I would like to express my sincere gratitude and appreciation to my supervisors Prof. Dr. Khalil K. Abbo for this valuable suggestion, encouragement and invaluable remark during writing this paper.

Abstract
The aim of this paper is to a geometric construction of Surface Complete (k, r)-cap in PG(3,7). We found that the maximum complete (k, 2)-cap which is called an ovaloid, exists in PG (3, 7) when k = 23. Moreover the complete (k, 3)-caps, (k, 4)-caps and (k, 5)-caps,(k,6)-caps , (k,7)-caps , (k,8)-caps, and we obtain a new example for theorem(2.8).

1-Introduction

I study of finite projective spaces PG (3, q) over Galois field GF(q), it is the largest of the projective plane over Galois field, Hirschfield, 1985 [5], gives the finite projective spaces of three dimensions. Hirschfield,1998 [1], give the basic definition and theorems of projective geometries over finite fields, and Al-Mukhtar, in 2008 [4] give the complete Arcs and surfaces in Three-dimensional projective space over Galois field and give (k, r)-caps in PG(3,q) over Galois fields GF(q), q = 2,3, and 5.In 2017 [2] Kareem give the complete (k, r)-Cap in PG (3, p) Over Galois Field GF (4) . In 2019[5] thus,give the arcs, caps, generalizations: results and problems, in 50 years of Combinatorics, Graph Theory, and computing. In this work we construct the (k, r)-caps in PG (3, 4). This paper is divided into three sections, section one is the preliminaries of projective 3-space which contains some definitions and theorems for that concept and section two consists of the construction of a geometric construction of surface complete (k, r)-cap (k, r)-caps for r = 2, 3, 4, 5 in PG (3, 7). Also, we obtain a new example. In section three obtain the conclusion. This work I have done manually without using the computer program.

2- Preliminaries

2.1 Definition: "Projective 3-Space" [20], [23], [24],[25],[26]
A projective 3-space PG(3,k) over a field k is a 3-dimensional projective space with that consists of points, lines, and planes with the incidence relation between them. The projective 3-space satisfies the following axioms:
A) Any two distinct points are contained in a unique line.
B) Any three distinct non-collinear points, also any line and a point not on the line are contained in a unique plane.

C) Any two distinct coplanar lines intersect in a unique point.
D) Any line not on a given plane intersects the plane in a unique point.
E) Any two distinct planes intersect in a unique line.

A projective space PG(3,p) over Galois field GF(p), $p = q^m$ for some prime number q and some integer m, is a 3-dimensional projective space. Any point in PG(3,p) has the form of a quadruple (x_1,x_2,x_3,x_4), where x_1,x_2,x_3,x_4 are elements in GF(p) with except for the quadruple consisting of four zero elements.

Two quadruples (x_1,x_2,x_3,x_4) and (y_1,y_2,y_3,y_4) represent the same point if there exists λ in GF(p)\{0} such that $(x_1,x_2,x_3,x_4) = \lambda\ (y_1,y_2,y_3,y_4)$.

Similarly, any plane in PG(3,p) has the form of a quadruple $[x_1,x_2,x_3,x_4]$, where x_1,x_2,x_3,x_4 are elements in GF(p) with the exception of the quadruple consisting of four zero elements.

Two quadruples $[x_1,x_2,x_3,x_4]$ and $[y_1,y_2,y_3,y_4]$ represent the same plane if there exists λ in GF(p)\{0} such that $[x_1,x_2,x_3,x_4] = \lambda\ [y_1,y_2,y_3,y_4]$

Also a point $p(x_1,x_2,x_3,x_4)$ is incident with the plane $\pi\ [a_1,a_2,a_3,a_4]$ iff $a_1x_1 + a_2x_2 + a_3x_3 + a_4x_4 = 0$.

2.2 Definition: "Plan π", [21],[22]

A plan π in PG(3,p) is the set of all points $p(x_1,x_2,x_3,x_4)$ satisfying a linear equation $u_1x_1 + u_2x_2 + u_3x_3 + u_4x_4 = 0$. This plane is denoted by $\pi\ [u_1,u_2,u_3,u_4]$.

2.3 Theorem: [6],[7],[8]

Four distinct points $A(x_1,x_2,x_3,x_4)$, $B(y_1,y_2,y_3,y_4)$, $C(z_1,z_2,z_3,z_4)$ and $D(w_1,w_2,w_3,w_4)$ are coplanar iff

$$\Delta = \begin{vmatrix} x_1 & x_2 & x_3 & x_4 \\ y_1 & y_2 & y_3 & y_4 \\ z_1 & z_2 & z_3 & z_4 \\ w_1 & w_2 & w_3 & w_4 \end{vmatrix} = 0 \cdot$$

2.4 Corollary: [11],[12]

If four distinct points $A(x_1,x_2,x_3,x_4)$, $B(y_1,y_2,y_3,y_4)$, $C(z_1,z_2,z_3,z_4)$ and $D(w_1,w_2,w_3,w_4)$ are collinear, then $\Delta = 0$.

2.5 Theorem: [5]

The points of PG(3,p) have unique forms which are (1,0,0,0), (x,1,0,0), (x,y,1,0), (x,y,z,1) for all x, y, z in GF(p).

2.6 Theorem: [13]

The planes of PG(3,p) have unique forms which are [1,0,0,0], [x,1,0,0], [x,y,1,0], [x,y,z,1] for all x, y, z in GF(p).

2.7 Theorem: [10]

A projective 3-space PG(3,p) satisfies the following:

A) Every line contains exactly p + 1 points and every point is on exactly p + 1 lines.
B) Every plane contains exactly $p^2 + p + 1$ points (lines) and every point is on exactly $p^2 + p + 1$ planes.
C) There exist $p^3 + p^2 + p + 1$ of points and there exists $p^3 + p^2 + p + 1$ of planes.
D) Any two planes intersect in exactly p + 1 points and any line is on exactly p + 1 planes, and any two points are on exactly p + 1 planes.

2.8 Theorem: [14]

There exists $(p^2+1)(p^2+p+1)$ of lines in PG(3,P).

2.9 Definition: [16]
A (k,ℓ)-set in PG(3,p) is a set of k spaces π_ℓ. A k-set is a (k,0)-set that is a set of k-points.

2.10 Definition: "(k,r)-cap", [13]
A (k,r)-cap is a set of k points in PG(n,p) with $n \geq 3$, such that at most r points on any line. Thus (k,2)-cap is a set of k points in PG(3,p), such that no three of them are collinear.

2.11 Definition: "Complete (k,r)-cap", [15]
A (k,r)-cap is a complete if it is not contained in a (k+1,r)-cap.

2.12 Definition: [18]
Let C_i be the number of points of index i in PG(3,p) which are not on a (k,r)-cap, then the constants C_i of (k,r)-cap satisfy the following:

i) $\sum_{\alpha}^{\beta} C_i = p^3 + p^2 + p + 1 - k$

ii) $\sum_{\alpha}^{\beta} iC_i = \frac{k(k-1)...(k-n+1)}{n!}(p^2 + p + 1 - n)$

where α is the smallest i for which $C_i \neq 0$, β be the largest i for which $C_i \neq 0$.

2.13 Remark: [15]
The (k,r)-cap is complete iff $C_0 = 0$.

2.14 Definition: [16]
The i-secant of a (k,r)-cap is a line intersects the cap in exactly i points, that is 0-secant is an external line, 1-secant is an unisecant line, 2-secant is a bisecant line and 3-secant is a trisecant line.

2.15 Rrmark:[16]
A (k, r)-cap is maximum iff every line in PG(3,p) is a 0-secant or r-secant.

2.16 Theorem: [19],[22]
A maximum (k, 2)-cap in PG(3,p) is an ovaloid.

3. The Approximate Algorithm of (k,r)-Cap in PG(3,7):

By using theorem (1.7) we will find the number of (k,r)-cap in the projective space PG(3,7) is (k,8)-cap, A (k,r)-cap is a complete if it is not contained in a (k+1,r)-cap .

If the opposite is true that we can add {p} to the (k,r)-arc B= A $\cup${p} , and constriction A (k+1,r)-cap, that is a contradiction of assuming.

We assume that want to construct the complete (k,2)-cap having a maximum number of points, we are starting with the reference five-point (Reference points) and we will add a few points (to take attention we want to constrict one arc no more of that),also we find with all time, the points of index zero we add one of the themes, the set B become have six elements, we continue to the adding one of points (index zero) of all times. Finally, we have reached the times k that we cannot add any points to the (k,2)-cap. That is B is the required complete caps. We are repeating the method to finding the required complete (k,3)-cap and (k,4)-cap….(k , q+1)-cap, and finding his arcs in all levels, with the attention that the reference points are growing by add from the points of index zero of all levels.

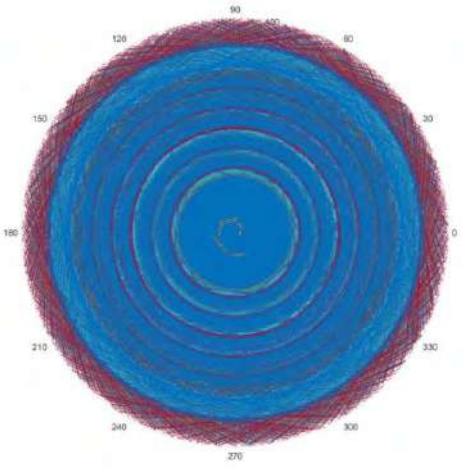

Figure 1: A representation a (k,n)-cap of projective space PG(3,7) by using computer programming.

3.1 The (k, 2)-caps in PG (3,7):

PG (3, 7) contains 400 points and 400 planes such that each point is on 57 planes and every plane contains 57 points and every line contains 8 points and it is the intersection of 8 planes, (table 1 and 2). In table (1), the set A={1,2,9,58,115} is taken which is the set of unit and reference points 1=(1,0,0,0), 2=(0,1,0,0), 9=(0,0,1,0), 58=(0,0,0,1), 115=(1,1,1,1), this set is a (5,2)-cap since no three points of A are collinear as in table (2).

A is a (5,2)-cap, which is not complete since there exists some point of index zero for it, which are

is the complete (222,8)-cap which can be obtained for any line of PG(3,7) contains eight points and hence there are no more than eight are collinear.

3.8 Theorem:

(a)-There exists a maximum complete 23-cap in PG(3,7).
(b)- There exists a complete (54, 3)-cap in PG(3,7).
(c)- There exists a complete (87, 4)-cap in PG(3,7).
(d)- There exists a complete (123, 5)-cap in PG(3,7).
(e)- There exists a complete (153, 6)-cap in PG(3,7).
(f)- There exists a complete (182, 7)-cap in PG(3,7).
(g)- There exists a complete (222, 8)-cap in PG(3,7).

Proof:

It will be sufficient to give an example of a maximum complete 23-cap in PG(3,7) These examples were also checked on completeness using . Computer programming

A complete (23,2) in PG(3,7), A complete (54,3) in PG(3,7), A complete (87,4) in PG(3,7), A complete (123,5) in PG(3,7), A complete (153,6) in PG(3,7), A complete (182,7) in PG(3,7), A complete (222,8) in PG(3,7).
the points constituting the complete caps in the respective space in PG(n, q) are denoted with homogeneous coordinates $(x_0,x_1,x_2,\ldots\ldots,x_n)$, in accordance with the terminology used in the preceding.

An example of maximum complete 23-cap in PG(3,7)

3.9 Theorem: in PG(3,7)

$$m_2(3,7)=17\text{-}30.$$

3.10 Corollary**:** in PG(3,7)

$$m'_2(3,7)=23.$$

4. Conclusions:

From the above results, the distinct complete (K,n)-caps in PG(3,7), $2\leq n\leq 8$
Is as follows:

(K, 2)-cap, where k=23 is a complete cap which is ovaloid.
(K, 3)-cap, where k=54 is a complete cap.
(K, 4)-cap, where k=87 is a complete cap.
(K, 5)-cap, where k=123 is a complete cap.
(K, 6)-cap, where k=153 is a complete cap.
(K, 7)-cap, where k=182 is a complete cap.
(K, 8)-cap, where k=222 is a complete cap, which is the whole space in PG (3, 7).

Abstract. In this paper, stability in a polynomial model called a polynomial self- regression model with trigonometric boundaries was studied. A linear approximation technique was used, and the Box-Genghis method was used in data analysis, and time series modeling of numbers of people with media. Data were obtained from AL-Yarmouk Hospital in Baghdad AL-Karkh for the period (2011- 2016) shows the numbers of patients with the disease through the technique of Linear approximation. Then we found the single point and the stability of the final cycle, and we tried to apply the results that we obtained on the correct data for audit.
Keywords. stability ,dynamic ,single ,limit cycle

1. Introduction

The subject of time series is one of the important topics through which most sciences can be entered in the way of medical, natural, biological sciences, human development sociology and many other sciences. Time series analysis methods are among the most used statistical methods, where any phenomenon can be analyzed for periods. Time is equal and not equal. The high interest in the subject of time series is due to the urgent need for a reliable and highly effective forecasting system So that it can be relied upon to explain many phenomena in different Journals [4]. Our research focuses on studying the stability of a proposed model Polynomial called the polynomial self-regression model polynomial autoregressive model with trigonometric terms(PAR). This model usually has cyclic nonlinear behavior and limit cycles. And we will try to find the traits of the dross or the stability of the singular point Using the method of linear approximation for the proposed nonlinear model and some other statistical characteristics.

2. Basic concepts and principles

2.1 Time Series

time series is a collection of data a recorded for particular phenomenon during a specific period that was economical, social, or statistical, and arranged sequentially according to time. Usually, the periods between the observations anal the other are equal.

A mathematical time series defines a sequence of random variables, defined within the probability space. Multivariate and index t, which belongs to the T group and denotes the time series usually $\{x(t);\ -\infty < t < \infty, t \in T\}$or abbreviated $\{x(t)\}$.

If it takes continuous values then the time series It is called " Continuous-time" if it takes intermittent value $t = o, \mp 1, \mp 2, \ldots$ then the series is called "Time-Discrete " symbolizes the god with the symbol $\{x_t; t = o, \mp 1, \mp 2, \ldots\} or \{x_t\}$[2].

2.2 The polynomial model

To be {y(t)} Time series,$\{z_t\}$ White annoyances . Assuming that f(0) Into the equation:
y(t)=f(y(t-1),,y(t-p),z(t-1)…….,z(t-p))+z_t
A p-degree polynomial We will get a polynomial self-regression model and have the following formula:
y(t)= p(t-1),….,y(t-p),z(t-1),…..,(t-q)) +z(t) (1)
If that p(0) is degree polynomial and {z(t)} White annoyances from a degree q.[7]

2.3 Exponential Autoregressive model

In [9], the Japanese researcher Ozaki defined the exponential regression model from the rank P as follows:

$$x_t = \sum_{i=l}^{p} (\propto_i + \pi e^{-\frac{x^2}{t-1}}) x_{t-i} + Z_t \quad (2)$$

Where $\{Z_t\}$ is an independent and uniform distribution of white inconvenience, and $i = 1,2, \ldots p$ and $\propto_i, \pi_i$ Constant quantities represent model coefficients.

2.4 polynomial autoregressive model with trigonometric

This proposed model is a polynomial Self- regression model with the terms of trigonometric functions with the following form:

$$x_t = \sum_{i=l}^{p} \alpha_i [cos\left(\frac{\pi}{2} x_{t-k}\right)]^i + Z_t \; ; k = 1,2,3, \ldots$$

Where, $\{x_t\}$ is a time series, $\propto_i$ is constant, Z_t white inconveniences, and $t = o, \mp 1, \mp 2, \ldots$

3. The theoretical Side

3.1 Nonlinear Dynamical System

In dynamic systems covered by non-Linear differential equations, they have often used Approximation methods for converting it into a system of linear differential equations, and there are two methods of approximation that depend on the structure. The physical system of the kinematic system and these two methods are approximation by wise cutting and approximation to the local sin. The stability of the kinematic systems depends mainly on the behavior of the solution, whether it approaches one point or a closed curve when the solution is cyclical or not. Non-Linear systems have several characteristics, including:

1. The nature of the Jump, since $c\dot{x}(t)$are the decaying force and $\propto x(t) + Bx^3(t)$ is the reference force of the oscillating force.
2. Reliability between the amplitude of the oscillator and the frequency, which Can beseen in models of random vibrations.
3. Having the final cycle and this behavior of the solution is clearly shown in the vender POL formula that formulated:

$$\ddot{x}(t) - B(1 - x^2(t))\dot{x}(t) + \propto x(t) = 0 \quad (3)$$

Where $\dot{x}(t) = \frac{dx(t)}{dt}$

And one of the most important techniques used to bring non-linear systems closer to Linear local systems near a single point. The stationary solution to the system is to approximate the local linear technique

and to demonstrate this technique. We have a non-Linear differential equation, and it is converted into a linear differential equation with the following steps:

1. Reducing the rank of the equation.
2. Writing it in the' space form.
3. Finding the fixed solution of the system, as follows:

We do not have the following equation: (Vander pol equation):

$$\ddot{x}(t) - (1 - x^2)\dot{x} + x = 0 \tag{4}$$

And put $\dot{x} = y$ the equation (2-2) becomes as:

$$\dot{y} = (1 - x^2)y - x \tag{5}$$

By rewriting it as the state space, that $(x, y)^T$ is the state vector, and that the only fixed point in the system (2-3) is the origin point, and the fixed solution at this point is zero ($\dot{x} = o, \dot{y} = o$).
Using the Taylor (2-3) system expansion around its original point, we obtain:

$$\dot{x} = o * x + 1 * y$$
$$\dot{y} = (-1 - 2xy)x + (1 - x^2)y \tag{6}$$

The expansion of Taylor is rounded in equation (2-4) to the second term only, given that the functions $X(x, y)$ and $Y(x, y)$ are functions with two variables x, y and $x(o, o) = o, y(o, o) = o$ at the original point:

$$\begin{bmatrix} 0 & 1 \\ -1 - 2xy & 1 - x^2 \end{bmatrix} = \begin{bmatrix} \dot{x} \\ \dot{y} \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} \tag{7}$$

And this system has an original point becomes as follows:

$$\begin{bmatrix} 0 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} \dot{x} \\ \dot{y} \end{bmatrix} = \begin{bmatrix} x \\ y \end{bmatrix} \tag{8}$$

That is:

$$\dot{x} = y$$
$$\dot{y} = -x + y$$

That is, the equation for Van DerpoL (2-3) and near to that fixed point becomes a linear equation as follows:

$$\ddot{x} - \dot{x} + x = 0 \tag{9}$$

This technique can be applied single non – zero points as well since non-Linear kinematic systems include single zero and non – zero points. The stability of these systems is determined by the behavior of the solution path when approaching these isolated $t \longrightarrow \infty$, points, or moving away from them when t and here represents time [12],[8].

3.2 Stationary and Stability

In many engineering and physical matters, we come across processes that can be described as statistically, stable, this means that if we get views of a process of this type and it is done.
Divide them into groups of periods. The different sections of these observations appear similar, and with more accurate words. The statistical characteristics are constant and do not change with time. Random operations that act in this way are called phased operations [1]. It means that there is no growth or erosion of time series data, in other words. The data are spread around a fixed medium and have a

constant variance. That means $x_1, x_2, x_3, \dots, x_t$ it must have the same probability density function, that is, $f(x_1, x_2, x_3, \dots, x_t) = f(x_{1+k}, x_{2+k}, x_{3+k}, \dots, x_{t+k})$ since k it represents a real exception. And that the Joint probability distribution does not change with the change in the period or when the displacement is carried out in a fixed number. It has been shown by the word priestly that the varied operations are usually created through a stable system that reaches the steady-state after an appropriate period. Specific output, and therefore the system is mathematically stable. if the roots of the system equation in the form of the defaults factor lie all outside the unit circle, and that the characteristics of the characteristics' equation are all located within the unit circle [1].

3.3 Singular point

The single point of the form $\in$ is defined;

$$x_t = f(x_{t-1}, \dots, x_{t-p}) \tag{10}$$

it is the one that the path of the model closes above, and the approach is either when $t \longrightarrow \infty \; ort \longrightarrow -\infty$.

If the path approach is when $t \longrightarrow \infty$ it is called single stable point. And if the path approaches a point $\in$ when $t \longrightarrow \infty$, then a single point is called unstable. And the necessary condition and what is sufficient for $\in$ is to achieve the relationship: [10] [12], $\in = f(\in)$.

3.4 Limit cycle

Let us have the following model: $x_t = f(x_{t-1}, \dots, x_{t-p})$.

Limit cycle of the above model is defined as the isolated and closed path. $x_t, x_{t+1}, x_{t+2}, \dots, x_{t+q} = x_t$ Since q represents a positive integer. The isolated path is defined as any path that begins very close to Limit cycle and approaches it either when $t \longrightarrow \infty$ or $t \longrightarrow -\infty$ifit is approaching it when $t \longrightarrow \infty$ it is called a stable Limit cycle, but if the approach is when $t \longrightarrow -\infty$ it is called an unstable limit cycle,but the closed path is if the initial values $x_1, x_2, x_3, \dots, x_p$ belong to the Limit cycle, then $(x_{1+kq}, \dots, x_{p+kq}) = (x_1, \dots, x_p)$for each positive integer K whereas P is the period to the Limit cycle, and it is the closed path points, and that q and k represent appositive integer [10].

3.5 Find the stability of non-linear models using Linear approximation

The Linear approximation method was proposed to find the stability of the non-Linear models based on the approximation technique in the previous paragraph that was applied to the non-linear exponential time series models by the researcher Ozaki. The method is summarized in two stages:

First stage: Finding the non-zero single Point of the non-Linear Model.

Second Stage: Stability test of this point using Linear approximation technique.

3.6 stability of the Polynomial self-regression model with the Limits of trigonometric functions

Let us have the following form:

$$x_t = \sum_{i=1}^{\infty} \alpha_i [cos\left(\frac{\pi}{2} x_{t-k}\right)]^i + Z_t \; ; k = 1,2, \dots \tag{11}$$

As $\propto_i$ constant and Z_t white inconveniences.

We assume that $k = 1$ (i.e. we will get Polynomials with trigonometric function and x_{t-1}) that is:

$$x_t = \sum_{i=1}^{\infty} \propto_j [cos\left(\frac{\pi}{2} x_{t-1}\right)]^j + Z_t \tag{12}$$

3.7 Find the single point of the proposed model

To have the model defined in equation (2-10), we assume the effect of $\{z_t\}$equals zero and by using the definition of a single point, and by assuming that$\in^n \longrightarrow o$For each $n \geq ,4\ and j = 1,2,3,4$ in equation (2-10) and using the decomposition of Taylor we get:

$$\Longrightarrow \in^2 + \frac{1}{B} \in -\frac{A}{B} = 0 \tag{13}$$

Where as:

$A = \propto_1 + \propto_2 + \propto_3 + \propto_4$

$B = \frac{\pi^2}{8}(\propto_1 + 2 \propto_2 + 3 \propto_3 + 4 \propto_4)$

That is:

$$\Longrightarrow \in = \frac{\frac{-1}{B} \pm \sqrt{(\frac{1}{B})^2 + 4\frac{A}{B}}}{2} \tag{14}$$

3.8 Single point of the proposed grade of rank k (k=2,3,…)

To find the single point of the proposed model (2 – 9) of rank k, we neglect the effect of Z_t on the form (2–9), so we obtain:

$$x_t = \sum_{j=1}^{\infty} \propto_j [cos\left(\frac{\pi}{2} X_{t-k}\right)]^j; k = 2,3, \ldots$$

Using the definition of a single point, we obtain:

$$\in = \sum_{j=1}^{\infty} \propto_j [cos\ (\frac{\pi}{2} \in)]^j$$

The individual points are not flogged to any rank, and we follow a formula similar to the way the single point is found when k=1.

3.9 Non–Zero single point stability of the polynomialmodel (proposed)

We will attempt to test the stability of the non – zero single point using the local linear approximation method near the single point as follows:

Let us have the model defined in (2–10) to assume the effect of Z_t non – existent and using the Taylor decoder and compensation for $x_t = \in + \in_t$ where $\in$are a very small amount and that $\forall n \geq 2;\ \in_{t-1}^n \longrightarrow o, J = 1,2,3,4$ we get:

$$\in + \in_t = A - B(\in^2 + 2 \in \in_{t-1}) \tag{15}$$

Where as:

$A = \propto_1 + \propto_2 + \propto_3 + \propto_4$

$B = \frac{\pi^2}{8}(\propto_1 + 2 \propto_2 + 3 \propto_3 + 4 \propto_4)$

Since then:

$$\in = \frac{\frac{-1}{B} + \sqrt{(\frac{1}{B})^2 + 4\frac{A}{B}}}{2}$$

With compensation in (15), we obtain:

$$\in +\in_t = A - B(\in^2 + 2 \in \in_{t-1}) \tag{16}$$

Accordingly, the model is stable if it is:

$$\left|1 - \sqrt{1 + 4AB}\right| < 1 \tag{17}$$

3.10 Limit cycle stability

We will find the stability of the limit cycle based on the following two views:

Theorem (1): the limit cycle in turn $a, x_{t+1}, x_{t+2}, \dots, x_{t+q}$,of the exponential regression from the first order is stable in orbit if the following condition is met:

$$\left|\prod_{j=1}^{q}[\emptyset_j + \pi_j(1 - 2x_{t+q-j}^2)e^{-x_{t+q-j}^2}]\right| < 1$$

The proof: Note [9]

Theorem (2): The limit cycle in turn q of the form (1 – 13) is stable if it is:

$$\left|\frac{\in_{t+q}}{\in_t}\right| < 1$$

Proof: Note [10]

3.10.1 Issue (1)

The limit cycle of the cycle q (if any) of the proposed model when p = 1 is stable if the condition is met:

$$\left|\prod_{j=1}^{q}[\alpha_j cos\,(\frac{\pi}{2}x_{t-1})]^j\right| < 1$$

The proof:

We assume that the proposed model has a limit cycle in the period q and $q > 1$ as:

$x_t, x_{t+1}, x_{t+2}, \dots, x_{t+q} = x_t$

It is a closed and isolated path.

Let us have the model defined in equation (12) below:

$$x_t = \sum_{j=1}^{\infty} \propto_j [cos\left(\frac{\pi}{2}x_{t-k}\right)]^j + z_t$$

We take a special case when k = 1, j = 1 and generalize the idea in the same way.

$$x_t = \propto_1 cos\left(\frac{\pi}{2}x_{t-1}\right) + Z_t$$

$$x_t = \sum_{j=1}^{\infty} \propto_j [cos\left(\frac{\pi}{2}x_{t-k}\right)]^j + z_t$$

We take a special case when k = 1, j = 1 and generalize the idea in the same way.

$$x_t = \propto_1 cos\left(\frac{\pi}{2}x_{t-1}\right) + Z_t$$

$$x_t = \propto_1 \sum_{k=o}^{\infty}(-1)^k \frac{(\frac{\pi}{2}x_{t-1})^{2k}}{2k!} + Z_t \tag{18}$$

Let $x_t = x_s + \in_s$ and assume that $|\in_{s-1}|^n \longrightarrow o$ for each $n \geq 2$ and neglecting the effect $\{z(t)\}$ we get study of the stability of a nonlinear self-regression model:

$$x_s + \in_s = \propto \left[1 - \frac{(\frac{\pi}{2})^2}{2!} x_{s-1}^2 + \frac{(\frac{\pi}{2})^4}{4!} x_{s-1}^4 - \frac{(\frac{\pi}{2})^6}{6!} x_{s-1}^6 + \cdots\right] - \propto \frac{2(\frac{\pi}{2})^2}{2!} x_{s-1} \in_{s-1} +$$
$$\propto \frac{4(\frac{\pi}{2})^4}{4!} x_{s-1}^3 \in_{s-1} - \propto \frac{6(\frac{\pi}{2})^6}{6!} x_{s-1}^6 \in_{s-1} + \cdots$$

That is:

$$\in_s = -\alpha_1 \frac{2(\frac{\pi}{2})^2}{2!} x_{s-1} \in_{s-1} + o(x_{s-1} \in_{s-1}) \quad (19)$$

Leads to $\in_s = \beta x_{s-1} \in_{s-1}$ (20)

Assume that:

$$\beta = -\alpha \frac{2(\frac{\pi}{2})^2}{2!}$$

$$T(x_{t-1}) = \beta x_{s-1}$$

$$\Longrightarrow \in_{t+q} = \left|\prod_{i=1}^{q} T(x_{t+q-i})\right| \in_t$$

$$\left|\frac{\in_{t+q}}{\in_t}\right| = \left|\prod_{i=1}^{q} T(x_{t+q-i})\right|$$

For the sake of zero convergence this ratio must be less than one:

$$\left|\prod_{i=1}^{q} T(x_{t+q-i})\right| < 1$$

Thus, the model has a stable orbital limit cycle if the following condition is met:

$$\left|\prod_{i=1}^{q} \beta(x_{t+q-i})\right| < 1 \quad (21)$$

And by this, the proof is made.

3.10.2 Issue (2)

The proposed model has a limit cycle if it is:

$$\left|\frac{\in_{t+q}}{\in_t}\right| < 1$$

The proof:

Let us have the model defined by the equation (18)

Neglecting the effect $\{z_t\}$ and using the assumptions in the previous paragraphs, we obtained the following form:

$$\in_t = (1 - \sqrt{1 + 4AB}) \in_{t-1}$$

Where:

$$A = \propto_1 + \propto_2 + \propto_3 + \propto_4$$

$$B = \frac{\pi^2}{8}(\propto_1 + 2 \propto_2 + 3 \propto_3 + 4 \propto_4)$$

We assume that:

$C = (1 - \sqrt{1 + 4AB})$
We get:
$\in_t = C \in_{t-1}$
$\in_{t+q} = C^q \in_t$
That is:
$\frac{\in_{t+q}}{\in_t} = C^q \Longrightarrow \left|\frac{\in_{t+q}}{\in_t}\right| = |C^q| < 1$
And this condition is fulfilled if it is $|C| < 1$. And then the proof ends.
Example 3.1
Let us have the following model:
$x_t = 0.398\ cos\left(\frac{\pi}{2} x_{t-1}\right) + z(t)$
And refer to the stability condition of the proposed model, we get the single point $\in = 0.29256$ and using the relationship (16) we get:
$\in_1 = -0.70784\ \in_{t-1}$
And since $|\lambda| < 1$ and therefore the model is stable.
The following figures show the stability of the model and by assuming different initial values.[15]

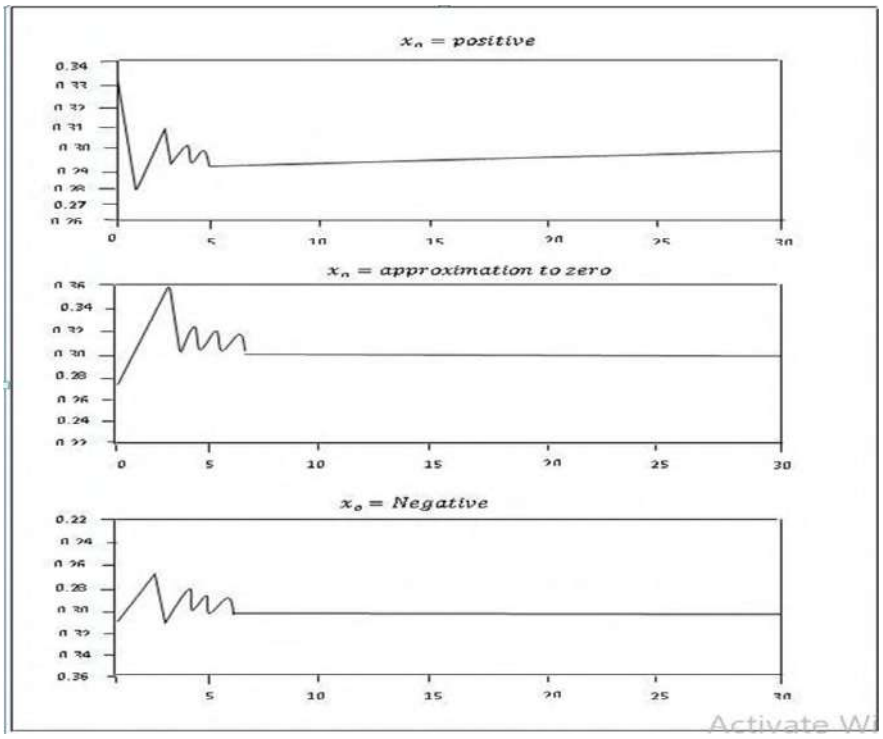

Figure (1). the serial series generated from the model

We notice from the above figures that the series generated by the model does not depend on the initial condition and that paths an approach to the limit cycle.
Example 3.2
Let us have the following model
$x_t = 2.787\ cos\left(\frac{\pi}{2} x_{t-1}\right) + z(t)$
And from it we get $\in = 1.26104$, and from the relationship (16) we get the form $\in_t = -2.44025\ \in_{t-1}$.

That is, $1 < |\lambda|$ which indicates that the stability condition has not been fulfilled, the form (2) is not stable.[15]
The following figures illustrate this:

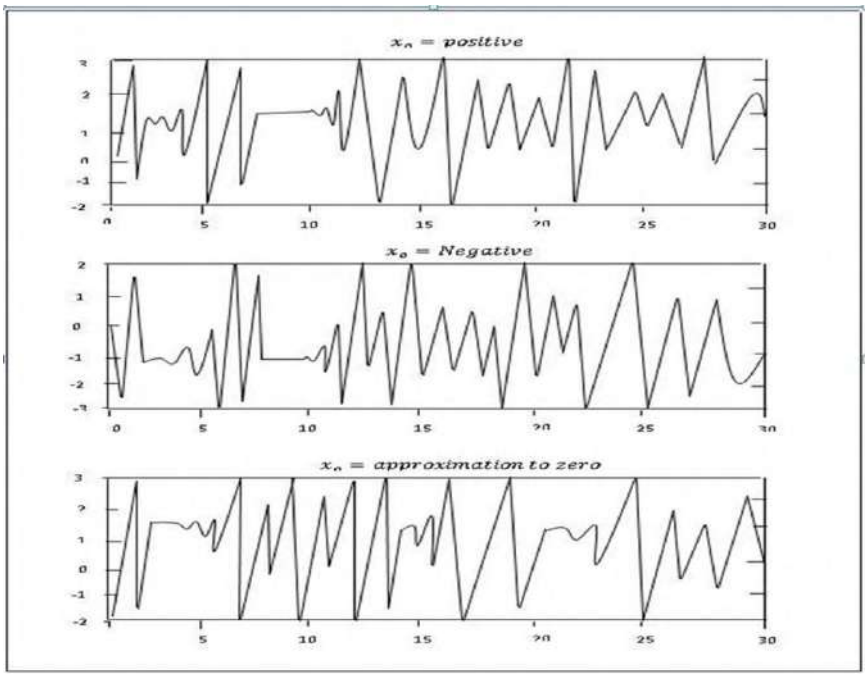

Figure (2). the serial series generated from the model(2)

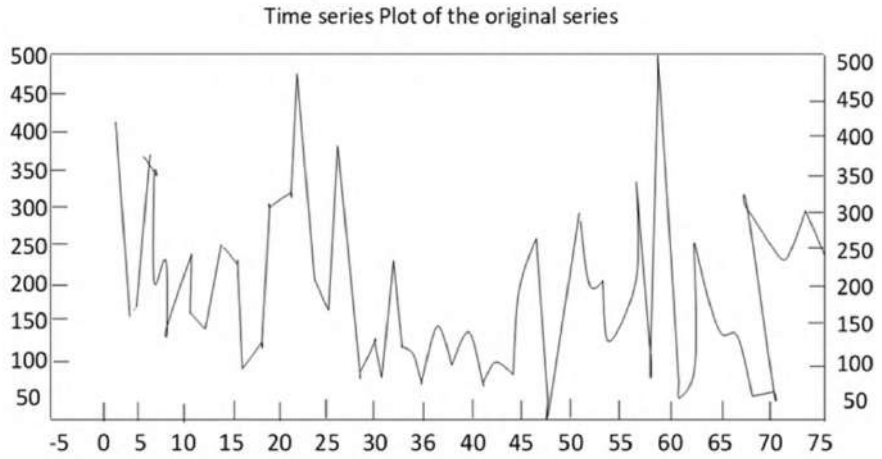
4. The practical side

4.1 introduction

During this time we will try to rely on the way (Box- Genghis) in the analysis and Modeling of the time series of numbers of People with media, where data was obtained from the Yarmouk Hospital in Baghdad/ AL-karkh for the period (2011- 2016) represented by the number of patients with the disease.
1-The first stage: diagnosing the model (Model-identification)
2.The second stage: estimating the parameters of the Model (Parameters Estimation)
3- Third stage: suitability test of the personalized Model (Diagnostic checking) [3].

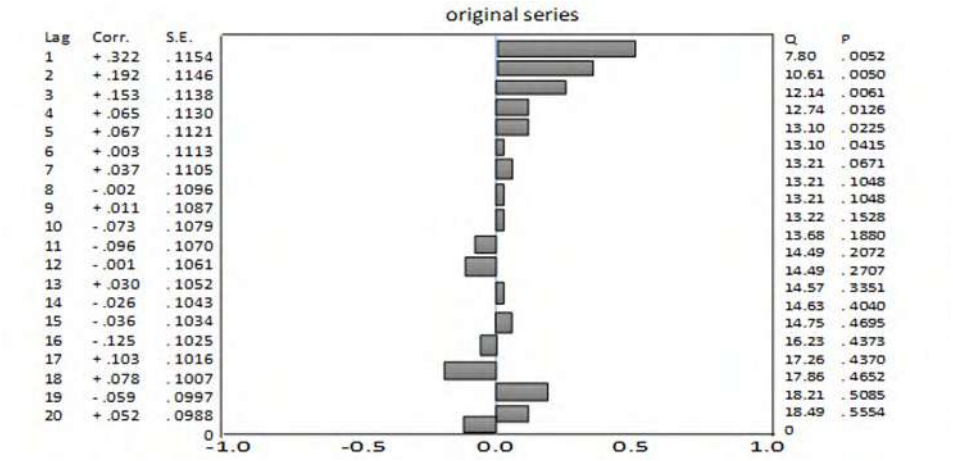
4.2 Data analysis

Figure (1) represents the graph of the time series. where the axis of the Years is the time t, and the axis of the antibiotics represents the numbers of patients with this disease, which represents the studied time series $\{x_t\}$. As we note that the series fluctuates irregularly, which indicates that the series is not crossed in the middle and that the series follows a periodic, irregular system, that is, it repeats itself for a specific period.

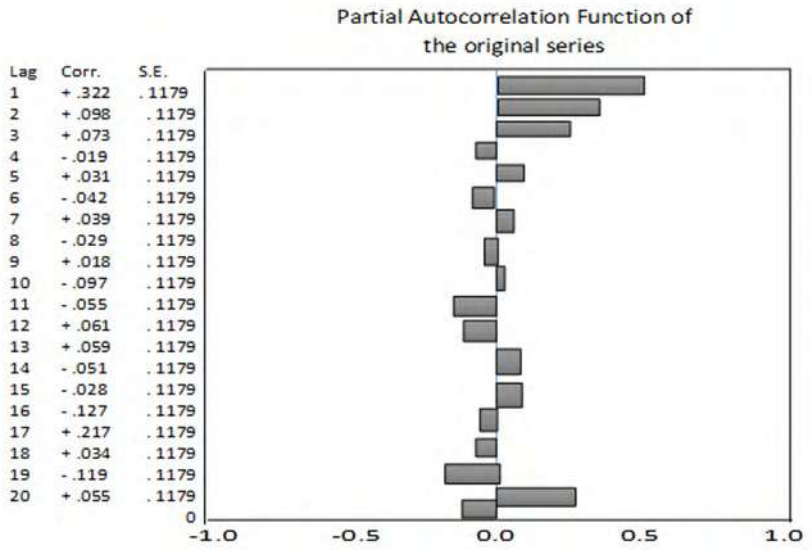


Figure(3). Diagram of the series represented by the number of cases of media

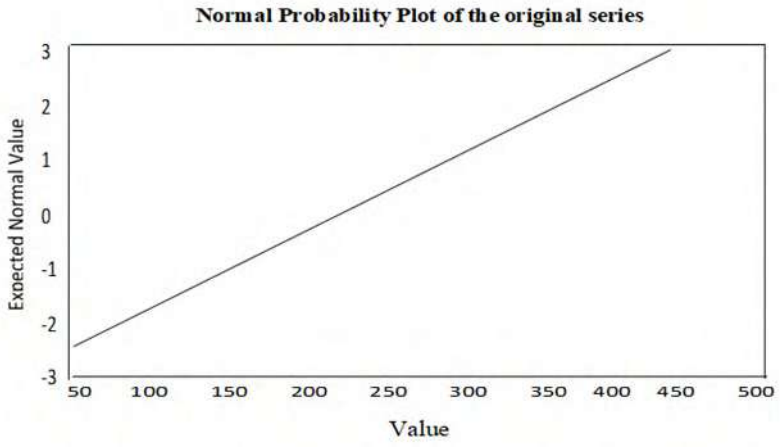
The figures (2), (3) and(4) represent the fee for the self-correlation function, the partial self-correlation function, and a drawing for the incidence of this disease.



Figure(4). auto correlation function for the original data



Figure(5). partial auto- link function for the original data



Figure(6). Charting the nature of the original data

Where we note that the sequence is not related, and we find that more than 8% approximately of the Self - Correlation coefficients are outside the constraint $\pm\frac{1.92}{\sqrt{n}}$, but they are close to the natural distribution, as we note that most of the data are close to the main axis of the nature drawing.

4.3 Modeling

From the observation of the graph of the series, figure (1) we find that the series is not arranged in the Middle, and fluctuate periodically, almost irregularly.

In order to convert it into a time series ranging in the Middle, the differences were taken for it,that is:

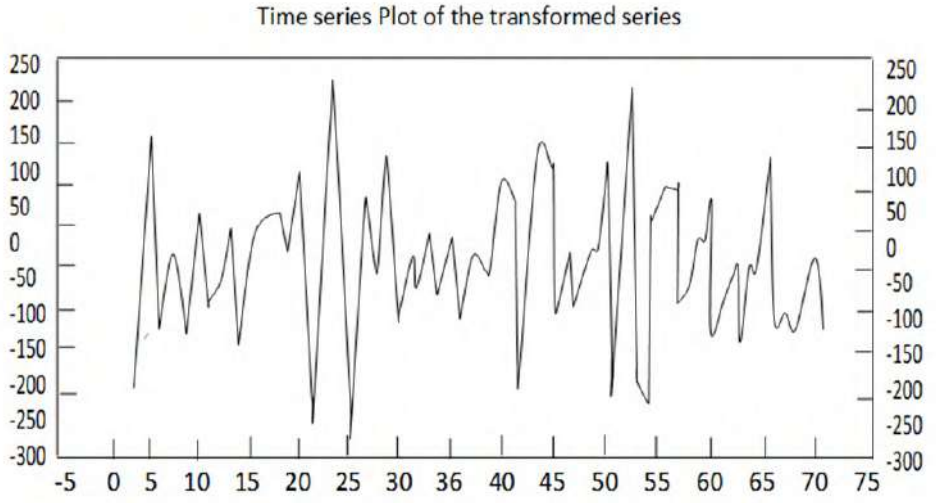
$Y_t = \Delta_{x_t}^d \ldots$

$d = 1,2, \ldots ; \ \Delta = (1 - B)$

x_t Represents the original series, Y_tRepresents the transformed series. And B displacementposteriortrigger, which is known as the following:

$B_{x_t}^r = x_{t-r} \, ; r = 1,2, \ldots$

And the shape (s) represents the transformed sequence (d =1), and we find that the sequence is rounded around the medium.



Figure(7). the serial drawing of the converted data

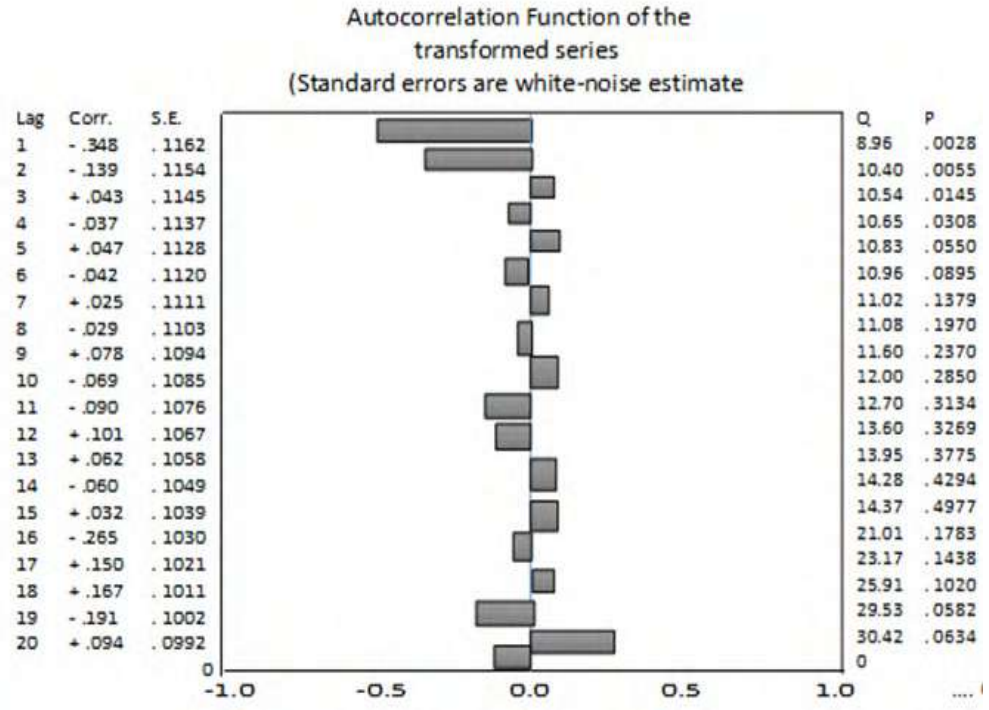


Figure (8) is a self-correlation function for the converted data

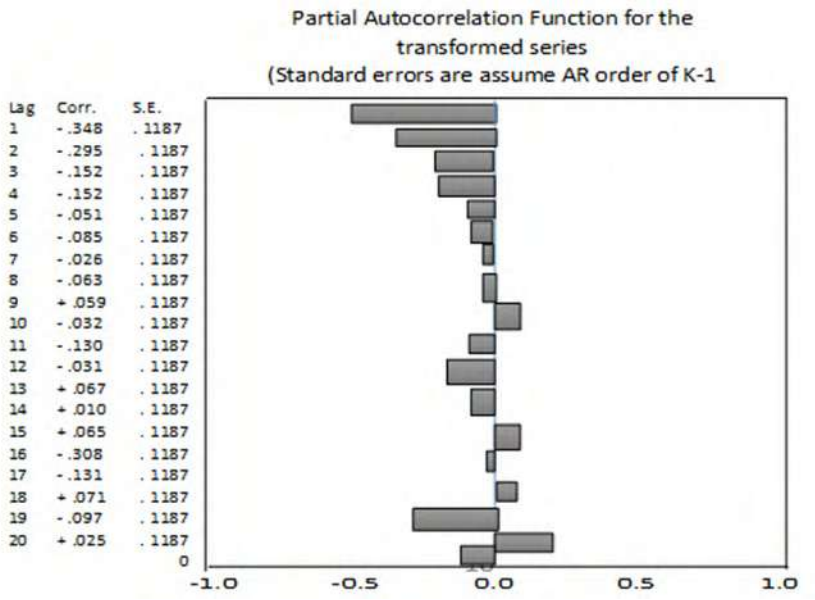
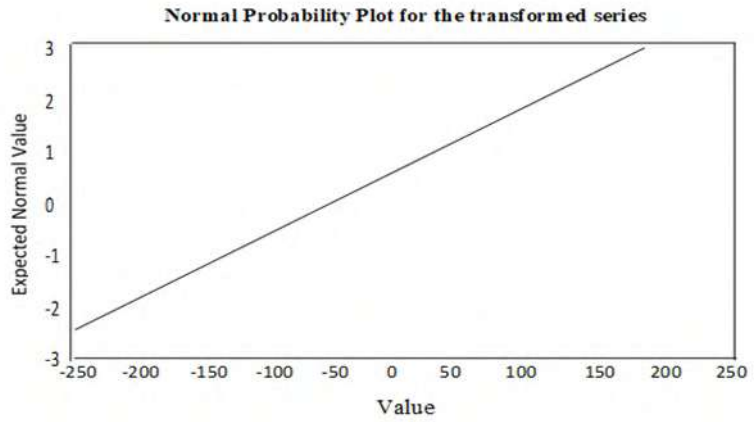


Figure(9) the partial self-correlation function for the converted data



Figure(10) Charting the natural of the transferred data

As for the shapes (6), (7) and (8), the represents the drawing of the self and partial correlation function and the nature drawing, as we note that the serial data are not correlated and where we observe more than 12% of the self-correlation coefficients that are outside the constraint $\pm\frac{1.92}{\sqrt{n}}$ but they are close to the natural distribution.

Depending on the graphical description and correlation function diagram, we have noticed that the series possesses periodic, characteristics and irregular cycle swhich enables us to use non -Liner models to represent the series.

Since the model we have is a polynomial model, since:

$$y_t = \sum_{j=1}^{p} \propto_j [cos\left(\frac{\pi}{2} y_{t-1}\right)]^j + Z_t$$

We will try to construct models form the first anal second ranks to demonstrate the stability of the model above using relationships obtained in the hypothetical side of the previous paragraphs.

let p = l be in the form above:

$y_t = \propto_1 cos\left(\frac{\pi}{2} y_{t-1}\right) + Z_t$

Using the Mathlab program, we obtained the following form:

$y_t = 0.0811\ cos\left(\frac{\pi}{2} y_{t-1}\right) + Z_t$

$\sigma_z^2 = 0.1476576$

$NBIC = -1.83249$

And when p = 2 that is:

$y_t = \propto_1 cos\left(\frac{\pi}{2} y_{t-1}\right) + \propto_2 (cos\ (\frac{\pi}{2} y_{t-1}))^2 + Z_t$

We obtained the following form:

$y_t = 0.0798\ cos\left(\frac{\pi}{2} y_{t-1}\right) + 0.0373\ (cos\ (\frac{\pi}{2} y_{t-1}))^2 + Z_t$

$\sigma_z^2 = 0.1722664$

$NBIC = -1.545764$

4.4 Stability

In this paragraph, we will attempt to apply the relationships (single Point and Limit cycle stability) obtained in the theoretical side of the models that were constructed to represent the studied sequence.

EXAMPLE 4.4.1 Polynomial regression model of the first order

That is:

$y_1 = 0.0622\ cos\left(\frac{\pi}{2} y_{t-1}\right) + Z_t$

Where as:

$\sigma_z^2 = 0.168576$

$NBIC = -1.842783$

$\propto = 0.0822$

i.The single Point

of the above model is by using the relationship (14) is:

$\in = 0.06018272$

ii. single point stability:

Using relationship (16), we get the following form:

$\in_1 = -0.0348714\ \in_{t-1}$

It is a first-order self – regression model and the characteristic equation for the model is:

$v + 0.0348714 = 0$

That is $\lambda = -0.0348714$ is the root of the equation, and it is clear that the above model is stable because $|\lambda| < 1$

iii. Limit cycle stability:

The higher model has a stable orbital limit cycle if the condition is met:

$\left|\frac{\in_{t+q}}{\in_t}\right| < 1$

From the relationship (16) and the hypotheses in that paragraph we obtained:

$\in_t = A\ \in_{t-1}$

From which we obtain:

$c = -0.0348625$

Therefore, the condition for the model to have a stable limit cycle is $|C^q| < 1$, and since $|C| < 1$ the amount $|C^q| < 1$ is fulfilled for all values $q > 1$

So the model has a limit – cycles

EXAMPLE 4.4.2The polynomial regression model of the second-order that is:

$y_t = 0.0876\ cos\left(\frac{\pi}{2} y_{t-1}\right) + 0.0373(cos\ cos\left(\frac{\pi}{2} y_{t-1}\right))^2 + Z_t$

Whereas:

$\sigma_z^2 = 0.1512664$
$NBIC = -1.444782$
$\propto_1 = 0.0876$
$\propto_2 = 0.0474$
i.The single Point of the above model is by using the relationship (14) is:
$\in = 0.12848034$
ii. The stability of a single point using the relationship (16), we get the following model:
$\in_t = -0.108305263 \ \in_{t-1}$
It is a second-order subjective regression model, and the characteristic equation for the model is:
$v + 0.108305263 = 0$
That is $\lambda = -0.108305263$
The root of the equation it is clear that the model is stable above because $|\lambda| < 1$
iii. Stability limit cycle the above form have Stability limit cycle if the condition is true:
$\left|\frac{\in_{t+9}}{\in_t}\right| < 1$
It is a relationship(16) and hypotheses we get .
$\in_t = A \in_{t-1}$
From them we get.
C= -0.108305263
And so it is condition of stability limit cycle $|C^q| < 1$
Since the $|C| < 1$ the value $|C^q| < 1$ all values will be fulfilled q> 1 so the model has stability limit cycle

E-mail: mukdadqaess2016@yahoo.com

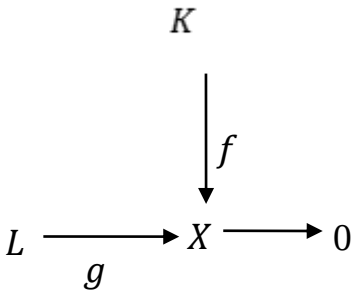
Abstract. Let R be a Ring with identity and let T be a unitary left Module over R. In this paper, we recall the concepts of generalized projectivity and *generalized projectivity. These types of projectivity are very useful for the study on direct sums of Modules to be semihollow-lifting.

1. Introduction

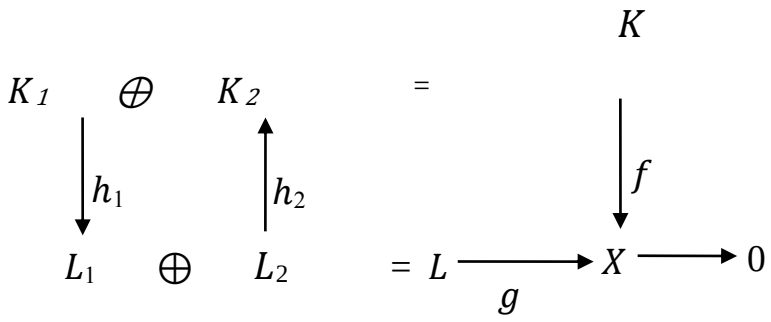
A Submodule H of an R-Module S is small Submodule of S ($H \ll S$) if for every Submodule D of S such that $S = H + D$ implies $D = S$[1]. A Submodule H of an R-Module S is semismall of S ($H \ll_S S$) if H = 0 or $H/F \ll S/F$ $\forall$ nonzero Submodule F of H[2]. Let S be an R-Module and H, F be Submodules of S such that $F \subset H \subset S$. F is semicoessential Submodule of H in S ($F \subseteq_{sce} H$ in S) if $\frac{H}{F} \ll_S \frac{S}{F}$[3]. An R-Module S is semihollow-lifting if for every Submodule H of S with $\frac{S}{H}$ hollow, there exists a Submodule F of S such that $S = F \oplus F^*$ and $F \subseteq_{sce} H$ in S[4].

A Module K is said to be generalized L-projective (or L cojective) if, for any epimorphism $g: L \to X$ and any homomorphism $f: K \to X$, there exist decompositions $K = K_1 \oplus K_2$, $L = L_1 \oplus L_2$, a homomorphism $h_1: K_1 \to L_1$ and an epimorphism $h_2: L_2 \to K_2$ such that $g \circ h_1 = f|K1$ and $f \circ h_2 = g|L_2$ [5].

That is, K is generalized L-projective if any diagram



Can be imbedded in a diagram



Such that h_2 is onto, $g \circ h_1 = f|K_1$ and $f \circ h_2 = g|L_2$.
The following proposition gives properties of the generalized projectivity. ■

Proposition1: [5] Let K and L be Modules with K is generalized L-projective, Thus for any direct summand L^* of L , the Module K is generalized L^*-projective.

We need the following lemma.

Lemma2: Let S= K⊕L and let L be a semihollow-lifting Module. If K is generalized L-projective, then for any Submodule N of S with $\frac{S}{N}$ hollow and S = N+L, there exists $N' \subseteq_{sce} N$ in S with $K' \subseteq K$ and $L' \subseteq L$ such that $S = N' \oplus K' \oplus L'$.

Proof: Let N be a Submodule of S with $\frac{S}{N}$ hollow and S = N+L. By second isomorphism theorem, $\frac{S}{N} = \frac{N+L}{N} \cong \frac{L}{N\cap L}$ and hence $\frac{L}{N\cap L}$ is hollow. Then by [6,Th.1], there exists a decomposition $L = L_1 \oplus L_2$ s.t $L_2 \subseteq N \cap L$ and $(N \cap L) \cap L_1 = N \cap L_1 \ll_S L_1$. S= N+L = N+L_1+L_2 = N+L_1. Since S = K⊕L, thus S = K⊕ $L_1 \oplus L_2$. By modular law, $N = N \cap S = N \cap (K \oplus L_1 \oplus L_2) = (N \cap (K \oplus L_1)) \oplus L_2$. Let A = K⊕ L_1, thus $N = (A \cap N) \oplus L_2$. Since S = N+$L_1$ and $L_1 \subseteq$ A, then $A = A \cap (N+L_1) = (A \cap N)+L_1$. Since K is generalized L-projective and L_1 is a direct summand of L, Then by Prop.1, K is generalized L_1-projective. But A= $K \oplus L_1$ and $A = (A \cap N)+L_1$, therefore there exists a decomposition $A = T \oplus K' \oplus L'_1 = T+L_1$ with $T \subseteq A \cap N$, $K' \subseteq K$ and $L'_1 \subseteq L_1$. Since $T \subseteq A \cap N$, $L_2 \subseteq$N and $T \cap L_2 = 0$, thus $L_2 \oplus T \subseteq N$. Now, S = N+L_1 = $(A \cap N)+L_2+L_1 = A+ L_2 = (T+L_2)+L_1$. Since S = $(T+L_2)+L_1$ and $N \cap L_1 \ll_S L_1$, thus by [2], $(T \oplus L_2) \subseteq_{sce}$ N in S. Since S = K⊕L = (K⊕L_1)⊕ L_2 and A = K ⊕ L_1, then $S = A \oplus L_2 = T \oplus K' \oplus L'_1 \oplus L_2$. Then S = $(T \oplus L_2) \oplus K' \oplus L'_1$, where $(T \oplus L_2) \subseteq_{sce}$ N in S, $K' \subseteq$ K and $L'_1 \subseteq$ L.

In the following proposition we give conditions to obtain the direct sum of two Modules is semihollow-lifting.

Proposition3: Let S = K⊕ L be a Module, where K is generalized L-projective and L is semihollow-lifting. If for every Submodule N of S with $\frac{S}{N}$ is hollow, S ≠ K+N. Then S is semihollow-lifting.

Proof: Let N be a Submodule of S s.t $\frac{S}{N}$ is hollow. Thus S ≠ K+N. Now, $\frac{S}{N} = \frac{K\oplus L}{N} = \frac{K+N}{N} + \frac{L+N}{N}$. Since $\frac{S}{N}$ is hollow, thus either $\frac{K+N}{N} = \frac{S}{N}$ or $\frac{L+N}{N} = \frac{S}{N}$. But S ≠ K+N, therefore $\frac{L+N}{N} = \frac{S}{N}$ and hence S = L+N. Since K is generalized L-projective and L is semihollow-lifting, thus by Lemma2, there exists $N' \subseteq_{sce} N$ in S, with $K' \subseteq$ K and $L' \subseteq$ L s.t $S = N' \oplus K' \oplus L'$. Then S is a semihollow-lifting Module.

Let T_1 and T_2 be R-Modules, recall that T_1 is h-semismall T_2- projective if every homomorphism $g: T_1 \rightarrow \frac{T_2}{W}$,(where W is a Submodule of T_2), $\frac{T_2}{W}$ is hollow and Im $g \ll_s \frac{T_2}{W}$ can be lifted to a homomorphism φ: $T_1 \rightarrow T_2$[7].

Proposition4: Let S = K⊕L has (D3). If L is a semihollow-lifting Module and K is generalized L-projective then K is h-semismall L-projective.

Proof: Let N be a Submodule of S s.t $\frac{S}{N}$ is hollow and S ≠ K+N. But, $\frac{S}{N} = \frac{K\oplus L}{N} = \frac{K+N}{N} + \frac{L+N}{N}$, therefore N $\subseteq_{sce}$ (K+N) in S and hence S = L+N. Since K is generalized L-projective and L is semihollow-lifting, thus by Lemma2, there exists N′ $\subseteq_{sce}$ N in S with K′⊆ K and L′⊆ L s.t S = N′⊕ K′⊕ L′. Since $\frac{S}{N}$ is semihollow, thus by [3,Prop.7], $\frac{S}{N'}$ is a semihollow Module. Now, $\frac{S}{N'} = \frac{L+N}{N'} = \frac{L+N'}{N'} + \frac{N}{N'}$. But N′ $\subseteq_{sce}$ N in *S*, therefore S = L + N′. Since *S* has (D_3) and L, N′ are direct summands of *S*, then L ∩ N′ is a direct summand of *S*. Since L ∩ N′⊆ N′, thus N′ = (L ∩ N′) ⊕ A, for some A ⊆ N′. Hence S = L+N′ = L+ ((L ∩ N′) ⊕ A) . this implies that S = L ⊕ A. Then K is h-semismall L-projective.

Lemma5: [8] If *S* = K + N, where K and N are supplemented Modules. Then S is supplemented, and any Submodule X of S has a supplement of the form K′ + N′ with K′ ⊆ K and N′ ⊆ N.

Assume that X is a supplement Submodule of S, thus K′ and X + N′ are mutual supplements in S and the same is true for N′ and X + K′.

Now, we prove the following proposition.

Proposition 6 : Let S = K⊕L, where K and L are supplemented Modules and L is semihollow-lifting. If K is generalized L-projective, then for every coclosed Submodule X of S such that $\frac{S}{X}$ is hollow, there exists a Submodule N of S such that either S = N ⊕ K″ or S = N ⊕ L″, where K″ ⊆ K and L″⊆ L and N $\subseteq_{ce}$ H in S such that H is a supplement Submodule in S and X ⊆ H.

Proof: Let X be a coclosed Submodule of S s.t $\frac{S}{X}$ is hollow. Since K and L are supplemented Modules, thus by Lemma 5, S is supplemented and X has a supplement K′⊕ L′, where K′ ⊆ K and L′ ⊆ L. Since S is supplemented, thus by [9, Lemma1.1], the coclosed Submodules are supplements. Then X is a supplement Submodule of S. By Lemma5, X+K′ and X+L′ are supplement Submodules of S, also X + K′ and L′ are mutual supplements in S. Thus S = (X+K′)+L′ and hence S = (X+K′)+L. Since $\frac{S}{X}$ is hollow, thus by [3,prop3], $\frac{S}{X+K'}$ is semihollow. But K is generalized L-projective and L is semihollow-lifting, so by Lemma2, there exists a Submodule N of *S* s.t N $\subseteq_{sce}$ (X+K′) in *S* and S = N⊕K″⊕ L″ , for some K″⊆ K and L″⊆ L. Let H = X+K′. Since $\frac{S}{H}$ is hollow, thus by [3,prop7], $\frac{S}{N}$ is semihollow. But by second isomorphism theorem, $\frac{S}{N} \cong K''\oplus L''$, therefore either K″ = 0 or L″ = 0. Thus either *S* = N ⊕ K″ or *S* = N ⊕ L″, where N $\subseteq_{sce}$ H, H is a supplement Submodule of *S* and X ⊆ H.

Let S = K⊕ L. Then K is *generalized L-projective (or L-*cojective), if for any supplement N of L in S, S decomposes as S = N ⊕ K′⊕ L′, with K′⊆ K and L′⊆ L[5].

The following proposition gives properties of *generalized projectivity.

Proposition 7: [10] Let L^* be a direct summand of L. If K is *generalized L-projective, thus K is *generalized L^*-projective.

Proposition 8: Let S = K⊕L be a Module, where K is *generalized L-projective and L is semihollow-lifting. If X $\subseteq_{scc}$ S such that $\frac{S}{X}$ is hollow with *S* = X+L, then *S* is decomposes S = X ⊕ K′⊕ L′ with K′ ⊆ K and L′ ⊆ L.

Proof: Let X be a semicoclosbmodule of S s.t $\frac{S}{X}$ is hollow with S = X+L. By the second isomorphism theorem, $\frac{S}{X} = \frac{X+L}{X} \cong \frac{L}{X\cap L}$. Then $\frac{L}{X\cap L}$ is hollow.Since L is semihollow-lifting, thus by [6.Th.1], there exists a decomposition $L = L_1 \oplus L_2$ s.t $L_1 \subseteq X \cap L$ and $(X \cap L)\cap L_2 \ll_S L_2$ and hence $X \cap L_2 \ll_S L_2$. Since $S = K \oplus L$, thus $S = K \oplus L_1 \oplus L_2$. Let $N = K \oplus L_2$, thus $S = N \oplus L_1$. By modular law, $X = X \cap (N \oplus L_1) = (X \cap N) \oplus L_1$, thus $X = X_1 \oplus L_1$, where $X_1 = X \cap N$. Since S = X+L, thus $S = X+L_1+L_2 = X+L_2$. Again by modular law, $N = N \cap (X+L_2) = (N \cap X)+L_2$, hence $N = X_1+L_2$. Since $X \cap L_2 \ll_S L_2$, thus $X_1 \cap L_2 \ll_S L_2$. Then L_2 is a semisupplement of X_1 in N, since X_1 is a direct summand of X and $X \subseteq_{cc} S$, thus by [10, Lemma 2.3], $X_1 \subseteq_{cc} S$. Since $X_1 \cap L_2 \ll_S S$ and $X_1 \subseteq_{cc} S$, then by [2], $X_1 \cap L_2 \ll_S X_1$ and hence X_1 is a semisupplement of L_2 in N. But K is *generalized L-projective and L_2 is a direct summand of L, thus by Prop.7, K is *generalized L_2-projective. Since X_1 is a semisupplement of L_2 in N, thus $N = X_1 \oplus K' \oplus L'_2$, where $K' \subseteq K$ and $L'_2 \subseteq L_2$. But $S = N \oplus L_1$, therefore $S = X_1 \oplus K' \oplus L'_2 \oplus L_1$ and hence $S = X_1 \oplus L_1 \oplus K' \oplus L'_2$. Since $X = X_1 \oplus L_1$, thus $S = X \oplus K' \oplus L'_2$ with $K' \subseteq K$ and $L'_2 \subseteq L$.
Remark9[11] Every hollow module is amply supplemented.
Proposition10[9] Let S be an amply supplemented Module. Thus every Submodule of S has a coclosure Submodule.

Proposition 11: [9] Let S be a weakly supplemented Module and $K \subseteq N$ be Submodules of S such that $\frac{N}{K} \subseteq_{scc} \frac{S}{K}$ and $K \subseteq_{scc} S$. Then $N \subseteq_{scc} S$.

Proposition12[11] Epimorphic image of hollow Module is hollow.

The following propositions give properties of Modules which have hollow factor Modules.

Proposition 13 **:** Let S be an R-Module, and let K and N be Submodules of S such that $K \subset N \subset S$, if $\frac{S}{K}$ is a hollow Module, thus $\frac{S}{N}$ hollow.

Proof: Suppose that $\frac{S}{K}$ is hollow, define a map f: $\frac{S}{K} \to \frac{S}{N}$ as follows $f(s+K) = s+N$, for all $s \in S$. It is clear that f is an epimorphism. Since $\frac{S}{K}$ is hollow thus by Prop.12, $\frac{S}{N}$ is hollow.

Proposition 14: Let $S = K \oplus L$ be a weakly supplemented R-Module, where K is *generalized L-projective and L is semihollow-lifting. Then for any semicoclosed Submodule X of S such that $\frac{S}{X}$ is hollow, either $S = X \oplus K'$ or $S = X \oplus L'$ where $K' \subseteq K$ and $L' \subseteq L$.

Proof**:** Let X be a semicoclosed Submodule of S s.t $\frac{S}{X}$ is hollow. Then by Remark9, $\frac{S}{X}$ is amply supplemented.Then by Prop.10, $\frac{K+X}{X}$ has a semicoclosure in $\frac{S}{X}$. That is, there exists a semicoclosed Submodule $\frac{N}{X}$ in $\frac{S}{X}$ s.t $\frac{N}{X} \subseteq_{sce} \frac{K+X}{X}$ in $\frac{S}{X}$. Thus by the third isomorphism theorem, $N \subseteq_{sce} (K+X)$ in S. Since $X \subseteq_{scc} S$ and $\frac{N}{X} \subseteq_{scc} \frac{S}{X}$ and S is a weakly supplemented Module, thus $N \subseteq_{scc} S$. Since $N \subseteq_{ce} (K+X)$ in S, thus $K+X \neq S$. But $\frac{S}{X} = \frac{K\oplus L}{X} = \frac{K+X}{X} + \frac{L+X}{X}$, therefore, $X \subseteq_{ce} (K+X)$ in S, thus S = L+X this implies that S = L+N. Since $\frac{S}{X}$ is hollow and $X \subseteq N$ thus by Prop.13, $\frac{S}{N}$ is hollow. But K is *generalized L-projective and L is semihollow-lifting, thus by Prop.8, S decomposes as $S = N \oplus K' \oplus L'$, with $K' \subseteq K$ and $L' \subseteq L$. Then by the second isomorphism theorem, $\frac{S}{N} \cong K' \oplus L'$. But $\frac{S}{N}$

is hollow, therefore, either $K' = 0$ or $L' = 0$. Thus either $S = N \oplus K'$ or $S = N \oplus L'$. If $S = N \oplus K'$, thus $\frac{S}{X} = \frac{N \oplus K'}{X} = \frac{N}{X} \oplus \frac{K' \oplus X}{X}$. Since $\frac{S}{X}$ is hollow, thus $X \subseteq_{ce} N$ in S, then $S = X \oplus K'$, where $K' \subseteq K$.
By the similar way, if $S = N \oplus L'$ then $S = X \oplus L'$, where $L' \subseteq L$.

Abstract. In this article, we recalled different types of iterations as Mann, Ishikawa, Noor, CR-iteration and, Modified $\mathcal{SP}$_iteration of quasi δ-contraction mappings, and we proved that all these iterations equivalent to approximate fixed points of δ -contraction mappings in Banach spaces.

1. Introduction:

The iterations methods are used to calculate a non-expansive mapping fixed point. Many of applied science and engineering's physical problems are commonly formulated as functional equations. These equations can conveniently be written in the form of fixed-point equations. An iterative method that approximates the solution of these equations in fewer stages is always needed. At the heart of systematic research, activity was the analysis of variational inequalities and complementarity concerns of mappings meeting those constraints. In view, fact that problems of variational inequalities are particularly useful in optimization theory, which can be found by solving an equation with some special type of nonlinear function for various forms of mappings, several studies are dealing with iterative methods, see[1-12], so it is very important to develop some faster Iterative process to find the approximate solution. Now we give some well- known Iteration methods.

The Mann iterative scheme was invented in 1953, see [13], and was used to obtain convergence to a fixed point for many functions for which the Banach principle fails. For example, the author showed that, for any continuous self map of a closed and bounded interval, the Mann iteration converges to a fixed point of the function. In 1974, Ishikawa [14] devised a new iteration scheme to establish convergence for a Lipschitzian pseudo contractive map in a situation where the Mann iteration process failed to converge. Let $(X, \|.\|)$ be a Banach space, $\mathcal{T}$ be self -mapping on $\mathcal{C}$ and $\emptyset \neq \mathcal{C}$ be a closed convex subset of X. we recalled different types of iterations as Mann, Ishikawa, Noor, CR- iteration and Modified $\mathcal{SP}$_iteration respectively:

1. Let $r_0 \in \mathcal{C}$ $r_{n+1} = (1 - a_n)r_n + a_n \mathcal{T} r_n , n \in N$, where $\langle a_n \rangle_{n=0}^{\infty}$ be a sequence in $(0, 1)$.
2. Let $c_0 \in \mathcal{C}$, $c_{n+1} = (1 - a_n)c_n + a_n \mathcal{T} d_n$,
$d_n = (1 - b_n)c_n + b_n \mathcal{T} c_n$, $n \in N$, where $\langle a_n \rangle_{n=0}^{\infty}$ and $\langle b_n \rangle_{n=0}^{\infty}$be a sequence in $(0, 1)$.
3. The third iteration process is referred to as Noor, in 2000 [15] introduced the following iterative
$u_0 \in \mathcal{C}$, $u_{n+1} = (1 - a_n)u_n + a_n \mathcal{T} q_n$,
$q_n = (1 - b_n)u_n + b_n \mathcal{T} p_n$,
$p_n = (1 - c_n)u_n + c_n \mathcal{T} u_n$, n $\in N$
where $\langle a_n \rangle_{n=0}^{\infty}$, $\langle b_n \rangle_{n=0}^{\infty}$ and $\langle c_n \rangle_{n=0}^{\infty}$ are sequences in $(0, 1)$.

4. The fourth CR- iteration, in 2012 [16] introduced the following iterative ,
   $k_0 \in \mathcal{C}$, $k_{n+1} = (1 - a_n)m_n + a_n \mathcal{T}m_n$,
   $m_n = (1 - b_n)\mathcal{T}k_n + b_n \mathcal{T}\mathcal{O}_n$
   $\mathcal{O}_n = (1 - c_n)k_n - c_n \mathcal{T}k_n$, where $\langle a_n\rangle_{n=0}^{\infty}$, $\langle b_n\rangle_{n=0}^{\infty}$and $\langle c_n\rangle_{n=0}^{\infty}$ are sequences in $(0, 1)$.
5. The fifth Modified $\mathcal{SP}$_iteration, in 2014 [17] introduced the following iterative,
   $d_0 \in \mathcal{C}$, $d_{n+1} = \mathcal{T}t_n$,
   $t_n = (1 - a_n)s_n + a_n \mathcal{T}s_n$,
   $s_n = (1 - b_n)d_n + b_n \mathcal{T}d_n$
   where $\langle a_n\rangle_{n=0}^{\infty}$ and $\langle b_n\rangle_{n=0}^{\infty}$ are sequences in $(0, 1)$.

1.1 Lemma:[18]
Let $\langle \tilde{a}_n\rangle_{n=0}^{\infty}$ and $\langle \tilde{b}_n\rangle_{n=0}^{\infty}$ be nonnegative real sequences satisfying the following condition:
$\tilde{a}_{n n+1} \le (1 - \mu_n)\tilde{a}_n + \tilde{b}_n$, where $\mu_n \in (0,1)$, for all $n \ge n_0$, $\sum_{n=1}^{\infty} \mu_n = \infty$ and $\frac{\tilde{b}_n}{\mu_n} \to 0$ as $n \to \infty$. Then $\lim_{n \to \infty} \tilde{a}_n = 0$.

1.2 Lemma:[19]
Let $\langle x_n\rangle_{n=0}^{\infty}$ be nonnegative real sequences and there exists $n_0 \in \mathbb{N}$, such that for all $a_n \ge n_0$ satisfying the following condition:
$x_{n+1} \le (1 - \mu_n)x_n + \mu_n a_n$,
Where $\mu_n \in (0,1)$ for all $n \in \mathbb{N}$, $\sum_{n=1}^{\infty} \mu_n = \infty$. Then the following inequality holds:
$0 \le \lim_{n \to \infty} \sup x_n \le \lim_{n \to \infty} \sup a_n$.

1.3 Definition:[20]
Let $(\mathcal{N}, \|\,.\,\|)$ be a normed space and $\mathcal{T}$ be self - mapping on $\mathcal{N}$. Then $\mathcal{T}$ is called quasi δ −contraction if satisfy the following inequality: For all $x, y \in \mathcal{N}$
$\|\mathcal{T}x - \mathcal{T}y\| \le \delta\|x - y\| + L m(x, y)$,for some $0 \le \delta < 1$, $L \ge 0$, where
$m(x, y) = \min\{\|x - \mathcal{T}x\|, \|y - \mathcal{T}y\|, \|x - \mathcal{T}y\|, \|y - \mathcal{T}x\|\}$.

1.4 Definition:[21]
Let $\langle a_n\rangle_{n=0}^{\infty}$ and $\langle b_n\rangle_{n=0}^{\infty}$ be two sequences converging to the same fixed point p . We say that $\langle a_n\rangle_{n=0}^{\infty}$ converges faster than $\langle b_n\rangle_{n=0}^{\infty}$ if $\lim_{n \to \infty} \frac{\|a_n - p\|}{\|b_n - p\|} = 0$.

2. Main Results

During this section, .we will study the convergence equivalent between many iterations by using quasi δ –contraction.

2.1 Theorem: Let $\mathcal{T}$ a quasi δ -contraction mapping on $\mathcal{C}$ which has a unique fixed point p . Consider the Ishikawa and Mann iterations with real sequences $\langle a_n\rangle_{n=0}^{\infty}, \langle b_n\rangle_{n=0}^{\infty}$ lies in $[0, 1]$. Then the following assertions are equivalent :

i. The Mann iteration converges to p .
ii. The Ishikawa iteration converges to p.

Proof: To show that (i) ⇒ (ii) .i.e, if the Mann iteration converges to p then the Ishikawa iteration does converge to p too.
Now Consider Mann and The Ishikawa iterations, we have

$$\begin{aligned} \|r_{n+1} - c_{n+1}\| &= \|(1 - a_n)r_n + a_n \mathcal{T}r_n - (1 - a_n)c_n - a_n \mathcal{T}d_n\| \\ &\le (1 - a_n)\|r_n - c_n\| + a_n\|\mathcal{T}r_n - \mathcal{T}d_n\| \\ &\le (1 - a_n)\|r_n - c_n\| + \delta a_n\|r_n - d_n\| + a_n L m(r_n, d_n) \end{aligned} \quad (2.1)$$

And,

$$\begin{aligned}\|r_n - d_n\| &= \|r_n - (1-b_n)c_n - b_n\mathcal{T}c_n\| \\ &\le (1-b_n)\|r_n - c_n\| + b_n\|r_n - \mathcal{T}c_n\| \\ &\le (1-b_n)\|r_n - c_n\| + b_n\|r_n - \mathcal{T}r_n\| + \delta b_n\|r_n - c_n\| + b_n L m(r_n, c_n) \quad (2.2)\end{aligned}$$

Substituting (2.2) in (2.1), we obtain

$$\begin{aligned}\|r_{n+1} - c_{n+1}\| &\le (1-a_n)\|r_n - c_n\| + \delta a_n(1-b_n)\|r_n - c_n\| + \delta a_n b_n\|r_n - \mathcal{T}r_n\| \\ &\quad + \delta^2 a_n b_n\|r_n - c_n\| + \delta a_n b_n L m(r_n, c_n) + a_n L m(r_n, d_n) \\ &\le [1 - a_n + \delta a_n(1-b_n) + \delta a_n b_n]\|r_n - c_n\| + \delta a_n\|r_n - \mathcal{T}r_n\| \\ &\quad + \delta a_n L m(r_n, c_n) + a_n L m(r_n, d_n) \\ &\le [1 - a_n(1 - \delta(1-b_n) - \delta b_n)]\|r_n - c_n\| + \delta a_n b_n\|r_n - \mathcal{T}r_n\| \\ &\quad + \delta a_n b_n L m(r_n, c_n) + a_n L m(r_n, d_n) \\ &\le [1 - a_n(1 - \delta(1 - b_n + b_n))]\|r_n - c_n\| + \delta a_n\|r_n - \mathcal{T}r_n\| \\ &\quad + \delta a_n L m(r_n, c_n) + a_n L m(r_n, d_n) \\ &\le [1 - a_n(1-\delta)]\|r_n - c_n\| + \delta a_n\|r_n - \mathcal{T}r_n\| + \delta a_n L m(r_n, c_n) + a_n L m(r_n, d_n)\end{aligned}$$

Since $\delta \in (0,1)$ and $[a_n(1-\delta)] < 1$, we have

$$\begin{aligned}\|r_{n+1} - c_{n+1}\| &\le [1 - a_n(1-\delta)]\|r_n - c_n\| + \delta a_n\|r_n - \mathcal{T}r_n\| \\ &\quad + \delta a_n L \min\{\|r_n - \mathcal{T}r_n\|, \|c - \mathcal{T}c_n\|, \|d_n - \mathcal{T}c_n\|, \|r - \mathcal{T}r_n\|\} \\ &\quad + a_n L \min\{\|r_n - \mathcal{T}r_n\|, \|d - \mathcal{T}d_n\|, \|r_n - \mathcal{T}d_n\|, \|d_n - \mathcal{T}r_n\|\}\end{aligned}$$

Let $\mu_n = a_n(1-\delta) \in (0,1)$

$\tilde{a}_n = \|r_n - c_n\|$, $\tilde{b}_n = \delta a_n\|r_n - \mathcal{T}r_n\| + \delta a_n L \min\{\|r_n - \mathcal{T}r_n\|, \|c - \mathcal{T}c_n\|, \|d_n - \mathcal{T}c_n\|, \|r - \mathcal{T}r_n\|\} + a_n L \min\{\|r_n - \mathcal{T}r_n\|, \|d - \mathcal{T}d_n\|, \|r_n - \mathcal{T}d_n\|, \|d_n - \mathcal{T}r_n\|\}$

Furthermore using $\mathcal{T}p = p$ and $\|r_n - p\| \to 0$, we have

$$\begin{aligned}\|r_n - \mathcal{T}r_n\| &= \|r_n - p + \mathcal{T}p - \mathcal{T}r_n\| \\ &\le \|r_n - p\| + \delta\|r_n - p\| + L m(r_n, p) \\ &= (1+\delta)\|r_n - p\| + L\min\{\|r_n - \mathcal{T}r_n\|, \|p - \mathcal{T}p\|, \|r_n - \mathcal{T}p\|, \|p - \mathcal{T}r_n\|\}\end{aligned}$$

Therefore $\|r_n - \mathcal{T}r_n\| \to 0$. So, we get $\check{b}_n \to 0$,

Now, by applying lemma (1.1), we obtain

$\check{a}_n = \|r_n - c_n\| \to 0$ as $n \to 0$.

Consequently ;

$\|r_{n+1} - c_{n+1}\| \to 0$ as $n \to 0$

Now we show that, (ii) ⇒ (i)

$$\begin{aligned}\|c_{n+1} - r_{n+1}\| &\le \|c_{n+1} - p\| + \|r_{n+1} - p\| \\ &= \|(1-a_n)c_n + a_n\mathcal{T}d_n - p\| + \|(1-a_n)r_n + a_n\mathcal{T}r_n - p\| \\ &\le (1-a_n)\|c_n - p\| + \delta a_n\|d_n - p\| + a_n L m(d_n, p) \\ &\quad + (1-a_n)\|r_n - p\| + \delta a_n\|r_n - p\| + a_n L m(r_n, p) \\ &\le (1-a_n)\|c_n - p\| + \delta a_n\|d_n - p\| + a_n L m(d_n, p) \\ &\quad + (1 - a_n(1-\delta))\|r_n - p\| + a_n L m(r_n, p) \quad (2.3)\end{aligned}$$

And,

$$\begin{aligned}\|d_n - p\| &= \|(1-b_n)c_n + b_n Tc_n - p\| \\ &\le (1-b_n)\|c_n - p\| + \delta b_n\|c_n - p\| + b_n L m(c_n, p) \\ &= (1 - b_n(1-\delta))\|c_n - p\| + b_n L m(c_n, p) \quad (2.4)\end{aligned}$$

Substituting (2.4) in (2.3), we obtain

$$\begin{aligned}\|c_{n+1} - r_{n+1}\| &\le (1-a_n)\|c_n - p\| + a_n L m(d_n, p) \\ &\quad + \delta a_n(1 - b_n(1-\delta))\|c_n - p\| + \delta a_n b_n L m(c_n, p) \\ &\quad + (1 - a_n(1-\delta))\|r_n - p\| + a_n L m(r_n, p) \\ \|c_{n+1} - r_{n+1}\| &\le (1-a_n) + \delta a_n\|c_n - r_n + r_n - p\| + a_n L m(d_n, p) \\ &\quad + \delta a_n L m(c_n, p) + (1 - a_n(1-\delta))\|r_n - p\| + a_n L m(r_n, p)\end{aligned}$$

$$\leq (1-a_n(1-\delta)\|c_n-p\|+a_nLm(d_n,p)$$
$$+\delta a_nLm(c_n,p)+(1-a_n(1-\delta))\|r_n-p\|+a_nLm(r_n,p)$$

Since $\delta\in(0,1)$ and $[a_n(1-\delta)]<1$, we have

$$\|c_{n+1}-r_{n+1}\| \leq (1-a_n(1-\delta)\|c_n-r_n\|+(1-a_n(1-\delta))^2\|r_n-p\|$$
$$+\delta a_nL\min\{\|c_n-\mathcal{T}c_n\|,\|p-\mathcal{T}p\|,\|p-\mathcal{T}c_n\|,\|c_n-\mathcal{T}p\|\}$$
$$+a_nL\min\{\|d_n-\mathcal{T}d_n\|,\|p-\mathcal{T}p\|,\|p-\mathcal{T}d_n\|,\|d_n-\mathcal{T}p\|\}$$
$$+a_nL\min\{\|r_n-\mathcal{T}r_n\|,\|p-\mathcal{T}p\|,\|r_n-\mathcal{T}p\|,\|p-\mathcal{T}r_n\|\}$$

Denote that $\mu_n=a_n(1-\delta)\in(0,1)$

$\check{a}_n=\|c_n-r_n\|$ and $\check{b}_n=(1-a_n(1-\delta))^2\|r_n-p\|$
$$+\delta a_nL\min\{\|c_n-\mathcal{T}c_n\|,\|p-\mathcal{T}p\|,\|p-\mathcal{T}c_n\|,\|c_n-\mathcal{T}p\|\}$$
$$+a_nL\min\{\|d_n-\mathcal{T}d_n\|,\|p-\mathcal{T}p\|,\|p-\mathcal{T}d_n\|,\|d_n-\mathcal{T}p\|\}$$
$$+a_nL\min\{\|r_n-\mathcal{T}r_n\|,\|p-\mathcal{T}p\|,\|r_n-\mathcal{T}p\|,\|p-\mathcal{T}r_n\|\}$$

Thus from lemma (1.1), we get

$\check{a}_n=\|c_n-r_n\|\to 0$ as $n\to 0$. Therefore,

$\|c_{n+1}-r_{n+1}\|\to 0$ as $n\to 0$.

2.2 Theorem: Let $\mathcal{T}$ a quasi δ -contraction mapping on $\mathcal{C}$ which has a unique fixed point p. Consider the Modified $\mathcal{SP}$_iteration and Mann iteration with real sequences $\langle a_n\rangle_{n=0}^{\infty},\langle b_n\rangle_{n=0}^{\infty}$ lies in $(0,1)$. Then the following assertions are equivalent :

i. The Mann iteration converges to p .

ii. The Modified $\mathcal{SP}$_iteration converges to p.

Proof. To show that (i) ⇒ (ii. i.e., if the Mann iteration converges to p then The Modified $\mathcal{SP}$_iteration does converge to p too. Now Consider Mann and The Modified $\mathcal{SP}$_iterations, we have

$$\|r_{n+1}-d_{n+1}\| = \|(1-a_n)r_n+a_n\mathcal{T}r_n-\mathcal{T}t_n\|$$
$$\leq (1-a_n)\|r_n-\mathcal{T}t_n\|+a_n\|\mathcal{T}r_n-\mathcal{T}t_n\|$$
$$\leq (1-a_n)\|r_n-\mathcal{T}r_n\|+\delta(1-a_n)\|r_n-t_n\|$$
$$+(1-a_n)Lm(r_n,t_n)+\delta a_n\|r_n-t_n\|+a_nLm(r_n,t_n)$$
$$=(1-a_n)\|r_n-\mathcal{T}r_n\|+\delta\|r_n-t_n\|+Lm(r_n,t_n) \quad (2.5)$$

And

$$\|r_n-t_n\| = \|r_n-(1-a_n)s_n-a_n\mathcal{T}s_n\|$$
$$\leq (1-a_n)\|r_n-s_n\|+a_n\|r_n-\mathcal{T}s_n\|+\delta a_n\|r_n-s_n\|+a_nLm(r_n,s_n)$$
$$\leq (1-a_n)\|r_n-s_n\|+a_n\|r_n-\mathcal{T}r_n\|$$
$$\leq (1-a_n(1-\delta))\|r_n-s_n\|+a_n\|r_n-\mathcal{T}r_n\|+a_nLm(r_n,s_n) \quad (2.6)$$

And,

$$\|r_n-s_n\| = \|r_n-(1-b_n)d_n-b_n\mathcal{T}d_n\|$$
$$\leq (1-b_n)\|r_n-d_n\|+b_n\|r_n-\mathcal{T}d_n\|$$
$$\leq (1-b_n)\|r_n-d_n\|+b_n\|r_n-\mathcal{T}r_n\|+\delta b_n\|r_n-d_n\|+b_nLm(r_n,s_n)$$
$$\leq (1-b_n(1-\delta))\|r_n-d_n\|+b_n\|r_n-\mathcal{T}r_n\|+b_nLm(r_n,d_n) \quad (2.7)$$

Substituting (2.7) in (2.6), we obtain

$$\|r_n-t_n\| \leq (1-a_n(1-\delta))[(1-b_n(1-\delta))\|r_n-d_n\|$$
$$+b_n\|r_n-\mathcal{T}r_n\|+b_nLm(r_n,d_n)]+a_n\|r_n-\mathcal{T}r_n\|+a_nLm(r_n,s_n)$$
$$\leq (1-b_n(1-\delta))\|r_n-d_n\|+a_nLm(r_n,s_n)$$
$$+b_n\|r_n-\mathcal{T}r_n\|+b_nLm(r_n,d_n)+a_n\|r_n-\mathcal{T}r_n\| \quad (2.8)$$

Substituting (2.8) in (2.5), we obtain

$$\|r_{n+1}-d_{n+1}\| \leq (1-a_n)\|r_n-\mathcal{T}r_n\|+Lm(r_n,t_n)$$
$$+\delta[(1-b_n(1-\delta))\|r_n-d_n\|+b_nLm(r_n,d_n)$$

$$+ a_n\|r_n - \mathcal{T}r_n\| + a_nLm(r_n, s_n)]$$
$$\leq (1 - b_n(1-\delta))\|r_n - d_n\| + (1 - a_n)\|r_n - \mathcal{T}r_n\|$$
$$+a_nL\min\{\|r_n - \mathcal{T}r_n\|, \|s - \mathcal{T}s_n\|, \|r_n - \mathcal{T}s_n\|, \|s - \mathcal{T}r_n\|\}$$
$$+b_nL\min\{\|r_n - \mathcal{T}r_n\|, \|d - \mathcal{T}d_n\|, \|r_n - \mathcal{T}d_n\|, \|d_n - \mathcal{T}r_n\|\}$$
$$+L\min\{\|r_n - \mathcal{T}r_n\|, \|t_n - \mathcal{T}t_n\|, \|r_n - \mathcal{T}t_n\|, \|t_n - \mathcal{T}r_n\|\}$$

Denote that

$\mu_n = b_n(1-\delta) \in (0,1)$, $\check{a}_n = \|r_n - d_n\|$ and $\check{b}_n = (1 - a_n)\|r_n - \mathcal{T}r_n\|$
$+a_nL\min\{\|r_n - \mathcal{T}r_n\|, \|s - \mathcal{T}s_n\|, \|r_n - \mathcal{T}s_n\|, \|s - \mathcal{T}r_n\|\}$
$+b_nL\min\{\|r_n - \mathcal{T}r_n\|, \|d - \mathcal{T}d_n\|, \|r_n - \mathcal{T}d_n\|, \|d_n - \mathcal{T}r_n\|\}$
$+L\min\{\|r_n - \mathcal{T}r_n\|, \|t_n - \mathcal{T}t_n\|, \|r_n - \mathcal{T}t_n\|, \|t_n - \mathcal{T}r_n\|\}$

Furthermore using $\mathcal{T}p = p$ and $\|r_n - p\| \to 0$, we have

$$\|r_n - \mathcal{T}r_n\| = \|r_n - p + \mathcal{T}p - \mathcal{T}r_n\|$$
$$\leq \|r_n - p\| + \delta\|r_n - p\| + Lm(r_n, p)$$
$$= (1+\delta)\|r_n - p\| + L\min\{\|r_n - \mathcal{T}r_n\|, \|p - \mathcal{T}p\|, \|r_n - \mathcal{T}p\|, \|p - \mathcal{T}r_n\|\}$$

Then $\|r_n - \mathcal{T}r_n\| \to 0$. Because of these results we get $b_n \to 0$, by applying lemma (1.1),
we obtain $\check{a}_n = \|r_n - d_n\| \to 0$ as $n \to 0$.
Consequently ; $\|r_{n+1} - d_{n+1}\| \to 0$ as $n \to 0$
Now we show that, (ii) ⇒ (i)

$$\|d_{n+1} - r_{n+1}\| \leq \|d_{n+1} - p\| + \|r_{n+1} - p\|$$
$$= \|\mathcal{T}t_n - p\| + \|(1 - a_n)r_n + a_n\mathcal{T}r_n - p\|$$
$$\leq \delta\|t_n - p\| + Lm(t_n, p) + (1 - a_n)\|r_n - p\|$$
$$+ \delta a_n\|r_n - p\| + a_nLm(r_n, p)$$
$$\leq \delta\|t_n - p\| + Lm(t_n, p) + a_nLm(r_n, p)$$
$$+(1 - a_n(1-\delta))\|r_n - p\| \quad (2.9)$$

And,

$$\|t_n - p\| = \|(1 - a_n)s_n + a_nTs_n - p\|$$
$$\leq (1 - a_n)\|s_n - p\| + \delta a_n\|s_n - p\| + a_nLm(s_n, p)$$
$$= (1 - a_n(1-\delta))\|s_n - p\| + a_nLm(s_n, p) \quad (2.10)$$

And,

$$\|s_n - p\| = \|(1 - b_n)d_n + b_nTd_n - p\|$$
$$\leq (1 - b_n)\|d_n - p\| + \delta b_n\|d_n - p\| + b_nLm(d_n, p)$$
$$= (1 - b_n(1-\delta))\|d_n - p\| + b_nLm(d_n, p) \quad (2.11)$$

Substituting (2.11) in (2.10), we obtain

$$\|t_n - p\| \leq (1 - a_n(1-\delta))[(1 - b_n(1-\delta))\|d_n - p\| + b_nLm(d_n, p)] + a_nLm(s_n, p)$$
$$\leq (1 - b_n(1-\delta))\|d_n - p\| + b_nLm(d_n, p) + a_nLm(s_n, p) \quad (2.12)$$

Substituting (2.12) in (2.9), we obtain

$$\|d_{n+1} - r_{n+1}\| \leq \delta[(1 - b_n(1-\delta))\|d_n - p\| + b_nLm(d_n, p)$$
$$+a_nLm(s_n, p)] + Lm(t_n, p) + a_nLm(r_n, p) + (1 - a_n(1-\delta))\|r_n - p\|$$
$$\leq \delta[(1 - b_n(1-\delta))(\|d_n - r_n\| + \|r_n - p\|) + b_nLm(d_n, p)$$
$$+a_nLm(s_n, p)] + Lm(t_n, p) + a_nLm(r_n, p) + (1 - a_n(1-\delta))\|r_n - p\|$$
$$\|d_{n+1} - r_{n+1}\| \leq (1 - b_n(1-\delta))\|d_n - r_n\| + (1 - a_n(1-\delta))\|r_n - p\|$$
$$+(1 - b_n(1-\delta))\|r_n - p\| + a_nLm(s_n, p) + Lm(t_n, p)$$
$$+a_nLm(r_n, p) + b_nLm(d_n, p)$$

Denote that:

$\mu_n = b_n(1-\delta) \in (0,1)$, $\check{a}_n = \|d_n - r_n\|$ and
$\check{b}_n = (1 - a_n(1-\delta))\|r_n - p\| + (1 - b_n(1-\delta))\|r_n - p\| + a_nLm(s_n, p)$
$+Lm(t_n, p) + a_nLm(r_n, p) + b_nLm(d_n, p)$

Thus from lemma (1.1), we get

$\check{a}_n = \|d_n - r_n\| \to 0$ as $n \to 0$ as a result of these inequalities,

$\|d_{n+1} - r_{n+1}\| \to 0$ as $n \to 0$.

2.3 Theorem: Let $\mathcal{T}$ a quasi δ -contraction mapping on $\mathcal{C}$ which has a unique fixed point $\mathcal{p}$. Consider the CR iteration and Mann iteration with real sequences $\langle a_n\rangle_{n=0}^{\infty}$, $\langle b_n\rangle_{n=0}^{\infty}$, $\langle c_n\rangle_{n=0}^{\infty}$ lies in $[0,1]$ .Then the following assertions are equivalent :

i.The Mann iteration converges to $\mathcal{p}$.

ii. The CR iteration converges to $\mathcal{p}$.

Proof. To show that (i) ⇒ (i, that is if the Mann iteration converges to $\mathcal{p}$ then The CR iteration does converge to $\mathcal{p}$ too. Now Consider Mann and The CR iterations, we have

$$\begin{aligned}\|r_{n+1} - k_{n+1}\| &= \|(1-a_n)r_n + a_n\mathcal{T}r_n - (1-a_n)m_n - a_n\mathcal{T}m_n\| \\ &\le (1-a_n)\|r_n - m_n\| + a_n\|\mathcal{T}r_n - \mathcal{T}m_n\| \\ \|r_{n+1} - k_{n+1}\| &\le (1-a_n)\|r_n - m_n\| + \delta a_n\|r_n - m_n\| + a_n L\mathcal{m}(r_n, m_n) \\ &= \big(1 - a_n(1-\delta)\big)\|r_n - m_n\| + a_n L\mathcal{m}(r_n, m_n) \qquad (2.13)\end{aligned}$$

And,

$$\begin{aligned}\|r_n - m_n\| &= \|r_n - (1-b_n)\mathcal{T}k_n + b_n\mathcal{T}o_n\| \\ &\le (1-b_n)\|r_n - \mathcal{T}k_n\| + b_n\|r_n - \mathcal{T}o_n\| \\ &\le (1-b_n)\|r_n - \mathcal{T}r_n\| + \delta(1-b_n)\|r_n - k_n\| + (1-b_n)L\mathcal{m}(r_n, k_n) \\ &\quad + b_n\|r_n - \mathcal{T}r_n\| + \delta b_n\|r_n - o_n\| b_n L\mathcal{m}(r_n, o_n) \\ &= \|r_n - \mathcal{T}r_n\| + \delta(1-b_n)\|r_n - k_n\| \\ &\quad +(1-b_n)L\mathcal{m}(r_n, k_n) + \delta b_n\|r_n - o_n\| + b_n L\mathcal{m}(r_n, o_n) \qquad (2.14)\end{aligned}$$

And,

$$\begin{aligned}\|r_n - o_n\| &= \|r_n - (1-c_n)k_n - c_n\mathcal{T}k_n\| \\ &\le (1-c_n)\|r_n - k_n\| + c_n\|r_n - \mathcal{T}k_n\| \\ &\le (1-c_n)\|r_n - k_n\| + c_n\|r_n - \mathcal{T}r_n\| + \delta c_n\|r_n - k_n\| + c_n L\mathcal{m}(r_n, k_n) \\ &\le \big(1 - c_n(1-\delta)\big)\|r_n - k_n\| + c_n\|r_n - \mathcal{T}r_n\| + c_n L\mathcal{m}(r_n, k_n) \qquad (2.15)\end{aligned}$$

Substituting (2.15) in (2.14), we obtain

$$\begin{aligned}\|r_n - m_n\| \le\ & \|r_n - \mathcal{T}r_n\| + \delta(1-b_n)\|r_n - k_n\| + (1-b_n)L\mathcal{m}(r_n, k_n) \\ & +\delta b_n\big(1 - c_n(1-\delta)\big)\|r_n - k_n\| + \delta b_n c_n\|r_n - \mathcal{T}r_n\| \\ & +\delta b_n c_n L\mathcal{m}(r_n, k_n) + b_n L\mathcal{m}(r_n, o_n) \qquad (2.16)\end{aligned}$$

Substituting (2.16)in (2.13), we obtain

$$\begin{aligned}\|r_{n+1} - k_{n+1}\| \le\ & \big(1 - a_n(1-\delta)\big)[\|r_n - \mathcal{T}r_n\| + \delta(1-b_n)\|r_n - k_n\| + (1-b_n)L\mathcal{m}(r_n, k_n) \\ & + \delta b_n\big(1 - c_n(1-\delta)\big)\|r_n - k_n\| + \delta b_n c_n\|r_n - \mathcal{T}r_n\| \\ & +\delta b_n c_n L\mathcal{m}(r_n, k_n) + b_n L\mathcal{m}(r_n, o_n)] + a_n L\mathcal{m}(r_n, m_n)\end{aligned}$$

Since $\delta \in (0,1)$ and $\big(1 - a_n(1-\delta)\big) < 1$, we have

$$\begin{aligned}\|r_{n+1} - k_{n+1}\| &\le (1 - a_n(1-\delta))\|r_n - \mathcal{T}r_n\| + \big[(1-b_n) + \delta b_n\big(1 - c_n(1-\delta)\big)\big]\|r_n - k_n\| \\ &\quad +(1-b_n)L\mathcal{m}(r_n, k_n) + b_n L\mathcal{m}(r_n, k_n) + b_n L\mathcal{m}(r_n, o_n) + a_n L\mathcal{m}(r_n, m_n) \\ &\le ((1 - a_n(1-\delta))\|r_n - \mathcal{T}r_n\| + [(1-b_n) + \delta b_n]\|r_n - k_n\| \\ &\quad +L\mathcal{m}(r_n, k_n) + b_n L\mathcal{m}(r_n, o_n) + a_n L\mathcal{m}(r_n, m_n) \\ &\le [(1 - b_n(1-\delta)]\|r_n - k_n\| + ((1 - a_n(1-\delta))\|r_n - \mathcal{T}r_n\| \\ &\quad +L\min\{\|r_n - \mathcal{T}r_n\|, \|k - \mathcal{T}k_n\|, \|r_n - \mathcal{T}k_n\|, \|k - \mathcal{T}r_n\|\} \\ &\quad +b_n L\min\{\|r_n - \mathcal{T}r_n\|, \|o_n - \mathcal{T}o_n\|, \|r_n - \mathcal{T}o_n\|, \|o_n - \mathcal{T}r_n\|\} \\ &\quad +a_n L\min\{\|r_n - \mathcal{T}r_n\|, \|m_n - \mathcal{T}m_n\|, \|r_n - \mathcal{T}m_n\|, \|m_n - \mathcal{T}r_n\|\}\end{aligned}$$

Let $\mu_n = a_n(1-\delta) \in (0,1)$, $\check{a}_n = \|r_n - k_n\|$ and

$\check{b}_n = (1 - a_n(1-\delta))\|r_n - \mathcal{T}r_n\| + L\min\{\|r_n - \mathcal{T}r_n\|, \|k - \mathcal{T}k_n\|, \|r_n - \mathcal{T}k_n\|, \|k - \mathcal{T}r_n\|\}$

$$+b_nL\min\{\|r_n-\mathcal{T}r_n\|,\|o_n-\mathcal{T}o_n\|,\|r_n-\mathcal{T}o_n\|,\|o_n-\mathcal{T}r_n\|\}$$
$$+a_nL\min\{\|r_n-\mathcal{T}r_n\|,\|m_n-\mathcal{T}m_n\|,\|r_n-\mathcal{T}m_n\|,\|m_n-\mathcal{T}r_n\|\}$$

Furthermore using $\mathcal{T}p=p$ and $\|r_n-p\|\to 0$, we have

$$\begin{aligned}\|r_n-\mathcal{T}r_n\| &= \|r_n-p+\mathcal{T}p-\mathcal{T}r_n\|\\ &\le \|r_n-p\|+\delta\|r_n-p\|+Lm(r_n,p)\\ &= (1+\delta)\|r_n-p\|+L\min\{\|r_n-\mathcal{T}r_n\|,\|p-\mathcal{T}p\|,\|r_n-\mathcal{T}p\|,\|p-\mathcal{T}r_n\|\}\end{aligned}$$

Then $\|r_n-\mathcal{T}r_n\|\to 0$. By applying lemma (1.1), we obtain

$a_n=\|r_n-k_n\|\to 0$ as $n\to 0$.

Consequently ; $\|r_{n+1}-k_{n+1}\|\to 0$ as $n\to 0$

Now we show that, (ii) ⇒ (i)

$$\begin{aligned}\|k_{n+1}-r_{n+1}\| &= \|k_{n+1}-p\|+\|r_{n+1}-p\|\\ &= \|(1-a_n)m_n+a_n\mathcal{T}m_n-p\|+\|(1-a_n)r_n+a_n\mathcal{T}r_n-p\|\\ &\le (1-a_n)\|m_n-p\|+\delta a_n\|m_n-p\|+a_nLm(m_n,p)\\ &\quad+(1-a_n)\|r_n-p\|+\delta a_n\|r_n-p\|+a_nLm(r_n,p)\\ &= (1-a_n(1-\delta))\|m_n-p\|+a_nLm(m_n,p)+\big(1-a_n(1-\delta)\big)\|r_n-p\|\\ &\quad+Lm(r_n,p)\end{aligned}\tag{2.17}$$

And

$$\begin{aligned}\|m_n-p\| &= \|(1-b_n)Tk_n+b_nTo_n-p\|\\ &\le \delta(1-b_n)\|k_n-p\|+(1-b_n)Lm(k_n,p)+\delta b_n\|o_n-p\|\\ &\quad+b_nLm(o_n,p)\end{aligned}\tag{2.18}$$

And

$$\begin{aligned}\|o_n-p\| &= \|(1-c_n)k_n+c_nTk_n-p\|\\ &\le (1-c_n)\|k_n-p\|+\delta c_n\|k_n-p\|+c_nLm(k_n,p)\\ &= (1-c_n(1-\delta))\|k_n-p\|+c_nLm(k_n,p)\end{aligned}\tag{2.19}$$

Substituting (2.19) in (2.18), we obtain

$$\begin{aligned}\|m_n-p\| &\le \delta(1-b_n)\|k_n-p\|+(1-b_n)Lm(k_n,p)\\ &\quad+\delta b_n\big(1-c_n(1-\delta)\big)\|k_n-p\|+\delta b_nc_nLm(k_n,p)+b_nLm(o_n,p)\end{aligned}\tag{2.20}$$

Substituting (2.20) in (2.17), we obtain

$$\begin{aligned}\|k_{n+1}-r_{n+1}\| &\le (1-a_n(1-\delta))[\delta(1-b_n)\|k_n-p\|+(1-b_n)Lm(k_n,p)\\ &\quad+b_nLm(o_n,p)+\delta b_n(1-c_n(1-\delta))\|k_n-p\|+\delta b_nc_nLm(k_n,p)]\\ &\quad+a_nLm(m_n,p)+\big(1-a_n(1-\delta)\big)\|r_n-p\|+a_nLm(r_n,p)\\ &\le \big(1-a_n(1-\delta)\big)\|r_n-k_n+k_n-p\|+(1-a_n(1-\delta))[\delta(1-b_n)\|k_n-p\|\\ &\quad+(1-b_n)Lm(k_n,p)+b_nLm(o_n,p)+\delta b_n\big(1-c_n(1-\delta)\big)\|k_n-p\|\\ &\quad+\delta b_nc_nLm(k_n,p)]+a_nLm(m_n,p)+a_nLm(r_n,p)\\ &\le \big(1-a_n(1-\delta)\big)\|r_n-k_n\|+[\big(1-a_n(1-\delta)\big)\delta(1-b_n)\\ &\quad+\delta b_n(1-c_n(1-\delta))]\|k_n-p\|+(1-b_n)Lm(k_n,p)+b_nLm(o_n,p)\\ &\quad+\delta b_nc_nLm(k_n,p)]+a_nLm(m_n,p)+a_nLm(r_n,p)\end{aligned}$$

Denote that

$\mu_n=a_n(1-\delta)\in(0,1)$, $\check{a}_n=\|r_n-k_n\|$ and

$$\begin{aligned}\check{b}_n &= [\big(1-a_n(1-\delta)\big)\delta(1-b_n)+\delta b_n(1-c_n(1-\delta))]\|k_n-p\|\\ &\quad+(1-b_n)Lm(k_n,p)+b_nLm(o_n,p)+\delta b_nc_nLm(k_n,p)]+a_nLm(m_n,p)+a_nLm(r_n,p)\end{aligned}$$

Thus from lemma (1.1), $\check{a}_n=\|r_n-k_n\|\to 0$ as $n\to 0$

Therefore, $\|k_{n+1}-r_{n+1}\|\to 0$ as $n\to 0$.

2.4 Theorem: Let $\mathcal{T}$ a quasi δ -contraction mapping on $\mathcal{C}$ which has a unique fixed point p . Consider the Noor iteration and Mann iteration with real sequences $\langle a_n\rangle_{n=0}^{\infty}$, $\langle b_n\rangle_{n=0}^{\infty}$, $\langle c_n\rangle_{n=0}^{\infty}$ lies in$[0,1]$ .Then the following assertions are equivalent :

i. The Mann iteration converges to $\mathcal{p}$.

ii. The Noor iteration converges to $\mathcal{p}$.

Proof. To show that (i) ⇒ (ii), that is if the Mann iteration converges to $\mathcal{p}$, then The Noor iteration does converge to $\mathcal{p}$ too. Now Consider Mann and The Noor iterations, we have

$$\begin{aligned}\|r_{n+1}-u_{n+1}\| &= \|(1-a_n)r_n + a_n\mathcal{T}r_n-(1-a_n)u_n-a_n\mathcal{T}q_n\|\\ &\le (1-a_n)\|r_n-u_n\| + \delta a_n\|r_n-q_n\| + a_nL\mathcal{m}(r_n,q_n) \qquad (2.21)\\ \|r_n-q_n\| &= \|r_n-(1-b_n)u_n-b_n\mathcal{T}p_n\|\\ &\le (1-b_n)\|r_n-u_n\| + b_n\|r_n-\mathcal{T}p_n\|\\ &\le (1-b_n)\|r_n-u_n\| + b_n\|r_n-\mathcal{T}r_n\| + \delta b_n\|r_n-p_n\| + b_nL\mathcal{m}(r_n,p_n) \qquad (2.22)\\ \|r_n-p_n\| &= \|r_n-(1-c_n)u_n-c_n\mathcal{T}u_n\|\\ &\le (1-c_n)\|r_n-u_n\| + c_n\|r_n-\mathcal{T}u_n\|\\ &\le (1-c_n)\|r_n-u_n\| + c_n\|r_n-\mathcal{T}r_n\| + \delta c_n\|r_n-u_n\| + c_nL\mathcal{m}(r_n,u_n)\\ &\le \big(1-c_n(1-\delta)\big)\|r_n-u_n\| + c_n\|r_n-\mathcal{T}r_n\| + c_nL\mathcal{m}(r_n,u_n) \qquad (2.23)\end{aligned}$$

Substituting (2.23) in (2.22), we obtain

$$\begin{aligned}\|r_n-q_n\| &\le (1-b_n)\|r_n-u_n\| + b_n\|r_n-\mathcal{T}r_n\|\\ &\quad +\delta b_n[(1-c_n(1-\delta))\|r_n-u_n\| + c_n\|r_n-\mathcal{T}r_n\|\\ &\quad +c_nL\mathcal{m}(r_n,u_n)] + b_nL\mathcal{m}(r_n,p_n)\\ &= (1-b_n)\|r_n-u_n\| + b_n\|r_n-\mathcal{T}r_n\| + \delta b_n\big(1-c_n(1-\delta)\big)\|r_n-u_n\|\\ &\quad +\delta b_nc_n\|r_n-\mathcal{T}r_n\| + \delta b_nc_nL\mathcal{m}(r_n,u_n) + \delta b_nL\mathcal{m}(r_n,p_n)\\ \|r_n-q_n\| &\le ((1-b_n)+\delta b_n)\|r_n-u_n\| + (b_n+\delta b_nc_n)\|r_n-\mathcal{T}r_n\|\\ &\quad +\delta b_nc_nL\mathcal{m}(r_n,u_n) + \delta b_nL\mathcal{m}(r_n,p_n)\\ &\le \big((1-b_n(1-\delta))\|r_n-u_n\| + (b_n+\delta b_nc_n)\|r_n-\mathcal{T}r_n\|\\ &\quad +\delta b_nc_nL\mathcal{m}(r_n,u_n) + \delta b_nL\mathcal{m}(r_n,p_n) \qquad (2.24)\end{aligned}$$

Substituting (2.24) in (2.21), we obtain

$$\begin{aligned}\|r_{n+1}-u_{n+1}\| &\le (1-a_n)\|r_n-u_n\| + \delta a_n\big((1-b_n(1-\delta))\|r_n-u_n\|\\ &\quad +(b_n+\delta b_nc_n)\|r_n-\mathcal{T}r_n\| + \delta b_nc_nL\mathcal{m}(r_n,u_n) + \delta b_nL\mathcal{m}(r_n,p_n)\\ &\quad +a_nL\mathcal{m}(r_n,q_n)\\ \|r_{n+1}-u_{n+1}\| &\le \Big((1-a_n)+\delta a_n\big((1-b_n(1-\delta))\big)\Big)\|r_n-u_n\|\\ &\quad +(b_n+\delta b_nc_n)\|r_n-\mathcal{T}r_n\| + \delta b_nc_nL\mathcal{m}(r_n,u_n) + \delta b_nL\mathcal{m}(r_n,p_n)\\ &\quad +a_nL\mathcal{m}(r_n,q_n)\\ &\le \big((1-a_n)+\delta a_n\big)\|r_n-u_n\| + (b_n+\delta c_n)\|r_n-\mathcal{T}r_n\|\\ &\quad +\delta b_nc_nL\mathcal{m}(r_n,u_n) + \delta b_nL\mathcal{m}(r_n,p_n) + a_nL\mathcal{m}(r_n,q_n)\\ &\le ((1-a_n(1-\delta))\|r_n-u_n\| + (b_n+\delta c_n)\|r_n-\mathcal{T}r_n\|\\ &\quad +\delta b_nc_nL\min\{\|r_n-\mathcal{T}r_n\|,\|u_n-\mathcal{T}u_n\|,\|r_n-\mathcal{T}u_n\|,\|u_n-\mathcal{T}r_n\|\}\\ &\quad +\delta b_nL\min\{\|r_n-\mathcal{T}r_n\|,\|p_n-\mathcal{T}p_n\|,\|r_n-\mathcal{T}p_n\|,\|p_n-\mathcal{T}r_n\|\}\\ &\quad +a_nL\min\{\|r_n-\mathcal{T}r_n\|,\|q_n-\mathcal{T}q_n\|,\|r_n-\mathcal{T}q_n\|,\|q_n-\mathcal{T}r_n\|\}\end{aligned}$$

Let $\mu_n = a_n(1-\delta) \in (0,1)$, $\check{a}_n = \|r_n-u_n\|$ and

$$\begin{aligned}\check{b}_n &= (b_n+\delta c_n)\|r_n-\mathcal{T}r_n\|\\ &\quad +\delta b_nc_nL\min\{\|r_n-\mathcal{T}r_n\|,\|u_n-\mathcal{T}u_n\|,\|r_n-\mathcal{T}u_n\|,\|u_n-\mathcal{T}r_n\|\}\\ &\quad +\delta b_nL\min\{\|r_n-\mathcal{T}r_n\|,\|p_n-\mathcal{T}p_n\|,\|r_n-\mathcal{T}p_n\|,\|p_n-\mathcal{T}r_n\|\}\\ &\quad +a_nL\min\{\|r_n-\mathcal{T}r_n\|,\|q_n-\mathcal{T}q_n\|,\|r_n-\mathcal{T}q_n\|,\|q_n-\mathcal{T}r_n\|\}\end{aligned}$$

Furthermore using $\mathcal{T}\mathcal{p}=\mathcal{p}$ and $\|r_n-\mathcal{p}\| \to 0$, we have

$$\begin{aligned}\|r_n-\mathcal{T}r_n\| &= \|r_n-\mathcal{p}+\mathcal{T}\mathcal{p}-\mathcal{T}r_n\|\\ &\le \|r_n-\mathcal{p}\| + \delta\|r_n-\mathcal{p}\| + L\mathcal{m}(r_n,\mathcal{p})\\ &= (1+\delta)\|r_n-\mathcal{p}\| + L\min\{\|r_n-\mathcal{T}r_n\|,\|\mathcal{p}-\mathcal{T}\mathcal{p}\|,\|r_n-\mathcal{T}\mathcal{p}\|,\|\mathcal{p}-\mathcal{T}r_n\|\}\end{aligned}$$

Then $\|r_n-\mathcal{T}r_n\| \to 0$. Because of these results we get, $\check{b}_n \to 0$, by applying lemma (1.1),

We obtain $\check{a}_n = \|r_n - u_n\| \to 0$ as $n \to 0$.
Consequently ;
$\|r_{n+1} - u_{n+1}\| \to 0$ as $n \to 0$
Now we show that, (ii) ⇒ (i)

$$\begin{aligned}\|u_{n+1} - r_{n+1}\| &= \|u_{n+1} - p\| + \|r_{n+1} - p\| \\ &= \|(1 - a_n)u_n + a_n \mathcal{T} q_n - p\| + \|(1 - a_n)r_n + a_n \mathcal{T} r_n - p\| \\ &\le (1 - a_n)\|u_n - p\| + \delta a_n \|q_n - p\| + a_n L m(q_n, p) \\ &\quad + (1 - a_n)\|r_n - p\| + \delta a_n \|r_n - p\| + a_n L m(r_n, p) \\ &= (1 - a_n)\|u_n - p\| + \delta a_n \|q_n - p\| + a_n L m(q_n, p) \\ &\quad + \big(1 - a_n(1 - \delta)\big)\|r_n - p\| + a_n L m(r_n, p) \end{aligned} \quad (2.25)$$

And,

$$\begin{aligned}\|q_n - p\| &= \|(1 - b_n)u_n + b_n T p_n - p\| \\ &\le (1 - b_n)\|u_n - p\| + \delta b_n \|p_n - p\| + b_n L m(p_n, p)\end{aligned} \quad (2.26)$$

And,

$$\begin{aligned}\|p_n - p\| &= \|(1 - c_n)u_n + c_n T u_n - p\| \\ &\le (1 - c_n)\|u_n - p\| + \delta c_n \|u_n - p\| + c_n L m(u_n, p) \\ &= (1 - c_n(1 - \delta))\|u_n - p\| + c_n L m(u_n, p)\end{aligned} \quad (2.27)$$

Substituting (2.27) in (2.26), we obtain

$$\begin{aligned}\|q_n - p\| &\le (1 - b_n)\|u_n - p\| + b_n L m(p_n, p) + \delta b_n c_n L m(u_n, p) + \delta b_n \|u_n - p\| \\ &= [1 - b_n + \delta b_n (1 - c_n(1 - \delta))]\|u_n - p\| \\ &\quad + b_n L m(p_n, p) + \delta b_n c_n L m(u_n, p)\end{aligned} \quad (2.28)$$

Substituting (2.28) in (2.25) , we obtain

$$\begin{aligned}\|u_{n+1} - r_{n+1}\| &\le (1 - a_n)\|u_n - p\| + \delta a_n([1 - b_n + \delta b_n]\|u_n - p\| \\ &\quad + b_n L m(p_n, p) + \delta b_n c_n L m(u_n, p)) + a_n L m(q_n, p) \\ &\quad + \big(1 - a_n(1 - \delta)\big)\|r_n - p\| + a_n L m(r_n, p) \\ \|u_{n+1} - r_{n+1}\| &\le (1 - a_n(1 - \delta)\|u_n - r_n + r_n - p\| \\ &\quad + b_n L m(p_n, p) + \delta b_n c_n L m(u_n, p)) + a_n L m(q_n, p) \\ &\quad + \big(1 - a_n(1 - \delta)\big)\|r_n - p\| + a_n L m(r_n, p) \\ &\le (1 - a_n(1 - \delta)\|u_n - r_n\| + b_n L m(p_n, p) + \delta b_n c_n L m(u_n, p)) \\ &\quad + a_n L m(q_n, p) + \big(1 - a_n(1 - \delta)\big)^2 \|r_n - p\| + a_n L m(r_n, p)\end{aligned}$$

Let $\mu_n = a_n(1 - \delta) \in (0, 1)$
$\check{a}_n = \|u_n - r_n\|$

$$\check{b}_n = \big(1 - a_n(1 - \delta)\big)^2 \|r_n - p\| + a_n L m(r_n, p) + b_n L m(p_n, p) + \delta b_n c_n L m(u_n, p)) + a_n L m(q_n, p)$$

Thus from lemma(1.1), we get
$\tilde{a}_n = \|u_n - r_n\| \to 0$ as $n \to 0$. So,
$\|u_{n+1} - r_{n+1}\| \to 0$ as $n \to 0$.

Abstract. Our goal in this article is to recall the notion of algebra fuzzy normed space and its basic properties to introduce the notion of fuzzy compact algebra fuzzy normed space. Then some properties of fuzzy compact algebra fuzzy normed spaces are proved. After that, we study a finite dimensional algebra fuzzy normed space and we proved some properties that algebra fuzzy normed spaces do not admit it.

1.Introduction

In 2009 [1] the fuzzy topological structure of a fuzzy normed space was studied by Sadeqi and Kia. In 2011 [2] Kider introduced a fuzzy normed space. Also he proved this fuzzy normed space has a completion in [3]. Again in 2012 [4] Kider introduced a new type of fuzzy normed space. In 2013 [5] Bag and Samanta study some basic results on finite dimensional fuzzy normed linear spaces.

In 2017 [6] Kider and Kadhum introduced the fuzzy norm for a fuzzy bounded operator on a fuzzy normed space and proved its basic properties then other properties were proved by Kadhum in 2017 [7]. In 2018 [8] Ali proved basic properties of complete fuzzy normed algebra. Again in 2018 [9] Kider and Ali introduced the notion of fuzzy absolute value and study some properties of finite dimensional fuzzy normed space.

The concept of general fuzzy normed space was presented by Kider and Gheeab in 2019 [10] [11] also they proved basic properties of this space and the general fuzzy normed space GFB (V, U). In 2019 [12] Kider and Kadhum introduced the notion fuzzy compact linear operator and proved its basic properties. In 2020 kider [13] introduced the notion fuzzy soft metric space after that he investigated and proved some basic properties of this space again kider in 2020 [14] introduced a new type of fuzzy metric space called algebra fuzzy metric space after that the basic properties of this space is proved.

In this paper, first we recall the notion algebra fuzzy absolute value space and its some basic properties that introduced by Khudhair and Kider in [15]. Then, we recall the notion algebra fuzzy normed space and its some basic properties that introduced by Khudhair and Kider in [15]. Our first aim is to define fuzzy compact algebra fuzzy normed space then we study this space and proved some of its basic properties.

The second aim is to assume that the algebra fuzzy normed space has a finite dimension and proved some basic results that this type of spaces must have.

2. Basic properties of algebra fuzzy normed space

Definition 2.1: [1]
Assume that S≠ ∅, a fuzzy set $\widetilde{\mathbf{D}}$ in S is represented by $\widetilde{\mathbf{D}}$ = {(s, $\boldsymbol{\mu}_{\widetilde{\mathbf{D}}}$(s)): s∈S, $0 \leq \boldsymbol{\mu}_{\widetilde{\mathbf{D}}}(s) \leq 1$} where $\boldsymbol{\mu}_{\widetilde{\mathbf{D}}}$(x): S⟶ I is a membership function where I=[0, 1].

Definition 2.2: [14]
The binary operation ⊙:I × I →I be is said to be continuous t-conorm if it satisfies
(i)r ⊙ s= s ⊙ r, (ii) r ⊙ [s ⊙ w] = [r ⊙ s] ⊙ w, (iii) ⊙ is continuous function
(iv)s ⊙ 0 = 0, (v) (r ⊙ z) ≤ (s ⊙ w) whenever r ≤ s and z ≤ w. For all r, s, z, w ∈ I=[0, 1].

Lemma 2.3: [14]
If ⊙ is a continuous t-conorm on [0, 1] then
(i)1 ⊙ 1=1, (ii)0 ⊙ 1 = 1 ⊙ 0 =1. (iii)0 ⊙ 0 = 0, (iv)p ⊙ p ≥ p for all p ∈ [0, 1].

Remark 2.4: [14]
If ⊙ is a continuous t-conorm then
(i)For any p, q ∈ (0, 1) with p > q we have w ∈ (0, 1) whenever p > q ⊙ w. In general for any p, q ∈ (0, 1) with p > q we can find $\boldsymbol{w_1}, \boldsymbol{w_2}, \ldots, \boldsymbol{w_k} \in (0, 1)$ whenever p > q ⊙ $\boldsymbol{w_1}$ ⊙ $\boldsymbol{w_2}$ ⊙ …⊙ $\boldsymbol{w_k}$ where k ∈ ℕ.
(ii) For any r ∈ (0, 1) ∃ s ∈ (0, 1) s. t. s ⊙ s ≤ r. In general for any r ∈ (0, 1) there exists $\boldsymbol{w_1}, \boldsymbol{w_2}, \ldots, \boldsymbol{w_k}$ ∈ (0, 1) such that $\boldsymbol{w_1}$ ⊙ $\boldsymbol{w_2}$ ⊙ …⊙ $\boldsymbol{w_k}$ ≤ r where k ∈ ℕ.

Example 2.5: [14]
The algebra product p ⊙ q = p + q − pq is a continuous t-conorm for all p, q ∈ [0, 1].

Definition 2.6: [15]
Let ⊙ be a continuous t-conorm and $\boldsymbol{a}_{\mathbb{R}}$:ℝ →I be a fuzzy set then a is called algebra fuzzy absolute value on ℝ if
(1)0< $\boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\alpha})$ ≤1, (2) $\boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\alpha})$=0 if and only if $\boldsymbol{\alpha}$=0, (3) $\boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\alpha\beta}) \leq \boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\alpha})$. $\boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\beta})$
(4) $\boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\alpha} + \boldsymbol{\beta}) \leq \boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\alpha})$ ⊙ $\boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\beta})$. For all $\boldsymbol{\alpha}, \boldsymbol{\beta} \in \mathbb{R}$. Then (ℝ, $\boldsymbol{a}_{\mathbb{R}}$, ⊙) is called algebra fuzzy absolute value space.

Example 2.7: [15]
Let |.| be absolute value on ℝ and $\boldsymbol{\alpha}$ ⊙ $\boldsymbol{\beta}$= $\boldsymbol{\alpha}$+ $\boldsymbol{\beta} - \boldsymbol{\alpha\beta}$ for all $\boldsymbol{\alpha}, \boldsymbol{\beta}$ ∈ I. Define $\boldsymbol{a}_{|.|}(\boldsymbol{\alpha})=\begin{cases} \frac{|\boldsymbol{\alpha}|}{1+|\boldsymbol{\alpha}|} & \boldsymbol{if\ \alpha \neq 1} \\ \mathbf{1} & \boldsymbol{if\ \alpha = 1} \end{cases}$
for all $\boldsymbol{\alpha} \in \mathbb{R}$. Then (ℝ, $\boldsymbol{a}_{|.|}$, ⊙) is algebra fuzzy absolute value space. Also $\boldsymbol{a}_{|.|}$ is called the standard algebra fuzzy absolute value on ℝ.

Example 2.8: [15]
Define $\boldsymbol{a}^{|.|}$: ℝ →I by $\boldsymbol{a}^{|.|}(r) = \begin{cases} \frac{\mathbf{1}}{|r|} & \boldsymbol{if\ r \neq 0} \\ \mathbf{0} & \boldsymbol{if\ r = 0} \end{cases}$
for all r ∈ ℝ and If s⊙r=s + r −sr for all s, r ∈I. Then (ℝ, $\boldsymbol{a}^{|.|}$, ⊙) is algebra fuzzy absolute value space. This space is called the algebra fuzzy absolute value space induced by |.|.

Definition 2.9: [15]
Let (ℝ, $\boldsymbol{a}_{\mathbb{R}}$, ⊙) be algebra fuzzy absolute value space and let $\{\mathbf{p_n}\}_{\mathbf{n=1}}^{\infty}$be a sequence in ℝ, we say that $\{\mathbf{p_n}\}_{\mathbf{n=1}}^{\infty}$ is fuzzy approaches to the limit p as n approaches to ∞ if ∀ s ∈ (0,1) ∃ N ∈ ℕ s. t. $\boldsymbol{a}_{\mathbb{R}}(\mathbf{p_n} - p)$

$<$ s, $\forall$ n$\geq$N. If $\mathbf{p_n}$ is fuzzy approaches to the limit p we write $\lim_{\mathbf{n\to\infty}} \mathbf{p_n}$= p or $\mathbf{p_n} \to$p as n approaches to ∞ or $\lim_{\mathbf{n\to\infty}} \boldsymbol{a}_{\mathbb{R}}(\mathbf{p_n} - \mathbf{p})$=0.

Definition 2.10: [15]
Let ($\mathbb{R}$, $\boldsymbol{a}_{\mathbb{R}}$, $\circledcirc$) be algebra fuzzy absolute value space and let $\{\mathbf{p_n}\}_{\mathbf{n=1}}^{\infty}$be a sequence in $\mathbb{R}$, we say that $\{\mathbf{p_n}\}_{\mathbf{n=1}}^{\infty}$ is fuzzy Cauchy sequence in $\mathbb{R}$ if $\forall$ s $\in$ (0,1) $\exists$ N $\in \mathbb{N}$ s. t. $\boldsymbol{a}_{\mathbb{R}}(\mathbf{p_k} - \mathbf{p_m}) <$ s, $\forall$ k, m $\geq$N.

Definition 2.11: [15]
Let ($\mathbb{R}$, $\boldsymbol{a}_{\mathbb{R}}$, $\circledcirc$) be algebra fuzzy absolute value space. The sequence $\{\mathbf{q_n}\}_{\mathbf{n=1}}^{\infty}$ in $\mathbb{R}$ is called fuzzy bounded if $\exists$ t $\in$ (0, 1) s. t. $\boldsymbol{a}_{\mathbb{R}}(\mathbf{q_n}) <$ t $\forall$ n $\in \mathbb{N}$

Theorem 2.12: [15]
Let ($\mathbb{R}$, $\boldsymbol{a}_{\mathbb{R}}$, $\circledcirc$) be algebra fuzzy absolute value space. If $\{\mathbf{q_n}\}_{\mathbf{n=1}}^{\infty}$ is a fuzzy Cauchy sequence in $\mathbb{R}$ then $\{\mathbf{q_n}\}_{\mathbf{n=1}}^{\infty}$ is fuzzy bounded.

Definition 2.13; [15]
The algebra fuzzy absolute value ($\mathbb{R}$, $\boldsymbol{a}_{\mathbb{R}}$, $\circledcirc$) is called fuzzy complete if every fuzzy Cauchy sequence in $\mathbb{R}$ fuzzy approaches to a real number in $\mathbb{R}$.

Definition 2.14: [15]
Let U be a vector space over $\mathbb{R}$ and let $\circledcirc$ be a continuous t-conorm. Let ($\mathbb{R}$, a, $\circledcirc$) be algebra fuzzy absolute value space and n: U$\to$I be a fuzzy set then n is called algebra fuzzy norm on U if
(1)0$<$ n(u) $\leq$ 1, (2)n(u) =0 if and only if u=0, (3)n($\boldsymbol{\alpha}$u) $\leq$ a($\boldsymbol{\alpha}$) n(u) for all 0$\neq$ $\boldsymbol{\alpha} \in \mathbb{R}$.
(4)n(u + v) $\leq$ n(u) $\circledcirc$ n(v)
For all u, v $\in$ U. Then (U, n, $\circledcirc$) is called algebra fuzzy normed space.

Example 2.15: [15]
Let U=C[p, b], t$\circledcirc$s=t + s $-$ts for all t, s $\in$I and ($\mathbb{R}$, a, $\circledcirc$) is algebra fuzzy absolute space. Define n(r) = $\boldsymbol{max}_{\boldsymbol{s\in[p,b]}}$ a[r(s)] for all r $\in$ U. Then (U, n, $\circledcirc$) is algebra fuzzy normed space

Definition 2.16: [15]
Suppose that (U, n, $\circledcirc$) is algebra fuzzy normed space and assume that $(\boldsymbol{u_k}) \in$ U, we say that $(\boldsymbol{u_k})$ is fuzzy converges to the limit u ask approaches to ∞ if $\forall$ s $\in$ (0,1) $\exists$ N $\in \mathbb{N}$ s. t. n($\mathbf{u_k} -$u) $<$ s, $\forall$ k$\geq$N. If $(\boldsymbol{u_k})$ is fuzzy approaches to the limit u we write $\lim_{\mathbf{k\to\infty}} \mathbf{u_k}$=u or $\mathbf{u_k} \to$u as k approaches to ∞ or $\lim_{\mathbf{n\to\infty}} \boldsymbol{n}(\mathbf{u_k} - \mathbf{u})$=0.

Definition 2.17: [15]
Let (U, n, $\circledcirc$) be algebra fuzzy normed space . Then the open and closed fuzzy ball with the center u $\in$U and radius t, with t $\in$ (0, 1) is defined by fb(u, r)= {v $\in$U: n(u$-$v) $<$ t} and fb[u, r]= {v $\in$ U: n(u$-$v) $\leq$ t}respectively.

Definition 2.18: [15]
Let (U, n, $\circledcirc$) be algebra fuzzy normed space and let $(\boldsymbol{u_k})$ be a sequence in U, we say that $(\boldsymbol{u_k})$ is fuzzy Cauchy sequence in U if $\forall$ s $\in$ (0, 1) $\ni$ N $\in \mathbb{N}$ s. t. n($\mathbf{u_k} - \mathbf{u_m}$) $<$ s, $\forall$ k, m $\geq$N.

Lemma 2.19: [15]
If (U, n, $\circledcirc$) is algebra fuzzy normed space then the function u $\longmapsto$ n(u) is a fuzzy continuous function from (U, n, $\circledcirc$) $\to$ ($\mathbb{R}$, n, $\circledcirc$).

Lemma 2.20: [15]
If (U, n, ⊙) is algebra fuzzy normed space then n(u−v) = n(v−u) for all u, v ∈ U.

Definitions 2.21: [15]
If (U, n, ⊙) is algebra fuzzy normed space and W⊆U is known as fuzzy open if fb(w, j) ⊆W for any arbitrary w∈W and for some j ∈(0, 1). Also D⊆U is known as fuzzy closed if $\boldsymbol{D^C}$ is fuzzy open. Moreover the fuzzy closure of D, $\overline{\mathbf{D}}$ is defined to be the smallest fuzzy closed set contains D.

Definition 2.22: [15]
If (U, n, ⊙) is algebra fuzzy normed space then D⊆U is known as fuzzy dense in U if whenever $\overline{\mathbf{D}}$ = U.
Theorem 2.23: [15]
If fb(s, j) is an open fuzzy ball in algebra fuzzy normed space (U, n, ⊙) then it is a fuzzy open set.

Definition 2.24: [15]
An algebra fuzzy normed space (U, n, ⊙) is known as fuzzy complete if $(\boldsymbol{s_k})$ is fuzzy Cauchy sequence in U then $\boldsymbol{s_k} \to$s ∈ U.

Theorem 2.25: [15]
In algebra fuzzy normed space (U, n, ⊙) if $\boldsymbol{u_k} \to$u ∈ U then $(\boldsymbol{u_k})$ is fuzzy Cauchy.

Theorem 2.26: [15]
In algebra fuzzy normed space (U, n, ⊙) when D⊂U then d∈$\overline{\mathbf{D}}$ if and only if there is $(\mathbf{d_k})$ ∈ D with $\mathbf{d_k} \to$ d.

3. Fuzzy compact algebra fuzzy normed space

Definition 3.1:
Let (U, n, ⊙) be algebra fuzzy normed space and P⊆ U. Let $\boldsymbol{\Omega} = \{\boldsymbol{O_j}: j \in J$ where $\boldsymbol{O_j}$ is fuzzy open set in U$\}$. Then $\boldsymbol{\Omega}$ is called a fuzzy open cover or a fuzzy open covering of P if $P \subseteq \bigcup_{\boldsymbol{O_j} \in \boldsymbol{\Omega}} \boldsymbol{O_j}$ that is for each p∈P there is $\boldsymbol{O_k} \in \boldsymbol{\Omega}$ such that p∈ $\boldsymbol{O_k}$ for some k ∈J. A finite sub collection of $\boldsymbol{\Omega}$ which itself is a fuzzy open cover is called a finite fuzzy open sub cover or a finite fuzzy open sub covering of P.

Definition 3.2:
An algebra fuzzy normed space (U, n, ⊙) is said to be fuzzy compact if every fuzzy open covering $\boldsymbol{\Omega}$ of U has a finite fuzzy open sub covering that is there is a finite sub collection $\{\mathbf{O_1}, \mathbf{O_2}, \mathbf{O_3}, \ldots, \mathbf{O_k}\} \subseteq \boldsymbol{\Omega}$ such that $U = \bigcup_{\mathbf{j=1}}^{\mathbf{k}} \mathbf{O_j}$.

Definition 3.3:
A nonempty subspace P of U is said to be fuzzy compact if every fuzzy open covering $\boldsymbol{\Omega}$ of P has a finite fuzzy open sub covering that is there is a finite sub collection $\{\mathbf{O_1}, \mathbf{O_2}, \mathbf{O_3}, \ldots, \mathbf{O_k}\} \subseteq \boldsymbol{\Omega}$ such that $P = \bigcup_{\mathbf{j=1}}^{\mathbf{k}} \mathbf{O_j}$.

Example 3.4:
The open interval $\{r \in \mathbb{R}: 0 < r < 1\}$ in the algebra fuzzy normed space $(\mathbb{R}, \boldsymbol{a}_{|.|}, \odot)$ where $\boldsymbol{a}_{|.|}(\boldsymbol{\alpha}) = \frac{|\boldsymbol{\alpha}|}{\mathbf{1}+|\boldsymbol{\alpha}|}$ is not fuzzy compact. Since the fuzzy open covering $\{(\frac{\mathbf{1}}{\mathbf{k}}, 1): k = 2, 3...\}$ is fuzzy open covering of (0, 1) from which no finite fuzzy open sub covering can be selected.

Remark 3.5:
If P is a finite subset of algebra fuzzy normed space (U, n, ⊙) then P is fuzzy compact.

Definition 3.6:
Assume that (U, n, ⊙) is algebra fuzzy normed space and P be a subset of U. Then P is called fuzzy totally bounded if for each $0 < r < 1$, there is a finite set of points $\{\boldsymbol{p_1}, \boldsymbol{p_2},\ldots,\boldsymbol{p_k}\} \subseteq P$ such that whenever u in U, $n(u - \boldsymbol{p_j}) < r$ for some $\boldsymbol{p_j} \in \{\boldsymbol{p_1},\boldsymbol{p_2},\ldots..,\boldsymbol{p_k}\}$. This set of points $\{\boldsymbol{p_1}, \boldsymbol{p_2},..., \boldsymbol{p_k}\}$ is called fuzzy r- net.

Proposition 3.7:
A fuzzy totally bounded algebra fuzzy normed space is fuzzy bounded.
Proof:
Let (U, n, ⊙) be fuzzy totally bounded and suppose $0 < r < 1$ is given. Then there exists a finite fuzzy r- net for U, say A. Since A is a finite set of points and $0 < n(A) < 1$, where $n(A) = \sup\{n(b-a): b, a \in A\}$. Now let $\mathbf{u_1}$and $\mathbf{u_2}$ be any two points of U. There exists points b and a in A such that $n(\mathbf{u_1} - b) < r$ and $n(\mathbf{u_2} - a) < r$. Now for n(A) and r there is t, where $0 < t < 1$ such that $r \odot n(A) \odot r \leq t$. It follows that
$n(\mathbf{u_1} - \mathbf{u_2}) \leq n(\mathbf{u_1} - b) \odot n(b-a) \odot n(a - \mathbf{u_2}) \leq r \odot n(A) \odot r \leq t$
So, $n(U) = \sup\{n(\mathbf{u_1} - \mathbf{u_2}):\mathbf{u_1}, \mathbf{u_2} \in X\} \leq t$. Hence U is fuzzy bounded.

Theorem 3.8:
Let (U, n, ⊙) be algebra fuzzy normed space and let P be a subset of U. Then P is fuzzy totally bounded if and only if ∀ $(\mathbf{p_k})$ in P contains subsequence $(\mathbf{p_{k_j}})$ which is fuzzy Cauchy.
Proof:
Let P be fuzzy totally bounded and $(\mathbf{p_k}) \in P$. Consider a finite fuzzy $\frac{\mathbf{1}}{\mathbf{2}}$ -net in P. Then we can find fuzzy open ball of radius $\frac{\mathbf{1}}{\mathbf{2}}$ with center in the fuzzy $\frac{\mathbf{1}}{\mathbf{2}}$ -net contains infinite elements of $(\mathbf{p_k})$. Let $(\mathbf{p_{1k}})$ denote the subsequence contains these element. Again consider a finite fuzzy $\frac{\mathbf{1}}{\mathbf{4}}$ -net in P. Then we can find fuzzy open ball of radius $\frac{\mathbf{1}}{\mathbf{4}}$ with center in the finite fuzzy $\frac{\mathbf{1}}{\mathbf{4}}$ -net contains infinitely many elements of $(\mathbf{p_{1k}})$.
Let $(\mathbf{p_{2k}})$ be the subsequence. After many steps we get $(\mathbf{p_k}) \supseteq (\mathbf{p_{1k}}) \supseteq (\mathbf{p_{2k}}) \supseteq \ldots$
At the jth step members of $(\mathbf{p_{jk}})$ lie in the fuzzy open ball of radius $\frac{\mathbf{1}}{\mathbf{2^j}}$ with center in the fuzzy $\frac{\mathbf{1}}{\mathbf{2^j}}$ -net.
Now $(\mathbf{p_{jj}})$ is a subsequence of $(\mathbf{p_j})$. Assume that $r \in (0, 1)$. Consider $N \in \mathbb{N}$ so large that
$(\frac{\mathbf{1}}{\mathbf{2^j}}) \odot (\frac{\mathbf{1}}{\mathbf{2^{j+1}}}) \odot \ldots \odot (\frac{\mathbf{1}}{\mathbf{2^{m-1}}}) < r$. Then for $m > j > N$, we have
$n(\mathbf{p_{jj}} - \mathbf{p_{mm}}) \leq n(\mathbf{p_{jj}} - \mathbf{p_{j+1j+1}}) \odot n(\mathbf{p_{j+1j+1}} - \mathbf{p_{j+2j+2}}) \odot \ldots \odot n(\mathbf{p_{m-1m-1}} - \mathbf{p_{mm}})$
$n(\mathbf{p_{jj}} - \mathbf{p_{mm}}) \leq (\frac{\mathbf{1}}{\mathbf{2^j}}) \odot (\frac{\mathbf{1}}{\mathbf{2^{j+1}}}) \odot \ldots \odot (\frac{\mathbf{1}}{\mathbf{2^{m-1}}}) < r$.
Thus the sequence $(\mathbf{p_{kk}})$ is a fuzzy Cauchy sequence.
To prove the converse assume that any sequence $(\mathbf{p_k})$ in P contains subsequence $(\mathbf{p_{k_j}})$ which is fuzzy Cauchy.
Let $r \in (0, 1)$ and let $\mathbf{p_1} \in P$. If $P - fb(\mathbf{p_1}, r) = \emptyset$, we have found a fuzzy r-net put it $\{\mathbf{p_1}\}$. Or consider $\mathbf{p_2} \in P - fb(\mathbf{p_1}, r)$. If $P - [fb(\mathbf{p_1}, r) \cup fb(\mathbf{p_2}, r)] = \emptyset$. We have found a fuzzy r-net put it by $\{\mathbf{p_1},\mathbf{p_2}\}$. We must prove that this process after a finite number of steps stops. If it does not stops, we get $(\mathbf{p_1}, \mathbf{p_2}, \ldots, \mathbf{p_k},\ldots)$ with $n(\mathbf{p_j} - \mathbf{p_m}) \geq r$, $j \neq m$. Thus this implies $(\mathbf{p_k})$ does not contain subsequence $(\mathbf{p_{k_j}})$ which is fuzzy Cauchy. This is a contradiction.

Proposition 3.9:
If (U, n, ⊙) is a fuzzy compact algebra fuzzy normed space then U is fuzzy totally bounded.
Proof:

Let $0 < r < 1$ then {fb(p, r) :for p∈U} is a fuzzy open cover of U. But U is fuzzy compact this implies that {fb(p, r) :for p∈U} contains {fb($\boldsymbol{p_1}$, r), fb($\boldsymbol{p_2}$, r),…, fb($\boldsymbol{p_k}$, r)} such that $U=\cup_{j=1}^{k} \mathbf{fb}(\boldsymbol{p_j}, \mathbf{r})$. Hence for $0 < r < 1$ { $\boldsymbol{p_1}$, $\boldsymbol{p_2}$. …, $\boldsymbol{p_k}$}U is a finite fuzzy r-net for U. Hence U is fuzzy totally bounded.

Proposition 3.10:
If (U, n, ⊙) is a fuzzy compact algebra fuzzy normed space then (U, n, ⊙) is fuzzy complete.
Proof:
Assume that (U, n, ⊙) is a fuzzy compact algebra fuzzy normed which is not fuzzy complete. Then we can find a fuzzy Cauchy ($\mathbf{p_k}$) in U does not has a limit in U. Let p∈U, since $\mathbf{p_k} \nrightarrow p$ ∃ $0 < r < 1$ such that n($\mathbf{p_k} - p$) ≥ r for k=1, 2, … but ($\mathbf{p_k}$) is fuzzy Cauchy ∃ N∈ ℕ s. t. n($\mathbf{p_j} - \mathbf{p_m}$) <t ∀ j, m ≥ N. Choose m ≥ N for which n($\mathbf{p_m} - p$) < t . So, the fuzzy open ball fb(p, t) contains { $\mathbf{p_1}$, $\mathbf{p_2}$, …,$\mathbf{p_k}$} where k ∈ ℕ. Now consider fuzzy { fb($\mathbf{p_1}$, t($\mathbf{p_1}$)), fb($\mathbf{p_2}$, t($\mathbf{p_2}$)),… fb($\mathbf{p_k}$, t($\mathbf{p_k}$))} where $0 < t(\mathbf{p_k}) < 1$ and $U=\cup_{j=1}^{k} \mathbf{fb}(\boldsymbol{p_j}, \mathbf{t}(\boldsymbol{p_j}))$. But each fb($\mathbf{p_j}$, t($\mathbf{p_j}$))} contains $\mathbf{p_k}$ for only a finite number of values so U, must contains $\mathbf{p_k}$ for only a finite number of values of k. This is a contradiction. Hence (U, n, ⊙) must be fuzzy complete.

Theorem 3.11:
If (U, n, ⊙) is fuzzy totally bounded and fuzzy complete algebra fuzzy normed space then (U, n, ⊙) is fuzzy compact.
Proof:
Assume that (U, n, ⊙) is not fuzzy compact. Then we can find a fuzzy open covering {$\mathbf{O_\lambda}$: $\boldsymbol{\lambda}$∈∧} of U that does not have a finite fuzzy open sub covering. But U is fuzzy totally bounded, so it is fuzzy bounded, hence consider fb(p, r) for some $0 < r < 1$ and some p∈U, clearly fb(p, r) ⊆U if U ⊆ fb(p, r) then we must have U = fb(p, r).
Put $\mathbf{t_k} = \frac{\mathbf{r}}{\mathbf{2^k}}$ but U is fuzzy totally bounded this means that U can be covered by finite fuzzy open balls of radius $\mathbf{t_1}$. By our assumption at least one of these fuzzy open balls, say fb($\mathbf{p_1}$, $\mathbf{t_1}$)≠ $\cup_{j=1}^{k} \mathbf{O}_{\lambda_j}$ since fb($\mathbf{p_1}$, $\mathbf{t_1}$) is itself fuzzy totally bounded. ∃ $\mathbf{p_2}$ ∈ fb($\mathbf{p_1}$, $\mathbf{t_1}$), s. t. fb($\mathbf{p_2}$, $\mathbf{t_2}$))≠ $\cup_{j=1}^{k} \mathbf{O}_{\lambda_j}$. After many steps we get a sequence ($\mathbf{p_k}$) has the property that for each k, fb($\mathbf{p_k}$, $\mathbf{t_k}$))≠ $\cup_{j=1}^{k} \mathbf{O}_{\lambda_j}$ and $\mathbf{p_{k+1}}$ ∈fb($\mathbf{p_k}$,$\mathbf{t_k}$). We next show that the sequence ($\mathbf{p_k}$) is convergent.
Since $\mathbf{p_{k+1}}$ ∈fb($\mathbf{p_k}$,$\mathbf{t_k}$) it follows that n($\mathbf{p_k} - \mathbf{p_{k+1}}$) < $\mathbf{t_k}$. Let $0 < t < 1$ such that $\mathbf{t_k} \circledcirc \mathbf{t_{k+1}} \circledcirc \ldots\ldots \circledcirc \mathbf{t_m} < t$
Hence n($\mathbf{p_k} - \mathbf{p_m}$) ≤ n($\mathbf{p_k} - \mathbf{p_{k+1}}$) ⊙……⊙ n($\mathbf{p_{m-1}} - \mathbf{p_m}$)
≤ $\mathbf{t_k} \circledcirc \mathbf{t_{k+1}} \circledcirc \ldots\ldots \circledcirc \mathbf{t_m} < t$
So ($\mathbf{p_k}$) is a fuzzy Cauchy sequence in U and since U is fuzzy complete, it converges to p∈U. Because p∈U ∃ $\boldsymbol{\lambda_0}$∈ ∧ s. t. p∈ $\mathbf{O}_{\lambda_0}$. Since $\mathbf{O}_{\lambda_0}$ is fuzzy open it contains fb(p, s) for some $0 < s < 1$. Let N∈ ℕ n($\mathbf{p_k} - p$) < s Then, for any u∈U such that n($u - \mathbf{p_k}$) < $\mathbf{t_k}$. It follows that
n(u−p) ≤ n($u - \mathbf{p_k}$) ⊙ n($\mathbf{p_k} - p$) ≤ $\mathbf{t_k}$ ⊙s < r,
for some $0 < r < 1$. So that fb($\mathbf{p_k}$, $\mathbf{t_n}$) ⊆ fb(p, r). Therefore fb($\mathbf{p_k}$,$\mathbf{t_k}$) has a finite fuzzy open sub covering, namely by the set $\mathbf{O}_{\lambda_0}$. Since this contradicts fb($\mathbf{p_k}$, $\mathbf{t_k}$))≠ $\cup_{j=1}^{k} \mathbf{O}_{\lambda_j}$. The proof is complete.

Proposition 3.12:
Let (U, n, ⊙) be algebra fuzzy normed space. Then every set {$\mathbf{u_1}$, $\mathbf{u_2}$, …,$\mathbf{u_k}$, …}in (U, n, ⊙) has at least one limit point in U ⇔ every sequence ($\mathbf{u_k}$) in (U, n, ⊙) contains ($\mathbf{u_{k_j}}$) such that $\mathbf{u_{k_j}} \rightarrow u \in U$.
Proof:
Assume that every set {$\mathbf{u_1}$, $\mathbf{u_2}$, …,$\mathbf{u_k}$, …}in (U, n, ⊙) has at least one limit point in U. Let ($\mathbf{u_k}$) ∈ U. If {$\mathbf{u_1}$, $\mathbf{u_2}$,…., $\mathbf{u_k}$} then take $\mathbf{u_j}$ ∈ {$\mathbf{u_1}$, $\mathbf{u_2}$,…., $\mathbf{u_k}$} and ($\mathbf{u_j}$, $\mathbf{u_j}$, …) ⊆ ($\mathbf{u_k}$), where ($\mathbf{u_j}$, $\mathbf{u_j}$, …) → $\mathbf{u_j}$. Now consider {$\mathbf{u_1}$, $\mathbf{u_2}$,…., $\mathbf{u_k}$, …}.

By our assumption the infinite set $\{\mathbf{u_1}, \mathbf{u_2},\ldots,\}$ has at least one limit point u∈U. Now we construct $(\mathbf{u_{k_j}})$ as follows: Take $\mathbf{k_1} \in \mathbb{N}$ s. t. $n(\mathbf{u_{k_1}} - u) > 0$.
Having defined $\mathbf{k_j}$, let $\mathbf{k_{j+1}}$ be the smallest integer such that $\mathbf{k_{j+1}} > \mathbf{k_j}$
and $n(\mathbf{u_{k_{j+1}}} - u) < \frac{1}{j+1}$. Then the sequence $(\mathbf{u_{k_j}})$ fuzzy converges to u.
Conversely assume that every sequence $(\mathbf{u_k})$ in (U, n, ⊙) contains $(\mathbf{u_{k_j}})$ such that $\mathbf{u_{k_j}} \to u \in U$. Let $S=\{\boldsymbol{p_1}, \boldsymbol{p_2}, \ldots\} \subseteq U$ then $\exists$ $(\mathbf{p_k})$ in U where $\mathbf{p_k} \neq \mathbf{p_j}$. By our assumption $(\mathbf{p_k})$ contains a subsequence $(\mathbf{p_{k_i}})$ where $\mathbf{p_{k_i}} \neq \mathbf{p_{k_j}}$ and $\mathbf{p_{k_i}} \to p \in U$. Thus ∀ fb(p, r) we have $\{\mathbf{p_{k_1}}, \mathbf{p_{k_2}}, \ldots, \mathbf{p_{k_j}}, \ldots\} \subseteq$ fb(p, r). But $\mathbf{p_{k_i}} \neq \mathbf{p_{k_j}}$ hence p∈U is a limit point of S.

Theorem 3.13:
Suppose that (U, n, ⊙) is algebra fuzzy normed space then the following is equivalent
(1)(U, n, ⊙) is fuzzy compact;
(2) ∀ $(\mathbf{u_k})$ in (U, n, ⊙) contains $(\mathbf{u_{k_j}})$ such that $\mathbf{u_{k_j}} \to u \in U$.
Proof:
(1)⇒(2)
Consider $(\mathbf{u_k})$ in U by using Theorem 3.12, it follows that $(\mathbf{u_{k_i}}) \subseteq (\mathbf{u_k})$ and $(\mathbf{u_{k_i}})$ is a fuzzy Cauchy. But $\mathbf{u_{k_i}} \to u \in U$ since U is fuzzy complete by Theorem 3.11.
(2)⇒(1)
Since every fuzzy convergent sequence is fuzzy Cauchy and by using Theorem 3.11 we have U is fuzzy totally bounded. Let $(\mathbf{p_k})$ be a fuzzy Cauchy sequence in U. By (2) $(\mathbf{p_{k_i}}) \subseteq (\mathbf{p_k})$ and $\mathbf{p_{k_i}} \to p \in U$. To prove that $\mathbf{p_k} \to p$. Consider $r \in (0, 1)$ by Remark 1.2, there is $0 < t < 1$ such that $r ⊙ r < t$.
Now $\mathbf{p_{k_i}} \to p$, there exist $\mathbf{N_1}$ such that $n(\mathbf{p_{k_i}} - p) < r$ for all $\mathbf{k_i} \geq \mathbf{N_1}$.
Since the sequence $(\mathbf{p_k})$ is fuzzy Cauchy, there exists $\mathbf{N_2}$ such that
$n(\mathbf{p_j} - \mathbf{p_m}) < r$ for all $m, j \geq \mathbf{N_2}$.
Let $N = \min\{\mathbf{N_1}, \mathbf{N_2}\}$ then $n(\mathbf{p_k} - p) \leq n(\mathbf{p_k} - \mathbf{p_{k_i}}) ⊙ n(\mathbf{p_{k_i}} - p) \leq r ⊙ r < t$
For all $k \geq N$. Hence U is fuzzy complete and by Theorem 3.11 U is fuzzy compact.

Corollary 3.14:
If P is a fuzzy closed subset of the fuzzy compact algebra fuzzy normed space (U, n, ⊙) then P is fuzzy compact.
Proof:
Let $(\mathbf{p_k}) \in P$. Then $(\mathbf{p_k})$ in U and $(\mathbf{p_{k_i}}) \subseteq (\mathbf{p_k})$ and $\mathbf{p_{k_i}} \to p \in U$. Thus p∈P since P is fuzzy closed. Hence by Theorem 3.13 P is fuzzy compact.

Theorem 3.15:
Suppose that (U, n, ⊙) is algebra fuzzy normed space and P ⊆U. If P is fuzzy compact then P is a fuzzy closed subset of U.
Proof:
Consider p ∈U is a limit point of P. Then $\exists$ $(\mathbf{p_k})$ in P such that $\mathbf{p_k} \to p$. But then $(\mathbf{p_k})$ is a fuzzy Cauchy sequence in P. Because P is fuzzy complete $\mathbf{p_k} \to q$ in P. Thus q = p and so q ∈P.Thus P fuzzy closed since it contains all its limit points.

4. When the dimension of algebra Fuzzy Normed Space is finite
In this section we deal with finite dimensional vector spaces with algebra fuzzy norm.
The following theorem plays the key role in the studying properties of finite dimensional algebra fuzzy normed linear spaces.

Theorem 4.1:

Let (U, n, ⊙) be algebra fuzzy normed space and ($\mathbb{R}$, $\boldsymbol{a}_{\mathbb{R}}$, ⊙) is algebra fuzzy absolute value space. Suppose that $\{\boldsymbol{u_1}, \boldsymbol{u_2}, \ldots, \boldsymbol{u_k}\}$ is linearly independent set in U . Then there is r ∈(0, 1) such that

$\boldsymbol{n_U}[\boldsymbol{\alpha_1 u_1} + \boldsymbol{\alpha_2 u_2} + \ldots + \boldsymbol{\alpha_k u_k}] \geq r[\boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\alpha_1}) \odot \boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\alpha_2}) \odot \ldots \odot \boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\alpha_k})]$

Proof:

Assume that we cannot find r ∈(0, 1) such that

$\boldsymbol{n_U}[\boldsymbol{\alpha_1 u_1} + \boldsymbol{\alpha_2 u_2} + \ldots + \boldsymbol{\alpha_k u_k}] \geq r[\boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\alpha_1}) \odot \boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\alpha_2}) \odot \ldots \odot \boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\alpha_k})]$.

Then we can find a sequence $(\boldsymbol{d_m})$ in U where $\boldsymbol{d_m} = \boldsymbol{\alpha_{1m} u_1} + \boldsymbol{\alpha_{2m} u_2} + \ldots + \boldsymbol{\alpha_{km} u_k}$ such that $\mathbf{n_U}(\mathbf{d_m}) \to 0$ as $\mathbf{m} \to \infty$.

Now for each fixed j we have a sequence $\boldsymbol{\alpha_{jm}} = (\boldsymbol{\alpha_{j1}}, \boldsymbol{\alpha_{j2}} \ldots, \boldsymbol{\alpha_{jm}}, \ldots)$ is fuzzy bounded since $0 \leq \mathbf{a}_{\mathbb{R}}(\boldsymbol{\alpha_{jm}}) \leq 1$ so $(\boldsymbol{\alpha_{jm}})$ has a convergent subsequence. Let $\boldsymbol{\alpha_j}$ denote the limit of the subsequence $(\boldsymbol{\alpha_{jm}})$ for each $1 \leq \mathbf{j} \leq k$. Let $(\mathbf{u_{jm}})$ denote the corresponding subsequence of $(\mathbf{d_m})$ where the corresponding subsequence of scalar $\boldsymbol{\alpha_{jm}}$ fuzzy converges to $\boldsymbol{\alpha_j}$ for each $\mathbf{1} \leq \mathbf{j} \leq k$.

Now put $d = \sum_{\mathbf{j=1}}^{\mathbf{k}} \boldsymbol{\alpha_j u_j}$ then $(\mathbf{d_m})$ has a subsequence $(\mathbf{d_{jm}})$ fuzzy converges to d since $\{\boldsymbol{u_1}, \boldsymbol{u_2}, \ldots, \boldsymbol{u_k}\}$ is linearly independent set so $d \neq 0$. Now $\mathbf{d_{jm}} \to d$ implies $\mathbf{n_U}(\mathbf{d_{jm}}) \to \mathbf{n_U}(d)$ by fuzzy continuity of the algebra fuzzy norm.

But $\mathbf{n_U}(\mathbf{d_m}) \to 0$ as $\mathbf{m} \to \infty$ by our assumption and $(\mathbf{d_{jm}})$ is a subsequence of $(\mathbf{d_m})$.Thus $\mathbf{n_U}(\mathbf{d_{jm}}, \mathbf{t}) \to 0$. Hence $\mathbf{n_U}(d) = 0$ so $d = 0$. This contradicts $d \neq 0$.

Theorem 4.2:

Consider (U, n, ⊙) is algebra fuzzy normed space. If D is a subspace of U with finite dimension, then D is fuzzy complete

Proof:

Consider that $(\boldsymbol{d_m})$ is a fuzzy Cauchy sequence in D. Let dim D=k and

B=$\{\boldsymbol{u_1}, \boldsymbol{u_2}, \ldots, \boldsymbol{u_k}\}$ be any basis for D. Then each $\mathbf{d_m}$ has a unique representation as $\mathbf{d_m} = \boldsymbol{\alpha_{1m} u_1} + \boldsymbol{\alpha_{2m} u_2} + \ldots + \boldsymbol{\alpha_{km} u_k}$ since $(\mathbf{d_m})$ is fuzzy Cauchy sequence so for every t ∈(0, 1) there is N ∈ ℕ such that $\mathbf{n_U}(\mathbf{d_m} - \mathbf{d_j}) \leq t$ for every m, j ≥N. Now by Theorem 4.1 we have some r ∈(0, 1) such that

$r[\boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\alpha_{1m}} - \boldsymbol{\alpha_{1j}}) \odot \boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\alpha_{2m}} - \boldsymbol{\alpha_{2j}}) \odot \ldots \odot \boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\alpha_{km}} - \boldsymbol{\alpha_{kj}})] \leq \mathbf{n_U}(\mathbf{d_m} - \mathbf{d_j}) = \mathbf{n_U}\left[\sum_{\mathbf{i=1}}^{\mathbf{k}} (\boldsymbol{\alpha_{im}} - \boldsymbol{\alpha_{ij}})\mathbf{u_i}\right] \leq t$ dividing by $\mathbf{r}$ we get $a(\boldsymbol{\alpha_{im}} - \boldsymbol{\alpha_{ij}}) \leq \frac{\boldsymbol{t}}{\boldsymbol{r}}$

This show that $(\boldsymbol{\alpha_{i1}}, \boldsymbol{\alpha_{i2}}, \ldots)$ is fuzzy Cauchy sequence in ℝ. Hence $\boldsymbol{\alpha_{jm}} \to \boldsymbol{\alpha_j}$ for each $1 \leq \mathbf{j} \leq k$. Put $d = \sum_{\mathbf{j=1}}^{\mathbf{n}} \boldsymbol{\alpha_j u_j}$. Clearly d ∈D.

Also now for all m>N

$\mathbf{n_U}(\mathbf{d_m} - \mathbf{d}) = \mathbf{n_U}\left[\sum_{\mathbf{i=1}}^{\mathbf{k}} (\boldsymbol{\alpha_{im}} - \boldsymbol{\alpha_i})\mathbf{u_i}\right]$

$\leq \boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\alpha_{1m}} - \boldsymbol{\alpha_1})\, \mathbf{n_U}(\boldsymbol{u_1}) \odot \boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\alpha_{2m}} - \boldsymbol{\alpha_2})\, \mathbf{n_U}(\boldsymbol{u_2}) \odot \ldots \odot \boldsymbol{a}_{\mathbb{R}}(\boldsymbol{\alpha_{km}} - \boldsymbol{\alpha_k})\, \mathbf{n_U}(\boldsymbol{u_k})$

By taking limit to both sides as $\mathbf{m} \to \infty$ we get

$\lim_{\mathbf{m}\to\infty} \mathbf{n_U}(\mathbf{d_m} - \mathbf{d}) \leq 0 \odot 0 \odot \ldots \odot 0 = 0$. Hence $\mathbf{d_m} \to \mathbf{d}$ and D is fuzzy complete.

Definition 4.3:

Consider that (U, $\boldsymbol{n_1}$, ⊙) is algebra fuzzy normed space and $(\boldsymbol{u_k}) \in$ U. Then the algebra fuzzy norm $\boldsymbol{n_2}$ is said to be equivalent to $\boldsymbol{n_1}$ whenever $\boldsymbol{u_k} \to u \in$ U in (U, $\boldsymbol{n_1}$, ⊙) if and only if $\boldsymbol{u_k} \to u \in$ U in (U, $\boldsymbol{n_2}$, ⊙).

Theorem 4.4:

Suppose that (U, $\boldsymbol{n_1}$, ⊙) is algebra fuzzy normed space then the algebra fuzzy norm $\boldsymbol{n_2}$ is equivalent to $\boldsymbol{n_1}$ if there exists p, q in (0, 1) such that $p\boldsymbol{n_2}(u) \leq \boldsymbol{n_1}(u) \leq q\boldsymbol{n_2}(u)$.

Proof:

Suppose that $\boldsymbol{u_k} \to u \in$ U in (U, $\boldsymbol{n_1}$, ⊙) then for any r ∈(0, 1) ∃ N∈ ℕ such that

$\boldsymbol{n_1}(\boldsymbol{u_k} - u)) \leq r$. Now $p\boldsymbol{n_2}(\boldsymbol{u_k} - u) \leq \boldsymbol{n_1}(\boldsymbol{u_k} - u)) \leq r$. By dividing both sides by p since $p \neq 0$ and taking limit to both sides as $k \to \infty$ we get $\boldsymbol{n_2}(\boldsymbol{u_k} - u) \to 0$. Hence we have $\boldsymbol{u_k} \to u \in U$ in $(U, \boldsymbol{n_2}, \circledcirc)$
Now assume that $\boldsymbol{u_k} \to u \in U$ in $(U, \boldsymbol{n_2}, \circledcirc)$ $\forall$ r $\in (0, 1)$ $\exists$ N$\in \mathbb{N}$ such that $\boldsymbol{n_2}(\boldsymbol{u_k} - u) \leq r$. But $\boldsymbol{n_1}(\boldsymbol{u_k} - u) \leq q\boldsymbol{n_2}(\boldsymbol{u_k} - u)$ or $\boldsymbol{n_1}(\boldsymbol{u_k} - u) \leq qr$ put $qr = t \in (0, 1)$ that is $\boldsymbol{n_1}(\boldsymbol{u_k} - u) \leq t$. Hence we have $\boldsymbol{u_k} \to u \in U$ in $(U, \boldsymbol{n_1}, \circledcirc)$.

Theorem 4.5:
Suppose that U is vector space with dim U=k if $\mathbf{n_1}$ and $\mathbf{n_2}$ are two algebra fuzzy norms on U then $\mathbf{n_1}$ is equivalent to $\mathbf{n_2}$.
Proof:
Since dim U=k and $B = \{\boldsymbol{u_1}, \boldsymbol{u_2}, \ldots, \boldsymbol{u_k}\}$ be any basis for U. Then for any $u \in U$ we have $u = \sum_{j=1}^{k} \alpha_j \mathbf{u_j}$. Now

$$\mathbf{n_1}(\mathbf{u}) = \mathbf{n_1}\left(\sum_{j=1}^{k} \alpha_j \mathbf{u_j}\right) \leq \mathbf{n_1}(\alpha_1 \mathbf{u_1}) \circledcirc \mathbf{n_1}(\alpha_2 \mathbf{u_2}) \circledcirc \ldots \circledcirc \mathbf{n_1}(\alpha_k \mathbf{u_k})$$
$$\leq \boldsymbol{a}_{\mathbb{R}}(\alpha_1)\, \mathbf{n_1}(\mathbf{u_1}) \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_2)\, \mathbf{n_1}(\mathbf{u_2}) \circledcirc \ldots \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_k)\, \mathbf{n_1}(\mathbf{u_k})$$
$$\leq t[\boldsymbol{a}_{\mathbb{R}}(\alpha_1) \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_2) \circledcirc \ldots \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_k)]$$

Where $t = \max\{\mathbf{n_1}(\mathbf{u_1}), \mathbf{n_1}(\mathbf{u_2}), \ldots, \mathbf{n_1}(\mathbf{u_k})\}$ that is
$\mathbf{n_1}(\mathbf{u}) \leq t[\boldsymbol{a}_{\mathbb{R}}(\alpha_1) \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_2) \circledcirc \ldots \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_k)]$ or dividing by t
$\frac{1}{t}\mathbf{n_1}(\mathbf{u}) \leq [\boldsymbol{a}_{\mathbb{R}}(\alpha_1) \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_2) \circledcirc \ldots \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_k)]$ …….(1)
Now by Theorem 4.1
$\mathbf{n_2}(\mathbf{u}) = \mathbf{n_2}\left(\sum_{j=1}^{k} \alpha_j \mathbf{u_j}\right) \geq r[\boldsymbol{a}_{\mathbb{R}}(\alpha_1) \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_2) \circledcirc \ldots \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_k)]$ or dividing by r
$\frac{1}{r}\mathbf{n_2}(\mathbf{u}) \geq [\boldsymbol{a}_{\mathbb{R}}(\alpha_1) \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_2) \circledcirc \ldots \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_k)]$ …….(2)
Now from (1) and (2) we have
$\frac{1}{t}\mathbf{n_1}(\mathbf{u}) \leq [\boldsymbol{a}_{\mathbb{R}}(\alpha_1) \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_2) \circledcirc \ldots \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_k)] \leq \frac{1}{r}\mathbf{n_2}(\mathbf{u})$ or
$\frac{1}{t}\mathbf{n_1}(\mathbf{u}) \leq \frac{1}{r}\mathbf{n_2}(\mathbf{u})$ this implies that $\mathbf{n_1}(\mathbf{u}) \leq \frac{t}{r}\mathbf{n_2}(\mathbf{u})$ put $\frac{t}{r} = q$ we have
$\mathbf{n_1}(\mathbf{u}) \leq q\, \mathbf{n_2}(\mathbf{u})$ …….(3)
In similar way

$$\mathbf{n_2}(\mathbf{u}) = \mathbf{n_2}\left(\sum_{j=1}^{k} \alpha_j \mathbf{u_j}\right) \leq \mathbf{n_2}(\alpha_1 \mathbf{u_1}) \circledcirc \mathbf{n_2}(\alpha_2 \mathbf{u_2}) \circledcirc \ldots \circledcirc \mathbf{n_2}(\alpha_k \mathbf{u_k})$$
$$\leq \boldsymbol{a}_{\mathbb{R}}(\alpha_1)\, \mathbf{n_2}(\mathbf{u_1}) \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_2)\, \mathbf{n_2}(\mathbf{u_2}) \circledcirc \ldots \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_k)\, \mathbf{n_2}(\mathbf{u_k})$$
$$\leq s[\boldsymbol{a}_{\mathbb{R}}(\alpha_1) \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_2) \circledcirc \ldots \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_k)]$$

Where $s = \max\{\mathbf{n_2}(\mathbf{u_1}), \mathbf{n_2}(\mathbf{u_2}), \ldots, \mathbf{n_2}(\mathbf{u_k})\}$ that is
$\mathbf{n_2}(\mathbf{u}) \leq s[\boldsymbol{a}_{\mathbb{R}}(\alpha_1) \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_2) \circledcirc \ldots \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_k)]$ or dividing by s
$\frac{1}{s}\mathbf{n_2}(\mathbf{u}) \leq [\boldsymbol{a}_{\mathbb{R}}(\alpha_1) \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_2) \circledcirc \ldots \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_k)]$ (4)
Again by Theorem 4.1
$\mathbf{n_1}(\mathbf{u}) = \mathbf{n_1}\left(\sum_{j=1}^{k} \alpha_j \mathbf{u_j}\right) \geq r[\boldsymbol{a}_{\mathbb{R}}(\alpha_1) \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_2) \circledcirc \ldots \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_k)]$ or dividing by r
$\frac{1}{r}\mathbf{n_1}(\mathbf{u}) \geq [\boldsymbol{a}_{\mathbb{R}}(\alpha_1) \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_2) \circledcirc \ldots \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_k)]$ (5)
Now from (4) and (5) we have
$\frac{1}{r}\mathbf{n_1}(\mathbf{u}) \geq [\boldsymbol{a}_{\mathbb{R}}(\alpha_1) \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_2) \circledcirc \ldots \circledcirc \boldsymbol{a}_{\mathbb{R}}(\alpha_k)] \geq \frac{1}{s}\mathbf{n_2}(\mathbf{u})$ or $\frac{1}{r}\mathbf{n_1}(\mathbf{u}) \geq \frac{1}{s}\mathbf{n_2}(\mathbf{u})$ this implies that
$\frac{s}{r}\mathbf{n_2}(\mathbf{u}) \leq \mathbf{n_1}(\mathbf{u})$ put $\frac{s}{r} = p$ we have
$p\mathbf{n_2}(\mathbf{u}) \leq \mathbf{n_1}(\mathbf{u})$ (6)
Now from (3) and (6) we obtain
$p\mathbf{n_2}(\mathbf{u}) \leq \mathbf{n_1}(\mathbf{u}) \leq q\, \mathbf{n_2}(\mathbf{u})$
Hence by Theorem 4.4, $\mathbf{n_1}$ is fuzzy equivalent to $\mathbf{n_2}$.

Theorem 4.6:

Suppose that (U, n, ⊙) is algebra fuzzy normed space with dim U=k and D⊂U . If D is fuzzy closed and fuzzy bounded, then D is fuzzy compact.
Proof:
Since dim U=k and B={$\boldsymbol{u_1}$, $\boldsymbol{u_2}$, …,$\boldsymbol{u_k}$} be any basis for U. Consider the sequence ($\boldsymbol{d_m}$) in D then ∀ r ∈(0, 1) ∃ N∈ ℕ such that $\boldsymbol{d_m}$=$\boldsymbol{\alpha_{1m}u_1}$+$\boldsymbol{\alpha_{2m}u_2}$+…+$\boldsymbol{\alpha_{km}u_k}$, since D is fuzzy bounded so, is ($\boldsymbol{d_m}$) that is $\boldsymbol{n_U(d_m)}$ <t for all **m** and for some t ∈(0, 1). Now by Theorem 4.1
$\boldsymbol{n_U[d_m]}$= $\boldsymbol{n_U[\sum_{j=1}^{k}\alpha_{jm}u_j]}$ ≥ r[$\boldsymbol{a_{\mathbb{R}}(\alpha_1)}$ ⊙ $\boldsymbol{a_{\mathbb{R}}(\alpha_2)}$ ⊙…⊙ $\boldsymbol{a_{\mathbb{R}}(\alpha_k)}$]
Thus r[$\boldsymbol{a_{\mathbb{R}}(\alpha_{1m})}$ ⊙ $\boldsymbol{a_{\mathbb{R}}(\alpha_{2m})}$ ⊙…⊙ $\boldsymbol{a_{\mathbb{R}}(\alpha_{km})}$] ≤ $\boldsymbol{n_U[d_m]}$ <t or
$\boldsymbol{a_{\mathbb{R}}(\alpha_{jm})}$ ≤ [$\boldsymbol{a_{\mathbb{R}}(\alpha_{1m})}$ ⊙ $\boldsymbol{a_{\mathbb{R}}(\alpha_{2m})}$ ⊙…⊙ $\boldsymbol{a_{\mathbb{R}}(\alpha_{km})}$] < $\frac{t}{r}$
Hence the sequence ($\boldsymbol{\alpha_{jm}}$) for fixed **j** is fuzzy bounded so it has a limit point $\boldsymbol{\alpha_j}$ for each 1<j<k. We see that ($\boldsymbol{d_m}$) has a subsequence ($\boldsymbol{z_m}$) which converges to z = $\boldsymbol{\sum_{j=1}^{n}\alpha_j u_j}$. Since D is closed so z ∈D. But ($\boldsymbol{d_m}$) was an arbitrary sequence in D. Hence D is fuzzy compact.

Lemma 4.7:
Consider that (U, n, ⊙) is algebra fuzzy normed space and assume that D and Z two subspace of U with D⊆Z and D is fuzzy closed. Then for every t∈(0, 1) there is $\boldsymbol{z \in Z}$ such that $\boldsymbol{n_U}$(z−d)≥t for all d∈D.
Proof:
Let u∈Z−D and put s=$\boldsymbol{\inf_{d\in D} n_U}$(u−d). Clearly s>0 since D is fuzzy closed. Take t∈(0, 1) with s>t then by definition of infimum there is $\boldsymbol{d_0}$ ∈D such that s≤ $\boldsymbol{n_U(u-d_0)} \le \frac{s}{t}$. put z=u−$\boldsymbol{d_0}$. Now $\boldsymbol{n_U}$(z−d)= $\boldsymbol{n_U}$(u−$\boldsymbol{d_0}$ −d)= $\boldsymbol{n_U}$(u−$\boldsymbol{d_1}$) where $\boldsymbol{d_1}$=$\boldsymbol{d_0}$+d. Hence $\boldsymbol{n_U}$(z−d)= $\boldsymbol{n_U}$(u−$\boldsymbol{d_1}$)≥s>t.

Theorem 4.8:
Suppose that (U, n, ⊙) is algebra fuzzy normed space and if D={u∈U: 0<n(u)≤1} is a fuzzy closed in U and is compact then U must be finite dimension.
Proof:
Suppose that D is fuzzy compact and dim U is not finite. Choose $\boldsymbol{u_1}$ ∈D and let $\boldsymbol{U_1}$ be the subspace of U with basis {$\boldsymbol{u_1}$} so it is fuzzy closed. But $\boldsymbol{U_1}$ ≠U since dimU is not finite. Now by Lemma 4.7 there is $\boldsymbol{u_2}$ ∈D such that n($\boldsymbol{u_2-u_1}$)≥t=$\frac{1}{2}$. Let $\boldsymbol{U_2}$ be the subspace of U with basis { $\boldsymbol{u_1}$, $\boldsymbol{u_2}$}since $\boldsymbol{U_2}$ ≠U so there is $\boldsymbol{u_3}$ ∈D such that n($\boldsymbol{u_3-u_2}$)≥ $\frac{1}{2}$ and n($\boldsymbol{u_3-u_1}$)≥ $\frac{1}{2}$.
Now by induction we get ($\boldsymbol{u_k}$) ∈D with n($\boldsymbol{u_m-u_j}$))≥ $\frac{1}{2}$ where m≠j. This implies that ($\boldsymbol{u_k}$) does not contains a subsequence which is fuzzy converges. This contradicts the compactness of D. Hence dimU must be finite.

Q and JCPI–ings

QR and JCPI –Rings

Raida D. Mahmood, Roua S. Mohammed

Department of Mathematics, College of Computer Sciences and Mathematics, University of Mosul, Iraq.

E-mail: raida.1961@uomosul.edu.iq

Abstract. In this paper, we continue studies of several other authors, on QR (quasi-regular) and JCPI (JCP-injective) rings. In particular, we investigate some characterizations of several basic properties of QR and JCPI rings. Also, we prove that, if R is a semisimple and quasi duo, then R is strongly regular if and only if every simple singular right R-modules are JCPI. Keywords: JCPI-ring, QR-ring, MP-ring, strongly regular ring.

1. Introduction

Throughout, this paper is R denoted an associative ring with identity, and R-modules is until. For $d \in R$, $r(d)$ ($\ell(d)$) to denote the right (left), annihilator. We write $J(R)$,$y(R)$ ($z(R)$), DR for the Jacobson radical, the right singular (left singular) ideal and division ring. A right R -modules M is called P-injective, if for every principal right ideal I of R, any right R-homomorphism of I into M extends to one of R into M. R is called a right P-injective if R_R is P-injective [2]. A ring R is said to be quasi duo if every maximal right ideal of Ris a two-sided ideal [3]. Regular rings have been studied extensively by many authors (for example, [9], [5], and [8]). It is well known that a ring R is regular (strongly regular), if for any $d \in R$, there exists $b \in R$ such that $d = dbd$ ($d = d^2b$) [8]. In section 2, we give a relation between QR-rings and DR, and in section 3 gives some concepts of right JCPI-ring and the relationship between these and strongly regular rings.

2. QR -rings

Following [7], a ring R is said to be right (left) QR -ring, if $d \in dRd$ for all $d \notin y(R)$ ($d \notin z(R)$). Clearly, R is regular if and only if R is right (left) QR-ring and $y(R) = 0$ ($z(R) = 0$) ,[7].

Examples: 1) Let Z_4 be a ring of integers modulo 4. Then Z_4 is QR but not DR.

2) Let Z_5 be a ring of integers modulo 5. Then Z_5 is DR and QR. Now, we give some properties right QR -rings

Proposition 2.1**:** Let R be a ring without zero divisors. Then R is DR ring if and only if R is QR – ring.

Proof: Let a be a non-zero divisor of R. Then $r(d)=0$ and $d \notin y(R)$. Since R is QR - ring, then there exists $b \in R$ such that $d = dbd$, this implies $(1-bd) \in r(d)=0$. Hence $bd=1$. Similarly, we can show that $db=1$. Therefore d is invertible, hence it follows that R is a DR. Conversely: It is clear.

Corollary 2.2: If R is commutative and without zero divisors, then R is a field if and only if R is QR-ring.

Proof: Since R is the field, then R is DR and by (Proposition (2.1)) R is QR – ring.
Conversely: It is clear.
A ring R is called a right (left) MP- ring, if every maximal right (left) ideal is a left (right) pure [3]. A ring R is called ZC if $d'b = 0$ implies $bd' = 0$ for all $d', b \in R$. R is said to be a reduced ring if, R has no non-zero nilpotent element [1].

Lemma 2.3: Let R be a right MP- ring. Then $Y'(R) = 0$ [3].From Lemma 2.3 we get the following results:

Theorem 2.4: Let R be a right MP and QR-ring. Then J(R) =0.

Proof: Let $d' \in J(R)$. Since R is QR-ring, then there exists $b \in R$ such that $d' = d'bd'$ ($Y'(R) = 0$, Lemma 2.3). Since $d' \in J(R)$, then 1- $d'b$ is an invertible and hence (1- $d'b$) $\mu = 1$, $\mu \in R$. Consequently $d' = d'(1- d'b)\mu = 0$. Thus J(R) =0.

Proposition 2.5**:** Let R be the right MP and ZC ring. Then R is right QR –ring.

Proof: suppose that R is QR - ring, then there exist $d' \notin Y'(R)$ such that $dR + r(d') \neq R$, ($Y'(R) = 0$ Lemma (2.3)). Let M be any maximal right ideal containing $dR + r(d')$. Now since $d' \in M$ and R is MP-ring, then M is a left pure and $d' = bd'$ for some $b \in M$, $(1-b) \in \ell(d') = r(d) \subseteq M$ (R is ZC). Yielding $1 \in M$, which is a contradiction. Therefore $R = dR + r(d)$. Hence $d' = dbd'$ and consequently R is QR – ring.

3- Right JCPI Rings

A right R - modules M is JCPI if, for each $d' \notin Y'(R)$, every right R -homomorphism from $d'R$ to M can be extended to one of R into M.If R_R is JCPI, we call R is a right JCPI-ring[7]. Right ́P-injective rings are right JCPI,[7]. A ring R is said to be left (right) uniform if and only if every non-zero left (right) ideal is essential [3]. A ring R is abelian if every idempotent element is central.

Proposition 3.1: Let R be a right uniform QR -ring and $\ell(d) \subseteq r(d)$, for every $d' \in R$. Then R either a DR or a local ring and $Y'(R) = J(R)$.

Proof : If $Y'(R) = 0$, for all $0 \neq d' \in R$, hence $r(d) = 0$. Therefore by Proposition (2.1) R is DR. Now suppose that $Y'(R) \neq 0$, then for any $d' \notin Y(R)$, $r(d')$ cannot be essential. If $r(d') \neq 0$, there exist $0 \neq x \in r(d)$ and $d'x = 0$, and $r(d')$ is essential, a contradiction. Therefore $r(d') = 0$, which implies a left invertible by (Proposition (2.1))**.** Therefore every proper (maximal) left ideal is contained in $Y'(R)$ hence $J(R) \subseteq Y'(R)$. Since every QR - the ring is JCPI –ring, then $Y(R) \subseteq J(R)$ [7, Theorem 2.5]. So $Y'(R) = J(R)$ is the unique maximal left ideal, thus R is the local ring.

Proposition 3.2: Let R be an abelian ring and $r(d') = 0$, for $d' \in R$ with every principal ideal is JCPI, then R is reduced.

Proof: Let $d' \in R$ such that $d'^2 = 0$. Since $r(d) = 0$, then $d' \notin Y'(R)$. Define f: $d'R \to d'R$, by $f(d'r) = d'r$, for any $r \in R$. Since $d'R$ is JCPI, then there exists $b \in R$ such that $f(d'r) = d'bd'r$, thus $d' = d'bd'$. If we set $e = d'b$, then $d' = ed' = d'e$ (R is an abelian). So $d' = d'(d'b) = d'^2b = 0$. Hence, R is reduced.

Corollary 3.3**:** Let ℜ be an abelian and ɤ(ɗ)=0, for ɗ∈ ℜ, with every principal ideal is JCPI. Then ɣ(ℜ) =ʒ(ℜ) =0.

Theorem 3.4: If ℜ is a ring without zero divisors, ℜ/ɗℜ is JCPI and ɗℜ= ℜɗ, then ℜ is a Dℜ.

Proof: Let 0 ≠ ɗ ∈ ℜ be a non-zero divisor, then ɤ(ɗ) =0 and ɗ ∉ ɣ(ℜ), there exists any right ℜ -homomorphism of ɗℜ into ℜ/ɗℜ extended to one of ℜ into ℜ/ɗℜ. Define f: ɗℜ → ℜ/ɗℜ by f(ɗɤ)= ɤ + ɗℜ for all ɤ ∈ ℜ. So f is well defined, indeed if ɗɤ1=ɗɤ2, then ɗ(ɤ1-ɤ2) =0, (ɤ1–ɤ2) ∈ ɤ(ɗ)=0, hence f(ɗɤ1)=f(ɗɤ2). Now, since ℜ/ɗℜ is JCPI, then f(ɗɤ)= (c+ɗℜ)ɗɤ = cɗɤ +ɗℜ , for some c ∈ ℜ , In particular f(ɗ) =1+ ɗℜ =cɗ+ ɗℜ . Thus 1-cɗ∈ ɗℜ = ℜɗ implies 1 ∈ ɗℜ, and hence ɗℜ = ℜ, thus ɗƀ = 1 for some ƀ ∈ ℜ. Therefore, ℜ is Dℜ.

Following [4], a right module ɱ is called right an almost WJCPI, if, for any ɗ∉ ɣ(ℜ), there exists an S- sub module ɤɗ of ɱ such that $l_{ɱ}r_{ℜ}(ɗ)=ɱ_{ɗ}\oplus ɤ_{ɗ}$ as left S-sub module (S=End (ɱℜ)). If ℜ is almost WJCPI, then we call $ℜ_{ℜ}$ a right almost WJCPI rings.

Lemma 3.5 [6]: If ℜ is semisimple and quasi duo rings, then ℜ is reduced.

Theorem 3.6: Let ℜ be a semisimple quasi duo. Then the following conditions are equivalent:
1- ℜ is strongly regular.
2- ℜ is regular.
3- ℜ is Qℜ.
4- Every right ℜ -module is JCPI.
5- Every simple ℜ -module is JCPI.
6- Every simple singular right ℜ -module is JCPI.
7- Every simple singular right ℜ -module is almost WJCPI.

Proof: 1→ 2→ 3 → 4 → 5 → 6 →7 are trivial
6 → 1: For any 0 ≠ ɗ∈ ℜ. If ɗℜ +ɤ(ɗ) ≠ ℜ, then there exists a maximal right ideal ɱ of ℜ containing ɗℜ + ɤ(ɗ). If ɱ is not essential in ℜ , then ɱ = ɤ(e) , e^2 = e ∈ ℜ . Therefore eɗ=0, since ℜ is an abelian and ɗe =0. Hence e ∈ ɤ(ɗ) ⊆ ɱ = ɤ(e), which is a contradiction. So ɱ is essential in ℜ, By hypothesis, ℜ /ɱ is JCPI, since ɣ(ℜ) = 0 (Lemma 3.5), hence for any right ℜ - homomorphism ɗℜ → ℜ/ɱ can be extended to ℜ → ℜ/ɱ, defined by f(ɗɤ) = ɤ + ɱ, ɤ ∈ ℜ. Since ℜ is reduced, then f is a well-defined right ℜ-homomorphism. Hence, there exists c ∈ ℜ such that 1+ ɱ = f(ɗ) = cɗ+ ɱ , So 1-cɗ∈ ɱ , 1∈ ɱ, because ℜ is quasi duo. This is a contradiction. Hence ɗℜ +ɤ(ɗ)= ℜ, and then ℜ is strongly regular.
7 → 1: Let 0≠ ɗ∈ ℜ and ɗ∉ ɣ(ℜ) (ℜ is reduced). If ƀ ℜ ⊕ ɤ(ƀ) ≠ ℜ. Then ƀℜ ⊕ ɤ(ƀ) ⊆ N for some maximal right ideal of ℜ. Similarly to prove of [4, Theorem 3.11] we get ℜ is a strongly regular ring.

E-mail: rasheed.mohammed40@yahoo.com

Abstract. Image analysis took wide areas in many fields, including medicine, physics, and other areas where you need a tool to deal with it smoothly and softly without losing the original image information. Using an image of a sample of a physical atom that was analyzed and highlighting the compression and raising the noise, histogram and statistics the image statistics where the best results were recorded when using a specific threshold i.e. when pressing the methods were used the first has the threshold methods is Balance sparsity-norm, Remove near 0 and Bal-sparsity-norm(sqrt). As for the methods of raising the noise are fixed form thresholding method with soft threshold, penalize high with hard threshold, penalize medium with hard threshold, penalize low with hard threshold, Bal sparsity norm (sqrt) with soft threshold, where image parameters were divided into approximation coefficients and details coefficients. Through the analysis, a suitable threshold value was obtained, which helps to restore energy that leads to the fact that the compressed necessity did not lose much of its original information, which proves the new wavelets in the field of physical and medical imaging.

1. Introduction

Image compression helped to avoid the problem of the large size that the image needs in storage and transportation as it is one of the techniques that achieve reducing the space that the image needs for storage and transportation when analyzing the image and is considered one of the applications that are obtained by using wavelets [1-3]. Other techniques are to raise the noise, image statistics and histogram that are recognized through the use of wavelets after the effect of the wavelets used, where the image is analyzed into coefficients of the approximation and details, and the latter is divided into vertical, diagonal and horizontal [4-7]. Many of the works included types of standard wavelengths that were used in the field of image analysis, where these wavelets bear the characteristic of orthogonally and their affiliation to the fields of linear and non-linear approximation of these common wavelets families are Symlets (Level 2), coiflets (constitute a family of wavelets with an unusual property-Level 2), Daubecheis (Level 2) and Haar [8-10]. Multi Resolution Analyze (MRA) that achieves the wavelets feature of the ability to analyze the wavelets of images, which is the analysis of wavelets into two fields, is the field scaling function and wavelet function, the field to which the wavelet belongs [11-12]. Wavelets that are constructed from the mother wavelet were used, which we obtain expansion and contraction with the help of coefficients s and r such as first, second, third and fourth Chebyshev wavelets, Legendre wavelet Hermite wavelet and Laguerre wavelets [13-22]. Through which the best results were obtained to reach the optimal solution to solve many numerical problems such as variational problems, optimal problems, integral equations Fredholm and voltera and integro differential equations.

In this work, a kind of these wavelengths Second Chebyshev Wavelet Transform (SCWT) have used in the field of image analysis after demonstrating several theories that qualify them to perform this function and a technique has obtained Multi Resolution Analyze (MRA) that obtained wavelet analysis to approximation factors and details. The new wavelet has used to analyze the image that belongs to a sample of a physical atom [23-32], where image statistics have obtained and noise has removed from them using methods the first has the threshold methods are Balance sparsity-norm, Remove near 0 and Bal-sparsity-norm(sqrt) in compression image and in de noising image used methods are soft threshold, penalize high with hard threshold, penalize medium with hard threshold, penalize low with hard threshold, Bal sparsity norm(sqrt) with soft threshold, and get the best results, which shows that the Tables (1-5). The objective of the present work is new wavelets were used for the first time that was used in other works to solve problems numerically. However, in this work they have used to analyze the image as it performed its job in the best image by the filter produced from it before that many new theories have demonstrated to prove its readiness in the field of images. One of these theorems is to prove the affiliation of the new wavelets to the fields of linear and non-linear approximation because of the property that the new wavelets possess, which is the property of orthogonality and their contain Scaling function and the realization of Multi Resolution Analyze (MRA) that achieves the wavelets feature of the ability to analyse the wavelets of images.

2. Suggested Wavelet Conversions

In this section, wavelets that have been used in previous works are chosen for many numerical solutions and to reach the optimum solution or the exact solution compared to other wavelets that have been compared with them where the best is reached. These wavelets will be built on the mother waves in the Eq. 1

$$\Psi_{s,r}(x) = |s|^{\frac{-1}{2}}\Psi\left(\frac{x-r}{s}\right)\ s, r \in R,\ \ s \neq 0 \qquad (1)$$

where: $\psi(t) = [\psi_0(t), \psi_1(t), \ldots, \psi_{M-1}]^T$

The elements $\psi_0(t), \psi_1(t), \ldots, \psi_{M-1}(t)$ are the basis functions, orthogonal on the [0,1].

If you don't wish to use the Word template provided, please set the margins of your Word document as follows.

2.1. Second Kind of Chebysheve Wavelet Transform (SCWT)

These wavelets are Second Kind of Chebysheve Wavelet Transform (SCWT) [33-34], which have proven in many actions in the foreground between the sons of their generation from the first, third and fourth wavelets of the worms of Chebysheve, by comparing the results when solving many numerical problems. For example, covariance issues Discrete Second Kind of Chebysheve Wavelet Transform (SCWT), denoted by (t) $D_{s,r}(t) = D(t, s, r, n)$, the parameters s, r transformed to discrete wavelet by used $x = 2^{-(n-1)}(2^n t),\ d = 2^{-(n-1)}(2s-1),\ c = 2^{-(n-1)}$ by substituting these parameters in Eq. 1 that have obtained Discrete Second Chebysheve Wavelet Transformations (DSCWT) as shown in Eq. 2,

$$D_{s,r}(t) = \begin{cases} 2^{\frac{n}{2}}\widetilde{D}_r(2^n t - 2s + 1) & t \in \left[\frac{s-1}{2^{n-1}}, \frac{s}{2^{n-1}}\right) \\ 0 & \text{otherwise} \end{cases} \qquad (2)$$

where: $\widetilde{D}_r(t) = \sqrt{\frac{2}{\pi}}D_r(t)$ $r = 0,1,2,\ldots,M-1$ for $k = 2$ with weight function $w_r(2^n t - 2s + 1) = \sqrt{(1-(2^n t - 2s + 1)^2)}$ on the interval $[-1, 1]$, satisfied the recursive formula

$$D_0 = 1, \qquad D_1 = 2t,\ \ D_{r+1}(t) = 2tD_r(t) - D_{r-1}(t),\ \ r = 1,2,\ldots,M-1$$

$$D_{1,0} = \frac{2\sqrt{2}}{\sqrt{\pi}}$$

$$D_{1,1} = \frac{2\sqrt{2}}{\sqrt{\pi}}(8t-2)$$
$$D_{1,2} = \frac{2\sqrt{2}}{\sqrt{\pi}}(64t^2-32t+3)$$
$$D_{1,3} = \frac{2\sqrt{2}}{\sqrt{\pi}}(512t^3-384t^2+80t-4), \text{ where: } 0 \le t < \frac{1}{2}$$
$$D_{2,0} = \frac{2\sqrt{2}}{\sqrt{\pi}}$$
$$D_{2,1} = \frac{2\sqrt{2}}{\sqrt{\pi}}(8t-6)$$
$$D_{2,2} = \frac{2\sqrt{2}}{\sqrt{\pi}}(64t^2-96t+35)$$
$$D_{2,3} = \frac{2\sqrt{2}}{\sqrt{\pi}}(512t^3-1152t^2+848t-204), \text{ where: } \frac{1}{2} \le t < 1$$

With respect to SKCWT the same above have get with the coefficients the function approximation

$$X(t) \cong X_{2^{n-1},M-1} = \sum_{s=1}^{2^{n-1}} \sum_{r=0}^{M-1} X_{s,r} D_{s,r}(t) = X^T D_{s,r}(t) \quad (3)$$

where: $C, D_{s,r}$ are $2^{n-1}M \times 1$ matrices

$$D = \left[D_{1,0}, D_{1,1}, \dots, D_{1,M-1}, D_{2,0}, \dots, D_{2^n,M-1}, \dots D_{2^n,0}, \dots D_{2^n,M-1}\right]^T$$

and

$$X = \left[X_{10}, X_{11}, \dots, X_{1(M-1)}, X_{20}, \dots, X_{2(M-1)}, \dots, X_{2^n}, \dots, X_{2^nM-1}\right]^T$$

2.2. Properties of SCWT and It's Scaling Function

Theories that will be demonstrated adapt the smoothness of the proposed waves in many new uses, for example image processing, such as medical and physical images [35-43], etc. These theories are the most important mathematical aspects in the field of wavelets

Definition 2.1

For every pair of $s, r \in Z$, define the period $I_{s,r}$ by $I_{s,r} = [2^{-s}r, 2^{-s}(r+1)]$ which is familiar as dyadic period. The group of all such period is called dyadic sub periods of R.

The collection of functions

$$\{\alpha_{s,r}(t)\}_{s,r\in Z} = \frac{1}{2^s}\alpha(2^{-s}-r) \forall s, r \in Z \quad (4)$$

Definition 2.2

(SCWT scaling function): Eq. 4 is called the scaling function of Second Kind of Chebysheve Wavelet Transform (SCWT), it defines

$$\alpha(t) = \begin{cases} 2\sqrt{2} & \text{if } 0 \le t \le 1 \\ 0 & \text{otherwise} \end{cases} \quad (5)$$

The system of Second Kind of Chebysheve Wavelet Transform (SCWT), $\forall s, r \in Z$ define

$$\{D_{s,r}(t)\}_{s,r\in Z} = \frac{1}{2^s}\alpha(2^{-s}-r) \forall s, r \in Z \quad (6)$$

Let $f(t)$ is defined on $L^2[0,1]$ has an expansion in terms of Second Kind of Chebysheve functions as follows.

$$f(t) = \sum_{s=S}^{2^s} < f, \alpha_{S,r} > \omega_{S,r}(t) + \sum_{s=S}^{\infty} \sum_{r=0}^{2^s} < f, D_{s,r} > D_{S,r}(t)$$
$$= \sum_{s=S}^{2^s} a_{s,r}\, \omega_{S,r}(t) + \sum_{s=S}^{\infty} \sum_{r=0}^{s-1} d_{s,r}\, D_{S,r}(t) \quad (7)$$

$d_{s,r}$ is the details of coefficients and $a_{s,r}$ is the approximate coefficients.

2.3. Multi Resolution Analyses (MRA) With Wavelet

The main coefficients of wavelet DSCWT through a system MRA L^2 (R):

$$f = \sum\sum X_{s,r} D_{s,r} \quad (8)$$

$$f \in V_s = \{f(t) | f(t) = \frac{1}{2^{s/2}} h(2^{-s}t),\ h(t) \in V_0\},$$

$$f(t) = \sum_{s\in z} < f, \alpha(r) > \alpha(r)$$

Then a MRA of DSCWT on R is a sequence of subspaces $\{V_s\}$ $s \in Z$ of functions L^2 on R, First and foremost, in order for the new wavelets to be ready for the applications that can take place in the next sections, the following characteristics must be found.

For $\forall\, s, r \in Z, V_s \subseteq V_{s+1}$.

If f(t) is R, then $f(t) \in \text{span}\{V_s\} s \in Z$, with $\epsilon > 0$, there is an $s \in Z$ and a function $g(t) \in V_s$ such that $\|f - g\|_2 < \epsilon$.

$$\cap_{s\in Z}\ V_s = \{0\}.$$

A function $f(t) \in V_0 \leftrightarrow 2^{-s/2} f(2^{-s}t) \in V_s$.

There exists a function $\alpha(t), L^2$ on R, called the scaling function such that the collection $\alpha(t - s)$ is an orthonormal system of translates and $V_0 = \text{span}\{\alpha(t - s)\}$.

Definition 2.3

Let $\{V_S\}$ be an MRA) with scaling function $\alpha(t)$ which satisfies (9) and $h(r)$ in this definition are considered calibration colander, where

$$D_{s,r}(t) = \frac{1}{2^s} D(2^{-s}t - r) \quad (9)$$

$$h(r) = < \frac{1}{\sqrt{\pi}} \alpha\left(\frac{t}{2}\right), \alpha(t - r) > \quad (10)$$

$\alpha(r)$Is the function that has called scaling wavelet

$$g(t) = (-1)^r h(1 - r) \quad (11)$$

DSCWT is defined

$$D(x) = \sum_{t\in Z} g(r) \frac{1}{\sqrt{\pi}} \alpha(\frac{t}{2} - r) \quad (12)$$

Then $\{D_{s,r}(t)\} s, r \in Z$ is a Chebysheve wavelet orthonormal standard on R.

Definition 2.4

Obtaining the Eq. 13 representing orthogonal projection if the function f is arbitrary

$$P_s f = \sum_{s\in Z} < f, \alpha_{s,r} > \alpha_{s,r} \quad (13)$$

$f \in L^2$ when it on to V_s

3. Suggested Wavelet Conversions With Approximation Spaces [44-55]

In this section, many theories that demonstrate the affiliation of wavelets proposed in this paper have demonstrated approximation spaces.

3.1. Approximation in Space of Square Integrable Functions over R

Let $f \in L_2(R)$ is continuous then the bases of SCWT be a series

$$f = \sum_{s=0}^{\infty} \sum_{r=0}^{R-1} < f, D_{s,r} > D_{s,r}(t) \quad (14)$$

$D_{s,r}$ be in the interval $I_{s,r} = \left[\frac{r}{2^{-s}}, \frac{(r+1)}{2^{-s}}\right]$,

$$< f, D_{s,r} > = \int f(t) D_{s,r}(t) dt = 2^{s/2} \int_{r2^s}^{(r+1)2^s} f(t) D(2^s t - r) dt. \quad (15)$$

Let $S=2^T$ is the coefficients if $T \in S$ has account in finite sum s= 0, 1, 2,…, $2^T - 1 = S$, then $\sum_{s=0}^{T-1} \sum_{r=0}^{S-1} 1 + 2 + 2^2 + \cdots + 2^T - 1 = S - 1$ coefficients of in SCWT that for each s only one of the non-zero coefficients is its size$2^{-s/2}$.

E is the approximate error in $L_2(R)$, which has determined from the Eq. 16

$$\left\| f - \sum_{s=0}^{T-1}\sum_{r=0}^{R-1} < f, D_{s,r} > D_{s,r}(t) \right\|_{L_2}^2 = \left\| \sum_{s=T}^{\infty}\sum_{r=0}^{S-1} < f, D_{s,r} > D_{s,r}(t) \right\|_{L_2}^2$$
$$= \sum_{s=T}^{\infty}\sum_{r=0}^{R-1} \left| < f, D_{s,r} > \right|^2 = \sum_{s=T}^{\infty} 2^{-s} = 2^{-T} = \frac{1}{S} = \sigma(2^{-s}) \quad (16)$$

Not: σ is any approximation result.

Theorem 3.1 (Approximation in $L_P(R)$)

Let $L_P(R)$ be a partial sum of SCWT and $f \in L_P(R)$ then

$$K = \sum_{s=0}^{T-1}\sum_{r=0}^{S-1} < f, D_{s,r} > D_{s,r}(t) \rightarrow E_{app} = \sigma(2^{-s/2})$$

Proof

E_{app} is a determine the approximate error in $L_P(R)$

$$E_{app} = \|f - K\|_{L_P} = \left\| f - \sum_{s=0}^{T-1}\sum_{r=0}^{S-1} < f, D_{s,r} > D_{s,r}(t) \right\|_{L_P}$$
$$= \left\| \sum_{s=I}^{\infty}\sum_{r=0}^{S-1} < f, D_{s,r} > D_{s,r}(t) \right\|_{L_P} = \left(\sum_{s=I}^{\infty}\sum_{r=0}^{S-1} \left| < f, D_{s,r} > \right|^P \right)^{1/P}$$
$$= \left(\sum_{s=T}^{\infty} 2^{-TP/2} \right)^{1/P} = 2^{-T/2} = \sigma 2^{-T/2}$$

Theorem 3.2 (Approximation in iPM L (□,P))

Let P is a constant $1 < P \leq \infty$, $M > 0$ and if $f \in L_{iPM}(\mu, P)$ then SCWT and T⊆S then

$$K(t) = \sum_{s=0}^{T-1}\sum_{r=0}^{S-1} < f, D_{s,r} > D_{s,r}(t) \rightarrow E_{app} = \sigma(2^{-T\mu})$$

Theorem 3.3 (Approximation in Besov Space B (L (R))

In SCWT $K(t) = \sum_{s=0}^{T-1}\sum_{r=0}^{S-1} < f, D_{s,r} > D_{s,r}(t)$ $f \in F^s(R)$ then $\exists: T \in S \rightarrow E_{app} = \sigma(2^{-TS/2})$ where $S = 2^T$ and E_{app}:- is the approximate error of in $F^s L_2(R)$

Proof

$$E_{app} = \|f - K\|_{L_2} = \left\| f - \sum_{s=0}^{T-1}\sum_{r=0}^{S-1} < f, D_{s,r} > D_{s,r}(t) \right\|_{L_2} \leq \left(\sum_{s=T}^{\infty}\sum_{r=0}^{S-1} \left| < f, D_{s,r} > \right|^2 \right)^{1/2} \leq$$
$$\left(\sum_{s=T}^{\infty}\sum_{r=0}^{S-1} \frac{2^r}{2^S} \left| < f, D_{s,r} > \right|^2 \right)^{1/2} \left(2^{-S} \sum_{s=T}^{\infty}\sum_{r=0}^{S-1} 2^r \left| < f, D_{s,r} > \right|^2 \right)^{1/2}$$ from spaces's properties
$$\|f\|_{F^s}\left(L_2(R)\right) \cong \left(\left(\sum_{s=T}^{\infty}\sum_{r=0}^{S-1} 2^{Sr} \left| < f, D_{s,r} > \right|^2 \right)^{1/2} \right) \text{ then } E_{app} \leq 2^{-S/2} \|f\|_{F^s}\left(L_2(R)\right) = \sigma 2^{-S/2}$$

4. Nonlinear Approximation in L(R)

Theorem 4.1

If the partial sum of SCWT with f and let $f \in L_P(R)$

$$K = \sum_{s=0}^{T-1}\sum_{r=0}^{S-1} < f, D_{s,r} > D_{s,r}(t),\ s \in Z \rightarrow E_{app} = \sigma(2^{-s/2})$$

Proof

$$E_{app} \|f - K\|_{L_P} = \left\| f - \sum_{s=0}^{T-1}\sum_{r=0}^{S-1} < f, D_{s,r} > D_{s,r}(t) \right\|_{L_P}$$
$$= \left\| \sum_{s=T+1}^{\infty}\sum_{r=0}^{S-1} < f, D_{s,r} > D_{s,r}(t) \right\|_{L_P} = \left(\sum_{s=T+1}^{\infty}\sum_{r=0}^{S-1} \left| < f, D_{s,r} > \right|^P \right)^{1/P}$$
$$= \left(\sum_{s=T+1}^{\infty} 2^{-TP/2} \right)^{1/P} = 2^{-T/2} = \sigma 2^{-T/2}.$$

5. New Filter of SCWT

The filter is constructed for the proposed wavelets starting from scaling function for SCWT according to the Eq. 5 with the wavelength function at zero. The following two basic atoms of wavelets called the laguerre wavelet.

$$D_{s,r}(t) = 2^{\frac{n}{2}} D(2^n t - 2s + 1) \qquad \text{for } (s,r) \in Z^2 \tag{17}$$

$$\alpha_{s,r}(t) = 2^{\frac{n}{2}} \alpha(2^n t - 2s + 1) \qquad \text{for } (s,r) \in Z^2 \tag{18}$$

Eq. 17 is the wavelet equation and Eq. 18 is the scaling equation.

5.1. The Coefficients of SCWT

In this section, the proposed wavelet coefficients are created. The wavelet coefficients of a signal S, in Eqns. 19 and 20 the wavelet coefficients and scaling coefficients

$$\delta_{s,r} = \int S(t) D_{s,r}(t) dt \qquad \text{in R} \tag{19}$$

$$\varphi_{s,r} = \int S(t) \alpha_{s,r}(t) dt \qquad \text{in R} \tag{20}$$

When using the parameters, the signal is rebuilt

$$S(t) = \sum_{s\in Z} \sum_{r\in Z} \delta_{s,r} D_{s,r}(t) \tag{21}$$

From MRA the space of scaling function V_0

$V_0 = \{f \in L^2(R) | f(t) = \varphi_{0,r} \alpha(2^n t - 2n + 1) \in l^2(Z)\}$ is span $V_1, V_2, \dots., V_s = V_{s+1} + W_{s+1}$

W_s the space of wavelet function

Wavelet coefficients, when analyzed, have divided into approximate coefficients and details coefficients of SCWT and scaling function of SCWT Eqns. 22 and 23 show these coefficients from Eq. 20 to obtain Eq. 22

$$a_s(t) = \sum_{r\in Z} \varphi_{s,r} \alpha_{s,r}(t) \text{ (Approximate coefficients)} \tag{22}$$

$$d_s(t) = \sum_{r\in Z} \delta_{s,r} D_{s,r}(t) \quad \text{(Details coefficients)} \tag{23}$$

In level s, then the coefficients whine $s = 0$ is $\{\varphi_{0,r}\}$

5.2. Decision Tree of SCWT

The signal S found is from level 0 to $a_0 = S$, in level 1 $d_1 = a_0 - a_1$ then $S = d_1 + a_1$ and in level 2

$$\begin{aligned} d_2 &= a_1 - a_2 \\ &= S - d_1 - a_2 \\ &= d_2 + d_1 + a_2 \end{aligned}$$

From Eq. 3; if $f_{s,r} = S$

$$S = \sum_{s=1}^{2^{n-1}} \sum_{r=0}^{M-1} \delta_{s,r} D_{s,r}(t) = \delta^T D_{s,r}(t) \tag{24}$$

$$\text{In general} \qquad S = a_N + \sum_{s\le N} d_s \tag{25}$$

and $a_{N-1} = a_N + d_N$

5.3. Formation Packets of SCWT

By Multi Resolution Analysis with the equation if $e_r, f_r \in l^2$

$$\frac{1}{2}\alpha\frac{1}{2} = \sum_{r\in Z} e_r \alpha(t - r) \in L^2 \tag{26}$$

$D_{0,r} = D(t - r)$ $D \in W_0$ such that

$$\frac{1}{2}D\frac{1}{2} = \sum_{s\in Z} f_r \alpha(t - r) \in L^2 \tag{27}$$

In the norm space the interval $[0,1) \rightarrow \{D_{s,r}\}_{s,r\in Z} \subseteq L^2$

The following Algorithm stages explain the construction Packets steps

Algorithm 5.1: construction Packets of SCWT

Step 1: Start with the candidates $u_{r,} v_r$ the orthogonal of SCWT and scaling function of SCWT with MRA of $L^2(R)$ has been the basis of sequences $\{e_r\}_{r\in Z}$ and $\{f_r\}_{r\in Z}$ in l^2

Step 2: The sequence of functions $(D_s)_{s\in Z}$ $(L_n)_{n\in N}$ the $D_0 = \alpha$ the scaling function

$$\begin{cases} D_{2r}(t) = \frac{2\sqrt{2}}{\sqrt{\pi}} \sum_{r=0} v_r D_r(2t-s) \\ D_{2r+1=} \frac{2\sqrt{2}}{\sqrt{\pi}} \sum_{r=0} u_r D_r(2t-s) \end{cases} \quad (28)$$

$$r = 0 \rightarrow v_0 = v_1 = \frac{2\sqrt{2}}{\sqrt{\pi}}, u_0 = -u_1 = \frac{-2\sqrt{2}}{\sqrt{\pi}} \quad (29)$$

Step 3: The wavelet SCWT in [0,1) in $r = 1$ and scaling function in $r = 0$

$$D_{2r}(t) = D_r(2t) + D_r(2t-1) \quad (30)$$

$$D_{2r+1}(t) = D_r(2t) - D_r(2t-1) \quad (31)$$

Step 4: Two copies of D_r in [0, 0.5) for $D_r(2t)$ obtain D_{2r} and in [0.5, 1) obtain D_{2r+1} from $D_r(2t-1)$.

Step 5: The result of smoothed relation for regular function in the interval $[0, 2M-1]$

$$D_r(2^k t - 2s + 1)$$

Let the (j, k) is the SCWT packet $j = 0,1,2,3, \ldots . \quad j \in Z \ , k = 0,1, \ldots, 2^j - 1$

$j = 0, \ \alpha_{0,0}(t) = \frac{\sqrt{2}}{\sqrt{\pi}} D_0(t) = 1$ and $j = 1, \ D_{1,0}(t) = \frac{\sqrt{2}}{\sqrt{\pi}} D_0(t) = \frac{2\sqrt{2}}{\sqrt{\pi}}, D_{1,1} = \frac{\sqrt{2}}{\sqrt{\pi}} D_1(2t-1) = \frac{\sqrt{2}}{\sqrt{\pi}}[1 - (2t-1)] \quad j = 2, \ D_{2,0} = \alpha_{0,0}(t) = D_{1,0}(t) = \frac{\sqrt{2}}{\sqrt{\pi}} D_0(t)$

The norm in this filter is $\frac{\sqrt{2}}{\sqrt{\pi}}$ will be obtained high filter and low filter then

High pass filter is $\frac{\sqrt{2}}{\sqrt{\pi}}$ $[2 \ -2]$ and low pass filter is $\frac{\sqrt{2}}{\sqrt{\pi}}$ $[2 \quad 2]$ this filter will be used in the image analyses after add this filter in MATLAB.

W divided into low pass filter will symbolize the filter L_0_D and high pass filter H_0_D they are used in decomposition step and reconstructed with invers SCWT filter denoted by R they are L_i_R and H_i_R with SCWT the figure displays that

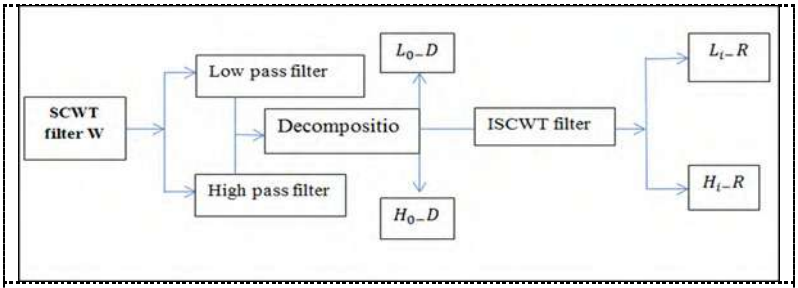

Figure 1. The four filters in second Chebyshev Wavelet Transform.

6. Applied SCWT With Image Processing

In this section, various applications in image processing such as compression and noise removal will be identified.

6.1. SCWT filter effect on analytic of image

In this section, the proposed wavelets are affected by the color image analysis. Where a physical image 256×256 was used for a specific atom, the color image is converted into a gray image. The image is divided into approximation coefficients, and the detail coefficients by which it is divided into three vertical, horizontal, and diagonal sections, so the image is divided into four blocks each Block size (16×16), Figure 2 shows the effect of SCWT filter on the proposed image, which is the physical image [37].

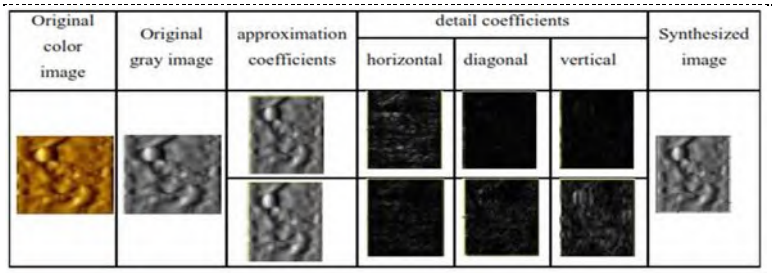

Figure 2. The effect of wavelets SCWT on the physical image.

6.2. The most Important Operations on the Physical Images

After analyzing the image using SCWT, the new wavelet faces four important operations, statistics, histograms, compress and de-noise. Figure 3 shows the statistics operation of image physical using SCWT in level 2 and the norm in statistics in level 1 is $8.91e^{+0.8}$ and in level 2 $3.22e^{+04}$ max norm 256.

6.2.1. The Statistics Image by SCWT

In this section, the effect of SCWT on the image will be displayed in terms of statistics with respect to the coefficients of approximation factors and details that are divided into vertical, horizontal and diagonal. Details are shown where the Figure 3 will display the original image with SCWT, Figure 4 shows how the effect Wavelets on approximation and rebuilding coefficients. As for the figure 5, it shows details of coefficients with rebuilding, showing the differences between them, Approximation Coefficients (AC), Approximation Reconstructed (AR), Details Horizontal Coefficients (DHC), Details Vertical Coefficients (DVC), Details Diagonal Coefficients (DDC), Details Horizontal Reconstructed (DHR), Details Vertical Reconstructed (DVR), Details Diagonal Reconstructed (DDR).

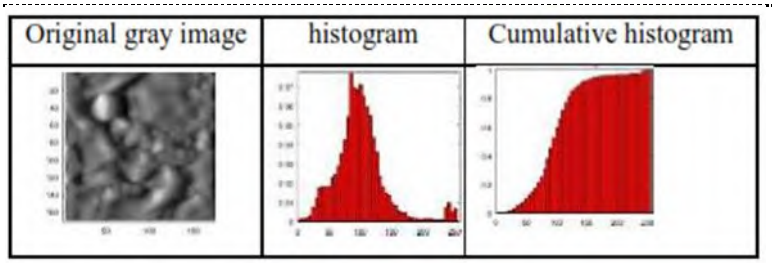

Figure 3. Original statistics image with SCWT.

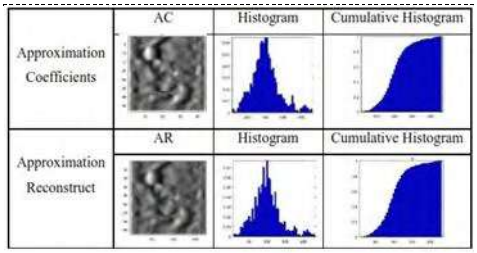

Figure 4. Approximation coefficients and reconstruct.

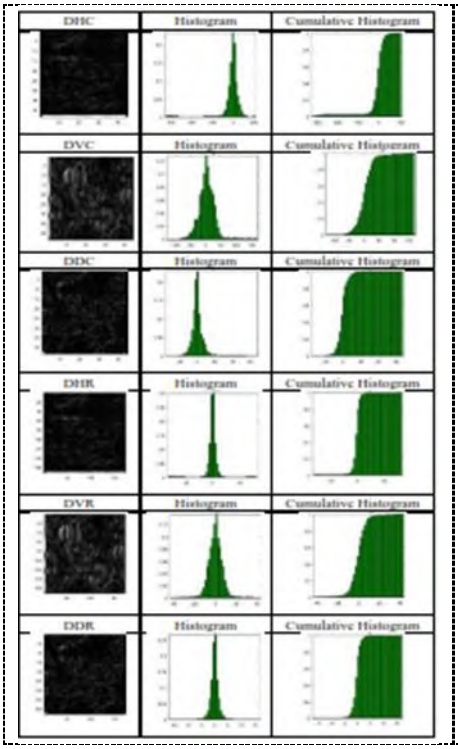

Figure 5. Details coefficients and reconstruct.

6.2.2. The histogram Image by SCWT

This section shows one of the effects of the new wavelet SCWT on the physical sample, where the signal represents and is equal to a_0 see section 5.2 the Figure 6 shows the approximation coefficients in level 1 and 2, and Figure 7 shows the details of coefficients horizontal, vertical and diagonal in level 1 and 2.

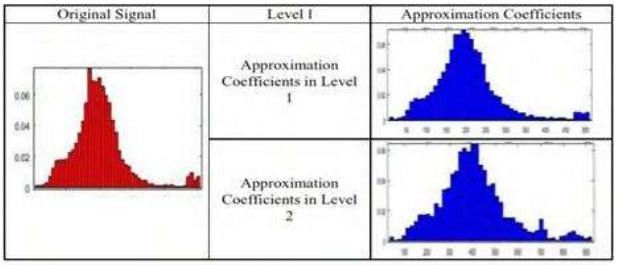

Figure 6. The approximation coefficients in level 1 and 2.

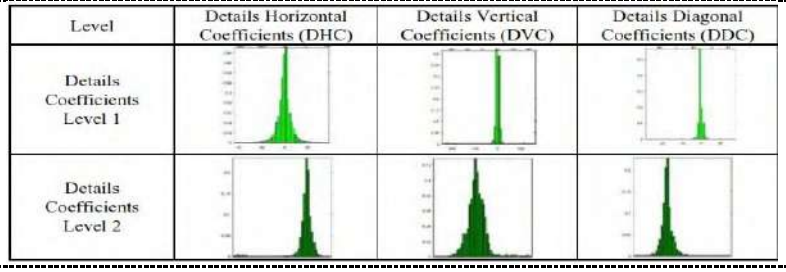

Figure 7. The details of coefficients horizontal, vertical and diagonal in level 1 and 2.

6.2.3. The Compression Image by SCWT

The appropriate technique for transferring image information without any losing of it's information. New waves will be used to compress the image. In Matlab program, the compression process is carried out using two methods, global thresholding and by level thresholding, the first has the threshold methods is Balance sparsity-norm, Remove near 0 and Bal-sparsity-norm (sqrt). Figure 8 represents the process of compression using the first method with SCWT, while Table 1 shows the results that were reached through the first method with the wavelets proposed. The second is with the methods of threshold scarce high, scarce medium, scarce low, balance sparsity-norm, remove near zero, and bal sparsity norm(sqrt), are shown in Figures 9 and 10. The results are identified from Table 2.

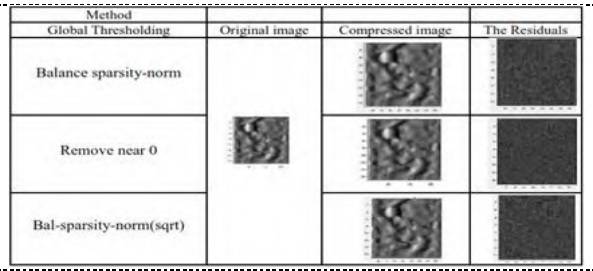

Figure 8. The compressed by global thresholding with SCWT.

Table 1. The results compressed of Global thresholding method with SCWT.

Global thresholding			
Balance spearsity-norm		Remove near zero	Bal- sparsety norm
Thresholding	6.76	6.76	5
Return energy (Information)	99.69%	99.69%	99.98
Number zero	73.38%	73.38%	65.42
L_2Norm	1.5	1.5	2.4
L_1Norm	681	681	104
Max norm	9	9	14

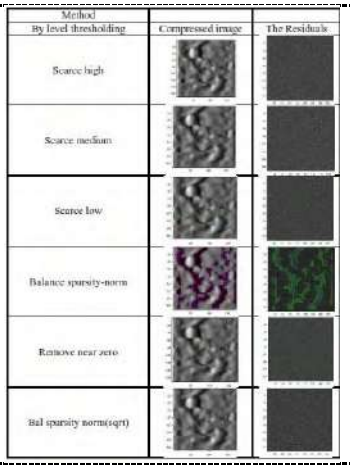

Figure 9. Details coefficients and reconstruct.

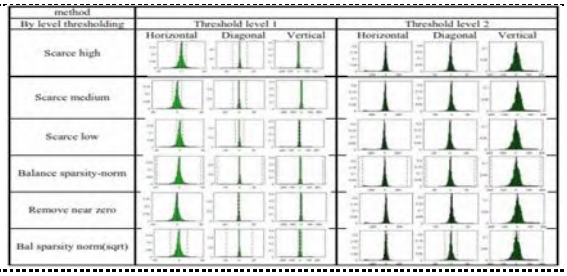

Figure 10. Threshold compressed by level method with SCWT.

Table 2. Results compressed by level thresholding with SCWT.

By level thresholding							
Thresholding method	Scarce high		Scarce medium	Scarce low	Balance sparsity-norm	Remove near zero	Bal sparsity norm(sqrt)
Thresholding	L_1	10.5	9	6	325.8	1.5	18.05
	L_2	0	0	0	47.3	1.5	18.05
Return energy (Information)		99.97%	99.99%	99.98%	99.92%	100%	96.21%
Number zero		20	22.74%	25.69%	30.85%	14.55%	35.70%
L_2Norm		575	$6.646e^{+04}$	504.5	$2.197e^{+05}$	40.14	$1.004e^{+06}$
L_1Norm		$1.273e^{+05}$	326.6	1.108	961.5	63.36	62.46
Max norm		9	5	8	17	1	100

6.2.4. De-Noising Image by SCWT

Adding new noise to the image or signal helps reduce and restore the noise of the color image or signal, the simple statistically significant relationship to noise reduction

Let F is the image to be de noised, the image to be restored, e is the noise and $\vartheta^2 I$ expressed in the following equation

$$F_{(r,s)} = l_{(s,r)} + e \qquad (32)$$

The removal of noise by wavelets consists of three stages

At the level in which the wavelets decompose the image from which the noise is to be removed.

In three directions the choice of threshold from the detail coefficients is with the absolute threshold dependent on ϑ.

This stage is to reconstruct the image after analysis and be dependent on the approximation coefficients.

The de noising image by SCWT selected thresholding method

1. Fixed form thresholding method with soft threshold.
2. Penalize high with hard threshold.
3. Penalize medium with hard threshold.
4. Penalize low with hard threshold.
5. Bal sparsity norm (sqrt) with soft threshold.

Select noise structure

1. Unscaled white noise
2. Scale white noise
3. Non scale white noise

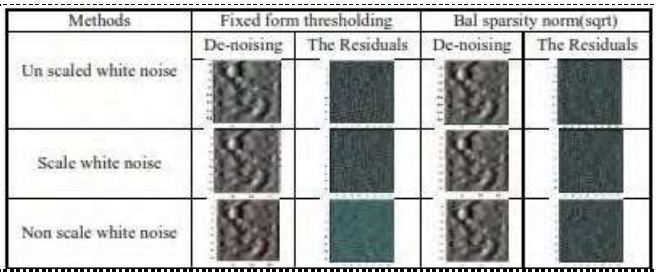

Figure 11. De-noising with soft threshold by SCWT.

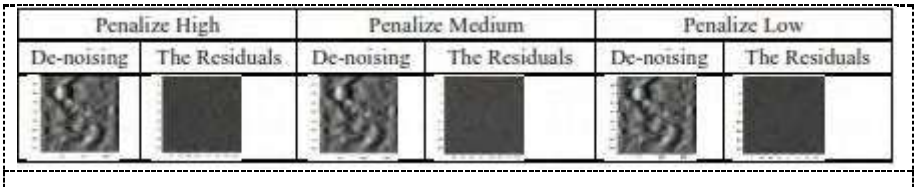

Figure 12. De-noising with hard threshold by SCWT.

Table 3. The results de noising soft threshold methods with SCWT.

	Fixed form Thresholding			Bal Sparsity Norm(sqrt)		
	Un scaled white noise	scale white noise	non scale white noise	Un scaled white noise	scale white noise	non scale white noise
Soft threshold	4.158	9.247	43.15	18.05	18.05	18.05
L^2norm	$1.431e^{+05}$	$2.791e^{+05}$	$7.668e^{+05}$	$4.522e^{+05}$	$4.522e^{+05}$	$4.522e^{+05}$
L^1norm	605.7	116.2	290.8	187.1	187.1	187.1
Max norm	6	12	21	4	23	23

Table 4. The results de noising soft threshold methods with SCWT

	Penalize High	Penalize Medium	Penalize Low
Hard threshold	8.5	4.75	4.25
L^2norm	$1.068e^{+05}$	$5.071e^{+04}$	$4.344e^{+04}$
L^1norm	488.4	265	238
Max norm	8	5	4

Table 5. Results of three different methods with the fixed form thresholding.

Method	Fixed Form Thresholding					
Hard thresold	Threshold level 1			Threshold level 2		
	Horizontal	Diagonal	Vertical	Horizontal	Diagonal	Vertical
Un Scaled white noise						
Scale white noise						

7. Discussion of The Results

In this work, unlike the usual work, a sample of a physical image of an atom was taken to shed the proposed wavelets and was used for the first time in a physical image analysis for analysis based on the wavelet image algorithm analysis, where the image was analyzed and its statistics, pressure, and the noise raising process have obtained. Good results were compared. The standard wavelets in the second level and the tables in the above sections indicate that and compared with the results obtained, they will be shown in the Table 4, where this table shows the efficiency of the new wavelets in this research.
The above table will be compared between one of the standard wavelets in level 8, (Symlet 2) has been compared with the new proposed wavelets. Compresses and compare the image with the results obtained by the method of Set Partitioning in Hierarchical Tree and relying on the measures obtained. Table 4 shows the compassion results of wavelets according to the following

1. Peak signal to noise ratio (PSNR): $\mathrm{PSNR} = 10\log10\left(\frac{255^2}{\mathrm{MSE}}\right)$ (33)
2. Compression ratio (CR): $\mathrm{CR} = \frac{\text{Original image size in bit}}{\text{Compressed image size in bit}}$ (34)
3. Bits per pixel (BPP): $\text{Bit Per Pixel} = \frac{\text{Compressed image size in bits}}{\text{Total number of Pixel in the image}}$ (35)
4. Mean Squared Error (MSE): $\mathrm{MSE} = \alpha_q^2 = \frac{1}{L}\sum\left(I(j,k), G(j,k)\right)^2$ (36)

Table 6. Compare the results between SCWT and Symlet 2 filter with loops of true compression by Set Partitioning in Hierarchical Tree (SPIHT) on Physical image.

	Symlet 2 Wavelet Transformations				Second Chebysheve Wavelet Transformations (DSCWT)			
Loops	MSE	PSNR	CR	BPP	MSE	PSNR	CR	BPP
1	4.07e^{+04}	2.025	0.03%	0.007815	4.07e^{+04}	2.025	0.03%	0.007815
2	9928	8.162	0.03%	0.007815	9928	8.162	0.03%	0.007815
3	9928	8.162	0.03%	0.007815	9928	8.162	0.03%	0.008178
4	4324	11.77	0.04%	0.008056	5045	11.1	0.04%	0.0083008
5	3342	12.89	0.04%	0.008911	3029	13.32	0.04%	0.009511
6	1896	15.35	0.06%	0.013306	1460	16.49	0.06%	0.014282
7	1179	17.24	0.09%	0.020508	1079	17.8	0.08%	0.019409
8	622	20.19	0.17%	0.04138	702.7	19.06	0.15%	0.03686
9	337	22.85	0.35%	0.083252	351.8	22.67	0.37%	0.087769
10	154.3	26.25	0.77%	0.18384	149.2	26.39	0.76%	0.18188
11	55.93	30.65	1.53%	0.3667	66.34	29.91	1.35%	0.32446
12	23.65	34.35	2.42%	0.58179	30.82	33.24	2.44%	0.56545
13	10	38.13	3.98%	0.95422	13.52	36.82	4.37%	1.04930
14	4.526	41.57	6.43%	1.5495	5.433	40.78	7.83%	1.8795
15	2.334	44.45	10.46%	2.5096	2.054	45	12.72	3.0525
16	1.483	46.42	16.14%	3.8745	1.108	47.69	18.12%	4.3616

The above table was compared with the results. It was observed that the difference in favor of the proposed new wavelet starts from step 5, 6 and 7, and this difference is repeated 10, 15 and 16.

This means the result obtained with the new wavelet SCWT is better than the result obtained from using the standard wavelet Symlet 2.

8. Conclusion

In this work, wavelets were relied on and were used in many businesses to find the best numerical solutions. In this work, I found a suitable filter from wavelets SCWT through scaling function and wavelet function find high pass filter and low pass filter used it to analyze the image where it was obtained. Good efficiency results obtained using new wavelets compared to the results obtained from the standard wavelets. Using an image of a sample of a physical atom that was analyzed and highlighting the compression and raising the noise, histogram and statistics the image statistics where the best results were recorded when using a specific threshold i.e. when pressing the methods were used the first has the threshold methods is Balance sparsity-norm, Remove near 0 and Bal-sparsity-norm (sqrt). As for the methods of raising the noise are fixed form thresholding method with soft threshold, penalize high with hard threshold, penalize medium with hard threshold, penalize low with hard threshold, Bal sparsity norm (sqrt) with soft threshold, where image parameters were divided into approximation coefficients and details coefficients. Through the analysis, a suitable threshold value was obtained, which helps to restore energy that leads to the fact that the compressed necessity did not lose much of its original information; which proves the new wavelets in the field of physical and medical imaging.

The Homomorphism of a cubic set of a semigroup in a KU-algebra

The Homomorphism of a cubic set of a semigroup in a KU-algebra

Omniat Adnan Hasan[1] , Fatema F. Kareem[1]

[1]Department of mathematics, college of education for pure sciences (Ibn AL-Haitham) University of Baghdad, Baghdad, Iraq.

E-mail: fatma.f.k@ihcoedu.uobaghdad.edu.iq

Abstract. The study of homomorphisms in cubic sets is considered one of the important concepts that transfer algebraic properties between different structures, so we study a homomorphism of a cubic set of a semigroup in a KU-algebra and defined the product of two cubic sets in this structure. Firstly, we define the image and the inverse image of a cubic set in a KU-semigroup and achieve some results in this notion. Secondly, the Cartesian product of cubic subsets in a KU-semigroup is discussed and some important characteristics are proved.

1-Introduction

A new algebraic structure which is named a KU-algebra was introduced by Prabpayak and Leerawat [9, 10]. They studied the concept of homomorphism of a KU-algebra. After that, the notions of fuzzy KU-ideals and an interval value fuzzy KU-ideals are discussed by Mostafa et al. [7,8]. In [4], Kareem and Hasan introduced the notion of a KU-algebra with semigroup which is called a KU-semigroup and defined some types of ideals in this concept. Also, they studied the fuzzy ideals of a KU-semigroup in [1]. And then, Kareem and Talib [5] introduced the notion of interval value fuzzy *k*-ideal of KU-semigroup and a few properties are investigated.

The concept of cubic subalgebras/ideals in BCK/BCI-algebras was introduced by Jun et al. [2, 3]. They discussed the relationship between a cubic subalgebra and a cubic ideal. And then, Yaqoob et al [11] introduced the notion of cubic KU-algebra which is a generalization of the concept of fuzzy KU-ideals of KU-algebras. In this paper, we study a homomorphism of a cubic set of a semigroup in a KU-algebra and defined the product of two cubic sets in this structure.

2. Preliminaries

In this section, we collect some basic definitions and theorems of KU-semigroup, which will be used in the next sections.

Definition2.1[10]. An Algebra$(\aleph,*,0)$ is called a KU-algebra if, for all$\chi,\gamma,\tau \in \aleph$,
$(\mathrm{ku}_1)\ (\chi*\gamma)*[(\gamma*\tau)*(\chi*\tau)]=0$,
$(\mathrm{ku}_2)\ \chi*0=0$,
$(\mathrm{ku}_3)\ 0*\chi=\chi$,
$(\mathrm{ku}_4)\ \chi*\gamma=0$ and $\gamma*\chi$ implies$\chi=\gamma$ and
$(\mathrm{ku}_5)\ \chi*\chi=0$.

A binary relation $\leq$ on $\aleph$ is define by $\chi \leq \gamma \Leftrightarrow \gamma * \chi = 0$. It follows that $(\aleph, \leq)$ is a partially ordered set.

Example 2.2 [9]. Let $\aleph = \{0, a, b, c\}$ be a set and $*$ a binary operation defined in the following table

*	0	a	b	c
0	0	a	b	c
a	0	0	0	b
b	0	b	0	a
c	0	0	0	0

It is easy to see that$(\aleph, *, 0)$ is a KU-algebra.

Theorem2.3[9]. Let $(\aleph, *, 0)$ be a KU-algebra. Then, for all$\chi, \gamma, \tau \in \aleph$,
(1) If $\chi \leq \gamma$ imply $\gamma * \tau \leq \chi * \tau$,
(2) $\chi * (\gamma * \tau) = \gamma * (\chi * \tau)$,
(3) $((\gamma * \chi) * \chi) \leq \gamma$.

Definition 2.4 [9]. Let $(\aleph, *, 0)$ be a KU-algebra and I be a non- empty subset of $\aleph$. Then I is called an ideal of $\aleph$ if for any $\chi, \gamma \in \aleph$, then
(i) $0 \in I$ and
(ii) If $\chi * \gamma \in I$ and $\chi \in I$ imply $\gamma \in I$.

Definition 2.5 [7]. Let I be a subset of a KU-algebra$(\aleph, *, 0)$ and $I \neq \varphi$. Then I is named a KU-ideal of $\aleph$, if
(I_1) $0 \in I$ and
$(I_2) \forall \chi, \gamma, \tau \in \aleph$, $(\chi * (\gamma * \tau)) \in I$, $\gamma \in I$ imply $\chi * \tau \in I$.

Definition2.6[4]. A KU-semigroup is a nonempty set $\aleph$ with two binary operations $*, \circ$ and a constant 0 satisfying the following
(I) $(\aleph, *, 0)$ is a KU-algebra,
(II) $(\aleph, \circ)$ is a semigroup,
(III) The operation $\circ$ is distributive (on both sides) over the operation$*$, i.e.
$\chi \circ (\gamma * \tau) = (\chi \circ \gamma) * (\chi \circ \tau)and(\chi * \gamma) \circ \tau = (\chi \circ \tau) * (\gamma \circ \tau)$, for all $\chi, \gamma, \tau \in X$.

Example 2.7[4]. Let $\aleph = \{0,1,2,3\}$ be a set. Define$*$ -operation and $\circ$-operation by the following tables

*	0	1	2	3
0	0	1	2	3
1	0	0	0	2
2	0	2	0	1
3	0	0	0	0

∘	0	1	2	3
0	0	0	0	0
1	0	1	0	1
2	0	0	2	2
3	0	1	2	3

Then $(\aleph,*,\circ,0)$ is a KU-semigroup.

Definition 2.8[4]. A *sub*KU-*semigroup* is a non-empty subset A of a KU-semigroup $\aleph$ and it is satisfied $\chi * \gamma, \chi \circ \gamma \in$ A, for all $\chi,\gamma \in$ A.

Definition2.9[4]. Let $(\aleph,*,\circ,0)$ be a KU-semigroup and $\varphi \neq I \subseteq \aleph$. Then
I is named an *S-ideal* of $\aleph$, if
(i) I is an ideal of a KU-algebra$(\aleph,*,0)$,
(ii) For all $\chi \in \aleph$, $a \in I$, we have$\chi \circ a \in I$ and $a \circ \chi \in I$.

Definition2.10 [4]. Let $(\aleph,*,\circ,0)$ be a KU-semigroup and $\varphi \neq A \subseteq \aleph$. Then A is said to be a *k-ideal* of $\aleph$, if
i) A is an KU-ideal of a KU-algebra $(\aleph,*,0)$,
ii) For all $\chi \in X, a \in$ A, we have $\chi \circ a \in$ A and $a \circ \chi \in$ A .
We recall the definition of a cubic set in a KU-semigroup as follows:
Let$(\aleph,*,\circ,0)$ be a KU-semigroup. A cubic set Θ in a set $\aleph$ is the structure
$\Theta = \{\langle x, \tilde{\mu}_\Theta(x), \lambda_\Theta(x)\rangle : x \in \aleph\}$, where $\tilde{\mu}_\Theta: \aleph \to D[0,1]$ such that
$\tilde{\mu}_\Theta(x) = [\tilde{\mu}_\Theta{}^L(x), \tilde{\mu}_\Theta{}^U(x)]$ is an interval valued fuzzy set in $\aleph$ and $\lambda_\Theta(x)$ is a fuzzy set in $\aleph$. We write a cubic set by briefly as follows $\Theta = \langle \tilde{\mu}_\Theta, \lambda_\Theta \rangle$,
We can define the level subset of $\Theta = \langle \tilde{\mu}_\Theta, \lambda_\Theta \rangle$ which is denoted by $U(\Theta, \tilde{t}, \alpha)$ as follows $U(\Theta, \tilde{t}, \alpha) = \{\chi \in \aleph : \tilde{\mu}_\Theta(x) \geq \tilde{t}, \lambda_\Theta(x) \leq \alpha\}$, for every $[0,0] \leq \tilde{t} \leq [1,1]$ and $\alpha \in [0,1]$.

Definition2.11[6]. Let$(\aleph,*,\circ,0)$ be a KU-semigroup. A cubic set $\Theta = \langle \tilde{\mu}_\Theta, \lambda_\Theta \rangle$ in $\aleph$ is called a cubic sub KU-semigroup if: for all $\chi, \gamma \in \aleph$,
(1) $\tilde{\mu}_\Theta(\chi * \gamma) \geq rmin\{\tilde{\mu}_\Theta(\chi), \tilde{\mu}_\Theta(\gamma)\}$, $\lambda_\Theta(\chi * \gamma) \leq max\{\lambda_\Theta(\chi), \lambda_\Theta(\gamma)\}$
(2) $\tilde{\mu}_\Theta(\chi \circ \gamma) \geq rmin\{\tilde{\mu}_\Theta(\chi), \tilde{\mu}_\Theta(\gamma)\}$, $\lambda_\Theta(\chi \circ \gamma) \leq max\{\lambda_\Theta(\chi), \lambda_\Theta(\gamma)\}$.

Example 2.12[6]. Let $\aleph = \{0,1,2,3\}$ be a set. We define two operations by the following tables

*	0	1	2	3
0	0	1	2	3
1	0	0	0	2
2	0	2	0	1
3	0	0	0	0

∘	0	1	2	3
0	0	0	0	0
1	0	1	0	1
2	0	0	2	2
3	0	1	2	3

Then $(\aleph,*,\circ,0)$ is a KU-semigroup. Define $\tilde{\mu}_\Theta(x)$ and $\lambda_\Theta(\chi)$ by

$$\tilde{\mu}_\Theta(x)=\begin{cases}[0.2,0.8] & if \quad \chi=\{0,1,2\}\\ [0.1,0.3] & if \quad \chi=3\end{cases},\ \lambda_\Theta(\chi)=\begin{cases}0.2 & if\ \chi=\{0,1,2\}\\ 0.4 & if\ \chi=3\end{cases},$$

And by apply definition3.1, we can prove that $\Theta=\langle\tilde{\mu}_\Theta,\lambda_\Theta\rangle$ is a cubic sub KU-semi group of $\aleph$.

Definition2.13[6]. A cubic set $\Theta=\langle\tilde{\mu}_\Theta,\lambda_\Theta\rangle$ in $\aleph$ is called a cubic ideal of a KU-semigroup $(\aleph,*,\circ,0)$ if it satisfies the following conditions: for all $\chi,\gamma\in\aleph$
(II_1) $\tilde{\mu}_\Theta(0)\geq\tilde{\mu}_\Theta(x)$ and $\lambda_\Theta(0)\leq\lambda_\Theta(x)$,
(II_2) $\tilde{\mu}_\Theta(\gamma)\geq$
$rmin\{\tilde{\mu}_\Theta(\chi*\gamma),\tilde{\mu}_\Theta(\chi)\}$, $\lambda_\Theta(\gamma)\leq max\{\lambda_\Theta(\chi*\gamma),\lambda_\Theta(\chi)\}$
(II_3) $\tilde{\mu}_\Theta(\chi\circ\gamma)\geq rmin\{\tilde{\mu}_\Theta(\chi),\ \tilde{\mu}_\Theta(\gamma)\}, \lambda_\Theta(\chi\circ\gamma)\leq max\{\lambda_\Theta(\chi)\ ,\ \lambda_\Theta(\gamma)\}$.

Example2.14[6]. Let $\aleph=\{0,1,2\}$ be a set. Define the operations $*,\circ$ by the following tables.

$*$	0	1	2
0	0	1	2
1	0	0	1
2	0	1	0

$\circ$	0	1	2
0	0	0	0
1	0	1	0
2	0	0	2

Then$(\aleph,*,\circ,0)$ is a KU-semigroup. Define $\Theta=\langle\tilde{\mu}_\Theta,\lambda_\Theta\rangle$ as follows:

$$\tilde{\mu}_\Theta(x)=\begin{cases}[0.4,0.8] & if\ \ \chi\in\{0,2\}\\ [0.1,0.3] & if\ \ \chi=1\end{cases}\ \text{and}\ \lambda_\Theta(x)=\begin{cases}0.1 & if\ \ \chi\in\{0,2\}\\ 0.3 & if\ \ \chi=1\end{cases}$$

Then $\Theta=\langle\tilde{\mu}_\Theta,\lambda_\Theta\rangle$ is a cubic ideal of $\aleph$.

Definition2.15[6]. A cubic set $\Theta=\langle\tilde{\mu}_\Theta,\lambda_\Theta\rangle$ in $\aleph$ is called a cubic *k*-ideal of a KU-semigroup$(\aleph,*,\circ,0)$ if it satisfies the following conditions:

For all $\chi,\gamma,\tau\in\aleph$
$(\boldsymbol{Ck_1})\tilde{\mu}_\Theta(0))\geq\tilde{\mu}_\Theta(\chi)$, and $\lambda_\Theta(0)\leq\lambda_\Theta(x)$
$\boldsymbol{(Ck_2)}\tilde{\mu}_\Theta(\chi*\tau)\geq rmin\{\tilde{\mu}_\Theta(\chi*(\gamma*\tau)),\tilde{\mu}_\Theta(\gamma)\}$,
$\lambda_\Theta(\chi*\tau)\leq max\{\lambda_\Theta(\chi*(\gamma*\tau)),\lambda_\Theta(\gamma)\}$
$\mathbf{(Ck_3)}\tilde{\mu}_\Theta(\chi\circ\gamma)\geq r\min\{\tilde{\mu}_\Theta(\chi)\ ,\ \tilde{\mu}_\Theta(\gamma)\}$ $,\lambda_\Theta(\chi\circ\gamma)\leq max\{\lambda_\Theta(\chi)\ ,\ \lambda_\Theta(\gamma)\}$.

3. Homomorphism of a cubic *k*-ideal

In this section we present definitions the homomorphism, image and preimage of a cubic KU-ideal, and some results on these concepts.

Definition 3.1. Let *f* be a mapping from KU-semigroup $\aleph$ into KU-semigroup $\aleph'$ if $\Theta=\langle\tilde{\mu}_\Theta(\chi),\lambda_\Theta(\chi)\rangle$ is a cubic sub set of $\aleph$, then the image of Θ under*f* is defined as follows

$$f(\tilde{\mu}_\Theta)(\gamma)=\begin{cases}rsup\ \tilde{\mu}_\Theta(\chi)_{\chi\in f^{-1}(\gamma)}, & if\quad f^{-1}(\gamma)=\{\chi\in\aleph: f(\chi)=\gamma,\gamma\in\aleph'\}\neq\emptyset\\ 0 & otherwise\end{cases}$$

And

$$f(\lambda_\Theta)(\gamma)=\begin{cases}inf\ \lambda_\Theta(\chi)_{\chi\in f^{-1}(\gamma)}, & if\ f^{-1}(\gamma)=\{\chi\in\aleph: f(\chi)=\gamma,\gamma\in\aleph'\}\neq\emptyset\\ 0 & otherwise\end{cases}$$

Definition 3.2. Let f be a mapping from $\aleph$ into $\aleph'$and $\beta = \langle \tilde{\mu}_\beta, \lambda_\beta \rangle$ be a cubic set in $\aleph'$. Then the inverse image of β, is defined as $f^{-1}(\beta) = \langle x, f^{-1}(\tilde{\mu}_\beta), f^{-1}(\lambda_\beta) \rangle$ with the membership function and non-membership function respectively are given by $f^{-1}(\tilde{\mu}_\beta(x)) = \tilde{\mu}_\beta\big(f(x)\big)$ and $f^{-1}(\lambda_\beta(x)) = \lambda_\beta\big(f(x)\big)$. It can be shown that $f^{-1}(\beta)$ is a cubic set.

Theorem 3.3. Let $f: \aleph \to \aleph'$ be an epimorphism between KU-semigroups $\aleph$ and $\aleph'$, if $\Theta = \langle \tilde{\mu}_\Theta(\chi), \lambda_\Theta(\chi) \rangle$ is a cubic *k*-ideal in $\aleph$,then $f(\Theta)$ is a cubic *k*-ideal in $\aleph'$.

Proof:
$\forall\, \chi', \gamma' \in \aleph'$, then $\exists\, \chi, \gamma \in \aleph$ such that $f(\chi) = \chi'$ and $f(\gamma) = \gamma'$. By definition of an image, we have
$f(\tilde{\mu}_\Theta)(\chi') = rsup\tilde{\mu}_\theta(\chi)_{\chi \in f^{-1}(\chi')}$, for some $\chi \in \aleph$, and
$f(\lambda_\Theta)(\chi') = \lambda_\Theta(\chi') = inf\lambda_\Theta(\chi)_{\chi \in f^{-1}(\chi')}$, for some $\chi \in \aleph$, we have
$\tilde{\mu}_\Theta(0) \geq \tilde{\mu}_\Theta(\chi), \forall\, \chi \in \aleph$, then the condition($\boldsymbol{Ck_1}$) is
$f(\tilde{\mu}_\Theta)(0') = rsup\tilde{\mu}_\Theta(0)_{0 \in f^{-1}(0')} \geq rsup\tilde{\mu}_\Theta(\chi)_{\chi \in f^{-1}(\chi')} = f(\tilde{\mu}_\Theta)(\chi)$
And
$f(\lambda_\Theta)(0') = inf\lambda_\theta(0)_{0 \in f^{-1}(0')} \leq inf\lambda_\theta(\chi)_{\chi \in f^{-1}(\chi')} = f(\lambda_\Theta)(\chi)$
($\boldsymbol{Ck_2}$)For any$\chi', \gamma', \tau' \in \aleph'$, let $\chi_0 \in f^{-1}(\chi'), \gamma_0 \in f^{-1}(\gamma'), \tau_0 \in f^{-1}(\tau')$, since f is a homomorphism, then $f(\tilde{\mu}_\Theta)(\chi' * \tau') = rsup\tilde{\mu}_\Theta(\chi_0 * \tau_0))_{\chi_0 * \tau_0 \in f^{-1}(\chi' * \tau')}$
$\geq rmin\{rsup\tilde{\mu}_\Theta(\chi_0 * (\gamma_0 * \tau_0))_{(\chi_0 * (\gamma_0 * \tau_0)) \in f^{-1}(\chi' * \gamma' * \tau')}, rsup\tilde{\mu}_\Theta(\gamma_0)_{\gamma_0 \in f^{-1}(\gamma')}\}$
$= rmin\{f(\tilde{\mu}_\Theta)(\chi' * (\gamma' * \tau'), f(\tilde{\mu}_\Theta)(\gamma')\}$
And then $f(\lambda_\Theta)(\chi' * \tau') = inf\lambda_\Theta(\chi_0 * \tau_0))_{\chi_0 * \tau_0 \in f^{-1}(\chi' * \tau')}$
$\leq max\{ inf\lambda_\Theta(\chi_0 * (\gamma_0 * \tau_0))_{(\chi_0 * (\gamma_0 * \tau_0)) \in f^{-1}(\chi' * (\gamma' * \tau'))}, inf\lambda_\Theta(\gamma_0)_{\gamma_0 \in f^{-1}(\gamma')}\}$
$= max\{f(\lambda_\Theta)(\chi' * (\gamma' * \tau')), f(\lambda_\Theta)(\gamma')$
($\boldsymbol{Ck_3}$) For any $\chi', \gamma' \in \aleph'$, let $\chi_0 \in f^{-1}(\chi'), \gamma_0 \in f^{-1}(\gamma')$ be such that
$f(\tilde{\mu}_\Theta)(\chi' \circ \gamma') = r\ sup\tilde{\mu}(\chi_0 \circ \gamma_0))_{\chi_0 \circ \tau_0 \in f^{-1}(\chi' \circ \tau')}$
$\geq rmin\{r\ sup\tilde{\mu}_\Theta(\chi_0)_{(\chi_0) \in f^{-1}(\chi')}, r\ sup\tilde{\mu}_\Theta(\gamma_0)_{\gamma_0 \in f^{-1}(\gamma')}\}$
$= rmin\{f(\tilde{\mu}_\Theta)(\chi'), f(\tilde{\mu}_\Theta)(\gamma')\}$ and
$f(\lambda_\Theta)(\chi' \circ \gamma') = inf\lambda_\Theta(\chi_0 \circ \gamma_0)_{\chi_0 \circ \tau_0 \in f^{-1}(\chi' \circ \tau')}$
$\leq max\{inf\tilde{\mu}_\Theta(\chi_0)_{(\chi_0) \in f^{-1}(\chi')}, inf\tilde{\mu}_\Theta(\gamma_0)_{\gamma_0 \in f^{-1}(\gamma')}\}$
$= max\{f(\lambda_\Theta)(\chi'), f(\lambda_\Theta)(\gamma')\}$, hence $f(\Theta)$ is a cubic *k*-ideal.

Theorem3.4. An epimorphism pre-image of a cubic *k*-ideal of a KU-semigroup$\aleph'$ also a cubic *k*-ideal of KU-semigroup $\aleph$.

Proof. Let $\beta = \langle \tilde{\mu}_\beta, \lambda_\beta \rangle$ be a cubic *k*-ideal of $\aleph'$, to prove $f^{-1}(\beta)$ is a cubic *k*-ideal of $\aleph$.
$\forall\, \chi', \gamma', \tau' \in \aleph'$, then $\exists\, \chi, \gamma, \tau \in \aleph$ such that $f(\chi) = \chi'$, $f(\gamma) = \gamma'$and $f(\tau) = \tau'$,
(Ck$_1$) we have
$f^{-1}\left(\tilde{\mu}_\beta(0)\right) = \tilde{\mu}_\beta(f(0)) = \tilde{\mu}_\beta(0') \geq \tilde{\mu}_\beta(\chi') = \tilde{\mu}_\beta(f(\chi)) = f^{-1}(\tilde{\mu}_\beta(\chi))$, and
$f^{-1}\left(\lambda_\beta(0)\right) = \lambda_\beta(f(0)) = \lambda_\beta(0') \leq \lambda_\beta(\chi') = \lambda_\beta(f(x)) = f^{-1}\left(\lambda_\beta(x)\right)$.
(Ck$_2$)$\forall\, \chi, \gamma, \tau \in \aleph$, we have
$f^{-1}\left(\tilde{\mu}_\beta(\chi * \tau)\right) = \tilde{\mu}_\beta(f(\chi * \tau)) = \tilde{\mu}_\beta(f(\chi) * f(\tau)) = \tilde{\mu}_\beta(\chi' * \tau')$
$\geq rmin\{\tilde{\mu}_\beta(\chi' * (\gamma' * \tau')),\ \tilde{\mu}_\beta(\gamma')\}$ (since β is a cubic *k*-ideal of $\aleph'$)

$= rmin\left\{\tilde{\mu}_\beta\left(f(x) * \left(f(\gamma) * f(\tau)\right),\ \tilde{\mu}_\beta(f(\gamma)\right)\right\} = rmin\{\tilde{\mu}_\beta(f\left(\chi * (\gamma * \tau)\right), \tilde{\mu}_\beta(f(\gamma))\}$
$= rmin\{f^{-1}(\tilde{\mu}_\beta\left(\chi * (\gamma * \tau)\right), f^{-1}(\tilde{\mu}_\beta(\gamma))\}$. And
$f^{-1}\left(\lambda_\beta(\chi * \tau)\right) = \lambda_\beta\left(f(\chi * \tau)\right) = \lambda_\beta\left(f(\chi) * f(\tau)\right) = \lambda_\beta(\chi' * \tau')$
$\leq ma\, x\{\lambda_\beta(\chi' * (\gamma' * \tau')), \lambda_\beta(\gamma')\} = max\{\lambda_\beta\left(f(\chi) * (f(\gamma) * f(\tau)\right), \lambda_\beta\left(f(\gamma)\right)$
$= max\{\lambda_\beta(f(\chi * (\gamma * \tau)), \lambda_\beta(f(\gamma)\}$
$= ma\, x\{f^{-1}\left(\lambda_\Theta(\chi * (\gamma * \tau)\right), f^{-1}\left(\lambda_\Theta(\gamma)\right)\}$

(Ck$_3$) $\forall\ \chi, \gamma \in \aleph$ **,** we have

$f^{-1}\left(\tilde{\mu}_\beta(\chi \circ \gamma)\right) = \tilde{\mu}_\beta\left(f(\chi \circ \gamma)\right) = \tilde{\mu}_\beta\left(f(\chi) \circ f(\gamma)\right) = \tilde{\mu}_\beta(\chi' \circ \gamma') \geq rmin\{\tilde{\mu}_\beta(\chi'), \tilde{\mu}_\beta(\gamma')\}$
$= rmin\{\tilde{\mu}_\beta\left(f(\chi)\right), \tilde{\mu}_\beta\left(f(\gamma)\right)\} = rmin\{f^{-1}(\tilde{\mu}_\beta(\chi)), f^{-1}(\tilde{\mu}_\beta(\gamma))\}$
and
$\lambda_\beta(\chi \circ \gamma) = \lambda_\beta\left(f(\chi \circ \gamma)\right) = \lambda_\beta\left(f(\chi) \circ f(\gamma)\right) = \lambda_\beta(\chi' \circ \gamma') \leq ma\, x\{\lambda_\beta(\chi'), \lambda_\beta(\gamma')\}$
$\leq max\{\lambda_\beta\left(f(\chi)\right), \lambda_\beta\left(f(\gamma)\right)\} = max\{f^{-1}\left(\lambda_\beta(\chi)\right), f^{-1}\left(\lambda_\beta(\gamma)\right)\}$, that is
$\beta = \langle\tilde{\mu}_\beta, \lambda_\beta\rangle$ is a cubic *k*-ideal of $\aleph$.

Definition3.5. Let $\Theta_1 = \langle\tilde{\mu}_{\Theta 1}(x), \lambda_{\Theta 1}(x)\rangle$ and $\Theta_2 = \langle\tilde{\mu}_{\Theta 2}(x), \lambda_{\Theta 2}(x)\rangle$ be two cubic subsets of KU-semigroup $\aleph_1$and $\aleph_2$ respectively. Then the Cartesian product of cubic subsets Θ_1 and Θ_2 is denoted by $\Theta_1 \times \Theta_2 = \langle\tilde{\mu}_{\Theta 1\times\Theta 2}(x), \lambda_{\Theta 1\times\Theta 2}(x)\rangle$ and is defined by
$\tilde{\mu}_{\Theta 1\times\Theta 2}(x_1, x_2) = rmin\{\tilde{\mu}_{\Theta 1}(x_1), \tilde{\mu}_{\Theta 2}(x_2)\}$ and $\lambda_{\Theta 1\times\Theta 2}(x_1, x_2) = max\{\lambda_{\Theta 1}(x_1), \lambda_{\Theta 2}(x_2)\}$, for all $(x_1, x_2) \in \aleph_1 \times \aleph_2$.

Remark3.6. Let $\aleph_1$, $\aleph_2$ be KU-semigroups , we define the binary operations $*$ and $\circ$ on $\aleph_1 \times \aleph_2$ by
$(x_1, x_2) * (y_1, y_2) = (x_1 * y_1, x_2 * y_2)$ and

$(x_1, x_2) \circ (y_1, y_2) = (x_1 \circ y_1, x_2 \circ y_2)$, for all $(x_1, x_2), (y_1, y_2) \in \aleph_1 \times \aleph_2$.

We can easy to prove that $(\aleph_1 \times \aleph_2, *, \circ, (0,0))$ is a KU-semigroup.

Theorem 3.7. If Θ_1 and Θ_2 are two cubic *k*-ideals of KU-semigroup $\aleph_1$and $\aleph_2$ respectively. Then the product $\Theta_1 \times \Theta_2$ is a cubic *k*-ideal of $\aleph_1 \times \aleph_2$.

Proof: Let $\Theta_1 = \langle\tilde{\mu}_{\Theta 1}(x), \lambda_{\Theta 1}(x)\rangle$, $\Theta_2 = \langle\tilde{\mu}_{\Theta 2}(x), \lambda_{\Theta 2}(x)\rangle$ be two cubic *k*-ideals.

(CK$_1$) For any $(x_1, x_2) \in \aleph_1 \times \aleph_2$

$\tilde{\mu}_{\Theta 1\times\Theta 2}(0,0) = rmin\{\tilde{\mu}_{\Theta 1}(0), \tilde{\mu}_{\Theta 2}(0)\} \geq rmin\{\tilde{\mu}_{\Theta 1}(x_1), \tilde{\mu}_{\Theta 2}(x_2)\} = \tilde{\mu}_{\Theta 1\times\Theta 2}(x_1, x_2)$

And

$\lambda_{\Theta 1\times\Theta 2}(0,0) = max\{\lambda_{\Theta 1}(0), \lambda_{\Theta 2}(0)\} \leq max\{\lambda_{\Theta 1}(x_1), \lambda_{\Theta 2}(x_2)\} = \lambda_{\Theta 1\times\Theta 2}(x_1, x_2)$

(CK$_2$) Let $(x_1, x_2), (y_1, y_2), (\tau_1, \tau_2) \in \aleph_1 \times \aleph_2$

$\tilde{\mu}_{\Theta 1\times\Theta 2}\left((x_1, x_2) * (\tau_1, \tau_2)\right) = \tilde{\mu}_{\Theta 1\times\Theta 2}(x_1 * \tau_1, x_2 * \tau_2)$
$= rmin\{\tilde{\mu}_{\Theta 1}(x_1 * \tau_1), \tilde{\mu}_{\Theta 2}(x_2 * \tau_2)\}$
$\geq rmin\{rmin\{\tilde{\mu}_{\Theta 1}\left(x_1 * (y_1 * \tau_1)\right), \tilde{\mu}_{\Theta 1}(y_1)\}, rmin\{\tilde{\mu}_{\Theta 2}(x_2 * (y_2 * \tau_2)), \tilde{\mu}_{\Theta 2}(y_2)\}\}$
$= rmin\{\ rmin\{\tilde{\mu}_{\Theta 1}\left(x_1 * (y_1 * \tau_1)\right), \tilde{\mu}_{\Theta 2}(x_2 * (y_2 * \tau_2)\}, rmin\{\tilde{\mu}_{\Theta 1}(y_1), \tilde{\mu}_{\Theta 2}(y_2)\}\}$
$= rmin\{\tilde{\mu}_{\Theta 1\times\Theta 2}\left((x_1, x_2) * \left((y_1, y_2) * (\tau_1, \tau_2)\right)\right), \tilde{\mu}_{\Theta 1\times\Theta 2}(y_1, y_2)\}$,

and

$\lambda_{\Theta 1\times\Theta 2}\left((x_1, x_2) * (\tau_1, \tau_2)\right) = \lambda_{\Theta 1\times\Theta 2}(x_1 * \tau_1, x_2 * \tau_2)$
$= max\{\lambda_{\Theta 1}(x_1 * \tau_1), \lambda_{\Theta 2}(x_2 * \tau_2)\}$

$\leq max\{max\{\lambda_{\Theta 1}(x_1 * (y_1 * \tau_1)), \lambda_{\Theta 1}(y_1)\}, max\{\lambda_{\Theta 2}(x_2 * (y_2 * \tau_2)), \lambda_{\Theta 2}(y_2)\}\}$

$= max\{max\{\lambda_{\Theta 1}(x_1 * (y_1 * \tau_1))\}, \lambda_{\Theta 2}(x_2 * (y_2 * \tau_2))\}, max\{\lambda_{\Theta 1}(y_1), \lambda_{\Theta 2}(y_2)\}\}$

$=max\{\lambda_{\Theta 1\times\Theta 2}\left((x_1, x_2) * \left((y_1, y_2) * (\tau_1, \tau_2)\right)\right), \lambda_{\Theta 1\times\Theta 2}(y_1, y_2)\}$

(CK₃) Let $(x_1, x_2), (y_1, y_2) \in \aleph_1 \times \aleph_2$

$\tilde{\mu}_{\Theta 1\times\Theta 2}((x_1, x_2) \circ (y_1, y_2)) = \tilde{\mu}_{\Theta 1\times\Theta 2}(x_1 \circ y_1, x_2 \circ y_2)$

$= rmin\{\tilde{\mu}_{\Theta 1}(x_1 \circ y_1), \tilde{\mu}_{\Theta 2}(x_2 \circ y_2)\}$

$\geq rmin\{rmin\{\tilde{\mu}_{\Theta 1}(x_1), \tilde{\mu}_{\Theta 1}(y_1)\}, rmin\{\tilde{\mu}_{\Theta 2}(x_2), \tilde{\mu}_{\Theta 2}(y_2)\}\}$,

Since both Θ_1 and Θ_2 are cubic *k*-ideal, then

$= rmin\{rmin\{\tilde{\mu}_{\Theta 1}(x_1), \tilde{\mu}_{\Theta 2}(x_2)\}, rmin\{\tilde{\mu}_{\Theta 1}(y_1), \tilde{\mu}_{\Theta 2}(y_2)\}\}$

$= rmin\{\tilde{\mu}_{\Theta 1\times\Theta 2}(x_1, x_2), \tilde{\mu}_{\Theta 1\times\Theta 2}(y_1, y_2)\}$, and

$\lambda_{\Theta 1\times\Theta 2}((x_1, x_2) \circ (y_1, y_2)) = \lambda_{\Theta 1\times\Theta 2}(x_1 \circ y_1, x_2 \circ y_2)$

$= max\{\lambda_{\Theta 1}(x_1 \circ y_1), \lambda_{\Theta 2}(x_2 \circ y_2)\}$

$\leq max\{max\{\lambda_{\Theta 1}(x_1), \lambda_{\Theta 1}(y_1)\}, max\{\lambda_{\Theta 2}(x_2), \lambda_{\Theta 2}(y_2)\}\}$,

Since both Θ_1 and Θ_2 are cubic *k*-ideal, then

$= max\{max\{\lambda_{\Theta 1}(x_1), \lambda_{\Theta 2}(x_2)\}, max\{\lambda_{\Theta 1}(y_1), \lambda_{\Theta 2}(y_2)\}\}$

$= max\{\lambda_{\Theta 1\times\Theta 2}(x_1, x_2), \lambda_{\Theta 1\times\Theta 2}(y_1, y_2)\}$, that is $\Theta_1 \times \Theta_2$ is a cubic *k*-ideal of $\aleph_1 \times \aleph_2$.

Now we discuss the converse in the following proposition.

Proposition 3.8. Let Θ_1 and Θ_2 be two cubic *k*-ideals of KU-semigroup $\aleph_1$and $\aleph_2$ respectively. If $\Theta_1 \times \Theta_2$ is a cubic *k*-ideal of $\aleph_1 \times \aleph_2$, then

(i) Either $\tilde{\mu}_{\Theta 1}(0) \geq \tilde{\mu}_{\Theta 1}(x_1)$, $\lambda_{\Theta 1}(0) \leq \lambda_{\Theta 1}(x_1)$ or $\tilde{\mu}_{\Theta 2}(0) \geq \tilde{\mu}_{\Theta 2}(x_2)$,$\lambda_{\Theta 2}(0) \leq \lambda_{\Theta 2}(x_2)$, for all $x_1 \in \aleph_1, x_2 \in \aleph_2$.

(ii) If $\tilde{\mu}_{\Theta 1}(0) \geq \tilde{\mu}_{\Theta 1}(x_1)$, $\lambda_{\Theta 1}(0) \leq \lambda_{\Theta 1}(x_1)$ for all $x_1 \in \aleph_1$. Then either $\tilde{\mu}_{\Theta 2}(0) \geq \tilde{\mu}_{\Theta 1}(x_1)$, $\lambda_{\Theta 2}(0) \leq \lambda_{\Theta 1}(x_1)$ or $\tilde{\mu}_{\Theta 2}(0) \geq \tilde{\mu}_{\Theta 2}(x_2)$, $\lambda_{\Theta 2}(0) \leq \lambda_{\Theta 2}(x_2)$.

(iii) If $\tilde{\mu}_{\Theta 2}(0) \geq \tilde{\mu}_{\Theta 2}(x_1)$, $\lambda_{\Theta 2}(0) \leq \lambda_{\Theta 2}(x_1)$, for all $x_1 \in \aleph_1$, then either $\tilde{\mu}_{\Theta 1}(0) \geq \tilde{\mu}_{\Theta 1}(x_1)$, $\lambda_{\Theta 2}(0) \leq \lambda_{\Theta 1}(x_1)$ or $\tilde{\mu}_{\Theta 1}(0) \geq \tilde{\mu}_{\Theta 2}(x_1)$, $\lambda_{\Theta 1}(0) \leq \lambda_{\Theta 2}(x_1)$.

Proof. (i) Suppose that $\tilde{\mu}_{\Theta 1}(0) \leq \tilde{\mu}_{\Theta 1}(x_1)$, $\lambda_{\Theta 1}(0) \geq \lambda_{\Theta 1}(x_1)$, and $\tilde{\mu}_{\Theta 2}(0) \leq \tilde{\mu}_{\Theta 2}(x_2)$

, $\lambda_{\Theta 2}(0) \geq \lambda_{\Theta 2}(x_2)$, for some $x_1 \in \aleph_1, x_2 \in \aleph_2$. Then

$\tilde{\mu}_{\Theta 1\times\Theta 2}(x_1, x_2) = rmin\{\tilde{\mu}_{\Theta 1}(x_1), \tilde{\mu}_{\Theta 2}(x_2)\} \geq rmin\{\tilde{\mu}_{\Theta 1}(x_1), \tilde{\mu}_{\Theta 2}(x_2)\} = \tilde{\mu}_{\Theta 1\times\Theta 2}(0,0)$

And

$\lambda_{\Theta 1\times\Theta 2}(x_1, x_2) = max\{\lambda_{\Theta 1}(x_1), \lambda_{\Theta 2}(x_2)\} \leq max\{\lambda_{\Theta 1}(0), \lambda_{\Theta 2}(0)\} = \lambda_{\Theta 1\times\Theta 2}(0,0)$

, for some $x_1 \in \aleph_1, x_2 \in \aleph_2$. This is a contradiction. Therefore, either $\tilde{\mu}_{\Theta 1}(0) \geq \tilde{\mu}_{\Theta 1}(x_1)$, $\lambda_{\Theta 1}(0) \leq \lambda_{\Theta 1}(x_1)$ or $\tilde{\mu}_{\Theta 2}(0) \geq \tilde{\mu}_{\Theta 2}(x_2)$, $\lambda_{\Theta 2}(0) \leq \lambda_{\Theta 2}(x_2)$, for all $x_1 \in \aleph_1, x_2 \in \aleph_2$.

(ii) Suppose that $\tilde{\mu}_{\Theta 2}(0) \leq \tilde{\mu}_{\Theta 1}(x_1)$, $\lambda_{\Theta 2}(0) \geq \lambda_{\Theta 1}(x_1)$ and $\tilde{\mu}_{\Theta 2}(0) \leq \tilde{\mu}_{\Theta 2}(x_2)$, $\lambda_{\Theta 2}(0) \geq \lambda_{\Theta 2}(x_2)$, for all $x_1 \in \aleph_1, x_2 \in \aleph_2$.

Then $\tilde{\mu}_{\Theta 1\times\Theta 2}(0,0) = rmin\{\tilde{\mu}_{\Theta 1}(0), \tilde{\mu}_{\Theta 2}(0)\} = \tilde{\mu}_{\Theta 2}(0)$, and

$\tilde{\mu}_{\Theta 1\times\Theta 2}(x_1, x_2) = rmin\{\tilde{\mu}_{\Theta 1}(x_1), \tilde{\mu}_{\Theta 2}(x_2)\} \geq rmin\{\tilde{\mu}_{\Theta 2}(0), \tilde{\mu}_{\Theta 2}(0)\} = \tilde{\mu}_{\Theta 2}(0) \quad = \tilde{\mu}_{\Theta 1\times\Theta 2}(0,0)$

And $\lambda_{\Theta 1\times\Theta 2}(0,0) = max\{\lambda_{\Theta 1}(0), \lambda_{\Theta 2}(0)\} = \lambda_{\Theta 2}(0)$ and $\lambda_{\Theta 1\times\Theta 2}(x_1, x_2) =$

$max\{\lambda_{\Theta 1}(x_1), \lambda_{\Theta 2}(x_2)\} \leq max\{\lambda_{\Theta 2}(0), \lambda_{\Theta 2}(0)\} = \lambda_{\Theta 2}(0) = \lambda_{\Theta 1\times\Theta 2}(0,0)$

. This is a contradiction. Therefore, either $\tilde{\mu}_{\Theta 2}(0) \geq \tilde{\mu}_{\Theta 1}(x_1)$, $\lambda_{\Theta 2}(0) \leq \lambda_{\Theta 1}(x_1)$ or

$\tilde{\mu}_{\Theta 2}(0) \geq \tilde{\mu}_{\Theta 2}(x_2)$, $\lambda_{\Theta 2}(0) \leq \lambda_{\Theta 2}(x_2)$.

(iii)The proof is similar to (ii).

The partial converse of Theorem3.7 is the following.

Theorem3.9. If $\Theta_2 \times \Theta_2$ is a cubic *k*-ideal of $\aleph_1 \times \aleph_2$, then either Θ_1 or Θ_2 is a cubic *k*-ideal of KU-semigroup $\aleph_1$, $\aleph_2$ respectively.

Proof. By Proposition (3.8) (i), without loss of generality we assume that $\tilde{\mu}_{\Theta 2}(0) \geq \tilde{\mu}_{\Theta 2}(x_2)$

, $\lambda_{\Theta 2}(0) \leq \lambda_{\Theta 2}(x_2)$, for all $x_2 \in \aleph_2$. By Proposition (3.8) (iii), then either $\tilde{\mu}_{\Theta 1}(0) \geq \tilde{\mu}_{\Theta 1}(x_1)$, $\lambda_{\Theta 2}(0) \leq \lambda_{\Theta 1}(x_1)$ or $\tilde{\mu}_{\Theta 1}(0) \geq \tilde{\mu}_{\Theta 2}(x_1)$, $\lambda_{\Theta 1}(0) \leq \lambda_{\Theta 2}(x_1)$.

If $\tilde{\mu}_{\Theta 1}(0) \geq \tilde{\mu}_{\Theta 1}(x_1)$, $\lambda_{\Theta 2}(0) \leq \lambda_{\Theta 1}(x_1)$, then
$\tilde{\mu}_{\Theta 1\times\Theta 2}(0, x_2) = rmin\{\tilde{\mu}_{\Theta 1}(0), \tilde{\mu}_{\Theta 2}(x_2)\} = \tilde{\mu}_{\Theta 2}(x_2)$……..(1)
And
$\lambda_{\Theta 1\times\Theta 2}(0, x_2) = max\{\lambda_{\Theta 1}(0), \lambda_{\Theta 2}(x_2)\} = \lambda_{\Theta 2}(x_2)$ ……(2)
Since $\Theta_2 \times \Theta_2 = \langle \tilde{\mu}_{\Theta 1\times\Theta 2}(x), \lambda_{\Theta 1\times\Theta 2}(x) \rangle$ is a cubic *k*-ideal of $\aleph_1 \times \aleph_2$, then
Let $(x_1, x_2), (y_1, y_2), (\tau_1, \tau_2) \in \aleph_1 \times \aleph_2$
$\tilde{\mu}_{\Theta 1\times\Theta 2}\big((x_1, x_2), (\tau_1, \tau_2)\big) \geq rmin\{\tilde{\mu}_{\Theta 1\times\Theta 2}\big((x_1, x_2) * ((y_1, y_2) * (\tau_1, \tau_2)\big), \tilde{\mu}_{\Theta 1\times\Theta 2}(y_1, y_2)\}$
$\tilde{\mu}_{\Theta 1\times\Theta 2}\big((x_1 * \tau_1), (x_2 * \tau_2)\big) \geq rmin\{\tilde{\mu}_{\Theta 1\times\Theta 2}\big((x_1, x_2) * ((y_1 * \tau_1), (y_2 * \tau_2)\big), \tilde{\mu}_{\Theta 1\times\Theta 2}(y_1, y_2)\}$
$= rmin\left\{\tilde{\mu}_{\Theta 1\times\Theta 2}\left(\big(x_1 * (y_1 * \tau_1)\big), (x_2 * (y_2 * \tau_2)\big), \tilde{\mu}_{\Theta 1\times\Theta 2}(y_1, y_2)\right\}\right.$
Put $x_1 = y_1 = \tau_1 = 0$, we have
$\tilde{\mu}_{\Theta 1\times\Theta 2}\big((0 * 0), (x_2 * \tau_2)\big) \geq rmin\left\{\tilde{\mu}_{\Theta 1\times\Theta 2}\left(\big(0 * (0 * 0)\big), (x_2 * (y_2 * \tau_2)\big), \tilde{\mu}_{\Theta 1\times\Theta 2}(0, y_2)\right\}\right.$
Then by using equation (1), we get
$\tilde{\mu}_{\Theta 2}(x_2 * \tau_2) \geq rmin\{\tilde{\mu}_{\Theta 2}(x_2 * (y_2 * \tau_2)), \tilde{\mu}_{\Theta 2}(y_2)\}$
And
$\lambda_{\Theta 1\times\Theta 2}\big((x_1, x_2), (\tau_1, \tau_2)\big) =$
$\leq max\{\lambda_{\Theta 1\times\Theta 2}\big((x_1, x_2) * ((y_1 * \tau_1), (y_2 * \tau_2)\big), \lambda_{\Theta 1\times\Theta 2}(y_1, y_2)\}$

$\lambda_{\Theta 1\times\Theta 2}\big((x_1 * \tau_1), (x_2 * \tau_2)\big) \leq max\{\lambda_{\Theta 1\times\Theta 2}\big((x_1, x_2) * ((y_1 * \tau_1), (y_2 * \tau_2)\big), \lambda_{\Theta 1\times\Theta 2}(y_1, y_2)\}$

$= max\left\{\lambda_{\Theta 1\times\Theta 2}\left(\big(x_1 * (y_1 * \tau_1)\big), (x_2 * (y_2 * \tau_2)\big), \lambda_{\Theta 1\times\Theta 2}(y_1, y_2)\right\}\right.$

Put $x_1 = y_1 = \tau_1 = 0$, we have

$\lambda_{\Theta 1\times\Theta 2}\big((0 * 0), (x_2 * \tau_2)\big) \leq max\left\{\lambda_{\Theta 1\times\Theta 2}\left(\big(0 * (0 * 0)\big), (x_2 * (y_2 * \tau_2)\big), \lambda_{\Theta 1\times\Theta 2}(0, y_2)\right\}\right.$
Then by using equation (2), we get
$\lambda_{\Theta 2}(x_2 * \tau_2) \leq max\{\lambda_{\Theta 2}(x_2 * (y_2 * \tau_2)), \lambda_{\Theta 2}(y_2)\}$.
also we have
$\tilde{\mu}_{\Theta 1\times\Theta 2}\big((x_1, x_2) \circ (y_1, y_2)\big) \geq rmin\{\tilde{\mu}_{\Theta 1\times\Theta 2}(x_1, x_2), \tilde{\mu}_{\Theta 1\times\Theta 2}(y_1, y_2)\}$
$\tilde{\mu}_{\Theta 1\times\Theta 2}(x_1 \circ y_1, x_2 \circ y_2) \geq rmin\{\tilde{\mu}_{\Theta 1\times\Theta 2}(x_1, x_2), \tilde{\mu}_{\Theta 1\times\Theta 2}(y_1, y_2)\}$
Put $x_1 = y_1 = 0$, then we have
$\tilde{\mu}_{\Theta 1\times\Theta 2}(0 \circ 0, x_2 \circ y_2) \geq rmin\{\tilde{\mu}_{\Theta 1\times\Theta 2}(0, x_2), \tilde{\mu}_{\Theta 1\times\Theta 2}(0, y_2)\}$ And by using equation (1), we get
$\tilde{\mu}_{\Theta 2}(x_2 \circ y_2) \geq rmin\{\tilde{\mu}_{\Theta 2}(x_2), \tilde{\mu}_{\Theta 2}(y_2)\}$. And $\lambda_{\Theta 1\times\Theta 2}\big((x_1, x_2) \circ (y_1, y_2)\big) \leq$
$max\{\lambda_{\Theta 1\times\Theta 2}(x_1, x_2), \lambda_{\Theta 1\times\Theta 2}(y_1, y_2)\}$
$\lambda_{\Theta 1\times\Theta 2}(x_1 \circ y_1, x_2 \circ y_2) \leq max\{\lambda_{\Theta 1\times\Theta 2}(x_1, x_2), \lambda_{\Theta 1\times\Theta 2}(y_1, y_2)\}$
Put $x_1 = y_1 = 0$, then we have
$\lambda_{\Theta 1\times\Theta 2}(0 \circ 0, x_2 \circ y_2) \leq max\{\lambda_{\Theta 1\times\Theta 2}(0, x_2), \lambda_{\Theta 1\times\Theta 2}(0, y_2)\}$ And by using equation (2), we get
$\lambda_{\Theta 2}(x_2 \circ y_2) \leq max\{\lambda_{\Theta 2}(x_2), \lambda_{\Theta 2}(y_2)\}$
It follows that Θ_2 is a cubic *k*-ideal of KU-semigroup $\aleph_2$.

Abstract. This paper presents an iterative method Accelerated Predictor-Corrector Hally's Method (AHM) for finding the voltage of a single-diode model for a solar cell from the equivalent circuit. The purposes of the obtained results are to reduce the number of iterations. Two numerical methods are applied and compared; Newton's and Hally's methods. The results showed that the proposed is the most efficient compare with NRM. The purpose of the present work is to acquire the results of photovoltaic parameters using two numerical models and the comparison between them. The acquired results presented the suggested technique (NRM) is a sufficient tool, powerful method to solve this model with the least iteration. All the calculations are achieved using Matlab program.

1. Introduction

The topics of numerical analysis are very important topics in all different fields of science and it is indispensable for all scientific branches, especially applied from the study of numerical analysis and multiple programming languages. Therefore, scientific problems have been solved based on this science in the scientific working life [1-14]. Nowadays, many researchers have developed different types of solar cells based on cost and efficiency. These solar cells were prepared using different and easy methods of preparation, depending on the materials used and the quality of solar cells and the goal is to reduce cost and increase efficiency [15-25]. Other researchers can be utilizing the mathematical techniques in order to solving nonlinear equations of various of solar cells structures depending on the technique of fabrication for inorganic and organic materials for example ceramic materials, silicon solar cells, thin films solar cells [26-36]. Different techniques have been utilized to calculate the parameters of photovoltaic cell and mathematical algorithms for example fuzzy set and logic techniques and visual studio program [37-47]. Recently researchers can be utilizing numerical techniques to solve nonlinear equations in space depending on Kepler's and Barker equations [48-64].

This article aims is to present a new iterative method Accelerated Predictor-Corrector Hally method (AHM) for solving nonlinear equation of a solar cell. The propose of reducing the root of iteration in the numerical solution of the nonlinear equation root. Systematic as the following points: in section two characterizing the model of a solar cell type single-diode; in section three establishing the root finding of Newton Raphson technique; whereas; in section four Accelerated Predictor-Corrector Hally method has been studied; in section five discussion of the results; section six conclusions of the acquired results.

2. Properties of The equation for a Single Diode Solar Cells [50-61]

Figure 1 presents the equivalent electronic circuit of the photovoltaic cell solar cell.

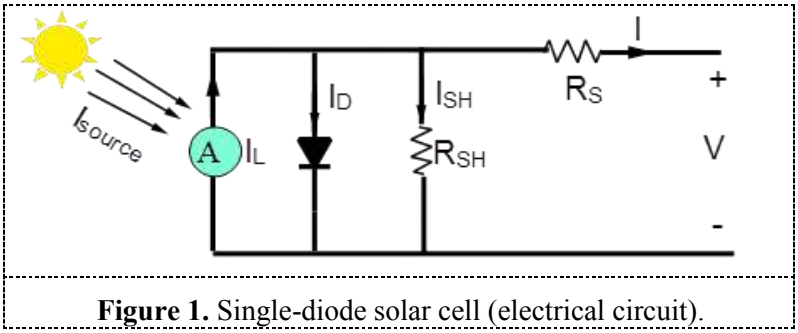

Figure 1. Single-diode solar cell (electrical circuit).

By applying Kirchhoff's current law of Figure 1; the final equation of the solar cell current can be extracted according to this equivalent as follows [52-61]

$$I = I_{ph} - I_D \quad (1)$$

$$I_D = I_0\left(e^{\frac{-V_{pv}}{nV_T}} - 1\right) \quad (2)$$

$$I = I_{ph} - I_0\left(e^{\frac{-V_{pv}}{mV_T}} - 1\right) \quad (3)$$

where:
I_{ph} : the photocurrent in (A), I_0: the diode's reverse saturation current in (A), V_{pv} and I are the delivered voltage and current in (A) and (V) respectively.

Thermic voltage can be calculated using the equation $V_T = \frac{kT}{q} = 0.0259\,V = 26$ mV, at room temperature, air-mass is 1.5; m: $(1 < m < 2)$, k: Boltzmann constant$= 1.38 \times 10^{-23}$J/K; T: the temperature of the junction $(p - n)$ (K); $q = 1.6 \times 10^{-19}$ C: the electron charge [36-37].

$$I_{ph} = I_{source} \quad (4)$$

$$I_D = I_s \times \left(e^{\frac{V_D}{nV_T}} - 1\right) \quad (5)$$

Substitute Eq. 4 in Eq. 5 yield

$$(I_{source}) - 10^{-12}\left(e^{\frac{-V}{1.2*0.026}} - 1\right) = \frac{V}{R} \quad (6)$$

where: I_s: reverse saturation current$= 10^{-12}$A. In the case of parallel, $V_D = V_{pv} = V$
By the first derivative of Eq. 6, the voltage of the cell is calculated numerically.

3. Newton's Method [50-55]

The following algorithm suggestion for solving Eq. 6 by using NRM
INPUT initial approximate solution $x_0 = 1$, ε (tolerance), N: the maximum number of iterations.
The OUTPUT for the approximate solution x_{n+1}
Step 1: Set $x = 0$
Step 2: while $i \leq x_0$
Step 3: Calculate
$x_{n+1} = x_n - \frac{f(x_n)}{f(x_n)}$ for $n = 0, 1, 2, \ldots$
Step 4: if $|x_i - x_{i-1}| < \varepsilon$; then OUTPUT x_{n+1} and stop.
Step 5: put $i = i + 1$ and $n = n + 1$; and go to Step 2.
Step 6: The OUTPUT

4. Accelerated Predictor-Corrector Hally Method (AHM)

To compare the different numerical methods of iterations, method 1 has been used against the proposed method 2. Also, Eq. 6 has been solved to demonstrate the performance of the new method, and determine the consistency and the stability of results. The results are examined using two iterative methods

Method 1: Newton Raphson Method (NRM)

$x_{n+1} = x_n - \frac{f(x_n)}{\acute{f}(x_n)}, n = 0, 1, 2, 3, \ldots$

Method 2: Accelerated Predictor- Corrector Hally Method (AHM)

$y_n = x_n - \frac{f(x_n)}{\acute{f}(x_n)}$

$x_{n+1} = y_n - \frac{2\times f(y_n)\acute{f}(y_n)}{2\times \acute{f}(y_n)^2 - f(y_n)\times \acute{\acute{f}}(y_n)}, n = 0, 1, 2, 3, \ldots$

$z_n = x_n - \frac{(x_{n+1}-x_n)^2}{x_{n+2}-2\times x_{n+1}+x_n}, \ n = 0, 1, 2, 3, \ldots$

We take $\varepsilon = 10^{-9}$ (tolerance).

For estimating the zero, the following equation is utilized

$|f(z_n)| < \varepsilon, \ \sigma = |z_{n+1} - z_n| < \varepsilon$

5. Results and Discussion

Suppose Eq. 6 is modelled has obtained the following approximate solutions and the NRM and AHM are achieved based on first initial value x_0. In Table 1 the NRM and AHM of the solution results; voltage V_{pv}; current I_{pv}; power P_{pv} of the solar cell. Table 1 shows the obtained results, $R = 1$ (load resistance).

Table 1. The obtained values using NRM and AHM.

Figure 6 The obtained values corresponding to Table 5.

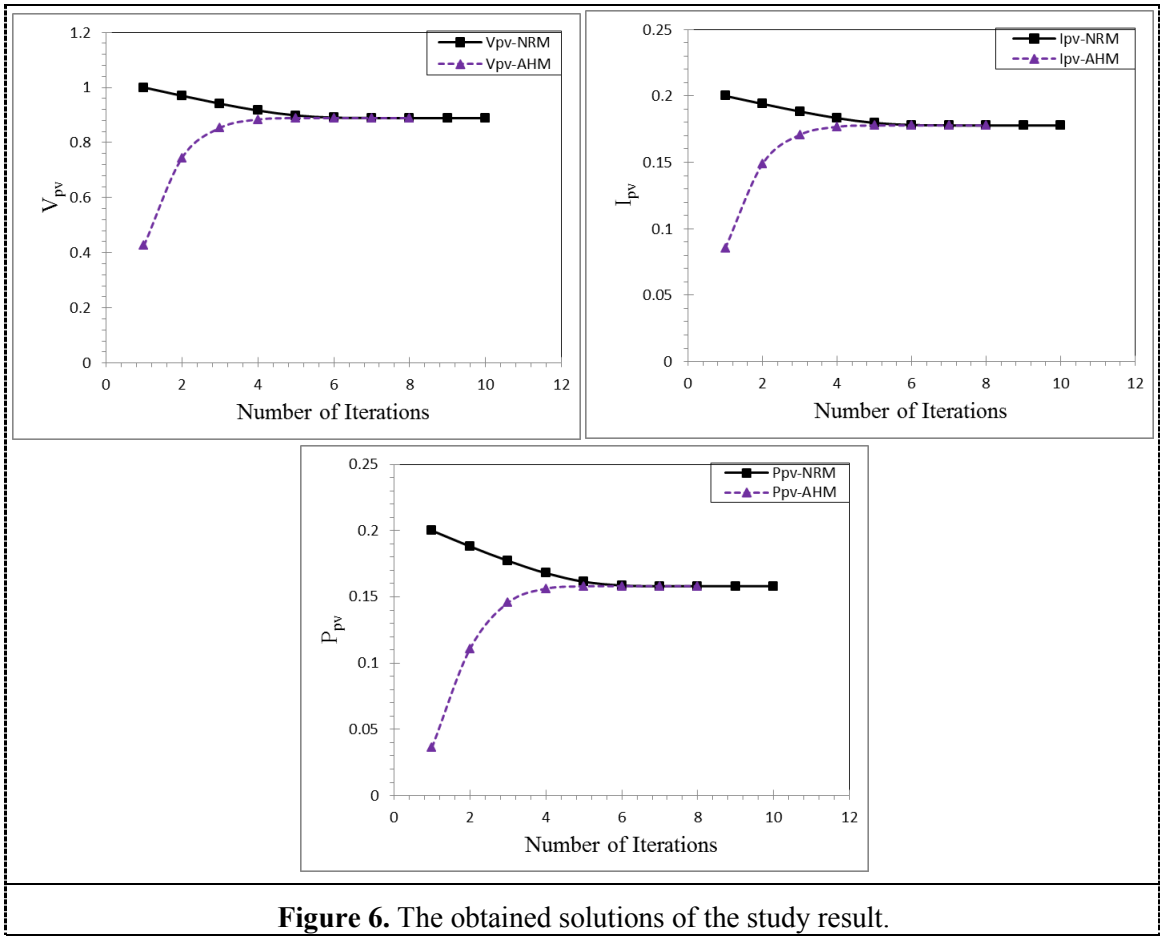

Figure 6. The obtained solutions of the study result.

Obtained results plot number of iteration V, I and P-plane and the initial-output values proves that the proposed method AHM has eight iterations indicated a fast behavior. The comparison between the two methods NRM and AHM is to acquire the results based on the least number of iterations, which confirms that the mathematical method with the least number of iterations is better and faster. The results confirmed with NRM, ten iterations were used, while using the AHM, eight iterations were utilized.

6. Conclusion

In this paper, we observed that the efficiency of the new Accelerated Predictor- Corrector Hally method considerably improve that of Newton method and the given two step method Remark that only 8 iterations are needed to reach the exact solution with small tolerance, while Newton's method requires ten iterations. Data acquired from the proposed method AHM were found to be sufficient and values for single diode solar cell were determined with fast convergence, more capable to determine these parameters and establishing towards the final values.

Soft Convergence Via Soft--Pre-Generalized-Open Sets

Soft Convergence Via Soft-ļ- Pre-Generalized-Open Sets

R B Esmaeel and A A Hammood

Department of Mathematics, College of Education for Pure Sciences Ibn Al-Haitham, University of Baghdad, Baghdad, Iraq

E-mail: ranamumosa@yahoo.com

Abstract. In this paper, the concept of soft open set is inserted by using soft ideal with soft *pre* -open sets, like: soft-ļ-*pre*-*g*-open sets "*sp*ļ*g*-open" some of the characteristics of these sets are offered. New soft functions are given such as; sļ*pg*-open functions, soft ļ**pg*-open functions, soft ļ***pg*-open functions, soft ļ*pg*-continuous *functions*, strongly soft ļ*pg*-continuous functions and soft ļ*pg*-irresolute-functions. New separation axioms and convergences are introduced by using soft-ļ-*pre*-*g*-open sets like; *s*ļ*pg*-Ţ$_0$-*space*, *s*ļ*pg*-Ţ$_1$-*space*, *s*ļ*pg*-Ţ$_2$-*space*. some figures and suggestions have been introduced the relationships with near soft functions as well some examples are explained.

1. Introduction

In 2011, *Shaber* [1] introduced smooth topological space. Many studies have been presented to study several topological properties using the soft set as *derived* groups, *compactness*, *separation* axioms and other properties see [2-4]. As well, Kandil use the Soft ideal Model, which is a family of soft sets that meet the added genetic and characteristic of Ẋ, to study the ideal of a soft function [5], The concept of soft topological spaces (Ẋ, Ţ, Đ) is considered the beginning of the study of many topological concepts by using the concept of the ideal see [6-9].

In this work, and by using the concept of soft pre- open set and soft ideal, we have defined a new type of soft near open set. Many properties of this set have also been studied and new types of functions defined using the concept under study and new types of separation axioms have also been studied by using this set in (Ẋ, Ţ, Đ, ļ).

2. Preliminaries

In this section, some basic concepts about soft space $(\dot{X}, \tau, Đ)$ with soft ideal were presented.

Definition 2.1: [10] Let $\dot{X} \neq \emptyset$ and Đ be a set of *parameters*, and let $\wp(\dot{X})$ be the power set of Ẋ.The collection of Ẋ and $P \neq \emptyset$ such that $P \subseteq Đ$. $(\digamma, Đ)$ (*Briefly* $\digamma_{Đ}$) is a *soft set* over Ẋ *whenever*, Ғ is a *function* such that $\digamma: Đ \to \wp(\dot{X})$. So, $\digamma_{Đ} = \{\digamma(d): d \in P \subseteq Đ, \digamma: Đ \to p(\dot{X})\}$.The *collection* of all soft sets (briefly $\S\S(\dot{X})_{Đ}$).

Definition 2.2: [10] Let $(\digamma, Đ), (\mathcal{Z}, Đ) \in \S\S(\dot{X})_{Đ}$. Then $(\digamma, Đ)$ is a soft subset of, $(\mathcal{Z}, Đ)$, (briefly$(\digamma, Đ) \tilde{\subseteq}, (\mathcal{Z}, Đ)$), if $\digamma(d) \tilde{\subseteq} \mathcal{Z}(d)$, for all $d \in Đ$. Now $(\digamma, Đ)$ is a soft subset of $(\mathcal{Z}, Đ)$and , $(\mathcal{Z}, Đ)$ is a soft super set of $(\digamma, Đ)$, $(\digamma, Đ) \tilde{\supseteq}$, $(\mathcal{Z}, Đ)$.

Definition 2.3: [11] The complement of $(\mathcal{F},Đ)$ (briefly $(\mathcal{F},Đ)'$) $(\mathcal{F},Đ)' = (\mathcal{F}',Đ)$, $\mathcal{F}': Đ \to \mathcal{P}(X)$ is a function such that $\mathcal{F}'(d) = X - \mathcal{F}(d)$, for all $d \in Đ$ and $\mathcal{F}'$ is namely the soft complement of $\mathcal{F}$.

Definition 2.4: [1] Let $(\mathcal{F},Đ)$ be a $soft$ over X and $x \in X$. If $x \in \mathcal{F}(d)$ for each $d \in Đ$, then $x \tilde{\in} (\mathcal{F},Đ)$.

Definition 2.5: [1] $(\mathcal{F},Đ)$ *is a NULL soft set* (briefly $\tilde{\emptyset}$ or $\emptyset_Đ$) whenever, $\forall\, d \in Đ$, $\mathcal{F}(d) = \emptyset$.
Definition 2.6: [1] $(\mathcal{F},Đ)$ *is an absolute soft set* (briefly $\tilde{X}$ or $X_Đ$) whenever, $\forall\, d \in Đ$, $\mathcal{F}(d) = X$.

Definition 2.7: [1] *Let* $\mathcal{T}$ is the set of soft sets on X with the same $Đ$, then $\mathcal{T} \in SS(X)_Đ$ is a soft topology on X if;

i. $\tilde{X}, \tilde{\emptyset} \in \mathcal{T}$ where, $\tilde{\emptyset}(d) = \emptyset$ and $\tilde{X}(d) = X$, for each $d \in Đ$
ii. $\cup_{\alpha\in\Lambda} (\eta_\alpha, Đ) \in \mathcal{T}$ whenever, $(\eta_\alpha, Đ) \in \mathcal{T}\ \forall\, \alpha \in \Lambda$,
iii. $((\mathcal{F},Đ) \tilde{\cap} (\mathcal{Z},Đ)) \in \mathcal{T}$ for each $(\mathcal{F},Đ), (\mathcal{Z},Đ) \in \mathcal{T}$.

The triple $(X,\mathcal{T},Đ)$ i*s a soft topological spac*e if $(\eta,Đ) \in \mathcal{T}$ then $(\eta,Đ)$ is an open soft set.

Definition 2.8: [12] Let $(X,\mathcal{T},Đ)$ be a soft topological space. A soft set $(\mathcal{F},Đ)$ over X is a soft closed set in X, if $(\mathcal{F},Đ)' \in \mathcal{T}$, the collection of all $soft$ closed sets (briefly $SC(X)_Đ$).

Definition 2.9: [12] *For any soft* space $(X,\mathcal{T},Đ)$. Let $(\mathcal{F},Đ)' \in SS(X)_Đ$, then *the soft closure* of $(\mathcal{F},Đ)'$, (briefly $cl(\mathcal{F},Đ)$), $cl((\mathcal{F},Đ)) = \tilde{\cap}\{(\mathcal{M},Đ) : (\mathcal{M},Đ) \in SC(X)_Đ, (\mathcal{F},Đ) \tilde{\subseteq} (\mathcal{M},Đ)\}$.

Definition 2.10: [12] For any $(X,\mathcal{T},Đ)$. Let $(\mathcal{F},Đ) \in SS(X)_Đ$, *then the soft interior* of $(\mathcal{Z},Đ)$, (briefly $int(\mathcal{Z},Đ)$), $int(\mathcal{Z},Đ) = \tilde{\cup}\{(\mathcal{M},Đ) : (\mathcal{M},Đ) \in \mathcal{T}, (\mathcal{M},Đ) \tilde{\subseteq} (\mathcal{Z},Đ)\}$.

Definition 2.11:. [2] Two soft sets $(\mathcal{C},Đ)$, $(\mathcal{U},Đ)$ in $SS(X)_Đ$, is said to be soft and disjoint, written $(\mathcal{W},Đ) \tilde{\cap} (\mathcal{U},Đ) = \tilde{\emptyset}$, $\mathcal{W}(đ) \cap \mathcal{U}(đ) = \emptyset$, for each $d \in Đ$.

Definition 2.12: . [2] The Two soft point $đ_{\mathcal{M}}, đ_{\mathcal{N}} \tilde{\in} \tilde{X}$ are different, written $đ_{\mathcal{M}} \neq đ_{\mathcal{N}}$, if *there* exest two soft sets $(\mathcal{C},Đ)$ and $(\mathcal{U},Đ)$ are *disjoint* $đ_{\mathcal{M}} \tilde{\in} (\mathcal{C},Đ)$ and $đ_{\mathcal{N}} \tilde{\in} (\mathcal{U},Đ)$

Definition 2.13: [5] *Let* $ǰ \neq \emptyset$, *then* $ǰ \tilde{\subseteq} SS(X)_Đ$ is a soft ideal whenever,
i. If $(\mathcal{F},Đ) \tilde{\in} ǰ$ and $(\mathcal{Z},Đ) \tilde{\in} ǰ$ implies, $(\mathcal{F},Đ) \tilde{\cup} (\mathcal{Z},Đ) \tilde{\in} ǰ$.
ii. If $(\mathcal{F},Đ) \tilde{\in} ǰ$ and $(\mathcal{Z},Đ) \tilde{\subseteq} (\mathcal{F},Đ)$ implies, $(\mathcal{Z},Đ) \tilde{\in} ǰ$.

Definition 2.14: [5] The space $(X,\mathcal{T},Đ)$ with a soft ideal $ǰ$ can be defined is $(X,\mathcal{T},Đ,ǰ)$ a soft topological space.

Definition 2.15: [14] For any $(X,\mathcal{T},Đ)$, then $(\mathcal{F},Đ)$ is a $soft\ pre$-open set (briefly Sp-open set if $(\mathcal{F},Đ) \tilde{\subseteq} int(cl(\mathcal{F},Đ))$. a $soft\ pre$-closed set (briefly $(\mathcal{F},Đ)'$).The family of each pre $soft$-open sets in $(X,\mathcal{T},Đ)$ (briefly $SpO(X)$). The *collection* of each $soft\ pre$-*closed* sets (*briefly* $SpC(X)$).

Definition 2.16: [2] Let $(X,\mathcal{T},Đ)$ be a soft topological space over X is a soft-$\mathcal{T}_0$-space if for all, $đ_{\mathcal{M}}$, $đ_{\mathcal{N}} \tilde{\in} \tilde{X}$ such that $đ_{\mathcal{M}} \neq đ_{\mathcal{N}}$. *If there exist soft open set* $(\eta,Đ)$ such that $đ_{\mathcal{M}} \tilde{\in} (\eta,Đ)$, $đ_{\mathcal{N}} \tilde{\notin} (\eta,Đ)$ or $đ_{\mathcal{M}} \tilde{\notin} (\eta,Đ)$, $đ_{\mathcal{N}} \tilde{\in} (\eta,Đ)$.

Definition 2.17: [2] Let $(X,\mathcal{T},Đ)$ be a soft topological space over X is a $soft$ $\mathcal{T}_1$-space if for all, $đ_{\mathcal{M}}$ $đ_{\mathcal{N}}, \tilde{\in} \tilde{X}$ *such that* $đ_{\mathcal{M}} \neq đ_{\mathcal{N}}$. $\exists$ $(\mathcal{F},Đ)$, $(\eta,Đ) \in \mathcal{T}$ whenever, $đ \tilde{\in} (\mathcal{F},Đ)$, $đ_{\mathcal{N}} \tilde{\notin} (\mathcal{F},Đ)$ and $đ_{\mathcal{M}} \tilde{\notin} (\eta,Đ)$, $đ_{\mathcal{N}} \tilde{\in} (\eta,Đ)$.

Definition 2.18: [2] *Let* $(\chi, \tau, Đ)$ be a $soft$ topological *space over* χ is *said* to be $soft$-τ_2-space if, for each $ḍ_{\mathcal{M}}$, $ḍ_{\mathcal{N}} \tilde{\in} \tilde{\chi}$ such that $ḍ_{\mathcal{M}} \neq ḍ_{\mathcal{N}}$. $\exists$ $(F, Đ)$, $(\eta, Đ) \in \tau$ whenever, $ḍ_{\mathcal{M}} \tilde{\in} (F, Đ)$, $ḍ_{\mathcal{N}} \tilde{\in} (\eta, Đ)$ and $(F, Đ) \tilde{\cap} (\eta, Đ) = \{\tilde{\emptyset}\}$.
Proposition 2.19: [2] For all soft- τ_{i+1}-space is a soft- τ_i-space and i $\in$ {0,1,2}

Definition 2.20: [13] Let $ŞŞ(\chi)_P$ and $ŞŞ(\Upsilon)_ɯ$ be two collections of soft sets, such that $\Gamma: \chi \to \Upsilon$ and $\Phi: P \to ω$ are two functions. Let $f_{\Phi\Gamma}: ŞŞ(\chi)_P \to ŞŞ(\Upsilon)_ɯ$ be .a function then;
i. If $(\mathcal{M}, P) \in ŞŞ(\chi)$. $f_{\Phi\Gamma}(\mathcal{M}, \mathcal{P}) = (f_{\Phi\Gamma}(\mathcal{M}), \Phi(P)) \in ŞŞ(\Upsilon)_ɯ$ whenever,

$$f_{\Phi\Gamma}(\mathcal{M})(\mathcal{b}) = \begin{cases} \cup \{\Gamma(\mathcal{M})(a) : a \in \Phi^{-1}(\mathcal{b}) \cap P\} \text{ if } \Phi^{-1}(\mathcal{b}) \cap P \neq \emptyset \\ \emptyset \qquad \text{Otherwise} \end{cases} \text{ for each } \mathcal{b} \in ω$$

ii. If $(\mathcal{Z}, ω) \in ŞŞ(\Upsilon)_ɯ$. Then $f_{\Phi\Gamma}^{-1}(\mathcal{Z}, ω) = (f_{\Phi\Gamma}^{-1}(\mathcal{Z}), \Phi^{-1}(ω)) \in ŞŞ(\chi)_P$ whenever,

$$f_{\Phi\Gamma}^{-1}(\mathcal{Z})(a) = \begin{cases} \Gamma^{-1}((\mathcal{Z}(\Phi(a)) & \text{if } \Phi(a) \in ω \\ \emptyset & \text{Otherwise} \end{cases} \text{ for each } a \in P$$

Now, if Φ and Γ are *surjective* (*respectively*, injective), functions then $f_{\Phi\Gamma}$ is a *surjective* (*respectively*, *injective*)

Definition 2.21: [15] Let $(\chi, \tau, Đ)$ and $(\Upsilon, ⍰, \mathcal{S})$ be soft topological spaces over χ and Υ respectively. Let $\Gamma: \chi \to \Upsilon$ and $\Phi: P \to ω$ be two functions. Let $f_{\Phi\Gamma}: ŞŞ(\chi)_p \to ŞŞ(\Upsilon)_ɯ$ be a function and $ḍ_{\mathcal{M}} \tilde{\in} \tilde{\chi}$. The function $f_{\Phi\Gamma}$ is soft $\Phi\Gamma$-*continuous* at $ḍ_{\mathcal{M}} \tilde{\in} \tilde{\chi}$ if for each $(\mathcal{G}, B) \tilde{\in} N_{\mp}(f_{\Phi\Gamma}(ḍ_{\mathcal{M}}))$, there exists a $(\mathcal{M}, \mathcal{P}) \tilde{\in} N_{\mp}(ḍ_{\mathcal{M}})$ such that $f_{\Phi\Gamma}(\mathcal{M}, \mathcal{P}) \tilde{\subseteq} (\mathcal{G}, ω)$. Then $f_{\Phi\Gamma}$ is soft $\Phi\Gamma$-*continuous* on $\tilde{\chi}$, if $f_{\Phi\Gamma}$ is soft $\Phi\Gamma$-*continuous* at *each soft point* in $\tilde{\chi}$.

Theorem 2.22: [15] Let $(\chi, \tau, Đ)$ and $(\Upsilon, ⍰, \mathcal{S})$ be soft topological spaces over χ and Υ respectively. Let $\Gamma: \chi \to \chi$ and $\Phi: P \to ω$ are two functions. Let $f_{\Phi\Gamma}: ŞŞ(\chi)_p \to ŞŞ(\Upsilon)_ɯ$ be a function . $f_{\Phi\Gamma}$ is a soft *continuous* if $f_{\Phi\Gamma}^{-1}((\eta, Đ))) \in \tau, \forall (\eta, Đ))) \in ⍰$

Definition 2.23:[16] If $S_n: \mathbb{N} \longrightarrow \mathcal{p}(\chi)$ and $S(n) = S_n \in \mathcal{p}(\chi)$ for all $n \in \mathbb{N}$, *then* S_n is a soft *sequence* over χ it can be written as S as S_n or $\prec S_1, S_2, S_3, ... \succ$.

Example : Let $\chi = \{1, 2, 3\}$, $S: \mathbb{N} \longrightarrow \mathcal{p}(\chi)$ such that $S_n = \{2\}\ \forall\ n \in \mathbb{N}/\{1\}$. $S_1 = \{1\}$, $S_2 = S_3 = S_4 = \cdots = \{2\}$. Then $S_n = \prec \{1\}, \{2\}, \{2\}, \{2\}, ... \succ$.

Definition 2.24 :[16] For a*ny soft space* $(\chi, \tau, Đ)$ *with* a set of *parameters* Đ where, $ɬ_{\mathcal{M}} \in \mathcal{p}(\chi)/\chi$ and the *soft sequence* $(S_n)_{n\in\mathbb{N}}$ over χ. Then $(S_n)_{n\in\mathbb{N}}$ is called *convergence* to $ɬ_{\mathcal{M}}$ ($briefly\ S_n \longrightarrow ɬ_{\mathcal{M}}$) if for all *soft open* set $(\eta, Đ)$ where, $ɬ_{\mathcal{M}} \tilde{\in} (\eta, Đ)$ there *exists* $k \in \mathbb{N}$ where, $S_n \tilde{\in} (\eta, Đ)$ for *every* $n \geqslant k$ and $ɬ_{\mathcal{M}}$ is called limit point for the soft sequence.
A soft sequence $(S_n)_{n\in\mathbb{N}}$ is *lled divergence, if it is not convergence.*

3. On *soft ideal pre-g-closed set*.

Definition 3.1: In *ft ideal topological space* $(\chi, \tau, Đ, ɻ)$, let $(F, Đ) \in ŞŞ(\chi)_Đ$ then $(F, Đ)$ is a soft-ɻ-*pre-g*-closed set (briefly sɻ*pg*-closed). If $(F, Đ) - (\eta, Đ) \in ɻ$ then , $cl(F, Đ) - (\eta, Đ) \in ɻ$ for each $(\eta, Đ) \in ŞpO(\chi)$. And $\tilde{\chi} - (F, Đ)$ is a *soft*-ɻ-*pre-g*-open set (briefly *s*ɻ*pg*-open set).

The family of all $s\mathfrak{g}pg$- closed sets (briefly $s\mathfrak{g}pg$-C(Ϫ)) and the family of all $s\mathfrak{g}pg$-open soft sets (briefly $s\mathfrak{g}pg$-O(Ϫ)$_{Đ}$).

Example 3.2: For a space $(Ϫ, Ţ, Đ, \mathfrak{g})$,where $Ϫ = \{e_{\mathfrak{g}}, m_{\mathfrak{g}}\}$, $Đ = \{d_1, d_2\}$,$Ţ=\{\tilde{\emptyset},\tilde{X}, (Ғ, Đ), (Ƞ, Đ)\}$, $\mathfrak{g} = \{\tilde{\emptyset}, \mathcal{M}\}$ such *that* $(Ғ, Đ) = \{(d_1, \{\emptyset\}), (d_2, \{e_{\mathfrak{g}}\})\}$, and$(Ƞ,Đ)=\{(d_1,\{e_{\mathfrak{g}}\}),(d_2,\{e_{\mathfrak{g}}\})\}$ and $(M, Đ) = \{(d_1, \{\emptyset\}), (d_2, \{e_{\mathfrak{g}}\})\}$ then $Ş p O(Ϫ)=\{\tilde{\emptyset}, \tilde{Ϫ}, (Ғ, Đ), (Ƞ, Đ), (\mathcal{Z}, Đ), (\mathcal{H}, Đ), (\mathcal{E}, Đ), (\mathcal{N}, Đ), (\mathcal{G}, Đ)\}$, $s\mathfrak{g}pg$-$C(Ϫ)_{Đ}=\{\tilde{Ϫ}, \tilde{\emptyset}, (Ғ', Đ), (Ƞ', Đ)\}$; $(Ғ', Đ))=\{(d_1, \{Ϫ\}), (d_2, \{m_{\mathfrak{g}}\})\}$, $(Ƞ', Đ)=\{(d_1,\{m_{\mathfrak{g}}\}),(d_2,\{m_{\mathfrak{g}}\})\}$ such that $(\mathcal{Z}, Đ)=\{(d_1,\emptyset),(d_2, \chi)\}$, $(\mathcal{H}, Đ) = \{(d_1, \{e_{\mathfrak{g}}\}), (d_2, \chi)\}$, $(\mathcal{E}, Đ)=\{(d_1,\{m_{\mathfrak{g}}\}),(d_2,\{e_{\mathfrak{g}}\})\}$, $(\mathcal{N}, Đ)=\{(d_1,\{m_{\mathfrak{g}}\}),(d_2, \chi)\}$ and $(\mathcal{G}, Đ)= \{(d_1, \chi) ,(d_2,\{e_{\mathfrak{g}}\})\}$.

Remark 3.3: For any $(Ϫ, Ţ, Đ, \mathfrak{g})$ then
i. Every closed $soft\ set$ is a $s\mathfrak{g}pg$-closed.
ii. Every $open\ soft\ set$ is a $s\mathfrak{g}pg$-open.

Proof (i) Let $(\mathcal{M}, Đ)$ $be\ any\ closed\ soft\ set\ in$ $(Ϫ, Ţ, Đ, \mathfrak{g})$ and $(Ƞ, Đ)$ be a $soft\ pre$-open set such that $(\mathcal{M}, Đ) - (Ƞ, Đ) \in \mathfrak{g}$, but $cl(\mathcal{M}, Đ) = (\mathcal{M}, Đ)$, since $(\mathcal{M}, Đ)$ is a closed soft set so, $cl(\mathcal{M}, Đ)$-$(Ƞ, Đ) = (\mathcal{M}, Đ) - (Ƞ, Đ) \in \mathfrak{g}$ this implies $(\mathcal{M}, Đ)$ is a soft-$\mathfrak{g}$-pre-g-closed soft set.

(ii) Let $(Ƞ, Đ)$ $be\ any$ open $soft$ set in $(Ϫ, Ţ, Đ, \mathfrak{g})$ $then$ $\tilde{Ϫ} - (Ƞ, Đ)$ is a closed $soft$ set this $implies$ by (i) $(\tilde{Ϫ} - (\mathcal{M}, Đ))is$ a $s\mathfrak{g}pg$-closed set $thus$ $(\mathcal{M}, Đ)$is a $s\mathfrak{g}pg$-open soft set .
The converse of $Remark$ 3;3 is not hold. See Example 3:2
i. Let $(\mathcal{E}', Đ) = \{(\hbar_1, \{e_{\mathfrak{g}}\}), (\hbar_2, \{m_{\mathfrak{g}}\})\}$ is a $s\mathfrak{g}pg$-closed set, but $(\mathcal{E}, Đ)$ is not $closed\ soft$ set.
ii. Let $(\mathcal{G}, Đ)= \{(\hbar_1, \{m_{\mathfrak{g}}\}), (\hbar_2, \{e_{\mathfrak{g}}\})\}$ is a $s\mathfrak{g}pg$-open set, but $(\mathcal{G}, Đ) \notin Ţ$.

Definition 3.4: The function $f_{\beta\Psi}$: $(Ϫ, Ţ, Đ) \rightarrow (Ϋ, \square, \mathcal{S})$ be $soft\ topological\ spaces\ over$ Ϫ and Y respectively . Let Γ: Ϫ→Ϫ and Φ:Đ →$\mathcal{S}$ are two functions be a mapping. Let $f_{\Phi\Gamma}$: Ş Ş(Ϫ)$_{Đ}$→ Ş Ş(Ϋ)$_{\mathcal{S}}$ be a function. then the function $f_{\Phi\Gamma}$ is called
(1)soft open if $f_{\Phi\Gamma}((Ƞ, Đ)) \in \square, \forall (Ƞ, Đ) \in Ţ$
(2)soft continuous if $f_{\Phi\Gamma}^{-1}((Ƞ, Đ)) \in Ţ$, $\forall (Ƞ, Đ) \in \square$

Definition 3.5: The function $f_{\beta\Psi}$: $(Ϫ, Ţ, Đ, \mathfrak{g}) \rightarrow (Ϋ, \square, \mathcal{S}, Ï)$ is called
i. Soft-$\mathfrak{g}$-pre-g-open function, (briefly s$\mathfrak{g}$pg-O-function), if $f_{\Phi\Gamma}((Ƞ, Đ)) \in s Ïpg$-O(Ϋ)$_{\mathcal{S}}$ whenever, $(Ƞ, Đ) \in s\mathfrak{g}pg$-O(Ϫ)$_{Đ}$.
ii. Soft-$\mathfrak{g}^*$-pre-g-open function, (briefly $s\mathfrak{g}^*pg$-O-function), if $f_{\Phi\Gamma}((Ƞ, Đ)) \in s Ïpg$-O(Ϋ)$_{\mathcal{S}}$ whenever,$(Ƞ, Đ) \in Ţ$.
iii. Soft-$\mathfrak{g}^{**}$-pre-g-open function, (briefly $s\mathfrak{g}^{**}pg$-O-function), if $f_{\Phi\Gamma}((Ƞ, Đ)) \in \square$ whenever,$(Ƞ, Đ) \in s\mathfrak{g}pg$-O(Ϫ)$_{Đ}$.

Proposition 3.6: Let $f_{\Phi\Gamma}$: $(Ϫ, Ţ, Đ, \mathfrak{g}) \rightarrow (Ϋ, \square, \mathcal{S}, Ï)$ is a $function$
i. If $f_{\Phi\Gamma}$ is a soft open $function\ then$ $f_{\Phi\Gamma}$ is a $s\mathfrak{g}^*pg$-O-$function$.
ii. If $f_{\Phi\Gamma}$ is a $s\mathfrak{g}^{**}pg$-O-$function\ then$ $f_{\Phi\Gamma}$ is a soft open $function$.
iii. If $f_{\Phi\Gamma}$ is a $s\mathfrak{g}pg$-O-$function\ then$ $f_{\Phi\Gamma}$ is a $s\mathfrak{g}^*pg$-O-$function$.
iv. If $f_{\Phi\Gamma}$ is a $s\mathfrak{g}^{**}pg$-O-$function\ then$ $f_{\Phi\Gamma}$ is a $s\mathfrak{g}pg$-O-$function$.
Proof:
i. Let $(Ƞ, Đ) \in Ţ$ since $f_{\Phi\Gamma}$ is a $soft\ open\ function,\ then$ $f_{\Phi\Gamma}((Ƞ, Đ)) \in \square$. By $Remark$ 3.3, $f_{\Phi\Gamma}((Ƞ, Đ)) \in s\mathfrak{g}pg$-O(Ϋ) . Hence $f_{\Phi\Gamma}$ is a $s\mathfrak{g}^*pg$O-function.
ii. Let $(Ƞ, Đ) \in Ţ$. By Remark 3.3, $(Ƞ, Đ) \in s\mathfrak{g}pg$-O(Ϫ)$_{Đ}$. Since $f_{\Phi\Gamma}$ is a $s\mathfrak{g}^{**}pgo$-$function$, then $f_{\Phi\Gamma}((Ƞ, Đ))$ $is\ an\ open\ in$ $(Ϋ, \square, \mathcal{S})$. Hence $f_{\Phi\Gamma}$ is an open $function$.
iii. Let $(Ƞ, Đ) \in Ţ$. By $Remark$ 3.3, $(Ƞ, Đ)$ is a $s\mathfrak{g}pg$-O(Ϫ)$_{Đ}$, since $f_{\Phi\Gamma}$ is a $s\mathfrak{g}pg$-O-$function$, then $f_{\Phi\Gamma}$ $(Ƞ, Đ) \in s\mathfrak{g}pg$-o(Ϋ)$_{\mathcal{S}}$. Hence $f_{\Phi\Gamma}$ is a $s\mathfrak{g}^*pg$-O-$function$.

iv. Let $(\eta, Đ) \in s\psi pg\text{-O}(\chi)_Đ$. Since $f_{ΦΓ}$ is a $s\psi^{**}pgo\text{-}function$, then $f_{ΦΓ}((\eta, Đ))$ $is\ a\ soft\ open\ in\ (\Upsilon, \square, \mathcal{S})$. By $Remark$ 3.3., $f_{ΦΓ}((\eta, Đ)) \in s\psi pg\text{-O}(\Upsilon)_{\mathcal{S}}$. Hence $f_{ΦΓ}$ is a $s\psi pg$o-function.

The inverse is not true. See the following examples.

Example 3.7: The function $f_{ΦΓ} : (\chi, \tau, Đ, \psi) \to (\chi, \tau, Đ, Ï)$ where , $\tau = \{ \tilde{\chi}, \tilde{\emptyset}, (Ғ, Đ)$; $Ғ(d) = \{e_ψ\}$, for all $d \in Đ\}$ where, $\chi = \{e_ψ, m_ψ, r_ψ\}$, $Đ = \{d_1, d_2\}$, $\psi = \{\tilde{\emptyset}\}$ and $Ï = Ş\S(\{\chi\})_Đ$ where, $Φ$: $Đ \to Đ$ such that $Φ(d_1) = \{d_1\}$, $Φ(d_2) = \{d_2\}$ and $Γ : \chi \to \chi$ such that $Γ(e_ψ) = \{m_ψ\}$, $Γ(m_ψ) = \{e_ψ\}$, $Γ(r_ψ) = \{r_ψ\}$ then $Ş pO(\chi) = \{(\mathcal{M}, Đ);\ e_ψ \in (\mathcal{M}, Đ)\}$for some $(d_i \in Đ)$such that i $=\{1,2\}$, then $s\psi pg\text{-O}(\chi)_Đ = \tau$, $s\psi pg\text{-C}(\chi)_Đ = \{ \tilde{\chi}, \tilde{\emptyset}, (Ғ', Đ)$; $Ғ'(d) = \{m_ψ, r_ψ\}$ for every $d \in Đ\}$ and $sÏpg\text{-C}(\chi)_Đ = sÏpg\text{-O-}(\chi)_Đ = Ş\S(\chi)_Đ$. Then $f_{ΦΓ}$ is a $s\psi pg$-O-function and $s\psi^{*}pg$-O-function which is not $s\psi^{**}pg$-O-function and not soft open function. Since$(Ғ, Đ) \in \tau$, but $f_{ΦΓ}((Ғ, Đ)) = (\mathcal{W}, Đ) \in Ş\S(\chi)_Đ$ such that $\mathcal{W}(d) = \{m_ψ\}\ \forall\ d \in Đ$, which is not open soft set.

Example 3.8: The function $f_{ΦΓ} : (\chi, \tau, Đ, \psi) \to (\chi, \tau, Đ, Ï)$ where, $\tau = \{\tilde{\chi}, \tilde{\emptyset}, (Ғ, Đ)$; $Ғ(d) = \{e_ψ\}$, for all $d \in Đ\}$ where, $\chi = \{e_ψ, m_ψ, r_ψ\}$, $Đ = \{d_1, d_2\}$, $Ï = \{\tilde{\emptyset}\}$ and $\psi = Ş\S(\{\chi\})_Đ$ where $Φ : Đ \to Đ$ such that $Φ(d_1) = \{d_1\}$, $Φ(d_2) = \{d_2\}$ and $Γ : \chi \to \chi$ such that $Γ(e_ψ) = \{e_ψ\}$, $Γ(m_ψ) = \{m_ψ\}$, $Γ(r_ψ) = \{r_ψ\}$ then $Ş pO(\chi) = \{(\mathcal{M}, Đ)$;$e_ψ \in (\mathcal{M}, Đ)\}$for some $(d_i \in Đ)$such that i $=\{1,2\}$, $s\psi pg\text{-C}(\chi)_{\mathcal{H}} = s\psi pg\text{-O}(\chi)_Đ = Ş\S(\chi)_{\mathcal{H}}$ .So, $sÏpg\text{-C-}(\chi)_Đ = \{ \tilde{\emptyset}, \tilde{\chi}, (Ғ', Đ)$; $Ғ'(d) = \{m_ψ, r_ψ\}$ for every $(d \in Đ)\}$ and $sÏpg\text{-O}(\chi)_Đ = \tau$. It is possible to see that $f_{ΦΓ}$ is open function and $s\psi^{*}pgc$-function which is not $s\psi pg$o-function and not $s\psi^{**}pg$-O-function. Since $(\mathcal{U}, Đ) \in s\psi pg\text{-O}(\chi) = Ş\S(\chi)_Đ$ such that $\mathcal{U}(d) = \{r_ψ\}$, but $f_{ΦΓ}((\mathcal{U}, Đ)) = (\mathcal{U}, Đ) \notin s\psi pg\text{-O}(\chi)_Đ = \tau\ (\forall\ d \in Đ)$.

Definition 3.9: The function $f_{ΦΓ}: (\chi, \tau, Đ, \psi) \to (\Upsilon, \square, \mathcal{S}, Ï)$ is a

i. Soft-ψ-p$re\text{-}g$-closed function, (briefly $s\psi pg$-C-function), if $f_{ΦΓ}((\eta, Đ)) \in s\psi pg\text{-C-}(\Upsilon)_{\mathcal{S}}$ whenever, $(\eta, Đ) \in s\psi pg\text{-C}(\chi)_Đ$.

ii. Soft-ψ^{*}-$pre\text{-}g$-closed function, (briefly $s\psi^{*}pg$-C-function), if $f_{ΦΓ}((\eta, Đ)) \in sÏpg\text{-C-}(\Upsilon)_{\mathcal{S}}$ whenever, $(\eta, Đ)$ is a soft closed set in $(\chi, \tau, Đ)$.

iii. soft-ψ^{**}-p$re\text{-}g$-closed function, (briefly $s\psi^{**}pg$-C-function), if $f_{ΦΓ}(\eta, Đ))$ is a soft closed set in $(\Upsilon, \square, \mathcal{S})$ whenever, $(\eta, Đ) \in s\psi pg\text{-C-}(\chi)_Đ$.

Proposition 3.10: Let $f_{ΦΓ}: (\chi, \tau, Đ, \psi) \to (\Upsilon, \square, \mathcal{S}, Ï)$ is a $function$

i. If $f_{ΦΓ}$ is a soft closed $function\ then$ $f_{ΦΓ}$ is a $s\psi^{*}pg\text{-C-}function.$

ii. If $f_{ΦΓ}$ is a $s\psi^{**}pg\text{-C-}function\ then$ $f_{ΦΓ}$ is a $soft\ closed\ function.$

iii. If $f_{ΦΓ}$ is a $s\psi pg\text{-C-}function\ then$ $f_{ΦΓ}$ is a $s\psi^{*}pg\text{-C-}function.$

iv. If $f_{ΦΓ}$ is a $s\psi^{**}pg\text{-C-}function\ then$ $f_{ΦΓ}$ is a $s\psi pg\text{-C-}function.$

By Proposition 3.10 proof is over.

Example 3.7 and example 3.8 shows the inverse of Proposition 3.10.

Definition 3.11: The $function$ $f_{ΦΓ}: (\chi, \tau, Đ, \psi) \to (\Upsilon, \square, \mathcal{S}, Ï)$ is called

i. soft-ψ-p$re\text{-}g$-continuous $function$, (briefly $s\psi pg$-continuous function), if $f_{ΦΓ}^{-1}((\mathcal{Z}, Đ))$ is a $s\psi pg$-$\text{O}(\chi)_Đ$for all $(\mathcal{Z}, Đ) \in \square$.

ii. strongly soft-ψ-p$re\text{-}g$-continuous $function$, (briefly strongly-$s\psi pg\text{-}continuous\ function$), if $f_{ΦΓ}^{-1}((\mathcal{Z}, Đ)) \in \tau$ for every $(\mathcal{Z}, Đ)$ is a $sÏpg$-open in Υ.

iii. soft-ψ-p$re\text{-}g$-irresolute $function$ (briefly $s\psi pg$-irresolute-function), if $f_{ΦΓ}^{-1}((\mathcal{Z}, Đ))$ is a $s\psi pg$O-$(\chi)_Đ$ for every $(\mathcal{Z}, Đ)$ is $s\psi pg\text{-O}(\Upsilon)_{\mathcal{S}}$.

Proposition 3.12: Let $f_{ΦΓ}: (\chi, \tau, Đ, \psi) \to (\Upsilon, \square, \mathcal{S}, Ï)$ is a function;

i. If $f_{ΦΓ}$ $a\ soft\ continuous\ function$, then $f_{ΦΓ}$ is a $s\psi pg$-continuous-$function.$

ii. If $f_{ΦΓ}$ is a strongly-$s\psi pg$-continuous $function$, $then$ $f_{ΦΓ}$ is a soft continuous $function.$

iii. If $f_{\Phi\Gamma}$ *is* a strongly-s$\mathfrak{l}pg$-continuous $function$, then $f_{\Phi\Gamma}$ is a s$\mathfrak{l}pg$-irresolute-$function$.
Proof:

i. *Let* $(\mathcal{Z}, Đ) \in$ □Since $f_{\Phi\Gamma}$ is a continuous $function$, *then*, $f_{\Phi\Gamma}^{-1}((\mathcal{Z}, Đ))$ is a soft open in $(Ϫ, Ţ, Đ)$. By *Remark* 3.3, $f_{\Phi\Gamma}^{-1}((\mathcal{Z}, Đ)) \in$ s$\mathfrak{l}pg$-O-$(Ϫ)_Đ$. Hence, $f_{\Phi\Gamma}$ is a s$\mathfrak{l}pg$-continuous-$function$.

ii. Let $(\mathcal{Z}, Đ)$ is an open sub set of $(Ύ, □, \mathcal{S})$. By *Remark* 3.3, $(\mathcal{Z}, Đ) \in$ sÏpg-open subset of $(Ύ, □, \mathcal{S}, Ï)$. Since if $f_{\Phi\Gamma}$ is a strongly-s$\mathfrak{l}pg$-continuous $function$, then $f_{\Phi\Gamma}^{-1}((\mathcal{Z}, Đ))$ is an open in $(Ϫ, Ţ, Đ)$. Hence $f_{\Phi\Gamma}$ is a continuous $function$.

iii. Let $(\mathcal{Z}, Đ) \in$ sÏpg-open subset of $(Ύ, □, \mathcal{S}, Ï)$.Since $f_{\Phi\Gamma}$ strongly-s$\mathfrak{l}pg$-continuous $function$, $f_{\Phi\Gamma}^{-1}((\mathcal{Z}, Đ)) \in Ţ$. By *Remark* 3.3, $f_{\Phi\Gamma}^{-1}((\mathcal{Z}, Đ)) \in$ s$\mathfrak{l}pg$-O$(Ϫ)_Đ$. Hence $f_{\Phi\Gamma}$ is a s$\mathfrak{l}pg$-irresolute-$function$.

The inverse is not true. See the following examples.

Example 3.13: The function $f_{\Phi\Gamma} : (Ϫ, Ţ, Đ, \mathfrak{l}) \to (Ϫ, Ţ, Đ, Ï)$ where, $Ţ=\{\widetilde{Ϫ}, \widetilde{Ø}, (Ƒ, Đ); Ƒ(d)=\{e_{\mathfrak{l}}\}$, for all $d \in Đ\}$ where, $Ϫ= \{e_{\mathfrak{l}}, m_{\mathfrak{l}}, r_{\mathfrak{l}}\}$, $Đ = \{d_1, d_2\}$ $\mathfrak{l}= \{\widetilde{Ø}\}$ and $Ï = ŞŞ(\{Ϫ\})_Đ$ $Φ : Đ \to Đ$ such that $Φ(d_1)=\{d_1\}$, $Φ(d_2) = \{d_2\}$ and $Γ: Ϫ \to Ϫ$ such that $Γ(e_{\mathfrak{l}}) = \{e_{\mathfrak{l}}\}, Γ(m_{\mathfrak{l}}) = \{m_{\mathfrak{l}}\}, Γ(r_{\mathfrak{l}}) = \{r_{\mathfrak{l}}\}$ then $ŞpO(Ϫ) = \{(\mathcal{M}, Đ)$;$e_{\mathfrak{l}} \in (\mathcal{M}, Đ)\}$for some $(d_i \in Đ)$such that i ={1,2} , s$\mathfrak{l}pg$-C-$(Ϫ)_Đ$= $\{\widetilde{Ø}, \widetilde{Ϫ}, (Ƒ', Đ); Ƒ'(d) = \{m_{\mathfrak{l}}, r_{\mathfrak{l}}\}$ for every $d \in Đ\}$ and s$\mathfrak{l}pg$-O$(Ϫ)_Đ$= $Ţ$ and sÏpg-C$(Ϫ)_Đ$= sÏpg-O$(Ϫ)_Đ$ = $ŞŞ(Ϫ)_Đ$ Now, $f_{\Phi\Gamma}$ is a continuous and is a s$\mathfrak{l}pg$-continuous function and it is not s$\mathfrak{l}pg$-irresolute function and not strongly-s$\mathfrak{l}pg$-continuous function. Since $(\mathcal{W}, Đ) \in ŞŞ(Ϫ)$; $\mathcal{W}(d) = \{m_{\mathfrak{l}}\}$ $(\forall\, d \in Đ)$ is a sÏpg-open set, but $f_{\Phi\Gamma}^{-1}((\mathcal{W}, Đ)) = (\mathcal{W}, Đ)$ which is not s$\mathfrak{l}pg$-open soft set and not open soft set.

Example 3.14: The function $f_{\Phi\Gamma} : (Ϫ, Ţ, Đ, \mathfrak{l}) \to (Ϫ, Ţ, Đ, Ï)$ where, $Ţ= \{\widetilde{Ϫ}, \widetilde{Ø}, (Ƒ, Đ); Ƒ(d)=\{e_{\mathfrak{l}}\}$, for all $d \in Đ\}$ where, $Ϫ= \{e_{\mathfrak{l}}, m_{\mathfrak{l}}, r_{\mathfrak{l}}\}$, $Đ = \{d_1, d_2\}$ $Ï= \{Ø\}$ and $\mathfrak{l}= ŞŞ(\{Ϫ\})_Đ$ $Φ : Đ \to Đ$ such that $Φ(d_1)=\{d_1\}$, $Φ(d_2)=\{d_2\}$ and $Γ : Ϫ \to Ϫ$ such that $Γ(e_{\mathfrak{l}}) = \{m_{\mathfrak{l}}\}, Γ(m_{\mathfrak{l}}) = \{e_{\mathfrak{l}}\}, Γ(r_{\mathfrak{l}}) = \{r_{\mathfrak{l}}\}$ then $ŞpO(Ϫ)= \{(\mathcal{M}, Đ)$;$e_{\mathfrak{l}} \in (\mathcal{M}, Đ)\}$for some $(d_i \in Đ)$such that i ={1,2} , s$\mathfrak{l}pg$-C$(Ϫ)_Đ$ = s$\mathfrak{l}pg$-O$(Ϫ)_Đ$ = $ŞŞ(Ϫ)_Đ$. So, sÏpg-C$(Ϫ)_Đ$= $\{\widetilde{Ø}, \widetilde{Ϫ}, (Ƒ', Đ); Ƒ'(d)= \{m_{\mathfrak{l}}, r_{\mathfrak{l}}\}$ for every $d \in Đ\}$ and sÏpg-O$(Ϫ)_Đ$= $Ţ$. Hence, $f_{\Phi\Gamma}$ is a s$\mathfrak{l}pg$-continuous function and s$\mathfrak{l}pg$-irresolute function which is not soft continuous and not strongly-s$\mathfrak{l}pg$-continuous function. Since $(Ƒ, Đ); Ƒ(d)=\{e_{\mathfrak{l}}\}$ $(\forall\, d \in Đ)$ is open soft set and s$\mathfrak{l}pg$-O-open set, but , $f_{\Phi\Gamma}^{-1}((Ƒ, Đ)) = (\mathcal{Z}, Đ)$ such that $\mathcal{Z}(d)=\{m_{\mathfrak{l}}\}$ $\forall\, d$ which is not open soft set.

4. Separation Axioms with soft-$\mathfrak{l}$- pre-g-open Sets.

Definition 4.1. A space $(Ϫ, Ţ, Đ, \mathfrak{l})$ is a soft-$\mathfrak{l}$-pre-g-$Ţ_0$-space (briefly s$\mathfrak{l}pg$-$Ţ_0$-space), if for each $ɖ_{\mathcal{M}} \neq ɖ_{\mathcal{N}}$ and $ɖ_{\mathcal{M}}, ɖ_{\mathcal{N}} \widetilde{\in} \widetilde{Ϫ}$, $\exists$ $(□, Đ) \in$ s$\mathfrak{l}$pg-O$(Ϫ)_Đ$ whenever, $ɖ_{\mathcal{M}} \widetilde{\in} (□, Đ)$, $ɖ_{\mathcal{N}} \widetilde{\notin} (□, Đ)$ or $ɖ_{\mathcal{M}} \widetilde{\notin} (□, Đ)$, $ɖ_{\mathcal{N}} \widetilde{\in} (□, Đ)$.

Example 4.2. In $(Ϫ, Ţ, Đ, \mathfrak{l})$ Let $Ϫ= \{e_{\mathfrak{l}}, m_{\mathfrak{l}}, r_{\mathfrak{l}}\}$, $Đ= \{ɖ_1, ɖ_2\}$, $Ţ= \{\widetilde{Ϫ}, \widetilde{Ø}, (□, Đ), (\mathcal{Z}, Đ)\}$ where, $((□, Đ) = \{(ɖ_1, \{e_{\mathfrak{l}}\}), (ɖ_2, \{e_{\mathfrak{l}}\})\}$, $(\mathcal{Z}, Đ) = \{(ɖ_1, \{e_{\mathfrak{l}}, m_{\mathfrak{l}}\}), (ɖ_2, \{e_{\mathfrak{l}}, m_{\mathfrak{l}}\})\}$ and $\mathfrak{l}= \{\widetilde{Ø}\}$. Then $ŞpO(Ϫ)_Đ= \{(Ƒ, Đ)$; $e_{\mathfrak{l}} \in (Ƒ, Đ)$ for some $ɖ \in Đ\}$. So, s$\mathfrak{l}pg$-$C(Ϫ)_{\mathcal{H}} = \{\widetilde{Ø}, \widetilde{\chi}, (□', Đ), (\mathcal{Z}', Đ)\}$ and s$\mathfrak{l}pg$-$O(\chi)_{\mathcal{H}} = Ţ$, hence $((Ϫ, Ţ, Đ, \mathfrak{l}))$ is a s$\mathfrak{l}pg$-$Ţ_0$-space. Since $\forall$ $ɖ_{\mathcal{M}} \neq ɖ$, $\exists$ $(Ƞ, Đ) \in$ s$\mathfrak{l}pg$-O$(Ϫ)_Đ$ whenever, $ɖ_{\mathcal{M}} \widetilde{\in} (Ƞ, Đ,)$, $ɖ_{\mathcal{N}} \widetilde{\notin} (Ƞ, Đ)$ or $ɖ_{\mathcal{M}} \widetilde{\notin} (Ƞ, Đ)$, $ɖ_{\mathcal{N}} \widetilde{\in} (Ƞ, Đ)$.

Proposition 4.3.If $(Ϫ, Ţ, Đ)$ is a soft-$Ţ_0$-space then $(Ϫ, Ţ, Đ, \mathfrak{l})$ is a s$\mathfrak{l}pg$-$Ţ_0$-space.
Proof : Let $ɖ_{\mathcal{M}}, ɖ_{\mathcal{N}} \widetilde{\in} \widetilde{Ϫ}$ such that $ɖ_{\mathcal{M}} \neq ɖ_{\mathcal{N}}$ since $(Ϫ, Ţ, Đ)$ is a soft-$Ţ_0$-space, then $\exists$ $(Ƞ, Đ) \in Ţ$ whenever, $ɖ_{\mathcal{M}} \widetilde{\in} (Ƞ, Đ)$, $ɖ_{\mathcal{N}} \widetilde{\notin} (Ƞ, Đ)$ or $ħ_{\mathcal{M}} \widetilde{\notin} (Ƞ, Đ)$, $ɖ_{\mathcal{N}} \widetilde{\in} (Ƞ, Đ)$. By *Remark* 3.3, $(Ƞ, Đ)$ is a s$\mathfrak{l}pg$-open set $such\ that$ $ɖ_{\mathcal{M}} \widetilde{\in} (Ƞ, Đ)$ and $ɖ_{\mathcal{N}} \widetilde{\notin} (Ƞ, Đ)$ or $ɖ_{\mathcal{M}} \widetilde{\notin} (Ƞ, Đ)$ and $ɖ_{\mathcal{N}} \widetilde{\in} (Ƞ, Đ)$.

Definition 4.4. $(Ϫ, Ţ, Đ, \mathfrak{l})$ is a soft-$\mathfrak{l}$-pre-g-$Ţ_1$-space (briefly s$\mathfrak{l}pg$-$Ţ_1$-space),If for each $ɖ_{\mathcal{M}}$, $ɖ_{\mathcal{N}} \widetilde{\in} \widetilde{\widetilde{Ϫ}}$ and $ɖ_{\mathcal{M}} \neq ɖ_{\mathcal{N}}$. Then there are s$\mathfrak{l}pg$-open sets $(Ƞ_1, Đ)$, $(Ƞ_2, Đ)$ whenever, $Đ_{\mathcal{M}} \widetilde{\in} ((Ƞ_1, Đ) - (Ƞ_2, Đ))$ and $ɖ_{\mathcal{N}} \widetilde{\in} ((Ƞ_2, Đ) - (Ƞ_1, Đ))$.

Example 4.5. A topological space $(X, \tau, Đ, ļ)$ when $X = \mathbb{N}$ *the set* of all *tural numbers*, $\tau = \tau_{Scof} = \{ F_{\mathcal{A}} : F'(ḍ)$ is finite set $\forall ḍ \} \cup \{\tilde{\emptyset}\}$ and $ļ = \{\tilde{\emptyset}\}$. so $(X, \tau, Đ, ļ)$ is a $sļpg$-τ_1-space. If $ḍ_{\mathcal{M}}, ḍ_{\mathcal{N}} \tilde{\in} \tilde{X}$ and $ḍ_{\mathcal{M}} \neq ḍ_{\mathcal{N}}$. Then there are $sļpg$-*open* sets $(\tilde{X} - ḥ_{\mathcal{N}})$, $(\tilde{X} - ḥ_{\mathcal{M}})$ whenever, $ḥ_{\mathcal{N}}$ and $ḥ_{\mathcal{M}}$ are two *finite* sets such that $ḥ_{\mathcal{N}} \subseteq ḍ_{\mathcal{N}}$, $ḥ_{\mathcal{M}} \subseteq ḍ_{\mathcal{M}}$ such that $ḍ_{\mathcal{M}} \tilde{\in} (\tilde{X} - ḥ_{\mathcal{N}})$ and $ḍ_{\mathcal{N}} \tilde{\in} (\tilde{X} - ḥ_{\mathcal{M}})$ and $(\tilde{X} - ḥ_{\mathcal{N}}) \tilde{\cap} (\tilde{X} - ḥ_{\mathcal{M}}) \neq \{\emptyset\}$.

Proposition 4.6. If $(X, \tau, Đ)$ is a $soft$-τ_1-space then, $(X, \tau, Đ, ļ)$ is a soft-$ļ$-pre-g-τ_1-space.
Proof : Let $ḍ_{\mathcal{M}}, ḍ_{\mathcal{N}} \tilde{\in} \tilde{X}$ such that $ḍ_{\mathcal{M}} \neq ḍ_{\mathcal{N}}$ since $(X, \tau, Đ)$ is a soft-τ_1-space, then $\exists$ $(\eta_1, Đ), (\eta_2, Đ) \in \tau$ such that $ḍ_{\mathcal{M}} \tilde{\in} ((\eta_1, Đ) - (\eta_2, Đ))$ and $ḍ_{\mathcal{N}} \tilde{\in} ((\eta_2, Đ) - (\eta_1, Đ))$. *By Remark* 3.3, $(\eta_1, Đ)$ and $(\eta_2, Đ)$ are $sļpg$-open sets , and the proof is over .

Proposition 4.7. If $(X, \tau, Đ, ļ)$ is a $sļpg$-τ_1-space then it is a $sļpg$-τ_0-*space*.
Proof : Let $ḍ_{\mathcal{M}}$, $ḍ_{\mathcal{N}} \tilde{\in} \tilde{X}$ such that $ḍ_{\mathcal{M}} \neq ḍ_{\mathcal{N}}$ since $(X, \tau, Đ, ļ)$ is a $sļpg$-τ_1-*space*, then $\exists (\eta_1, Đ), (\eta_2, Đ) \in sļpg$-$O(X)_Đ$ such that, $ḍ_{\mathcal{M}} \tilde{\in} ((\eta_1, Đ) - (\eta_2, Đ))$ and $ḍ_{\mathcal{N}} \tilde{\in} ((\eta_2, Đ) - (\eta_1, Đ))$. Then $\exists$ $(\eta , Đ) \in sļpg$-$O(X)_Đ$ -open set *whenever*, $ḍ_{\mathcal{M}} \tilde{\in} (\eta , Đ)$, $ḍ_{\mathcal{N}} \tilde{\notin} (\eta , Đ)$ or $ḍ_{\mathcal{M}} \tilde{\notin} (\eta , Đ)$, $ḍ_{\mathcal{N}} \tilde{\in} (\eta , Đ)$.
The conclusions in Proposition 4.7, is not *reversible* by *example* 4.8.

Example 4.8. $(X, \tau, Đ, ļ)$; $X = \{ę , ṃ , ṛ\}$, $\tau = \{\tilde{X}, \tilde{\emptyset}, (\eta, Đ)\}$such that $(\eta, Đ) = \{(ḍ_1 , \{ę , ṃ\}), (ḍ_2 , \{ę , ṃ\})\}$ and $ļ = ŞŞ(\{ṃ, ṛ\})$. Then $Şp O(X)_Đ$ =All $ŞŞ(X)$ $/(⍰, Đ); \{ṛ\} \tilde{\in} (⍰, Đ) \cup \{\tilde{\emptyset}\}$. So, $sļpg$-$C(X)_Đ$ =$\{ \tilde{\emptyset}$, $\tilde{X}$,$(\eta', Đ)\}$ $\cup (\mathcal{Z}, Đ) \cup (\mathcal{M}, Đ)$; $(\mathcal{Z}, Đ)$=$\{(ḍ_1, \{\emptyset\}), (ḍ_2, \{ṛ\})\}$, and $(M, Đ)$=$\{(ḍ_1, \{ṛ\}), (ḍ_2, \{\emptyset\})\}$ And $sļpg$-$O(X)_Đ$= $\tau \cup (\mathcal{Z}', Đ) \cup (\mathcal{M}', Đ)\}$; $(\mathcal{Z}', Đ)$=$\{(ḍ_1, X), (ḍ_2, \{ę, ṃ\})\}$ and $(\mathcal{M}', Đ)$=$\{(ḍ_1, \{ę , ṃ\}), (ḍ_2, X)\}$. Implies $(X, \tau, Đ, ļ)$ is a $soft$-τ_0-*space*, but not $sļpg$-τ_1-*space* .

Definition 4.9. $(X, \tau, Đ, ļ)$ is a soft-$ļ$-pre-g-τ_2-space (briefly sļpg-τ_2-space). If for any two *different elements* $ḍ_{\mathcal{M}} \neq ḍ_{\mathcal{N}}$ there are $sļpg$-*open* sets $(⍰_1, Đ)$, $(⍰_2, Đ)$ such that $ḍ_{\mathcal{M}} \tilde{\in} (⍰_1, Đ)$, $ḍ_{\mathcal{N}} \tilde{\in} (⍰_2, Đ)$and $(⍰_1, Đ) \cap (⍰_2, Đ) = \{\tilde{\emptyset}\}$.

Example 4.10. A *topological* space $(X, \tau, Đ, ļ)$; $X = \{ę, ṃ , ṛ\}$, $\tau = \{\tilde{X}, \tilde{\emptyset}\}$ and $ļ = ŞŞ(X)_Đ$ .Then $ŞpO(X)_Đ$ = τ. So, $sļpg$-$C(X)_Đ$ = $sļpg$-$O(X)_Đ$ = $ŞŞ(X)_Đ$. Then $(X, \tau, Đ, ļ)$ is a $sļpg$-τ_2-*space*.
Remark 4.11. If $(X, \tau, Đ)$ is a soft-τ_2-*space*, then $(X, \tau, Đ, ļ)$ is a $sļpg$-τ_2-*space*.
Proof : Let $ḍ_{\mathcal{M}}$, $ḍ_{\mathcal{N}} \tilde{\in} \tilde{X}$ whenever, $ḍ_{\mathcal{M}} \neq ḍ_{\mathcal{N}}$ since $(X, \tau, Đ, ļ)$ is a soft-τ_2-*space*, then $\exists$ $(⍰_1, Đ), (⍰_2, Đ) \in \tau$ *such* that $ḍ_{\mathcal{M}} \tilde{\in} (⍰_1, Đ)$, $ḍ_{\mathcal{N}} \tilde{\in} (⍰_2, Đ)$ and $(⍰_1, Đ) \tilde{\cap} (⍰_2, Đ) = \{\tilde{\emptyset}\}$. By Remark 3.3, there are $sļpg$-open sets $(⍰_1, Đ), (⍰_2, Đ)$, such that $ḍ_{\mathcal{M}} \tilde{\in} (⍰_1, Đ)$, $ḍ_{\mathcal{N}} \tilde{\in} (⍰_2, Đ)$ and $(⍰_1, Đ) \tilde{\cap} (⍰_2, Đ) = \{\tilde{\emptyset}\}$.

Remark 4.12. If $(X, \tau, Đ, ļ)$ is a $sļpg$-τ_2-*space* then it is a $sļpg$-τ_1-*space*.
Proof : Let $ḍ_{\mathcal{M}}$, $ḍ_{\mathcal{N}} \tilde{\in} \tilde{X}$ whenever, $ḍ_{\mathcal{M}} \neq ḍ_{\mathcal{N}}$ since $(X, \tau, Đ, ļ)$ is a $sļpg$-τ_2-*space* ,then there are $sļpg$-open sets $(⍰_1, Đ)$, $(⍰_2, Đ)$ such that $ḍ_{\mathcal{M}} \tilde{\in} (⍰_1, Đ)$, $ḍ_{\mathcal{N}} \tilde{\in} (⍰_2, Đ)$ and $(⍰_1, Đ) \cap (⍰_2, Đ) = \{ \tilde{\emptyset} \}$. Implies, $ħ_{\mathcal{M}} \tilde{\in} ((⍰_1, Đ) - (⍰_2, Đ))$ and $ħ_{\mathcal{N}} \tilde{\in} ((⍰_2, Đ) - (⍰_1, Đ))$.
The *conclusions* in Remark 4.12, is not *reversible* by example 4.5.
A space $(X, \tau, Đ, ļ)$ is a $sļpg$-τ_1-space. If for each, $ḍ_{\mathcal{M}}$, $ḍ_{\mathcal{N}} \tilde{\in} \tilde{X}$ and $ḍ_{\mathcal{M}} \neq ḍ_{\mathcal{N}}$. Then there are $sļpg$-open sets $(\tilde{X} - ḍ_{\mathcal{N}})$, $(\tilde{X} - ḍ_{\mathcal{M}})$ whenever, $ḍ_{\mathcal{M}} \tilde{\in} ((\tilde{X} - ḍ_{\mathcal{N}}) - (\tilde{X} - ḍ_{\mathcal{M}}))$ and $ḍ_{\mathcal{N}} \tilde{\in} ((\tilde{X} - ḍ_{\mathcal{M}}) - (\tilde{X} - ḍ_{\mathcal{N}}))$ .Which is not $sļpg$-τ_2-space. Since for any two $sļpg$-open sets $(⍰_1, Đ)$, $(⍰_2, Đ)$ such that $ḍ_{\mathcal{M}} \tilde{\in} (⍰_1, Đ)$, $ḍ_{\mathcal{N}} \tilde{\in} (⍰_2, Đ)$ then $(⍰_1, Đ) \cap (⍰_2, Đ) \neq \tilde{\emptyset}$. We have *previously noted* that X is a $sļpg$-τ_i-*space* whenever, it is a τ_{i+1}-*space* $(\forall\, i = 0 , 1 \text{ and } 2)$.
The opposite is not *generally achieved* as the following example shows:

Example 4.13. $(X, \tau, Đ, ļ)$ is a $sļpg$-τ_i-*space* $(i \in \{0,1,2\})$, where, $X = \{ę, ṃ , ṛ\}$, $\tau = \{\tilde{\emptyset}, \tilde{\chi}\}$ and $ļ = ŞŞ(X)_Đ$ So, $sļpg$-$C(X)_Đ$ = $sļpg$-$O(X)_Đ$ = $ŞŞ(X)_Đ$. But the space $(X, \tau, Đ)$ is not soft-τ_i-*space* (i $\in$

$\{0,1,2\}$) . The following figure shows the relationship between the various types of concepts we mentioned earlier.

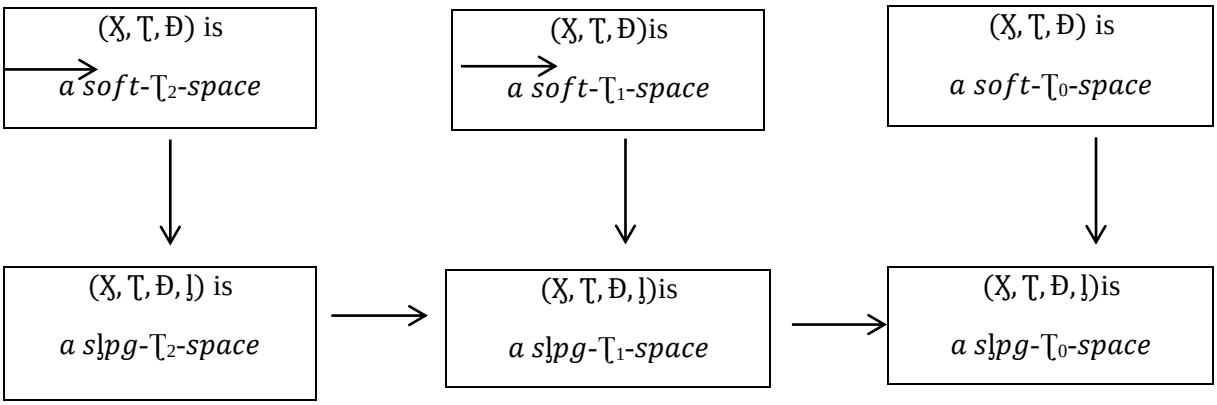

Figure 1

5. Separation axioms with pre types of ft functions.

Proposition 5.1. If $(Ϫ, Ƭ, Đ, ļ)$ is a $sļpg$-$Ƭ_i$-$space$ (i $\in \{0,1,2\}$) and $ƒ_{ΦΓ}$ is a bijective $sļpg$-O-$function$ from $(Ϫ, Ƭ, Đ, ļ)$ to $(Ƴ, ⍰, \mathcal{S}, Ï)$ then Y is a $sÏpg$-$Ƭ_i$-space ($i \in \{0,1,2\}$).

Proof :

If $= 0$: Let $ɖ_{\mathcal{R}}$, $ɖ_{\mathcal{S}} \widetilde{\in} \widetilde{Ƴ}$ such that $ɖ_{\mathcal{R}} \neq ɖ_{\mathcal{S}}$. Since $ƒ_{ΦΓ}$ is a $jective\ function$, Then $ƒ_{ΦΓ}^{-1}(ɖ_{\mathcal{R}}) \neq \{\widetilde{∅}\} \neq ƒ_{ΦΓ}^{-1}(ɖ_{\mathcal{S}})$ and $ƒ_{ΦΓ}^{-1}(ɖ_{\mathcal{R}})$, $ƒ_{ΦΓ}^{-1}(ɖ_c) \widetilde{\in} \widetilde{Ϫ}$ .So, $(Ϫ, Ƭ, Đ, ļ)$ is a $sļpg$-$Ƭ_0$-$space$, then $\exists\ (Ƞ , Đ) \in sļpg$-$O(Ϫ)_Đ$ whenever, $ƒ_{ΦΓ}^{-1}(ɖ_{\mathcal{R}}) \widetilde{\in} (Ƞ , Đ)$, $ƒ_{ΦΓ}^{-1}(ɖ_c) \widetilde{\notin} (Ƞ , Đ)$ or $ƒ_{ΦΓ}^{-1}(ɖ_{\mathcal{R}}) \widetilde{\notin} (Ƞ , Đ)$, $ƒ_{ΦΓ}^{-1}(ɖ_c) \widetilde{\in} (Ƞ , Đ)$. Since $ƒ_{ΦΓ}$ is a $sļpg$-O-function, then $ƒ_{ΦΓ}((Ƞ , Đ))$ is a $sÏpg$-open set such that $ɖ_{\mathcal{R}} \widetilde{\in} ƒ_{ΦΓ}((Ƞ , Đ))$ and $ɖ_c \widetilde{\notin} ƒ_{ΦΓ}((Ƞ , Đ))$ or . $ɖ_{\mathcal{R}} \widetilde{\notin} ƒ_{ΦΓ}((Ƞ , Đ))$ and $ɖ_{\mathcal{S}} \widetilde{\in} ƒ_{ΦΓ}((Ƞ , Đ))$ Hence Y is a $sÏpg$-$Ƭ_0$-space.

If $= 1$: Let $ɖ_{\mathcal{R}}$, $ɖ_c \widetilde{\in} \widetilde{Ƴ}$ such that $ɖ_{\mathcal{R}} \neq ɖ_c$. Since $ƒ_{ΦΓ}$ is a $bijective\ function$, then $ƒ_{ΦΓ}^{-1}(ɖ_{\mathcal{R}}) \neq \{\widetilde{∅}\} \neq ƒ_{ΦΓ}^{-1}(ɖ_c)$, $f_{ΦΓ}^{-1}(ɖ_{\mathcal{R}})$, $ƒ_{ΦΓ}^{-1}(ɖ_c) \widetilde{\in} \widetilde{Ϫ}$. So, Ϫ is a $sļpg$-$Ƭ_1$-$space$, then $\exists\ (Ƞ_1,Đ)$, $(Ƞ_2,Đ) \in sļpg$-$O(Ϫ)_Đ$ such that $ƒ_{ΦΓ}^{-1}(ɖ_{\mathcal{R}}) \widetilde{\in} ((Ƞ_1,Đ) - (Ƞ_2,Đ))$, $ƒ_{ΦΓ}^{-1}(ɖ_c) \widetilde{\in} ((Ƞ_2,Đ) - (Ƞ_1,Đ))$. By the condition $ƒ_{ΦΓ}^{-1}$ is a $sļpg$-O-$function$, $ƒ_{ΦΓ}^{-1}((Ƞ_1,Đ))$, $ƒ_{ΦΓ}^{-1}((Ƞ_2,Đ))$ are $sÏpg$-open sets in $Ƴ$ such that $ɖ_{\mathcal{R}} \widetilde{\in} (ƒ_{ΦΓ}^{-1}((Ƞ_1,Đ)) - ƒ_{ΦΓ}^{-1}((Ƞ_2,Đ)))$ and $ɖ_c \widetilde{\in} (ƒ_{ΦΓ}^{-1}((Ƞ_2,Đ)) - ƒ_{ΦΓ}^{-1}((Ƞ_1,Đ)))$. Hence $Ƴ$ is a $sÏpg$-$Ƭ_1$-space.

If $i = 2$: Let $ɖ_{\mathcal{R}}$, $ɖ_c \widetilde{\in} \widetilde{Ƴ}$ such that $ɖ_{\mathcal{R}} \neq ɖ_c$. Since $ƒ_{ΦΓ}$ is a $bijective\ function$, then $ƒ_{ΦΓ}^{-1}(ɖ_{\mathcal{R}}) \neq \{\widetilde{∅}\} \neq ƒ_{ΦΓ}^{-1}(ɖ_c)$, $ƒ_{ΦΓ}^{-1}(ɖ_{\mathcal{R}})$, $ƒ_{ΦΓ}^{-1}(ɖ_c) \widetilde{\in} \widetilde{Ϫ}$. So, Ϫ is a $sļpg$-$Ƭ_2$-$space$, then there $\exists\ (⍰_1,Đ)$, $(⍰_2,Đ) \in sļpg$-$O(Ϫ)_Đ$ whenever, $ƒ_{ΦΓ}^{-1}(ɖ_{\mathcal{R}}) \widetilde{\in} ((⍰_1,Đ))$, $ƒ_{ΦΓ}^{-1}(ɖ_{\mathcal{S}}) \widetilde{\notin} ((⍰_2,Đ))$ and $(⍰_1,Đ) \cap (⍰_2,Đ) = \{\widetilde{∅}\}$. By the condition $ƒ_{ΦΓ}$ is a $sļpg$-O-$function$, then $ƒ_{ΦΓ}((⍰_1,Đ))$ and $ƒ_{ΦΓ}((⍰_2,Đ)) \in sÏpg$-O-$(Ƴ)_{\mathcal{S}}$ whenever, $ɖ_{\mathcal{R}} \widetilde{\in} ƒ_{ΦΓ}((⍰_1,Đ))$, $ɖ_c \widetilde{\in} ƒ_{ΦΓ}((⍰_2,Đ))$ and $ƒ_{ΦΓ}((⍰_1,Đ)) \widetilde{\cap} ƒ_{ΦΓ}((⍰_2,Đ)) = \{\widetilde{∅}\}$. $Hence$ Y is a $sÏpg$-$Ƭ_2$-$space$.

Proposition 5.2. If $(Ϫ, Ƭ, Đ, ļ)$ is a soft-$Ƭ_i$-$space$ (i $\in \{0,1,2\}$) and $ƒ_{ΦΓ}$ is a $bijective\ sļ^{*}pgo$-$function$ from $(Ϫ, Ƭ, Đ, ļ)$ to $(Ƴ , ⍰, \mathcal{S}, Ï)$ then Y is a $sÏpg$-$Ƭ_i$-space.
Proof : Start from the facts $ƒ_{ΦΓ}((Ƞ , Đ))$ is a $sÏpg$-open in Y for each $sļpg$-open sets $(Ƞ , Đ)$ in Ϫ.

$Proposition\ 5.3.$ If Ϫ is a $sļpg$-$Ƭ_i$-$space$ (i $\in \{0,1,2\}$) and $ƒ_{ΦΓ}$ is a $bijective$ $sļ^{**}pgo$-$function$ from $(Ϫ, Ƭ, Đ, ļ)$ to $(Ƴ , ⍰, \mathcal{S}, Ï)$ then, Y is a soft-$\mathcal{T}_i$-$space$ (i $\in \{0,1,2\}$).
Proof : Follow $ƒ_{ΦΓ}((Ƞ , Đ))$ is a $soft\ open$ in Y for each $sļpg$-$open$ sets $(Ƞ , Đ)$ in Ϫ.

Remark 5.4. If $ƒ_{ΦΓ}$ is a soft $open\ function$ from $(Ϫ, Ƭ, Đ)$ to $(Ƴ, ⍰, \mathcal{S})$

and$(\chi, \tau, Đ)$ is a soft τ_i-*space* whenever, (i ∈ {0,1,2}), then $(\Upsilon, ▯, \mathcal{S}, Ï)$ is a $s Ïpg$-τ_i-space, for any ideal Ï on Y.

Proposition 5.5. If Y is a soft τ_i-*space* whenever, ($i \in \{0,1,2\}$) *and* $f_{\Phi\Gamma} : (\chi, \tau, Đ, ⨌) \to (\Upsilon, ▯, \mathcal{S}, Ï)$ is an *bijective s⨌pg-continuous function* then $(\chi, \tau, Đ, ⨌)$ is a $s⨌pg$-τ_i-*space* (i ∈ {0,1,2}).
Proof :

If $i = 0$: Let $⨋_{\mathcal{M}}$, $⨋_{\mathcal{N}} \tilde{\in} \tilde{\chi}$ such that $⨋_{\mathcal{M}} \neq ⨋_{\mathcal{N}}$ since $f_{\beta\Psi}$ is *an bijective function* ,then $f_{\Phi\Gamma}(⨋_{\mathcal{M}}) \neq f_{\Phi\Gamma}(⨋_{\mathcal{N}})$ where, $f_{\Phi\Gamma}(⨋_{\mathcal{M}})$, $f_{\Phi\Gamma}(⨋_{\mathcal{N}}) \tilde{\in} \tilde{\Upsilon}$. So, $(\Upsilon, ▯, \mathcal{S})$ is a soft-τ_0-*space* ,*then* ∃ $(▯,\mathcal{S}) \in ▯$ whenever, $f_{\Phi\Gamma}(⨋_{\mathcal{M}}) \tilde{\in} (▯,\mathcal{S})$, $f_{\Phi\Gamma}(⨋_{\mathcal{N}}) \tilde{\notin} (▯,\mathcal{S})$ or $f_{\Phi\Gamma}(⨋_{\mathcal{M}}) \tilde{\notin} (▯,\mathcal{S})$, $f_{\Phi\Gamma}(⨋_{\mathcal{N}}) \tilde{\in} (▯,\mathcal{S})$. By $f_{\Phi\Gamma}$ is a $s⨌pg$-continuous function, then $f_{\Phi\Gamma}^{-1}((▯,\mathcal{S})) \in s⨌pg\text{-}O(\chi)_Đ$ *whenever*, $⨋_{\mathcal{M}} \tilde{\in} f_{\Phi\Gamma}^{-1}((▯,\mathcal{S}))$, $⨋_{\mathcal{N}} \tilde{\notin} f_{\Phi\Gamma}^{-1}((▯,\mathcal{S}))$ or $⨋_{\mathcal{M}} \tilde{\notin} f_{\Phi\Gamma}^{-1}((▯,\mathcal{S}))$, $⨋_{\mathcal{N}} \tilde{\in} f_{\Phi\Gamma}^{-1}((▯,\mathcal{S}))$. Hence $(\chi, \tau, Đ, ⨌)$ is a $s⨌pg$-τ_0-space.

If $i = 1$: Let $⨋_{\mathcal{M}}$, $⨋_{\mathcal{N}} \tilde{\in} \tilde{\chi}$ such that $⨋_{\mathcal{M}} \neq ⨋_{\mathcal{N}}$ since $f_{\Phi\Gamma}$ is an *bijective function* then $f_{\Phi\Gamma}(⨋_{\mathcal{M}}) \neq f_{\Phi\Gamma}(⨋_{\mathcal{N}})$ where, $f_{\Phi\Gamma}(⨋_{\mathcal{M}})$, $f_{\Phi\Gamma}(⨋_{\mathcal{N}}) \tilde{\in} \tilde{\Upsilon}$. So, $(\Upsilon, ▯, \mathcal{S})$ is a soft-τ_1-*space*, *then* ∃ $(▯_1,\mathcal{S})$, $(▯_2,\mathcal{S}) \in ▯$ whenever, $f_{\Phi\Gamma}(⨋_{\mathcal{M}}) \tilde{\in} ((▯_1,\mathcal{S})$ *and* $f_{\Phi\Gamma}(⨋_{\mathcal{N}}) \tilde{\notin} (▯_1,\mathcal{S})$ and $f_{\Phi\Gamma}(⨋_{\mathcal{M}}) \tilde{\notin} ((▯_2,\mathcal{S})$ and $f_{\Phi\Gamma}(⨋_{\mathcal{N}}) \tilde{\in} (▯_2,\mathcal{S})$. Since $f_{\Phi\Gamma}$ is a *s⨌pg-continuous function*, then $f_{\Phi\Gamma}^{-1}((▯_1,\mathcal{S}))$ and $f_{\Phi\Gamma}^{-1}((▯_2,\mathcal{S}))$ are $s⨌pg$-open sets whenever, $⨋_{\mathcal{M}} \tilde{\in} (f_{\Phi\Gamma}^{-1}(▯_1,\mathcal{S})$ and $⨋_{\mathcal{N}} \tilde{\notin} f_{\Phi\Gamma}^{-1}((▯_1,\mathcal{H})$ and $⨋_{\mathcal{M}} \tilde{\notin} (f_{\Phi\Gamma}^{-1}(▯_2,\mathcal{S})$ and $⨋_{\mathcal{N}} \tilde{\in} f_{\Phi\Gamma}^{-1}((▯_2,\mathcal{H})$. Hence $(\chi, \tau, Đ, ⨌)$is a $s⨌pg$-τ_1-space.

If $i = 2$: Let $⨋_{\mathcal{M}}$, $⨋_{\mathcal{N}} \tilde{\in} \tilde{\chi}$ such that $⨋_{\mathcal{M}} \neq ⨋_{\mathcal{N}}$ since $f_{\Phi\Gamma}$ is an *bijective function*, then $f_{\Phi\Gamma}(⨋_{\mathcal{M}}) \neq f_{\Phi\Gamma}(⨋_{\mathcal{N}})$ where, $f_{\Phi\Gamma}(⨋_{\mathcal{M}})$, $f_{\Phi\Gamma}(⨋_{\mathcal{N}}) \tilde{\in} \tilde{\Upsilon}$. So, $(\Upsilon, ▯, \mathcal{S})$ is a soft-τ_2-*space*, *then* ∃ $(▯_1,\mathcal{S})$, $(▯_2,\mathcal{S}) \in ▯$ such that, $f_{\Phi\Gamma}(⨋_{\mathcal{M}}) \tilde{\in} ((▯_1,\mathcal{S}))$, $f_{\Phi\Gamma}(⨋_{\mathcal{N}}) \tilde{\in} ((▯_2,\mathcal{S}))$ and $((▯_1,\mathcal{S})) \tilde{\cap} ((▯_2,\mathcal{S})) = \tilde{\emptyset}$. Since $f_{\Phi\Gamma}$ is a *s⨌pg-continuous function*, then $f_{\Phi\Gamma}^{-1}((▯_1,\mathcal{S}))$ and $f_{\Phi\Gamma}^{-1}((▯_2,\mathcal{S}))$ are $s⨌pg$-open sets implies, $⨋_{\mathcal{M}} \tilde{\in} (f_{\Phi\Gamma}^{-1}((▯_1,\boldsymbol{\mathcal{S}}))$, $⨋_{\mathcal{N}} \tilde{\in} (f_{\Phi\Gamma}^{-1}((▯_2,\boldsymbol{\mathcal{S}})))$ and $(f_{\Phi\Gamma}^{-1}((▯_1,\boldsymbol{\mathcal{S}}))) \tilde{\cap} (f_{\Phi\Gamma}^{-1}((▯_2,\boldsymbol{\mathcal{S}}))) = \{\tilde{\emptyset}\}$.So, $(\chi, \tau, Đ, ⨌)$is a $\boldsymbol{s⨌pg}$-τ_2-space.

Corollary 5.6. If Y is a soft-τ_i-*space* whenever, (i ∈ {0,1,2}) and $f_{\Phi\Gamma} : (\chi, \tau, Đ, ⨌) \to (\Upsilon, ▯, \mathcal{S}, Ï)$ is an *bijective soft*-continuous *function* then χ is a $s⨌pg$-τ_i-space (i ∈ {0,1,2}).
Proof: Since, every *soft* continuous *function* is a *s⨌pg-continuous* by *proposition* 3.12 then Remark 5.4 , is *applicable*.

Proposition 5.7. If $(\Upsilon, ▯, \mathcal{S}, Ï)$ is a $sÏpg$-τ_i-*space* whenever, ($i \in \{0,1,2\}$) and $f_{\Phi\Gamma} : (\chi, \tau, Đ, ⨌) \to (\Upsilon, ▯, \mathcal{S}, Ï)$ is an *bijective strongly-s⨌pg-continuous function* then $(\chi, \tau, Đ, ⨌)$ is a soft-τ_i-*space*.
Proof*: Follows* from, $f_{Φ⨌}^{-1}((▯,Đ)) \in \tau$ for each $(▯,Đ) \tilde{\in} sÏpg\text{-}O(\Upsilon)_{\mathcal{S}}$.

Proposition 5.8. If $(\Upsilon, ▯, \mathcal{S}, Ï)$ is a $sÏpg$-τ_i-*space* whenever, (i ∈ {0,1,2}) and $f_{\Phi\Gamma} : (\chi, \tau, Đ, ⨌) \to (\Upsilon, ▯, \mathcal{S}, Ï)$ is an *bijective s⨌pg-irresolute function* then χ is a $s⨌pg$-τ_i-space whenever, ($i \in \{0,1,2\}$).
Proof : Since $f_{\Phi\Gamma}^{-1}((▯,Đ)) \tilde{\in} s⨌pg\text{-}O(\chi)_Đ$ for each $(▯,Đ) \tilde{\in} sÏpg\text{-}O(\Upsilon)_{\mathcal{S}}$.

6. Soft-⨌- pre-g-Convergence Sequence.

Definition 6.1: In a space $(\chi, \tau, Đ, ⨌)$where, $⨏_{\mathcal{M}} \in \wp(\chi)/\chi$ then the soft sequence $(S_n)_{n\in\mathbb{N}}$ over χ is called *soft-⨌-pre-g-convergence* to $⨏_{\mathcal{M}}$ (briefly, $S_n \rightarrowtail ⨏$) if for all $s⨌pg$-open set $(\eta, Đ)$ where, $⨏_{\mathcal{M}} \tilde{\in} (\eta, Đ)$, there exist $k \in \mathbb{N}$ *such that* $S_n \tilde{\in} (\eta, Đ)$ for every $n \geqslant k$.

A soft sequence $(S_n)_{n\in\mathbb{N}}$ is a *soft-⨌-pre-g-divergence* if it is not *soft-⨌-pre-g-convergence*.

Theorem 6.2*:* If $(\chi, \tau, Đ, ⨌)$ is a soft-⨌-*pre-g*-τ_2-*space then* every soft-⨌-*pre-g-convergence sequence* over χ has *only* one limit point.

Proof: Let $(S_n)_{n\in\mathbb{N}}$ is a soft *sequence* over χ and $S_n \rightarrowtail \aleph_{\mathcal{M}}$, $S_n \rightarrowtail \aleph_{\mathcal{N}}$; $\aleph_{\mathcal{M}} \neq \aleph_{\mathcal{N}}$ where, $\aleph_{\mathcal{M}}$, $\aleph_{\mathcal{N}} \in \mathcal{P}(\chi)/\chi$. Since $(\chi, \tau, Đ, ļ)$ is a *sļpg*-τ_2-space, then $\exists$ $(\square_1, Đ)$, $(\square_2, Đ) \in$ *sļpg-O*$(\chi)_Đ$ such that $\aleph_{\mathcal{M}} \tilde{\in} (\square_1, Đ)$, $\aleph_{\mathcal{N}} \tilde{\in} (\square_2, Đ)$ and $(\square_1, Đ) \cap (\square_2, Đ) = \{\tilde{\emptyset}\}$. Now, since $S_n \rightarrowtail \aleph_{\mathcal{M}}$ and $\aleph_{\mathcal{M}} \tilde{\in} (\square_1, Đ)$ implies $\exists k_1 \in \mathbb{N}$; $S_n \in (\square_1, Đ)$ $\forall\, n \geq k_1$. And $S_n \rightarrowtail \aleph_{\mathcal{N}}$ and $\aleph_{\mathcal{N}} \tilde{\in} (\square_2, Đ)$ *implies* $\exists k_2 \in \mathbb{N}$; $S_n \in (\square_2, Đ)$ $\forall\, n \geq k_2$. Leads to $(\square_1, Đ) \tilde{\cap} (\square_2, Đ) \neq \tilde{\emptyset}$ where that *contradiction*.

The precondition is that a space $\tilde{\chi}$ is a *sļpg*-τ_2-*space* is *very requisite* to *make theorem* 5.5, is valid.

By Example 4.2, where, $Ş pO(\chi)_Đ = \{ (F, Đ) ; e_ḍ \in (F, Đ)$ for some $ḍ \in Đ\}$. So, *sļpg-C*$(\chi)_{\mathcal{H}} = \{ \tilde{\emptyset}$, $\tilde{\chi}, (\square', Đ)$, $(\mathcal{Z}', Đ)$ $\}$ and *sļpg-O*$(\chi)_{\mathcal{H}} = \tau$. Obviously; the sequence $(S_n)_{n\in\mathbb{N}}$ over χ, where $S_n = \{ṛ\}$ for all n, has one limit point; $S_n \rightarrowtail \{ṛ\}$. But $(\chi, \tau, Đ, ļ)$ is not *sļpg*- τ_2- space.

Proposition 6.3*:* If a soft *sequence* $(S_n)_{n\in\mathbb{N}}$ is a soft-ļ-*pre-g-convergence* to $\aleph_{\mathcal{M}}$ in a soft ideal space χ, then it is soft *convergent* to $\aleph_{\mathcal{M}}$.
Proof: Let $(\eta, Đ)$ is a soft open set where, $\aleph_{\mathcal{M}} \tilde{\in} (\eta, Đ)$. By Remark 3.3, $(\eta, Đ)$ is a *sļpg-open set* where, $\aleph_{\mathcal{M}} \tilde{\in} (\eta, Đ)$. Since $(S_n)_{n\in\mathbb{N}}$ is a *soft*-ļ-*pre-g*-convergence to $\aleph$, *then* $\exists\ k \in \mathbb{N}$ whenever, $S_n \in (\eta, Đ)$ for every $n \geqslant k$. Hence $(S_n)_{n\in\mathbb{N}}$ is *convergent* to $\aleph_{\mathcal{M}}$.

The *conversely* in *Example* 6.4, *is not reversible*, in general.

Example 6.4*: Let* ļ is a soft ideal in a *space* $(\chi, \tau, Đ, ļ)$ where, $\chi = \mathbb{N}$, $\tau = \{ \tilde{\emptyset}$, $\tilde{\chi}\}$ and ļ = $Ş Ş(\chi)_Đ$. So $Ş pO(\chi) = \{ \tilde{\emptyset}$, $\tilde{\chi}$ $\} = \tau$, then *sļpg-C*$(\chi)_Đ$ = *sļpg-O*$(\chi)_Đ$ = $Ş Ş(\chi)_Đ$. The soft *quence* $(S_n)_{n\in\mathbb{N}}$, where $S_n = \{n\}$ $\forall\ n \in \mathbb{N}$, is *soft convergent* to $\aleph_{\mathcal{M}}$ $\forall$ $\aleph_{\mathcal{M}} \tilde{\in} \mathcal{P}(\chi)/\chi$ which is not soft-ļ-*pre-g-convergent*. *Since let* F: $\mathbb{N} \longrightarrow \mathcal{P}(\chi)$ *such that* F $(n) = \{e_ḍ\}$ $\forall\ n$. $\{e_ḍ\} \tilde{\in}$ (F, $\mathbb{N}$), *but* $S_n \not\subseteq$ (F, $\mathbb{N}$) $\forall\ k \in \mathbb{N}$ such that $n \geq k$.

Proposition 6.5*:* Let $f_{\Phi\Gamma}$: $(\chi, \tau, Đ, ļ) \rightarrow (\Upsilon, \square, \mathcal{S}, Ï)$ be an bijective and *sļpg*-irresolute function and $(S_n)_{n\in\mathbb{N}}$ be a soft *sequence* over χ, *then* $(f_{\Phi\Gamma}(S_n)) \rightarrowtail f_{\Phi\Gamma}(\aleph_{\mathcal{M}})$ in Υ whenever, $S_n \rightarrowtail \aleph_{\mathcal{M}}$ in χ.

Proof*:* Let $(\eta, \mathcal{S})$ is a sÏpg-open set in Υ where $f_{\Phi\Gamma}(\aleph_{\mathcal{M}}) \tilde{\in} (\eta, \mathcal{S})$. Since $f_{\Phi\Gamma}$ is a *sļpg-irresolute function*, then $f_{\Phi\Gamma}{}^{-1}((\eta, \mathcal{S}))$ is a sļpg-*open* set *where*, $\aleph_{\mathcal{M}} \tilde{\in} f_{\Phi\Gamma}{}^{-1}((\eta, \mathcal{S}))$. By $(S_n)_{n\in\mathbb{N}}$ is soft-ļ-*pre-g-convergence* to $\aleph_{\mathcal{M}}$, *then there exis*t $k \in \mathbb{N}$ where, $S_n \in f_{\Phi\Gamma}{}^{-1}((\eta, \mathcal{S}))$ for all n ≥ k. Implies, *there* exist $k \in \mathbb{N}$ where, $f_{\Phi\Gamma}(S_n) \tilde{\in} (\eta, \mathcal{S})$ for all n ≥ k. Hence $f_{\Phi\Gamma}(S_n)$ is a soft-ļ-*pre-g-convergence* to $f_{\Phi\Gamma}(\aleph_{\mathcal{M}})$.

Theorem 6.6*:* If $f_{\beta\Psi}$: $(\chi, \tau, Đ, ļ) \rightarrow (\Upsilon, \square, \mathcal{S}, Ï)$ be an *bijective* and a *sļpg-continuous* function and $(S_n)_{n\in\mathbb{N}}$ be a soft *sequence* over χ. *Then* $(f_{\Phi\Gamma}(S_n)) \longrightarrow f_{\Phi\Gamma}(\aleph_{\mathcal{M}})$ in Υ whenever, $S_n \rightarrowtail \aleph_{\mathcal{M}}$ in χ.
Proof: Let $(\eta, \mathcal{S})$ is a soft-open set in $(\Upsilon, \square, \mathcal{S}, Ï)$where, $f_{\Phi\Gamma}(\aleph_{\mathcal{M}}) \tilde{\in} (\eta, \mathcal{S})$. Since $f_{\Phi\Gamma}$ is a *sļpg*-continuous function, then $f_{\Phi\Gamma}{}^{-1}((\eta, \mathcal{S}))$ is a sļpg-*open* set in $\tilde{\chi}$ where, $\aleph_{\mathcal{M}} \tilde{\in} f_{\Phi\Gamma}{}^{-1}((\eta, \mathcal{S}))$. By $(S_n)_{n\in\mathbb{N}}$ is soft-ļ-*pre-g*-convergence to $\aleph_{\mathcal{M}}$, then there exist $k \in \mathbb{N}$ where, $S_n \tilde{\in} f_{\Phi\Gamma}{}^{-1}((\eta, \mathcal{S}))$ for all $n \geq k$. Implies, there exist $k \in \mathbb{N}$ where, $f_{\Phi\Gamma}(S_n) \tilde{\in} (\eta, \mathcal{S})$ for all $n \geq k$. Hence $f_{\Phi\Gamma}(S_n)$ is a *convergence* to $f_{\Phi\Gamma}(\aleph_{\mathcal{M}})$.

Proposition 6.7*:* If $f_{\Phi\Gamma}$: $(\chi, \tau, Đ, ļ) \rightarrow (\Upsilon, \square, \mathcal{S}, Ï)$ be a strongly-sļpg-*continuous function* and $(S_n)_{n\in\mathbb{N}}$ be a soft sequence over χ . Then $(f_{\Phi\Gamma}(S_n)) \rightarrowtail f_{\Phi\Gamma}(\aleph_{\mathcal{M}})$ in Υ whenever, $S_n \longrightarrow \aleph_{\mathcal{M}}$ in χ.
Proof: Let $(\eta, \mathcal{S})$ is a *sÏpg*-open set in $(\Upsilon, \square, \mathcal{S}, Ï)$where, $f_{\Phi\Gamma}(\aleph_{\mathcal{M}}) \tilde{\in} (\eta, \mathcal{S})$. Since $f_{\Phi\Gamma}$ is a *sļpg-continuous* function, *then* $f_{\Phi\Gamma}{}^{-1}((\eta, \mathcal{S}))$ is an open set in $Ş Ş(\chi)_Đ$ where, $\aleph_{\mathcal{M}} \tilde{\in} f_{\Phi\Gamma}{}^{-1}((\eta, \mathcal{S}))$. By $(S_n)_{n\in\mathbb{N}}$ is convergence to $\aleph_{\mathcal{M}}$, *then* there exist k ∈ $\mathbb{N}$ where, $S_n \tilde{\in} f_{\Phi\Gamma}{}^{-1}((\eta, \mathcal{S}))$ for all $n \geq k$. Implies, there exists $k \in \mathbb{N}$ *where*, $f_{\Phi\Gamma}(S_n) \tilde{\in} (\eta, \mathcal{S})$ for all n ≥ k. Hence $(f_{\Phi\Gamma}(S_n))$ is a soft-ļ-*pre*-g-*convergence* to $f_{\Phi\Gamma}(\aleph_{\mathcal{M}})$.

Abstract. In this work, the exact operational matrices for shifted Pell polynomials are achievable; so one can integrate and product the vector of basic functions s. The general form of the matrix of integration P is established, the dual matrix of integration Q is derived with general formulation, and the general form of the matrix derived from the product of two shifted Pell polynomials has been given. This idea is implemented on shifted Pell basis vector. Using such exact matrices, then the resident function of the equation is reached which can be written as $R.P(x)$, where R is an algebraic equation vector and $P(x)$ is the shifted Pell basis vector. The presented matrices can be utilized to find the approximate solution of differential equations, integral equation and the calculus of variations problems. An investigation for the convergence and error analysis of the proposed shifted Pell expansion is performed. Numerical treatment for problems in physics are included in this work to demonstrate the accuracy, easy to implement as well as accurate and satisfactory results with a small number of shifted Pell basis. Using operational matrices and the spectral technique are used together for solving Lane-Emden equation.

1. Introduction

Keywords: Shifted Pell polynomials, operation matrix, Lane-Emden equation, dual operation matrix, convergence analysis.

Approximating using an orthogonal family of functions has played an important role in the improvement of engineering, physical sciences, and mathematical analysis. In particular, classical orthogonal functions are applied extensively for the approximate solution of some problems together with spectral methods. For example, in [1], the collocation method was applied using sixth-kind Chebyshev polynomials for treating a class of fractional nonlinear quadratic integro-differential equations. An efficient approximate approach for fractional differential equations was proposed in [2-3] by applying a Tau-Collocation method. The authors in [4] investigated a computational scheme based Müntz polynomials and the collocation method for the approximate solution of fractional differential equations while Legendre collocation spectral technique was presented in [5] for numerically solving the high-order Volterra–Fredholm integro-differential equations.

Special attention has been given to different important orthogonal polynomials using spectral procedures, the explicit formula for the expansion coefficients of the integrals in terms of the original expansion coefficients of the polynomials are required. The new idea in this article, all the presented operational matrices are written in terms of power basis. The advantage has the new formulation of the operational matrices ids the easier computation of the coefficients. When reducing the original problem

to a set algebraic equations which are easy to solve. Moreover, only a small number of shifted Pell basis is required to reach a satisfactory results. The authors in [6] used Taylor wavelet method to solve Lane-Emden singular problems. Other techniques for solving Lane-Emden type equations are fractional Adomian decomposition [7], Legendre wavelets spectral technique [8], a general analytical solution [9], a special algorithm that produces an approximate polynomial solution [10], a modified Legendre-spectral method [11], Haar wavelet collocation [12], and analytical solutions [13]. For more works, one can see [14-17].

The Pell polynomials have become interested in numerical analysis from partial and theoretical points of view. There are Pell and modified Pell polynomials. The research papers dealing with Pell polynomials include some results and properties of either Pell or modified Pell polynomials [18-24]. The best of our knowledge up to now no analytical expressions for the operational matrices of integral, dual and the product of shifted Pell polynomials are given yet in the literature. This motivates our interest in shifted Pell polynomials. Moreover, utilize of shifted Pell polynomials in solving Lane-Emden equation is also studied in the present article.

The organization of this work is as follows: the definition of shifted Pell polynomials is given in section 2 with some important properties. In section 3-5 state with proof, the three formulas expressing explicitly the integration, dual integral and the product of two shifted Pell polynomials. The convergence analysis and error estimates are studied in section 6. Section 7 gives numerical examples to explain the numerical spectral solution of a Lane-Emden equation. Finally, section 8 lists some concluding remarks.

2. Properties of Shifted Pell Polynomials

The fundamental property of the shifted Pell polynomials is that the function is expressed in terms of the independent variable τ or vice versa.

$\overline{P}_0(\tau) = 0$

$\overline{P}_1(\tau) = 1$

$\overline{P}_2(\tau) = 4\tau - 2$

$\overline{P}_3(\tau) = 16\tau^2 - 16\tau + 5$

$\overline{P}_4(\tau) = 46\tau^3 - 96\tau^2 + 56\tau - 12$

$\overline{P}_5(\tau) = 256\tau^4 - 512\tau^3 + 432\tau^2 - 176\tau + 29$

and

$1 = \overline{P}_1(\tau)$

$\tau = \frac{1}{4}\left[\overline{P}_2(\tau) + 2\overline{P}_1(\tau)\right]$

$\tau^2 = \frac{1}{16}\left[\overline{P}_3(\tau) + 4\overline{P}_2(\tau) + 3\overline{P}_1(\tau)\right]$

$\tau^3 = \frac{1}{64}\left[\overline{P}_4(\tau) + 6\overline{P}_3(\tau) + 10\overline{P}_2(\tau) + 2\overline{P}_1(\tau)\right]$

The recurrence relation of the shifted Pell polynomials can be written as

$$\overline{P}_{n+1}(x) = (4\tau - 2)\overline{P}_n(x) + \overline{P}_{n-1}(\tau)) \quad (1)$$

where: $\overline{P}_0(\tau) = 0$, $\overline{P}_1(\tau) = 1$

The other property of the shifted Pell polynomials functions is that

$$\overline{P}_n(\tau) = \frac{1}{4n}\left(\dot{\overline{P}}_{n+1}(\tau) + \dot{\overline{P}}_{n-1}(\tau)\right) \quad (2)$$

A function $f(\tau)$ that is square integrable on $x\epsilon[0,1]$ can be expressed, exactly in terms of shifted Pell polynomials as

$$f(\tau) = \sum_{k=1}^{\infty} a_k \overline{P}_k(\tau) \quad (3)$$

The infinite series in Eq. 3, can be truncated to a sufficient order n to get

$$f(\tau) = \sum_{k=1}^{n} a_k \overline{P}_k(\tau) = A_n^T \overline{P}(\tau) \quad (4)$$

where: $A_n = [a_1 \quad a_2 \quad \dots \quad a_n]^T$ is called shifted Pell spectrum of $f(\tau)$ which makes orthogonal polynomials in general adequate for approximate computations in different complex applied mathematical problems.

$\overline{P}(\tau) = \left[\overline{P}_1(\tau) \quad \overline{P}_2(\tau) \quad \dots \quad \overline{P}_n(\tau)\right]^T$ is called the shifted Pell polynomials vector. The coefficients a_k in Eq. 4 are given by the following

$$a_k = < f(\tau), P_k(\tau) >, \quad k = 1,2, \dots, n \tag{5}$$

3. Matrix Form Shifted Pell Polynomials

Shifted Pell polynomials can be represented in the matrix form as follows

$$\overline{P}(\tau) = Z\ T \tag{6}$$

where: $\overline{P}(\tau) = \left[\overline{P}_1(\tau) \quad \overline{P}_2(\tau) \quad \dots \quad \overline{P}_n(\tau)\right]^T, T = (1 \quad \tau \quad \dots \quad \tau^n)^T,$
and the matrix Z is a $n \times n$ matrix defined by

$$Z = \begin{pmatrix} 1 & 0 & 0 & 0 & 0 & \dots & 0 \\ -2 & 4 & 0 & 0 & 0 & \dots & 0 \\ 5 & z_{21} & 4 & 0 & 0 & \dots & 0 \\ -12 & z_{31} & z_{32} & 4^3 & 0 & \dots & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \dots & \vdots \\ z_{io} & z_{n1} & z_{n2} & z_{n3} & z_{n4} & \dots & 4^{n-1} \end{pmatrix}$$

The first element of each row is

$$z_{io} = \sum_{k=0}^{\left[\frac{n}{2}\right]} (-1)^k 2^{n-2k} \binom{n-k}{k}, i = 0, 1, \dots, n$$

In addition, other elements are defined by

$$z_{ij} = 4z_{i-1,j-1} + 2z_{i-1,j} + z_{i-2,j}$$

4. Product of Shifted Pell Polynomials

Before solving the nonlinear TFF equation, we recall Weierstrass theorem [21]:

Theorem 4.1: The product of two shifted Pell polynomials is given by the expression

$$\overline{P}_n(\tau)\overline{P}_m(\tau) = \sum_{k=0}^{\min(n,m)-1} (-1)^k\, \overline{P}_{n+m-(2k+1)}(\tau),\ n, m > 1 \tag{7}$$

where: $\overline{P}_0(\tau)\overline{P}_m(\tau) = \overline{P}_0(\tau)$

Proof

Take $m = 1$, then one can get $\overline{P}_n(\tau)\overline{P}_1(\tau) = \overline{P}_n(\tau)$, this means that Eq. 7 is true for $m = 1$. Assume that Eq. 7 is true for m, that is

$$\overline{P}_n(\tau)\overline{P}_m(\tau) = \sum_{k=0}^{\min(n,m)-1} (-1)^k\, \overline{P}_{n+m-(2k+1)}(\tau)$$

Multiply both sides of this equation by $(4\tau - 2)$, yields

$$\overline{P}_n(\tau)((4\tau-2)\overline{P}_m(\tau)) = (4\tau-2)\sum_{k=0}^{\min(n,m)-1} (-1)^k\, \overline{P}_{n+m-(2k+1)}(\tau) \tag{8}$$

Using the important recurrence relation for shifted Pell polynomials

$(4\tau - 2)\overline{P}_n(\tau) = \overline{P}_{n+1}(\tau) - \overline{P}_{n-1}(\tau)$, this will lead to

$$\overline{P}_n(\tau)\left[\overline{P}_{m+1}(\tau) - \overline{P}_{m-1}(\tau)\right] = \sum_{k=0}^{\min(n,m)-1} (-1)^k \left[\overline{P}_{n+m-2k}(\tau) - \overline{P}_{n+m-(2k-2)}(\tau)\right]$$

$$\overline{P}_n(\tau)\overline{P}_{m+1}(\tau) = \overline{P}_n(\tau)\overline{P}_{m-1}(\tau) + \sum_{k=0}^{\min(n,m)-1} (-1)^k \left[\overline{P}_{n+m-2k}(\tau) - \overline{P}_{n+m-(2k-2)}(\tau)\right]$$

$$\overline{P}_n(\tau)\overline{P}_{m+1}(\tau) = \sum_{k=0}^{\min(n,m-1)-1} (-1)^k \overline{P}_{n+m-(2k+2)}(\tau)$$
$$+\sum_{k=0}^{\min(n,m)-1}(-1)\overline{P}_{n+m-2k}(\tau)\sum_{k=0}^{\min(n,m)-1}(-1)^k\overline{P}_{n+m-(2k+2)}(\tau) \quad (9)$$

From Eq. 9, it is easy to obtain the desired result.
That is

$$\overline{P}_n(\tau)\overline{P}_{m+1}(\tau) = \sum_{k=0}^{\min(n,m-1)-1} (-1)^k \overline{P}_{n+m-(2k+2)}(\tau)$$

5. Operation Matrix of Integration

The structure of shifted Pell operational matrix of integration is given. Take $n = 5$, in this case $\overline{P}(\tau) = \left[\overline{P}_1(\tau) \quad \overline{P}_2(\tau) \quad \overline{P}_3(\tau) \quad \overline{P}_4(\tau) \quad \overline{P}_5(\tau)\right]^T$. By integrating the vector $\overline{P}(\tau)$ from 0 to τ and representing them in matrix form, yields

$$\int_0^\tau \overline{P}_1(t)dt = \left[\tfrac{1}{2} \quad \tfrac{1}{4} \quad 0 \quad 0\right]\overline{P}(\tau)$$

$$\int_0^\tau \overline{P}_2(t)dt = \left[\frac{-5}{8} \quad 0 \quad \frac{1}{8} \quad 0\right]\overline{P}(\tau)$$

$$\int_0^\tau \overline{P}_3(t)dt = \left[\frac{14}{12} \quad \frac{1}{12} \quad 0 \quad \frac{1}{12} \quad 0\right]\overline{P}(\tau)$$

$$\int_0^\tau \overline{P}_4(t)dt = \left[\frac{34}{16} \quad 0 \quad \frac{1}{16} \quad 0 \quad \frac{1}{16}\right]\overline{P}(\tau)$$

$$\int_0^\tau \overline{P}_5(t)dt = \left[\frac{-82}{20} \quad 0 \quad 0 \quad \frac{1}{20} \quad 0\right]\overline{P}(\tau) + \frac{1}{20}\overline{P}_6(\tau)$$

Thus

$$\int_0^\tau \overline{P}(t)dt = R_{5\times5}\,\overline{P}(\tau) + \overline{P}_6(\tau)$$

where: $R_{5\times5} = \begin{pmatrix} \frac{1}{2} & \frac{1}{4} & 0 & 0 & 0 \\ \frac{5}{8} & 0 & \frac{1}{8} & 0 & 0 \\ \frac{-14}{12} & \frac{1}{12} & 0 & \frac{1}{12} & 0 \\ \frac{34}{16} & 0 & \frac{1}{16} & 0 & \frac{1}{16} \\ \frac{-82}{20} & 0 & 0 & \frac{1}{20} & 0 \end{pmatrix}$

$$\overline{P}_6(\tau) = \left[0 \quad 0 \quad 0 \quad 0 \quad \frac{1}{20}\right]^T$$

Fortunately, for general n, operational matrix of integration for shifted Pell polynomials has a regular expression, so no need to pre-calculate the corresponding operational matrix R and R for different n when dealing with the problems

$$\int_0^\tau \overline{P}(t)dt = R\,\overline{P}(\tau) + \overline{P}_{n+1}(\tau)$$

where: R is $n \times n$ matrix given by

$$\begin{pmatrix} \delta & \frac{1}{4} & 0 & 0 & \dots & 0 \\ -\delta & 0 & \frac{1}{8} & 0 & \dots & 0 \\ \delta & \frac{1}{12} & 0 & \frac{1}{12} & \dots & 0 \\ -\delta & 0 & \frac{1}{16} & 0 & \dots & 0 \\ \vdots & \vdots & \vdots & \vdots & \dots & \vdots \\ \delta & 0 & 0 & \frac{1}{4n} & \dots & \frac{1}{4n} \end{pmatrix}$$

$$\overline{P}(\tau) = \begin{bmatrix} \overline{P}_1(\tau) & \overline{P}_2(\tau) & \dots & \overline{P}_n(\tau) \end{bmatrix}^T$$

$$\overline{P}_{n+1}(\tau) = \begin{bmatrix} 0 & 0 & 0 \dots & 0 & \frac{1}{4n} \end{bmatrix}^T$$

$$\delta = \overline{P}_{n+1}(0) + \overline{P}_{n-1}(0)$$

$$\delta = \begin{cases} \sum_{k=0}^{\left[\frac{n}{2}\right]} 2^{n-2k} \binom{n-k}{k} & n\ odd \\ -\sum_{k=0}^{\left[\frac{n}{2}\right]} 2^{n-2k} \binom{n-k}{k} & n\ even \end{cases}$$

6. Dual Operational Matrix

The dual operational matrix of $\overline{P}(\tau)$ is presented in this section. The integration of the cross product is taken of two shifted Pell basis vectors; the results is $(n+1) \times (n+1)$ dimensional matrix which is indicated by

$$H = \int_0^1 \overline{P}(\tau)\overline{P}^T(\tau)d\tau \quad (10)$$

The matrix H is called the dual operational matrix of $\overline{P}(\tau)$ and will be calculated as follows
The integrals of the products of shifted Pell basis functions is

$$\int_0^1 \overline{P}_n(\tau)\overline{P}_m(\tau)d\tau = \int_0^1 \sum_{k=1}^{\min(n,m)} (-1)^{k+1}\overline{P}_{n+m-(2k+1)}(\tau)d\tau$$
$$= \sum_{k=1}^{\min(n,m)} (-1)^{k+1} \int_0^1 \overline{P}_{n+m-(2k+1)}(\tau)d\tau$$

Since

$$\int_0^1 \overline{P}(\tau)d\tau = \begin{cases} \sum_{k=0}^{\left[\frac{n}{2}\right]} 2^{n-2k} \binom{n-k}{k} & n\ odd \\ 0 & n\ even \end{cases}$$

Therefore, we have $H_1 = \begin{pmatrix} \overline{P}_1\overline{P}_1 & \overline{P}_1\overline{P}_2 & \overline{P}_1\overline{P}_3 \\ \overline{P}_2\overline{P}_1 & \overline{P}_2\overline{P}_2 & \overline{P}_2\overline{P}_3 \\ \overline{P}_3\overline{P}_1 & \overline{P}_3\overline{P}_1 & \overline{P}_3\overline{P}_3 \end{pmatrix}$

$$H = \int_0^1 \overline{P}(\tau)\overline{P}^T(\tau)d\tau = \int_0^1 H_1 d\tau = \begin{pmatrix} \int_0^1 \overline{P}_1\overline{P}_1 d\tau & \int_0^1 \overline{P}_1\overline{P}_2 d\tau & \int_0^1 \overline{P}_1\overline{P}_3 d\tau \\ \int_0^1 \overline{P}_2\overline{P}_1 d\tau & \int_0^1 \overline{P}_2\overline{P}_2 d\tau & \int_0^1 \overline{P}_2\overline{P}_3\, d\tau \\ \int_0^1 \overline{P}_3\overline{P}_1\, d\tau & \int_0^1 \overline{P}_3\overline{P}_1 d\tau & \int_0^1 \overline{P}_3\overline{P}_3\, d\tau \end{pmatrix}$$

7. Convergence Analysis and Error Estimate

The approximate function of $f(\tau)$ using shifted Pell polynomials is as follows

$f_n(\tau) = \sum_{i=1}^{n+1} a_i \overline{P}(\tau)$ (11)

where: $a_i =< f(\tau), \overline{P}_n(\tau) >= \int_0^1 f(\tau)\overline{P}_n(\tau)d\tau$ (12)

Since every continuous function on the closed interval is a bounded function, thus there is a constant ε such that $|f(\tau)| \le \varepsilon \quad \forall \tau \in [0,1]$ (13)

Therefore, Eq. 12 leads to

$$|a_n| \le \varepsilon \int_0^1 \left|\overline{P}_n(\tau)\right| d\tau$$

$$\le \varepsilon \int_0^1 \left| \sum_{k=n}^{\left[\frac{n}{2}\right]} \binom{n-k}{k} (4\tau-2)^{n-2k} \right| d\tau$$

$$\le \varepsilon \int_0^1 \sum_{k=n}^{\left[\frac{n}{2}\right]} \binom{n-k}{k} \left|(4\tau-2)^{n-2k}\right| d\tau$$

$$\le \varepsilon \int_0^1 \sum_{k=0}^{\left[\frac{n}{2}\right]} \binom{n-k}{k} \sum_{i=0}^{n-2k} (-1)^{n-i} \binom{n-2k}{i} 2^{n-2k} \left|(2^{4+i})\right| d\tau$$

$\int_0^1 \left|\overline{P}_n(\tau)\right| d\tau \le \sum_{k=0}^{\left[\frac{n}{2}\right]} 2^{n-2k} \prod_{L=0}^{k-1} \frac{n-k-L}{k-L}$ for odd n and $\int_0^1 \left|\overline{P}_n(\tau)\right| d\tau = 0$ for even n.

This will lead to the following result

$$|a_n| \le \varepsilon \sum_{k=0}^{\left[\frac{n}{2}\right]} 2^{n-2k} \prod_{L=0}^{k-1} \frac{n-k-L}{k-L}$$

8. Application of the Shifted Pell Operational Matrices

This section describes the application of the presented operational matrices of shifted Pell polynomials for solving some problems arising in physics throughout the following two suggested examples.

8.1 *Application to Lane-Emden Type Equation*

Consider the following Lane-Emden singular initial value problem equation

$f''(\tau) + \frac{2}{\tau} f'(\tau) + f(\tau) = \tau^2 + 7,\ f(0) = 1,\ f'(0) = 0, \tau \in (0,1]$ (14)

with the exact $f(\tau) = \tau^2 + 1$ (15)

Assume that the unknown function $f''(\tau)$ is approximated by n basis of the shifted Pell polynomials as below

$f''(\tau) = \sum_{i=1}^{n} a_i \overline{P}_i(\tau) = a^T \overline{P}(\tau)$ (16)

where: $a = [a_1 \dots a_n]^T$

For approximate the solution $f'(\tau)$ and $f(\tau)$ two-times integration are applied on both sides Eq. 16, yields

$\int_0^\tau f''(t)dt = f'(\tau) - f'(0) = a^T I\overline{P}(\tau)$ (17)

and $\int_0^\tau f'(t)dt = f(\tau) - f(0) = \int_0^\tau a^T\, If(t)dt$

or $f(\tau) = a^T I^2\overline{P}(\tau) + V^T\overline{P}(\tau)$ (18)

(Note that $1 = V^T\overline{P}(\tau)$

Eq. 18 can be rewritten as follows

$f(\tau) = (a^T I^2 + V^T)\overline{P}(\tau) = L^T\overline{P}(\tau)$ (19)

Using the relationship between shifted Pell polynomials and the powers $1 = \tau, \dots, \tau^n$ one can obtain

$\tau = V^T\overline{P}(\tau)$ (20)

$\tau^3 + 7\tau = Z^T\overline{P}(\tau)$ (21)

$\tau\ddot{f}(\tau) = a^T V_1\,\overline{P}(\tau)$ (22)

$\tau f(\tau) = a^T V_2\,\overline{P}(\tau)$ (23)

Eq. 14 can be rewritten as

$a^T V_1\,\overline{P}(\tau) + 2a^T I\overline{P}(\tau) + a^T V_2\,\overline{P}(\tau) = Z^T\overline{P}(\tau)$

That is $a^T V_1 + a^T V_2 = Z^T$ (24)

Eq. 24 yields a set of algebraic equations which can be solved for a.

For the case $n = 2$, one can get

$$f_2(\tau) = \overline{P}_1(\tau) + \frac{1}{4}\left(\frac{1}{2}a_1 - \frac{5}{8}a_2\right)\left(\overline{P}_2(\tau) - 2\overline{P}_1(\tau)\right) + \frac{1}{32}a_1\left(\overline{P}_3(\tau) - 5\overline{P}_1(\tau)\right) + \frac{1}{96}a_2\left(\overline{P}_4(\tau) + \overline{P}_2(\tau) + 14\overline{P}_1(\tau)\right)$$

or

$f_2(\tau) = a^T\overline{P}(\tau)$

where: $a^T = \left[\left(1 + \frac{3}{32}a_1 - \frac{16}{96}a_2\right) \quad \frac{1}{8}a_1 - \frac{14}{96}a_2 \quad \frac{1}{32}a_1 \quad \frac{1}{96}a_2\right]$

Note that in this case $a_1 = 2$ and $a_2 = 0$, as a result

$f_2(\tau) = \frac{19}{16}\overline{P}_1(\tau) + \frac{1}{4}\overline{P}_2(\tau) + \frac{1}{16}\overline{P}_3(\tau)$

8.2 *Application to Emden-Fowler Type Equation*

Consider the Emden-Fowler equation studied by [25],

$f''(\tau) + \frac{k}{\tau}f'(\tau) + \tau^r f^{(n)}(\tau) = 0,\ n \in \mathbb{N} \cup \{0\}, \tau \in (0,1]$ (25)

together with the initial conditions

$f(0) = 1, f'(0) = 0$ (26)

Eq. 25 governed by the conditions in Eq. 26 has $f(\tau) = \frac{\sin\tau}{\tau}$ as exact solution when $r = 0$, $n = 1$ and $k = 1$. The application of the operational shifted Pell matrices which is proposed in the previous sections yields the following approximate solutions corresponding to $n = 1$ and $n = 3$, respectively

$f_1(\tau) = 0.96875\,\overline{P}_1(\tau) - 0.041667\overline{P}_2(\tau) - 0.0104167\overline{P}_3(\tau)$

and

$f_3(\tau) = 0.96855\,\overline{P}_1(\tau) - 0.04115\overline{P}_2(\tau) - 0.009733\overline{P}_3(\tau) + 0.00026\overline{P}_4(\tau) + 0.000033\overline{P}_5(\tau)$

Table 1 lists the results in the case of $n = 1, 3$ using shifted Pell operational matrices and the results obtained by applying orthonormal Bernstein polynomials developed in [25]. With some comparisons aiming to illustrate the applicability and accuracy of the proposed shifted Pell operational matrices procedure. Assume ε_1 and ε_2 denote the error in maximum norm corresponding to the approximate solution $f_1(\tau)$ and $f_3(\tau)$ respectively, that is

$\varepsilon_1 = \max_{\tau\in[0,1]}|f(\tau) - f_1(\tau)|$ and $\varepsilon_1 = \max_{\tau\in[0,1]}|f(\tau) - f_1(\tau)|$

Figure 1 ensures that the obtained approximate solution using shifted Pell operational matrices is closer to the exact one with few basis shifted Pell. Figure 2 plots the absolute error of Example 2. The results in Table 1 illustrate that the obtained numerical solution with few terms of the presented shifted Pell expansion is more accurate than the results in [25]. The advantage of the proposed method is demonstrated when compared with other approximate method.

Conclusion

In the present work, the definition of shifted Pell polynomials is presented first with some important properties. Then a novel general procedure for calculating operational matrices corresponding to the shifted Pell polynomials is presented. They are operational matrix of integration, operation matrix of product and dual operational matrix. These matrixes can be applied together with spectral methods to solve problems arising in physics called Lane-Emden equation. The efficiency of the proposed technique is shown from the obtained results. The aim of such technique is to get an effective algorithm that is suitable the digital computers by reducing the underlying Lane-Emden equation to algebraic equations.

Two Embedded Pairs for Solve Directly Third-Order Ordinary Differential Equation by Using Runge-Kutta Type Method (RKTGD)

Two Embedded Pairs for Solve Directly Third-Order Ordinary Differential Equation by Using Runge-Kutta Type Method (RKTGD)

Abstract. In this paper, two pairs of embedded Runge-Kutta (RK) type techniques for straightforwardly tackling third-order ordinary differential equations (ODEs) of the form $v''' = f(x, v, v')$ signified as RKTGD strategies were proposed and explored. Relying on the order conditions, the primary pair with mathematical order 4 and 3 was called RKTGD4(3), while different has order 5 and 4, and was named RKTGD5(4). The new strategies were determined so that the higher-order techniques were exact and the lower order techniques would bring about the best error estimates. At that point, variables step-size codes were created to support the methods and utilized in solving a lot of third-order problems. Comparisons were made between mathematical results and existing embedded RK pairs within the scientific literature, that require the problems to be reduced into a system of first-order ODEs, and the effectiveness of the new RKTGD pairs have appeared.

1.Introduction

In the present paper, the numerical integration of 3rd-order ODEs and initial conditions of the structure

$$v'''(t) = f\big(x, v(t), v'(t)\big), \quad v(t_0) = v_0, \quad v'(t_0) = v_0', \quad v''(t_0) = v_0'', \quad t \geqslant t_0 \tag{1}$$

was considered, where $v, v' \in \mathrm{R}^d$, $f : \mathrm{R}\times\mathrm{R}^d \to \mathrm{R}^d$ is a continuous vector-valued function that doesn't explicitly depend on the second derivatives. Some examples of such problems are found in electromagnetic waves, thin film flow and gravity driven flow [1-3]. A number of engineers, scientists, and researchers usually solve problem (1) by transforming the third-order ODEs into a system of first-order equations three times the dimension. See examples in the references [4-8]. These methods are multi-step methods, therefore, they require starting values when utilized in solving problem (1). However, it is more efficient if the problem can be solved directly with the aid of numerical methods. This paper is focused on the use of a one-step embedded explicit process, in particular, the RK type methods for solve directly third-order ODEs of the problem (1) which don't need the beginning values. The regular sort of new procedure with *m*-stage for solving initial value problems (IVPs) (1) can be formulated in [9]:

$$v_{n+1} = v_n + hv_n' + \frac{h^2}{2}v_n'' + h^3\sum_{i=1}^{m} b_i k_i, \tag{2}$$

$$v_{n+1}' = v_n' + hv_n'' + h^2\sum_{i=1}^{m} b_i' k_i, \tag{3}$$

$$v''_{n+1} = v''_n + h\sum_{i=1}^{m} b''_i k_i, \quad (4)$$

Where

$$k_i = f(x_n + c_i h, v_n + c_i h v_n^i + \frac{h^2}{2} c_i^2 v''_n + h^3 \sum_{j=1}^{i-1} a_{ij} k_j, v'_n + c_i h v''_n + h^2 \sum_{j=1}^{i-1} \bar{a}_{ij} k_j), \quad (5)$$

for $i = 2, 3, \ldots, m$.

RKTGD method parameters b_i , b'_i , b''_i, a_{ij}, $\bar{a}_{ij}$ and c_i of the new technique assumed to be realistic, m is the number of phases of the technique. Then, this method is explicit when $a_{ij} = 0$ for $i \leq j$. To decide the coefficients of the technique given by (2-5), the RKTGD strategy expression is extended by utilizing Taylor's series expansion [10, 11]. After being simplified mathematically, this expansion is then compared to the solution was given by Taylor's series expansion. At that point, this process requires a great deal of mathematical and numeric calculations, however utilizing programming like Maple as in [10]. General order conditions for the RKTGD strategy can be gotten from the direct expansion of the local truncation error. Likewise, efficient RK codes frequently utilize embedded pair of request $p(q)$ where p is greater or equal to $q + 1$, examples of these are seen in [12-16]. This study is significantly dedicated to additional work in this exploration field of study. Especially, it is pointed tat deriving the $p(q)$ pairs of explicit RKTGD techniques utilized in variable step size codes to give a tinny error estimation, and it's based on the techniques (c, A, b, b', b'') of order p, and $(c, A, \hat{b}, \hat{b}', \hat{b}'')$ of order q.

For Butcher Tableau, the embedded pair can be expressed as follows:

$$\begin{array}{c|c|c|} c & A & \bar{A} \\ \hline & b^T & b'^T & b''^T \\ \hline & \hat{b}^T & \hat{b}'^T & \hat{b}''^T \end{array} \quad (6)$$

The essential reason for building the embedded pairs of explicit RKTGD strategy is to obtain a low value local error estimate that would be utilized in the step-size algorithm of the vector. Obviously, the method will calculate v_{n+1}, v'_{n+1} and v''_{n+1} to approximate $v(x_{n+1})$, $v'(x_{n+1})$ and $v''(x_{n+1})$, where v_{n+1} is the measured solution and $v(x_{n+1})$ is an accurate solution.

2.CONSTRUCTION OF THE METHODS

The order conditions of RKTGD method are derived up to order six by using the Taylor expansion and Maple package, For the new system, the local truncation errors or the order terms for m-stage up to order six can be expressed (see [9]). The construction of the embedded Runge-Kutta method is an active research area producing continuous improvements to the existing codes. we are concerned with the derivation of p(q) pairs of explicit RKTG methods which are used in variable step size codes to provide a cheap error estimation. The following simplifying assumption is used to minimize the number of equations to solve;

$$\sum_{j=1}^{m} \bar{a}_{ij} = \frac{c_i^2}{2} \quad (7)$$

To develop efficient pairs, the following techniques are used:

(a) For both the higher and lower order RKTGD formulas, the $\| \tau_g^{(p+1)} \|_2$ and $\| \hat{\tau}_g^{(p+1)} \|_2$ quantities should be as minimal as possible, where

$$\left\| \tau_g^{(p+1)} \right\|_2 = \sqrt{\sum_{i+1}^{n_p+1} (\tau_i^{(p+1)})^2 + \sum_{i+1}^{n'_p+1} (\tau'_{i\,i}^{(p+1)})^2 + \sum_{i+1}^{n''_p+1} (\tau''_{i\,i}^{(p+1)})^2},$$

and

$$\left\|\hat{\tau}_g^{(q+1)}\right\|_2 = \sqrt{\sum_{i+1}^{n_q+1}(\hat{\tau}_i^{(q+1)})^2 + \sum_{i+1}^{n'_q+1}(\hat{\tau}'^{(q+1)}_i)^2 + \sum_{i+1}^{n''_q+1}(\hat{\tau}''^{(q+1)}_i)^2},$$

Where $\tau^{(p+1)}$, $\tau'^{(p+1)}$ and $\tau''^{(p+1)}$ are the local truncation error norms for y, y' and y'' respectively, $\tau_g^{(p+1)}$ is the global local truncation error.

(b) The calculation of the local error at point x_{n+1} is determined using the formula:

$$LTE = max\{\| \delta_{n+1} \|_\infty, \| \delta'_{n+1} \|_\infty, \| \delta''_{n+1} \|_\infty\},$$

where

$$\delta_{n+1} = \hat{v}_{n+1} - v_{n+1}$$
$$\delta'_{n+1} = \hat{v}'_{n+1} - v'_{n+1}$$
$$\delta''_{n+1} = \hat{v}''_{n+1} - v''_{n+1}$$

The solutions using the higher order formula are v_{n+1}, v'_{n+1} and v''_{n+1}, while the solutions using the lower order formula are $\hat{v}_{n+1}$, $\hat{v}'_{n+1}$ and $\hat{v}''_{n+1}$. These local error estimates (LTE) can be used by the standard formula as given in [17] to control the step size h,

$$h_{n+1} = 0.9h_n\left(\frac{Tol}{LTE}\right)^{\frac{1}{q+1}} \quad (8)$$

Where 0.9 is considered to be a safety factor and represents the estimate of local error at each step, Tol represents the necessary accuracy, which is the maximum permissible local error. If $LTE \leq Tol$, local extrapolation (or higher-order mode) method will be accepted; this means that a more precise approximation will be used to advance the integration and h would be updated using the formula (8). On the other hand, if $LTE > Tol$, the step would be rejected and the step-size would be halved.

3.The Derivation of 4(3) pair

A three-stage RKTGD technique of order four is derived in this section. The conditions of the algebraic order up to order four are used (see [9]) and the simplifying assumption (7). Then, the system of equations can be reduced to 13 nonlinear equations with 17 unknowns and left with four degrees of freedom by simplifying assumptions. The solution of the equation system results simultaneously in a solution in terms of four free parameters, which are c_3, a_{21}, a_{31} and b_2:

$$\bar{a}_{21} = \frac{9 - 24c_3 + 16c_3^2}{8(c_3^2 - 12c_3 + 4)}, \bar{a}_{31} = \frac{c_3(9 - c_3^3 - 20c_3^2 + 14c_3 - 3)}{-3 + 4c_3},$$

$$\bar{a}_{32} = -\frac{c_3(18 - c_3^3 - 36c_3^2 + 25c_3 - 6)}{-3 + 4c_3}, a_{21} = a_{21}, a_{31} = a_{31},$$

$$a_{32} = -\frac{-12a_{31} + 16a_{31}c_3 + 423a_{21}c_3^4 - 864a_{21}c_3^3 + 567a_{21}c_3^2 - 128a_{21}c_3}{-12 + 16c_3} + \frac{50c_3^3 - 36c_3^2 + 9c_3 - 24c_3^4}{-12 + 16c_3},$$

$$b'_1 = \frac{6c_3^2 - 6c_3 + 1}{8(-3 + 4c_3)c_3}, b'_2 = \frac{3c_3 + 2 + 48b_2c_3 - 36b_2}{24c_3(3c_3 - 2)}, b'_3 = \frac{-1 + c_3}{6c_3(3 - 8c_3 + 6c_3^2)}, c_1 = 0,$$

$$c_2 = \frac{-3 + 4c_3}{2(3c_3 - 2)}$$

$$b_2 = b_2, b_1 = -\frac{12c_3^2 + 11c_3 + 72b_2c_3^2 - 96b_2c_3 - 2 + 36b_2}{24c_3(3c_3 - 2)},$$

$$b_3 = -\frac{3c_3 + 2 + 48b_2c_3 - 36b_2}{24c_3(3c_3 - 2)},$$

$$b''_1 == \frac{6c_3^2 - 6c_3 + 1}{8(-3 + 4c_3)c_3}, b''_2 = \frac{2(27c_3^3 - 54c_3^2 + 36c_3 - 8)}{3(-50c_3^2 + 36c_3 - 9 + 24c_3^3)}, \quad b''_3 = \frac{1}{6c_3(3 - 8c_3 + 6c_3^2)}$$

and setting $c_3 = 1$ and $a_{31} = 0$ gives:

$$\| \tau_g^{(5)} \|_2 = \frac{1}{960}(72000 b_2^2 - 14400 b_2 + 4429 + 512000 a_{21}^2 - 33280 a_{21})^{\frac{1}{2}}$$

By using the *minimize* command in Maple, then a_{21} = 0.0325000022021653 and b_2 = 0.100000024350969, and the minimum value $\left\|\tau_g^{(5)}\right\|_2$ is 0.0586320476692477264. Again for the optimized values, $a_{21} = \frac{3}{100}$ and $b_2 = \frac{1}{10}$ were chosen.

Therefore, the coefficients denoted by RKTGD4 of the three-stage fourth-order RKTGD method can be defined as follows:

$$c_2 = \frac{1}{2}, c_3 = 1, a_{21} = \frac{3}{100}, a_{32} = \frac{13}{100}, \bar{a}_{21} = \frac{1}{8}, \bar{a}_{32} = \frac{1}{2}, b_1 = \frac{3}{40}, b_2 = \frac{1}{10},$$
$$b_3 = -\frac{1}{120}, b_1' = \frac{1}{6}, b_2' = \frac{1}{3}, b_3' = 0, b_1'' = \frac{1}{6}, b_2'' = \frac{2}{3}, b_3'' = -\frac{1}{6}$$

A three-stage (s=3) third-order (q=4) embedded formula can now be derived considering the above solutions for A and c. Solving the third-order equations for $v(t)$, $v(t)$ (see [9]) simultaneously yields a solution for b_i in b_i terms, while b_i' and b_i'' are the same as the fourth-order formula. Three free parameters of the solution in terms of b_3' , $b_2$and b_3 are obtained as follows:

$$b_1' = \frac{1}{6} - b_2 - b_3, b_2 = b_2, b_3 = b_3, b_1' = \frac{1}{6} + b_3', \quad b_2' = \frac{1}{3} - 2\, b_3', \quad b_3' = b_3',$$
$$b_1'' = \frac{1}{6}, b_2'' = \frac{2}{3}, b_3'' = \frac{1}{6}$$

Here, take $b_3' = \frac{1}{15}$ then:

$$\| \tau_g^{(4)} \|_2 = \frac{1}{120}\sqrt{3600 b_2^2 + 14400 b_2 b_3 - 600 b_2 + 14400 b_3^2 - 1200 b_3 + 45}$$

Two free parameters b_2 and b_3 do not appear in the solution now, but for fourth-order conditions, they appear in the local truncation error. According to Dormand [9], the free parameters b_2 and b_3 can be determined by minimizing the local truncation error norms $\| \tau_g^{(4)} \|_2$. By using the *minimize* command in Maple, b_2 = 0.416666666666741, b_3 = −0.166666666666519 were obtained, and the minimum error is 0.0372677996249964963. For the optimized value in fractional form, $b_2 = \frac{4}{10}$ and $b_3 = -\frac{2}{10}$ were chosen.

Finally, all the three-stage embedded RKTGD system coefficients denoted by RKTGD4(3) can be written in the following way (see Table 1):

Table I. The RKTGD4(3) Method.

0	0			0					
$\frac{1}{2}$	$\frac{3}{100}$	0		$\frac{1}{8}$	0				
1	0	$\frac{13}{100}$	0	0	$\frac{1}{2}$	0			
	$\frac{3}{40}$	$\frac{1}{10}$	$-\frac{1}{120}$	$\frac{1}{6}$	$\frac{1}{3}$	0	$\frac{1}{6}$	$\frac{2}{3}$	$\frac{1}{6}$
	$-\frac{1}{30}$	$\frac{2}{5}$	$-\frac{1}{5}$	$\frac{7}{30}$	$\frac{1}{5}$	$\frac{1}{15}$	$\frac{1}{6}$	$\frac{2}{3}$	$\frac{1}{6}$

4.The Derivation of 5(4) pair

The four-stage RKTGD method of order five is derived in this section, and the algebraic conditions (see [9]) and assumption simplification (7) are used. Then, 31 nonlinear equations consist of the resulting system of equations with 24 unknown variables to be solved. Using the simplified assumption (7), the system of equations is reduced to 20 equations with 24 unknowns and 4 degrees of freedom remaining. Solving the system and the solution family simultaneously in the form of a_{41}, a_{42}, a_{43} and c_4 gives the following:

$$\bar{a}_{21} = \frac{c_4^2}{2(4c_4-1)^2}\ , \bar{a}_{31} = -\frac{2(-71c_4^2+48c_4-16+20c_4^3)}{125c_4(10c_4^2-12c_4+3)},$$

$$\bar{a}_{32} = \frac{2[(-4+5c_4)(11c_4-4)(4c_4-1)}{125c_4(10c_4^2-12c_4+3)}$$

$$\bar{a}_{41} = \frac{30c_4^3-59c_4^2+40c_4-8}{4}, \bar{a}_{42} = -\frac{c_4(38c_4-59c_4^2-8+30\,30c_4^3)(4c_4-1)}{11c_4-4}$$

$$, \bar{a}_{43} = \frac{5c_4(38c_4-59c_4^2-8+30\,30c_4^3)(4c_4-1)}{4(11c_4-4)}, \qquad a_{21} = \frac{a_{41}+a_{42}+a_{43}}{(16c_4^2-8c_4+1)(4c_4-1)},$$

$$a_{41} = a_{41}\ , a_{42} = a_{42}\ , a_{43} = a_{43}\ ,$$

$$a_{31} = \frac{2(-50a_{41}c_4^2-226a_{43}c_4^3+20a_{42}c_4+108a_{43}c_4-16a_{43}+16c_4^2+87c_4^3}{625(10c_4^2-12c_4+3)(-1+2c_4)c_4^3}$$

$$+\frac{105a_{42}c_4^2+100a_{43}c_4^3 100a_{42}c_4^3+73c_4^5-110c_4^6}{625(10c_4^2-12c_4+3)(-1+2c_4)c_4^3}$$

$$a_{32} = \frac{2(11c_4-4)(-40c_4^5+62c_4^4-29c_4^3+4c_4^2+16a_{43}c_4+5a_{42}c_4-4a_{43}}{625(10c_4^2-12c_4+3)(-1+2c_4)c_4^3},$$

$$b_1' = \frac{2c_4^2+4c_4-1}{48c_4^2}, b_2' = \frac{(4c_4-1)^2(12c_4^2-7c_4+1)}{24c_4^2(-1+2c_4)(11c_4-4)}, b_3' = \frac{25(10c_4^2-12c_4+3)}{48(-4+5c_4)(11c_4-4)},$$

$$b_2' = \frac{(c_4-1)}{24c_4^2(-1+2c_4)(-4+5c_4)}, c_1 = 0, c_2 = \frac{c_4}{4c_4-1}, c_3 = \frac{4}{5},$$

$$b_1 = \frac{-17c_4^3+1056b_2c_4^3+120c_4^2-912b_2c_4^2-27c_4+192c_4b_2}{96c_4(4c_4-1)},$$

$$b_3 = \frac{5(72c_4^2-21c_4+2-240b_2c_4^2-80c_4^3+480b_2c_4^3}{(4c_4-1)^2(-4+5c_4)},$$

$$b_4 = \frac{-16c_4^2+8c_4-1+132b_2c_4^2-48c_4b_2}{(4c_4-1)^2(-4+5c_4)},$$

$$b_1'' = \frac{2c_4^2+4c_4+1}{48c_4^2},$$

$$b_2'' = \frac{(4c_4-1)^2(16c_4^2+8c_4-1)}{24c_4^2(-1+2c_4)(11c_4-4)},$$

$$b_3'' = \frac{125(10c_4^2-12c_4+3)}{48(-4+5c_4)(11c_4-4)},$$

$$b_4'' = \frac{1}{24c_4^2(-1+2c_4)(-4+5c_4)},$$

Letting $a_{41} = a_{42} = a_{43} = 0$ and $c_4 = \frac{2}{3}$, the local truncation error in one free parameter is given by:

$$\| \tau_g^{(5)} \|_2 = \frac{1}{18000}\sqrt{553025 - 879360 b_2 + 3391488 b_2^2}$$

By using the *minimize* command in Maple, $b_2 = 0.129642210144928$ was obtained, and the minimum error is 0.0391272028545436926. For the optimized value in fractional form, $b_2 = \frac{1}{10}$ was chosen. Finally, all the coefficients of four-stage fifth-order RKTG method denoted by RKTGD5 can be written as follows:

$$c_2 = \frac{2}{5}, c_3 = \frac{4}{5}, c_4 = \frac{2}{3}, \quad a_{21} = 0, a_{31} = \frac{4}{124}, a_{32} = \frac{4}{125}, \bar{a}_{21} = \frac{2}{25}, \bar{a}_{31} = \frac{4}{25},$$

$$\bar{a}_{32} = \frac{4}{25}, b_1 = \frac{19}{300}, b_3 = -\frac{1}{240}, b_4 = \frac{23}{400}$$

$$b_1' = \tfrac{23}{192}, b_2' = \tfrac{25}{64}, b_3' = \tfrac{25}{192}, \; b_4' = -\tfrac{9}{64}, b_1'' = \tfrac{23}{192}, b_2'' = \tfrac{125}{192}, b_3'' = \tfrac{125}{192}, b_4'' = -\tfrac{27}{64},$$

A three-stage (s=3) fourth-order (q=4) embedded formula may now be derived based on the above solution for values of A and c. Solving the third and fourth-order equations for v (see [9]), so that the resulting equation system consists of 2 nonlinear equations with 4 variable unknowns to be solved. Solving the method at the same time gives:

$$b_1 = b_1, b_2 = \frac{25}{96} + \frac{1}{2}b_3 - \frac{5}{2}b_1, b_3 = b_3, b_4 = \frac{3}{2}b_1 - \frac{3}{2}b_3 - \frac{3}{32}$$

Choosing $b_1 = \frac{1}{20}$, another free parameter b_3 was found by minimize error norm $\| \tau_g^{(4)} \|_2$.

where

$$\| \tau_g^{(4)} \|_2 = \frac{1}{3000}\sqrt{725 - 12800 b_3 + 6264 b_3^2}$$

Here, one free parameter b_3 did not appear in the solution but it appeared in the local truncation error. According to Dormand [11], The free b_3 parameter can be calculated by minimizing the local truncation error and obtaining $b_3 = \frac{1}{10}$by using Maple. For v', the equation of order-four were solved and simplifying assumption (7) was used. The simplifying assumption reduces the equation system to 3 nonlinear equations with 4 unknowns, simultaneously solving the system gives:

$$b_1 = b_1, b_2 = \frac{95}{96} - 5b_1, b_3 = -5b_1 + \frac{35}{48}, b_4 = 9b_1 - \frac{39}{32}$$

where

$$\| \tau_g^{(4)} \|_2 = \frac{1}{9000}\sqrt{155302 - 1405056 b_1 + 9326592 b_1^2}$$

It can be noticed that there is one free parameter b_1, using the minimize command in Maple, then b_1=0.0753252635046047 was obtained and for optimized value, $b_1 = \frac{7}{100}$ was chosen. While for *v*00, the equations until order four were solved, and using simplifying assumption to reduce the system of equations to 4 nonlinear equations with 4 unknowns; then $\hat{b}_i$ is the same as the fifth-order formula. Finally, all the coefficients of four-stage embedded RKTGD method denoted by RKTGD5(4) can be written as follows (see Table II):

Table II. The RKTGD5(4) Method.

Problem 1. (Homogeneous Linear Problem)

$y'''(x) = -y(x) + 2\,y'(x), y(0) = 0, y'(0) = 1, y''(0) = 1,$

Theoretical solution:

$$y(x) = 2e^{x} + (-1 - \tfrac{2}{5}\sqrt{5})\,e^{\frac{1}{2}(\sqrt{5}-1)x} + (-1 + \tfrac{2}{5}\sqrt{5})\,e^{-\frac{1}{2}(\sqrt{5}+1)x}.$$

Problem 2. (Linear System)

$$y_1'''(x) = \frac{1}{2}e^{4t}y_3(x)y_2'(x), \quad y_2'''(x) = \frac{8}{3}e^{2x}y_1(x)y_3'(x), \quad y_3'''(x) = 27y_2(x)y_1'(x)$$

$$y_1(0) = 1, y_1'(0) = -1, y_1''(0) = 1, \quad y_2(0) = 1, y_2'(0) = -2, y_2''(0) = 4, \quad y_3(0) = 1, y_3'(0) = -3, y_3''(0) = 9,$$

Theoretical solution:

$y_1(x) = e^{-x}$, $y_2(x) = e^{-2x}$, $y_3(x) = e^{-3x}$.

Problem 3. (Homogeneous Non-Linear Problem)

$$y'''(t) = \frac{3y'(x)}{4\big(y(x)\big)^{4}}$$

$$y(0) = 1, y'(0) = \tfrac{1}{2}\ , y''(0) = \tfrac{1}{4},$$

Theoretical solution:

$$y(x) = \sqrt{x+1}$$

Comparison between RKTGD4(3), RK4(3)Z, RK4(3)M, RK4(3)D and RK4(3)F with respect to problems 1 to 3 was made and results are displayed in Figures 1 to 3.

6.Conclusion

Two pairs of embedded RKTGD methods for directly solving third-order ODEs using the variable step size codes have been suggested and discussed in this study. The methods are called, respectively, RKTGD4(3) and RKTGD5(4). Step-size codes of variables based on the methods were created and used to solve the third-order ODEs. The comparison was made with the Runge-Kutta methods of the current single step, as other direct methods are multi-step in nature. Numerical outcomes of the same RKTGD and RK pairs of the same order were also compared. The results showed that the RKTGD4(3) is more efficient than the Runge–Kutta 4(3) pairs like the RK4(3)Z method (Hairer et. al [18]), RK4(3)M (Merson [18]), RK4(3)D (Dormand [11]), and RK4(3)F (Fehlberg [19]) for all the problems tested. This new pair is more efficient for RKTGD5(4) compared to RK5(4)B (Butcher [20]), RK5(4)F (Fehlberg as in [19]), and RK5(4)D given by Dormand and Prince [12]. It has been shown from the numerical results that, compared to the existing embedded RK pairs of the same order in the literature, the new methods are more efficient. Hence, it can be concluded that in solving third order ODEs, the RKTGD pairs are computationally more efficient.

Estimation the Shape Parameter for Power Function Distribution

Estimation the Shape Parameter for Power Function Distribution

Abstract. In the paper estimate of the shape parameter for power function distribution was proposed. For different sample sizes (small, medium, and large). Using different methods, Maximum likelihood method, Moment method, Shrinkage methods, and Least square method. mean square error (MSE) was implemented as an indicator of performance and comparisons of performance have been carried out through data analysis and computer simulation between the estimation methods according to the applied indicator. It was observed from the results that the shrinkage method (constant weight factor (sh_2)) estimates for the shape parameter are the best in performance for each case.

1. Introduction

The power function distribution an important distribution for it is used in daily life and most distributions such as Rayleigh distribution, gamma distribution, and Weibull distribution has a relationship with the power function distribution, It has an inverse relationship with Pareto distribution the negative moments for Pareto distribution are simply the moment for the power function distribution [1][2]. The first to use the power function distribution. Malik H J in 1967, found a precise expression of the moment for power function distribution and he studied the exact moment for power function distribution [7]. The power function distribution is flexible distribution and used in many applications such as engineering, economics, natural sciences, and applied mathematics, The power function distribution is a special case for Pareto family distributions[3][4]. The problem of estimating unknown parameters in statistical distribution is one of the most important problems. [10]. The reliability function, which is a monotonically decreasing function of the lifetime, the study of reliability is an important task to develop future plans to develop performance and quality for the equipment and estimate the reliability system in stress-strength when follows power function for different shape parameter [12].

The aim of this study is to comparisons of performance the shape parameter (α) based on power function distribution (PD) have been carried out through data analysis and computer simulation between among four estimation methods, Maximum likelihood method (MLE), Moment method(MOM), Shrinkage methods(SH) and Least square method(LS) according to the applied indicator. and obtain the best using (MSE) and find the best method.

2. Methodology

Let x be random variable from power distribution with shape parameter (α) and scale parameter (γ); then the probability density function (pdf) is defined as following [3]

$$f(x,\alpha,\gamma) = \alpha\gamma^{\alpha}x^{\alpha-1}, \qquad 0 < x < \gamma^{-1} \tag{1}$$

When α and γ are often called the shape and scale parameters
While the cumulative distribution function (c.d.f) for power function distribution

$$F(x,\alpha,\gamma) = x^{\alpha}\gamma^{\alpha}, \qquad 0 < x < \gamma^{-1} \tag{2}$$

And as a special case when $\gamma = 1$ the (p.d.f) for power function distribution will be

$$f(x,\alpha) = \alpha x^{\alpha-1}, \qquad 0 < x < 1 \tag{3}$$

And the (c.d.f) for power function distribution become

$$F(x,\alpha) = x^{\alpha}, \qquad 0 < x < 1 \tag{4}$$

For estimation of shape parameter for power function distribution, we need to find the random variable of cumulative distribution function then

$$x = [f(x)]^{\frac{1}{\alpha}} \tag{5}$$

3. Estimation methods of the shape parameter of power function distribution

3.1 Maximum likelihood method (MLE)[8][11]

The Maximum likelihood method is one of the most reliable and popular methods using to obtaining point estimation for the parameter in all distributions, The Maximum likelihood method has many excellent statistical properties, so the statisticians prefer the MLE for other methods, Let $x_1, x_2, \ldots\ldots x_n$ be a random sample of $pow\ (\alpha,1)$. The Maximum likelihood for α

$$L = L(\alpha_i, x_i) = \prod_{i=1}^{n} f(x_i)$$

$$L = \alpha^n \prod_{i=1}^{n} x_i^{\alpha-1} \tag{6}$$

Taking the logarithm of the likelihood, yields

$$Ln(L) = nln\ \alpha + (\alpha - 1)\sum_{i=1}^{n} lnx_i \tag{7}$$

The partial derivation for the equation with respect to the shape parameter and equating the result to zero given as follows.

$$\hat{\alpha}_{mle} = \frac{-n}{\sum_{i=1}^{n} lnx_i} \tag{8}$$

3.2 Moment method (MOM)

In this section, we estimate the shape parameter for power function distribution by using the simplest technique commonly is the moment method, the general idea for moment method to determine the population moment $M_r = E(x^r)$ [9]. Let x pow(α)

$$E(x) = \frac{\alpha}{\alpha + 1} \tag{9}$$

We equate the first moment with $\frac{\sum_{i=1}^{n} x_i}{n}$ as below

$$\frac{\alpha}{\alpha + 1} = \frac{\sum_{i=1}^{n} x_i}{n} \tag{10}$$

By solving equation (7) we get

$$\hat{\alpha}_{mom} = \frac{\sum_{i=1}^{n} x_i}{n - \sum_{i=1}^{n} x_i} \tag{11}$$

3.3 Least square method (LS) [4][5]

The least squares method can be applied in reliability engineering mathematics problem, we assume that there is a linear relationship between two variables.

$$F(x_i) = x_i^{\alpha}$$

$$x_i = [F(x_i)]^{\frac{1}{\alpha}} \tag{12}$$

Take logarithm for both sides

$$lnx_i = \frac{1}{\alpha} ln\, F(x_i) \tag{13}$$

$$y = ax + b$$

$$x = \ln F(x_i)$$

$$a = \frac{\sum_{i=1}^{n} x_i y_i - \frac{\sum_{i=1}^{n} x_i y_i}{n}}{\sum_{i=1}^{n} x_i^2 - \frac{[\sum_{i=1}^{n} x_i]^2}{n}} \tag{14}$$

$$\hat{\alpha}_{Ls} = \frac{\sum_{i=1}^{n} [ln\, F(x_i)]^2 - \frac{[\sum_{i=1}^{n} ln\, F(x_i)]^2}{n}}{\sum_{i=1}^{n} ln\, F(x_i)\, ln\, x_i - \frac{\sum_{i=1}^{n} ln\, F(x_i)\, ln\, x_i}{n}} \tag{15}$$

3.4 Shrinkage estimator (SH) [3]

In 1968, Thompson introduced the basic reason for use prior estimation. He suggested the problem of shrink in the usual estimator $\hat{\alpha}$ of parameter α toward prior information. The shrinkage estimation method is to use α as the initial value prior information α_0 from the past and usual estimator $\hat{\alpha}_{ub}$ through consideration them by shrinkage- weight factor $\emptyset(\hat{\alpha})$ where $0<\emptyset(\hat{\alpha})<1$ as below

$$\hat{\alpha}_{sh} = \emptyset(\hat{\alpha})\alpha_{ub} + [1 - \emptyset(\hat{\alpha})]\alpha_0 \tag{16}$$

Now, to find α_{ub} from $\hat{\alpha}_{mle}$

$$\hat{\alpha}_{mle} = \frac{-n}{\sum_{i=1}^{n} \ln x_i}$$

$$x\ pow(\alpha)$$

$$z = \sum_{i=1}^{n} \ln x_i$$

$$z\ IG(n, 1)$$

$$\frac{n}{n-1}\hat{\alpha}_{mle} \neq \hat{\alpha}_{mle}$$
$$\alpha_{ub} = \frac{n-1}{n}\hat{\alpha}_{mle}$$
$$\alpha_{ub} = \frac{-(n-1)}{\sum_{i=1}^{n} ln\, x_i} \quad (17)$$

3.4.1 shrinkage- weight function(sh_1)[3][6]

In this section, the shrinkage- weight factor will be assumed as a function of n, $\emptyset(\hat{\alpha}) = \left|\frac{\sin n}{n}\right|$ Put in (10), will be

$$\hat{\alpha}_{sh1} = \left|\frac{sin\, n}{n}\right| \alpha_{ub} + (1 - \left|\frac{sin\, n}{n}\right|)\alpha_0 \quad (18)$$

3.4.2 constant- shrinkage weight factor (sh_2)[3][6]

In this section, assumed $\emptyset(\hat{\alpha}) = K$ the constant- shrinkage weight factor and K=0.001, 1-K=0.999 put in (10), will be

$$\hat{\alpha}_{sh2} = K\alpha_{ub} + (1-K)\alpha_0 \quad (19)$$

3.4.3 Beta- shrinkage weight factor (sh_3)[3][6]

In this section,$\emptyset(\hat{\alpha}) = \beta(1,n)$ the Beta- shrinkage weight factor, put in(10), will be

$$\hat{\alpha}_{sh3} = \beta(1,n)\alpha_{ub} + [1 - \beta(1,n)]\alpha_0 \quad (20)$$

4. Simulation study

Let x according to the uniform distribution on the interval (0,1)

$F(x_i) = x_i^{\alpha}$

$x_i = [F(x_i)]^{\frac{1}{\alpha}}, i = 1,2,\dots,n$

Step 1. By equation (8) calculated $\hat{\alpha}_{mle}$

Step 2. by equations (11) calculated $\hat{\alpha}_{mom}$.

Step 3. by equations (15) calculated $\hat{\alpha}_{Ls}$.

Step 4. by equations (18),(19), and (20), calculated $\hat{\alpha}_{shi}$ for $i = 1,2,3$

Step 5. by $MSE(\gamma) = \frac{\sum_{i=1}^{n}(\gamma_i - \gamma)^2}{n}$ calculated MSE for all method and cases

And by using random sample n=30,50,100.

We obtain the result shown in the following tables

Table 1:Estimation of the shape parameter of (PD) when alpha= 1

n	Mle	Mom	Sh1	Sh2	Sh3	Ls

5. Numerical result and conclusion

Consequently, for practical work and taking the mean square error as the indicator of preference between the different estimator methods, the following result obtained

1. for the conventional methods and for different sample size the following results are obtained:-

- Small sample size(n=30)
  i. When alpha= 1, Sh2 estimator method was given the best results, then his methods Sh1, Sh3, MLE, MOM, and LS respectively.
  ii. When alpha= 2, Sh2 estimator method was given the best results, then his methods Sh1, Sh3, MLE, MOM, and LS respectively.
  iii. When alpha= 3, Sh2 estimator method was given the best results, then his methods Sh1, Sh3, MLE, MOM, and LS respectively.
- Medium sample size(n=50)
  i. When alpha= 1, Sh2 estimator method was given the best results, then his methods Sh1, Sh3, MLE, MOM, and LS respectively.
  ii. When alpha= 2, Sh2 estimator method was given the best results, then his methods Sh1, Sh3, MLE, MOM, and LS respectively.
  iii. When alpha= 3, Sh2 estimator method was given the best results, then his methods Sh1, Sh3, MLE, MOM, and LS respectively.
- Large sample size(n=100)
  i. When alpha= 1, Sh2 estimator method was given the best results, then his methods Sh1, Sh3, MLE, MOM, and LS respectively.
  ii. When alpha= 2, Sh2 estimator method was given the best results, then his methods Sh1, Sh3, MLE, MOM, and LS respectively.
  iii. When alpha= 3, Sh2 estimator method was given the best results, then his methods Sh1, Sh3, MLE, MOM, and LS respectively.

2. The result of the simulation (estimate the shape parameter) of power function distribution for studied methods for different sample sizes (n=30, 50, 100). From tables, it is clear that, the shrinkage (constant weight factor (sh_2)) estimates for the α shape parameter, are the best in performance for each case. Then his first shrinkage way (sh_1) comes after.

3. From the tables for each (n), we conclude that the suggested Shrinkage method has a good performance based on constant - weight factor (sh_2) has the minimum mean square error (MSE) in the majority of cases.

Parameters estimation of new mixed Weibull Rayleigh and Exponential distribution

Parameters estimation of new mixed Weibull Rayleigh and Exponential distribution

Abstract. A new idea of mixing was introduced in this paper. Mixing parameters; p_i where $0 \leq p_i \leq 1$ and $\sum_{i=1}^{n} p_i = 1$ are used to find a new distribution from mixing some distributions. Therefore, we can get many mixed distributions with several parameters. Three distributions Weibull, Rayleigh, and Exponential are mixed to get a new distribution which is more flexible than these distributions. The mixed distribution with a new parameter is representing the ratio of contribution of each of these distributions which are mixed. Several values of the mixing parameter were taken, and the properties of the mixed distribution were found. Two methods (MLE and OLS) of estimation are used to estimate the parameters of the new distribution. Simulation studies are used to prove the properties of new distribution and to apply the estimation method to estimate the parameters of new distribution.

1. Introduction

Recent studies are looking at finding mixed distributions resulting from merging previous distributions to obtain new distributions that have benefits in scientific applications, including discrete and continuous distributions. The new distributions are more flexible than the previous distributions and have new characteristics. As it is known that Weibull and Raleigh distributions have good applications in the field of industries; meanwhile, Exponential distribution has good applications in the field of lifetime analysis. Therefore, the goal of this research, is to propose a new idea, which is how to find a new distribution resulting from integrating of three distributions (Weibull, Raleigh and Exponential), each distribution consists of number of parameters.

Consequently, the new distribution has number of parameters greater than these distributions and it will be more flexible than them in the statistical work. Several studies about mixing distributions introduced development in this field. Afify [1] worked on mixing Rayleigh distribution and introduced different methods to estimate the parameters of new distribution. El-Bassiouny, et al., [2] worked on mixing Exponential, generalized Weibull and Gomperts distributions and introduced different methods of estimation of parameters. Cheema and Aslam [3] worked on three components mixing of Exponential-Weibull distributions and introduced Bayesian method to estimate the parameters of the new distribution by using different loss function and simulation studies. Aslam, et at., [4] worked on two components mixing of transmuted Pareto distribution and introduced properties and apply the estimation under Bayesian framework. Berchtod [5] worked on mixing transition distribution model and introduce E.M algorithm simulation to estimate the parameters.

The plan of this study is, Section two devoted to present the methodology of mixing the distributions; Section three consists of estimation methods; Section four devoted to present the simulation studies to estimate the parameters of new distribution, Section five consists of the discussion of the results; the important conclusions are the subject of the last section. Therefore, how to get the new distribution from mixing the other distributions is the subject of the next section.

2. Methodology

Let x be random variable from Weibull distribution with shape parameter (k) and scale parameter (θ); then the probability density function (pdf) is defined as in equation (1)[3,6,7]:

$$f_W(x) = \frac{k}{\theta}\ x^{k-1}\ e^{-x^k/\theta} \qquad 0 < x < \infty \tag{1}$$

Also, let another random variable $y = x$ from Rayleigh distribution with scale parameter (θ), then the (pdf) is defined as in equation (2)[1]:

$$f_R(x) = \frac{2}{\theta}\ x\ e^{-x^2/\theta} \qquad 0 < x < \infty \tag{2}$$

and another random variable $z = x$ Exponential distribution with scale parameter (θ); then the (pdf) is defined as in equation (3)[8,9,10,]:

$$f_E(x) = \theta\ e^{-\theta x} \qquad 0 < x < \infty \tag{3}$$

Consequently, the pdf of the new distribution can be get it from mixing the pdf's in Eq.'s (1), and (3) by applying the following proportion rule under the conditional $p_1 + p_2 + p_3 = 1$ [2,10,6] :

$$(p_1 = \frac{\beta}{2\beta+1}, p_2 = \frac{\beta}{2\beta+1}, p_3 = \frac{1}{2\beta+1})$$

$$\therefore f_{WRE}(x,k,\theta) = \frac{\beta}{2\beta+1} f_W(x) + \frac{\beta}{2\beta+1} f_R(x) + \frac{1}{2\beta+1} f_E(x)$$

$$f_{WRE}(x,k,\theta) = \frac{\beta}{2\beta+1}\frac{k}{\theta}\ x^{k-1}\ e^{-x^k/\theta} + \frac{\beta}{2\beta+1}\frac{2}{\theta}\ x\ e^{-x^2/\theta} + \frac{\beta}{2\beta+1}\theta e^{-\theta x} \tag{4}$$

$$0 \ \le x\ \le \infty \quad , \beta \ge -1\ ,\ \ k\ , \theta, \ge 0$$

$f_{WRE}(x,\beta,k,\theta)$ represents the new pdf of mixed distribution from (Weibull, Rayleigh and Exponential) distributions with three parameters (k) shape parameter,(θ) scale parameter and (β) is a mixing parameter.

The cumulative distribution function (cdf) corresponding to pdf in equation (5) is:

$$F_{WRE}(x\ ,\beta\ ,\theta\ ,\ \ k) = \ \ p_r(\ X \le x)$$

$$F_{WRE}(x) = \int_0^x f(u)du$$

$$F_{WRE}(x) = 1 - \left(\frac{1}{2\beta+1}\left(\beta\ e^{\frac{-x^k}{\theta}} + \beta e^{\frac{-x^2}{\theta}} + \ e^{-\theta x} \right) \right) \tag{5}$$

The new distribution is mixed distribution of (Weibull, Rayleigh and Exponential) and can be derived the parameter of new distribution are $\beta\ ,\theta\ ,\ \ k$ from $p.d.f$ where

θ Is the scale parameter

k Is the shape parameter

β Is mixed proportion parameter

the other characteristic follow

The mean is $E(x)\ = \int_0^\infty x\ f_{WRE}(x)dx$

$$E(x)\ = \frac{\beta\theta^{\frac{1}{k}}}{2\beta+1}\ \Gamma\left(1+\frac{1}{k}\right) + \frac{\beta\theta^{\frac{1}{2}}\sqrt{\pi}}{2(2\beta+1)}\ + \frac{1}{(2\beta+1)\theta}$$

The variance is $var(x) = E(X^2) - (E(X))^2$

$$var(x) = \frac{\beta\theta^{\frac{2}{k}}}{2\beta+1}\ \Gamma\left(1+\frac{2}{k}\right) + \frac{\beta\theta^{\frac{1}{2}}}{2\beta+1}\ + \frac{2}{(2\beta+1)\theta^2} - \frac{\beta\theta^{\frac{1}{k}}}{2\beta+1}\ \Gamma\left(1+\frac{1}{k}\right) - \frac{\beta\theta^{\frac{1}{2}}\sqrt{\pi}}{2(2\beta+1)} - \frac{1}{(2\beta+1)\theta}$$

Also, we can derive the function of the Reliability and hazard function from the new distribution.

Meanwhile, the Reliability function is:

$$R(t) = 1 - F(x)$$

$$R(t) = \frac{1}{2\beta+1}\left(\beta e^{\frac{-x^K}{\theta}} + \beta\, e^{\frac{-x^2}{\theta}} + e^{-\theta x} \right) \tag{6}$$

and the hazard rate function:

$$\mathrm{h(t)} = \frac{\mathrm{f(t)}}{\mathrm{R(t)}},$$

$$h(t) = \frac{\left(\frac{\beta k}{\theta} x^{k-1} e^{\frac{-x^k}{\theta}} + \frac{2\beta}{\theta} x\, e^{\frac{-x^2}{\theta}} + \theta e^{-\theta x} \right)}{\left(\beta e^{\frac{-xk}{\theta}} + \beta\, e^{\frac{-x^2}{\theta}} + e^{-\theta x} \right)} \tag{7}$$

3. Estimation methods

In this section, two methods of estimation are presented which will be used to estimate the parameters of the new distribution (β, θ, k). These methods are maximum likelihood (MEL) and ordinary least square (OLS) which are discussed in the following subsections.

3.1 Maximum Likelihood Estimation (MLE) method [9]

This method of estimation depends on maximizing the pdf estimation:

$$L = f(x_1, x_2, \dots, x_n, \theta) = \prod_{i=1}^{n} f(x_i, \theta)$$

$$L = \prod_{i=1}^{n} \left[\frac{\beta K x_i^{K-1}}{(2\beta+1)\theta}\ e^{\frac{-x_i^K}{\theta}} + \frac{2\beta x_i}{(2\beta+1)\theta}\ e^{\frac{-x_i^2}{\theta}} + \frac{\theta}{2\beta+1}\ e^{-\theta x_i} \right] \tag{8}$$

$$ln(L) = \sum_{i=1}^{n} ln \left[\frac{\beta K x_i^{K-1}}{(2\beta+1)\theta}\ e^{\frac{-x_i^K}{\theta}} + \frac{2\beta x_i}{(2\beta+1)\theta}\ e^{\frac{-x_i^2}{\theta}} + \frac{\theta}{2\beta+1}\ e^{-\theta x_i} \right]$$

$$\frac{\partial ln\,(L)}{\partial k} = \sum_{i=1}^{n} \frac{\frac{\beta}{(2\beta+1)\theta}\left[x_i^{k-1} e^{-\frac{x_i^k}{\theta}} + k x_i^{K-1} ln(x_i)\, e^{-\frac{x_i^k}{\theta}} - x_i^{k-1}\ \frac{k}{\theta} x_i^k\ e^{-\frac{x_i^k}{\theta}} ln(x_i) \right]}{\left[\frac{\beta K x_i^{K-1}}{(2\beta+1)\theta}\ e^{\frac{-x_i^K}{\theta}} + \frac{2\beta x_i}{(2\beta+1)\theta}\ e^{\frac{-x_i^2}{\theta}} + \frac{\theta}{2\beta+1} e^{-\theta x_i} \right]} \tag{9}$$

$$\frac{\partial ln(L)}{\partial \theta} = \sum_{i=1}^{n} \frac{\left[\frac{\beta K x_i^{K-1}}{2\beta+1} * \left(\frac{e^{\frac{-x_i^K}{\theta}} \frac{x_i^k}{\theta} - e^{\frac{-x_i^K}{\theta}}}{\theta^2} \right) \right] + \left[\frac{2\beta x_i}{(2\beta+1)} * \left(\frac{e^{\frac{-x_i^2}{\theta}} \frac{x_i^2}{\theta} - e^{\frac{-x_i^2}{\theta}}}{\theta^2} \right) \right] + \left[\frac{\theta}{2\beta+1} * \left(e^{-\theta x_i} - \theta x_i e^{-\theta x_i} \right) \right]}{\left[\frac{\beta K x_i^{K-1}}{(2\beta+1)\theta}\ e^{\frac{-x_i^K}{\theta}} + \frac{2\beta x_i}{(2\beta+1)\theta}\ e^{\frac{-x_i^2}{\theta}} + \frac{\theta}{2\beta+1} e^{-\theta x_i} \right]}$$

$$\frac{\partial ln(L)}{\partial \beta} = \sum_{i=1}^{n} \frac{\left[\frac{k\, x_i^{k-1} e^{\frac{-x_i^K}{\theta}}}{\frac{\theta}{(2\beta+1)^2}} \right] + \left[\frac{2x_i e^{\frac{-x_i^2}{\theta}}}{\frac{\theta}{(2\beta+1)^2}} \right] - \left[\frac{2\theta e^{-\theta x_i}}{(2\beta+1)^2} \right]}{\left[\frac{\beta K x_i^{K-1}}{(2\beta+1)\theta}\ e^{\frac{-x_i^K}{\theta}} + \frac{2\beta x_i}{(2\beta+1)\theta}\ e^{\frac{-x_i^2}{\theta}} + \frac{\theta}{2\beta+1} e^{-\theta x_i} \right]} \tag{10}$$

Where we notice that equations (9), (10) and (11) are non-linear equations, so it is difficult to find them, so we will use one of the numerical methods such as ***F-solve*** method to estimator the parameter

3.2 Ordinary Least Square (OLS) method [6]

This method depends on Minimizing the sum of squares of random errors and can be define mathematically as follows:

$$OLS = \sum_{i=1}^{n}\left[\left(\frac{i}{n+1}\right) - F(x)\right]^2$$

Note that $\left(\frac{i}{n+1}\right)$ is the amount of non-parametric

$$OLS = \sum_{i=1}^{n}\left[\left(\frac{i}{n+1}\right) - \left(1 + \frac{\beta}{2\beta+1}\, e^{\frac{-x^K}{\theta}} + \frac{\beta}{2\beta+1}\, e^{\frac{-x^2}{\theta}} + \frac{1}{2\beta+1}\, e^{-\theta x}\right)\right]^2$$

$$take\ the\ \frac{\partial OLS}{\partial \theta} = 0$$

$$\frac{\partial OLS}{\partial \vartheta} = 2\sum_{i=1}^{n}\left[\left(\frac{i}{n+1}\right) - \left(1 + \frac{\beta}{2\beta+1}\, e^{\frac{-x_i{}^k}{\theta}} + \frac{\beta}{2\beta+1}\, e^{\frac{-x_i{}^2}{\theta}} + \frac{1}{2\beta+1}\, e^{-\theta x_i}\right)\right] * \left[\left(\frac{-\beta}{2\beta+1} * \frac{x_i{}^k}{\theta^2} * e^{\frac{-x_i{}^k}{\theta}}\right) - \left(\frac{\beta}{2\beta+1} * \frac{x_i{}^2}{\theta^2} * e^{\frac{-x_i{}^2}{\theta}}\right) + \left(\frac{x}{2\beta+1} * e^{-\theta x_i}\right)\right] = 0 \quad (12)$$

$$take\ the\ \frac{\partial OLS}{\partial k} = 0$$

$$\frac{\partial OLS}{\partial k} = 2\sum_{i=1}^{n}\left[\left(\frac{i}{n+1}\right) - \left(1 + \frac{\beta}{2\beta+1} * e^{\frac{-x_i{}^k}{\theta}} + \frac{\beta}{2\beta+1} * e^{\frac{-x_i{}^2}{\theta}} + \frac{1}{2\beta+1} * e^{-\theta x_i}\right)\right] * \left(\frac{-\beta}{2\beta+1}\left(e^{\frac{-x_i{}^k}{\theta}} * \frac{x_i{}^K}{\theta} * ln\, x_i\right)\right) = 0 \quad (11)$$

$$take\ the\ \frac{\partial OLS}{\partial \beta} = 0$$

$$\frac{\partial OLS}{\partial \beta} = 2\sum_{i=1}^{n}\left[\left(\frac{i}{n+1}\right) - \left(1 + \frac{\beta}{2\beta+1}\, e^{\frac{-x^K}{\theta}} + \frac{\beta}{2\beta+1}\, e^{\frac{-x^2}{\theta}} + \frac{1}{2\beta+1}\, e^{-\theta x}\right)\right] * \left(\left[\frac{-e^{\frac{-x_i^K}{\theta}}}{(2\beta+1)^2}\right] - \left[\frac{e^{\frac{-x_i^2}{\theta}}}{(2\beta+1)^2}\right] + \left[\frac{2e^{-\theta x_i}}{(2\beta+1)^2}\right]\right) = 0 \quad (12)$$

Where we notice that equations (12), (13) and (14) are non-linear equations, so it is difficult to find them, so we will use one of the numerical methods such as ***F-solve*** method to estimator the parameter.

4. Simulation studies:

In the previous section, two methods of estimation (MLE and OLS) were addressed to estimate the parameters of the new mixed distribution, and the formulation of estimation equations for both methods was found. As for the application, the method of acceptance and rejection was used to

generate the distribution data because of the difficulty in obtaining the cumulative distribution function by the inverse conversion method, the simulated data is used to estimate the parameters by using iterative methods a simulation program on the Matlab program. Here is an algorithm for this method [11]:

If $f\ (x)$ is a probability density function from which to generate random numbers and $g\ (x)$ is a proposed probability density function from which random numbers can be easily generated, and $cg\ (x)\ \geq f\ (x)$ so that $c \geq 1$ and the following algorithm summarize this Method:

Step (1): Generate the random number X from the function $g\ (x)$.

Step (2): Generate the random number U from the uniform distribution $U\ (0,1)$, independently of X.

Step (3): If $f\ (X)\ /\ [Cg\ (X)]\ U$ count the generated number as $Z\ =\ X$, otherwise return to step (1).

The following default values were used in order to estimate the parameters of the new distribution, namely:

Table 1. The initial values of the parameters

Model	K	B	θ
1	1	3	3
2	2	0.5	0.5
3	3	2	1

As for the samples used in the assessment, four sample sizes were used (25,50.75.100).

The estimation methods were compared using the average mean of squares of error (MSE) scale, according to the following formula [12]:

$$\boldsymbol{AMSE}_{(\hat{\theta})} = \frac{\sum_1^r \left(\hat{\theta} - \theta\right)^2}{r}$$

As:

r : the number of iterations of each experiment (r = 1000).

$\hat{\theta}$: Parameter Estimator.

θ: the values of the assumed (real) parameters.

A simulation program was used on Matlab 2015 program to estimate the parameters and the results shown in the following tables were reached:

5. Discussion of the results

Using the simulated data and the methods of estimation to estimate the parameters of the new distribution based on the initial values of the parameters as in table 1 gives the following results when we use the initial value as in model 1.

Table 2. The estimated values of the new distribution parameters and AMSE for model 1

n	Method		K	B	θ	Best Method
25	MLE	Est. Parameters	**2**	**2.3**	**0.4**	OLS
		AMSE	**2.25**	**3.06**	**6.9**	
	OLS	Est. Parameters	**0.6**	**1.5**	**3.7**	
		AMSE	**0.02**	**0.92**	**0.48**	
50	MLE	Est. Parameters	**6**	**9**	**0.23**	OLS
		AMSE	**30.27**	**72.93**	**7.66**	
	OLS	Est. Parameters	**0.7**	**1.5**	**3.7**	
		AMSE	**0.04**	**1.04**	**0.52**	
75	MLE	Est. Parameters	**6.3**	**9.5**	**0.23**	OLS
		AMSE	**33.94**	**80.31**	**7.67**	
	OLS	Est. Parameters	**0.7**	**1.6**	**3.9**	
		AMSE	**0.03**	**1.13**	**0.74**	
100	MLE	Est. Parameters	**6.9**	**6.3**	**0.24**	OLS

		AMSE	**41.44**	**33.28**	**7.64**
	OLS	Est. Parameters	**0.7**	**1.5**	**3.9**
		AMSE	**0.03**	**0.93**	**0.72**

The results in Table 2 show that when the initial values for the parameters were (K = 1, B = 3, θ = 3) and the sample size is 25 the Ordinary Least Squares method was the best in estimating the three parameters of the new mixed distribution, since although the AMSE value in the Maximum Likelihood method was less than the greatest probability in estimating the one parameters (θ), the AMSE was large In estimating the two parameter (K and b), therefore, the Ordinary Least Square is better in estimating the parameters of the distribution as the average mean sum squares of error for the parameters was (AMSEK = 0.002, AMSEB = 0.001, AMSEθ = 8.99).

Meanwhile, when the estimated values of the parameters were (K = 0.5, B = 3.4, θ = 3.4) and the sample size is becoming 50 these results show that the Ordinary Least Squares method was the best in estimating the three parameters of the new mixed distribution, since although the AMSE value in the Maximum Likelihood method was less than the Ordinary Least Squares in estimating the one parameters θ, the AMSE was large in estimating the two parameter (K and b), therefore, the Ordinary Least Squares is better in estimating the parameters of the distribution as the average mean sum squares of error for the parameters is (AMSEK = 0.002, AMSEB = 0.0009, AMSEθ = 8,99).

But, when the estimated values of the parameters were (K = 0.4, B = 2.9, θ = 2.9) and the sample size is becoming 75 these results show that the Ordinary Least Squares method was the best in estimating the three parameters of the new mixed distribution, since although the AMSE value in the Maximum Likelihood method was less than the Ordinary Least Squares in estimating the one parameters θ, the AMSE was large In estimating the two parameter (K and b), therefore, the Ordinary Least Squares method is better in estimating the parameters of the distribution as the average mean sum squares of error for the parameters is (AMSEK = 0.0001, AMSEB = 0.0006, AMSEθ = 9).

Also, when the estimated values of the parameters were (K = 0.4, B = 3.2, θ = 3.2) and the sample size is becoming 100 these results show that the Ordinary Least Squares method was the best in estimating the three parameters of the new mixed distribution, since although the MSE value in the Maximum Likelihood method was less than the Ordinary Least Squares in estimating the one parameters θ, the MSE was large In estimating the two parameter (K and b), therefore, the Ordinary Least Squares is better in estimating the parameters of the distribution as the average mean sum squares of error for the parameters is (AMSEK = 0.0001, AMSEB = 0.00005, AMSEθ = 8.99). It is evident from the surveyed results that the best estimate of the parameters was at the sample size 100 because it had the lowest average mean sum of squares of error among the sample sizes used.

Using the initial values of the parameters as in model 2 with the simulated data gives the following results as in Table 3.

Table 3. The estimated values of the distribution parameters and AMSE for model 2

n	**Method**		**K**	**B**	$\boldsymbol{\theta}$	**Best Method**
25	MLE	Est. Parameters	0.4	2.3	2	OLS
		AMSE	6.9	3.06	2.25	
	OLS	Est. Parameters	3.7	1.5	0.6	
		AMSE	0.48	0.92	0.02	
50	MLE	Est. Parameters	0.23	9	6	OLS
		AMSE	7.66	72.93	30.27	
	OLS	Est. Parameters	3.7	1.5	0.7	
		AMSE	0.52	1.04	0.04	
75	MLE	Est. Parameters	0.23	9.5	6.3	OLS
		AMSE	7.67	80.31	33.94	
	OLS	Est. Parameters	3.9	1.6	0.7	
		AMSE	0.74	1.13	0.03	
100	MLE	Est. Parameters	0.24	6.3	6.9	OLS

	AMSE	7.64	33.28	41.44
OLS	Est. Parameters	3.9	1.5	0.7
	AMSE	0.72	0.93	0.03

The results in Table 3 show that when the initial values for the parameters were (K = 3, B = 0.5, θ = 0.5) and the sample size is 25 the sample size is becoming 25 these results show that the Ordinary Last Square method was the best in estimating the three parameters of the new mixed distribution, since although the AMSE value in the Maximum Likelihood method was greater than the Ordinary Last Square in estimating the three parameters (K , b and θ), therefore, the possibility is better in estimating the parameters of the distribution as the average sum of squares of error for the parameters is (AMSEK = 0.48, AMSEB = 0.92, AMSEθ = 0.02).

Meanwhile, when the estimated values of the parameters were (K = 3.7, B = 1.5, θ = 0.7) and the sample size is becoming 50 these results show that the Ordinary Last Square method was the best in estimating the three parameters of the new mixed distribution, since although the AMSE value in the Maximum Likelihood method was greater than the Ordinary Last Square in estimating the three parameters (K , b and θ), therefore, the possibility is better in estimating the parameters of the distribution as the average sum of squares of error for the parameters is (AMSEK = 0.52, AMSEB = 1.04, AMSEθ = 0.04).

But, when the estimated values of the parameters were (K = 3.9, B = 1.6, θ = 0.7) and the sample size is becoming 75 these results show that the Ordinary Last Square method was the best in estimating the three parameters of the new mixed distribution, since although the AMSE value in the Maximum Likelihood method was greater than the Ordinary Last Square in estimating the three parameters (K , b and θ), therefore, the possibility is better in estimating the parameters of the distribution as the average sum of squares of error for the parameters is (AMSEK = 0.74, AMSEB = 1.13, AMSEθ = 0.03).

And, when the estimated values of the parameters were (K = 3.9, B = 1.5, θ = 0.7) and the sample size is becoming 100 these results show that the Ordinary Last Square method was the best in estimating the three parameters of the new mixed distribution, since although the AMSE value in the Maximum Likelihood method was greater than the Ordinary Last Square in estimating the three parameters (K , b and θ), therefore, the possibility is better in estimating the parameters of the distribution as the average sum of squares of error for the parameters is (AMSEK = 0.72, AMSEB = 0.93, AMSEθ = 0.03). It is evident from the surveyed results that the best estimate of the parameters was at the sample size of 25 because it had the lowest mean sum of squares of error among the sample sizes used.

Using the initial values of the parameters as in model 3 with the simulated data gives the following results as in Table 4. The results in Table (4) show that when the initial values for the parameters were (K = 3, B = 2, θ = 1) and the sample size is 25 the Maximum Likelihood method was the best in estimating the two parameters of the new mixed distribution, since although the AMSE value in the Ordinary Least Squares method was less than the greatest probability in estimating the one parameters (K), the AMSE was large In estimating the two and third parameter (b, θ)), therefore, the possibility is better in estimating the parameters of the distribution as the average sum of squares of error for the parameters was (AMSE(K) = 4.33, AMSE(B) = 0.02, AMSE(θ) = 0.19).

Meanwhile, when the estimated values of the parameters were (K = 0.7, B = 1.1, θ = 1.5) and the sample size is becoming 50 these results show that the Maximum Likelihood method was the best in estimating the two parameters of the new mixed distribution, since although the AMSE value in the Ordinary Least Squares method was less than the greatest probability in estimating the one parameters (K), the AMSE was large In estimating the two and third parameter (b, θ)), therefore, the possibility is better in estimating the parameters of the distribution as the average sum of squares of error for the parameters was (AMSE(K) = 5.52, AMSE(B) = 0.78, AMSE(θ) = 0.29).

Table 4. The estimated values of the new distribution parameters and AMSE for model 3

n	Method		K	B	θ	Best Method
25	MLE	Est. Parameters	5.1	1.9	0.6	MLE
		AMSE	4.33	0.02	0.19	
	OLS	Est. Parameters	3.9	1	0.01	
		AMSE	0.00004	0.99	0.99	
50	MLE	Est. Parameters	0.7	1.1	1.5	MLE
		AMSE	5.52	0.78	0.29	
	OLS	Est. Parameters	3.1	1	0.01	
		AMSE	1.01	0.94	0.99	
75	MLE	Est. Parameters	5.7	2.3	0.6	MLE
		AMSE	7.31	0.07	0.14	
	OLS	Est. Parameters	3.1	1	0.01	
		AMSE	0.0001	1.02	0.98	
100	MLE	Est. Parameters	5	1.8	0.5	MLE
		AMSE	4.12	0.05	0.23	
	OLS	Est. Parameters	3.1	1	0.01	
		AMSE	0.0002	1.04	0.98	

When the estimated values of the parameters were (K = 5.7, B = 2.3, θ = 0.6) and the sample size is becoming 75 these results show that the Maximum Likelihood method was the best in estimating the two parameters of the new mixed distribution, since although the AMSE value in the Ordinary Least Squares method was less than the greatest probability in estimating the one parameters (K), the AMSE was large In estimating the two and third parameter (b, θ)), therefore, the possibility is better in estimating the parameters of the distribution as the average sum of squares of error for the parameters was (AMSE(K) = 7.31, AMSE(B) = 0.07, AMSE(θ) = 0.14).

And, when the estimated values of the parameters were (K = 5, B = 1.8, θ = 0.5) and the sample size is becoming 100 these results show that the Maximum Likelihood method was the best in estimating the two parameters of the new mixed distribution, since although the AMSE value in the Ordinary Least Squares method was less than the greatest probability in estimating the one parameters (K), the AMSE was large In estimating the two and third parameter (b, θ)), therefore, the possibility is better in estimating the parameters of the distribution as the average sum of squares of error for the parameters was (AMSE(K) = 4.12, AMSE(B) = 0.05, AMSE(θ) = 0.23). It is evident from the surveyed results that the best estimate of the parameters was at a sample size of 100 because it had the lowest mean sum of squares of error among the sample sizes used.

6. Conclusion

Based on the presented and discussed results the most important conclusions may be as follow:

1. The results showed that the Ordinary Least Squares method is better than the Maximum Likelihood method for 100% of the sample size 100 because it achieved the lowest average sum of squares of error.
2. The results showed that the regular Ordinary Least Squares are better than the method of Maximum Likelihood with respect to size sample 25 because it achieved the least sum of the mean squares of error.
3. The comparison result showed that the Maximum Likelihood method is better than the Ordinary Least Squares method for sample size 100 because it achieved the lowest average sum of the squares of error.

Abstract. In this paper, the branch and bound technique used to solve a single machine scheduling problem, which is the problem of scheduling n- job on a single machine of multi-objective function with triangle fuzzy due date numbers which are formulated as $1\backslash\widetilde{D}_j = TFN\backslash\sum_{j=1}^{n} C_j + L_{max}$. The target of this paper is to obtained optimal sequence of our problem. The computational results are calculated by using Matlab program and compare the results with the complete enumeration method

1.Introduction

The problem of scheduling n- job on single machine problems is important for the understanding theory of scheduling and manufacturing an initiation simple for decision makers. After scheduling problem is in truth a common of abstemious machine scheduling problems. A single machine planning issues help an opportunity to rearrange the framework to the extent that could reasonably be expected will assistance a choice creator comprehends know framework segments furthermore prerequisites. Recently, the single machine of multi-objective functions (completion time, the tardiness, the earliness, and the late work) are studied by using branch and bound method to get optimal sequence, Hanan and Alaa [18]. The multi-objective functions for machine scheduling problem are studied with good lower bound and upper bound to obtain optimal sequence and proved special cases, Hanan et al. [19]. The concept of the fuzzy due date on single machine scheduling problems has already studied by some researchers in the literature pertinent works include that Ishii et al. [1], Han et al. [2], and Ishibuchi et al. [3,4]. There are studies a maximize the total degree of satisfaction with a fuzzy due date, Stanfield et al. [5] found the optimal scheduling problem among those that do not surpass the maximum acceptable possibility of lateness in the problem with respect fuzzy due date. and S.S Lam, X. Cai [6] studied scheduling n-job on single machine with fuzzy due date to the objective of minimize the weighted earliness and tardiness function and introduced measure to evaluate the deviations of job. S.S Lam, X. Cai [7] studied fuzzy lateness function to measure the lateness of job with fuzzy due date and used genetic algorithm to find optimal scheduling. Chengyao and Dingwei found the optimal scheduling of NP-hard problem with triangular fuzzy process time [13]. Sunita studied single machine problem with fuzzy due date, and found methods to found optimal sequence of minimize cost of earliness and tardiness for small system [14]. Helen and Sumathi used branch and

bound to solve single machine scheduling problem using type-2 trapezoidal fuzzy numbers to find optimal sequence for minimizing total tardiness [15].

Abdelaziz and Ismail used a new method to solve a single machine problem with fuzzy processing time and distinct due date for an objective function minimize total earliness and total tardiness [16]. Oğuzhan solved minimizes the sum of the products of earliness/tardiness in single machine problem with fuzzy due date [17]. In this paper, we are involved in the direct generalization of the traditional of the total cost of completion time and maximum lateness where the due date is represented by a triangular membership function [8]. All the jobs are released at a different point in time. The problem is to find a schedule with minimum objective function. The general problem is NP-hard in the strong sense. Our main contribution is BAB algorithm based on a lower bound.

2. Preliminaries

2.1 Fuzzy set [9]

We say $\tilde{A}$ is fuzzy set on X if $\tilde{A}$ is function from X to I where I = [0, 1] i.e.

$\tilde{A} = \left\{\left(\chi, \tilde{A}(\chi)\right) : \chi \in X, 0 \le \tilde{A}(\chi) \le 1 \; where \; \tilde{A}(\chi): X \to [0,1]\right\}$

2.2 Fuzzy number [9]

let R in real line R. A fuzzy set $\tilde{A}: R \to [0,1]$ which satisfies the following conditions

- $\tilde{A}$ is piece wise continuous
- there exist an $\chi \in R$ such that $\tilde{A}(\chi) = 1$
- if $\chi_1, \chi_2 \in R$ and $\gamma \in [0,1]$ then $\tilde{A}(\gamma\chi_1 + (1-\gamma)\chi_2) \ge \tilde{A}(\chi_1) \Lambda \tilde{A}(\chi_{2)}$ then $\tilde{A}$ is convex

is called a fuzzy number. For all $\chi \in R$ we define the support of $\tilde{A}$ by $\{\chi \in R: \tilde{A}(\chi) > 0\}$ and α-cat defined by $[\tilde{A}]_\alpha = \{\chi \in R: \tilde{A}(\chi) \ge \alpha\}$

Now we define the membership of a fuzzy number $\tilde{A}$ in general:

$$\tilde{A}(\chi) = \begin{cases} 0 & For \; \chi < a \\ f_{\tilde{A}}(\chi) & For \; a \le \chi < c \\ 1 & For \; c \le \chi \le d \\ g_{\tilde{A}}(\chi) & For \; d < \chi \le b \\ 0 & For \; b < \chi \end{cases}$$

Where the function $f_{\tilde{A}}(\chi)$ and $g_{\tilde{A}}(\chi)$ are non-decreasing and non- increasing function

Definition2.1: [12] A fuzzy number $\tilde{A} = ({d_j}^I, {d_j}^c, {d_j}^u)$ is triangle fuzzy number with following membership function $\tilde{A}$ defined by:

$$\tilde{A}(\chi) = \begin{cases} 0 & if \; \chi < {d_j}^I \\ \dfrac{\chi - {d_j}^I}{{d_j}^c - {d_j}^I} & if \; {d_j}^I \le \chi < {d_j}^c \\ \dfrac{{d_j}^u - \chi}{{d_j}^u - {d_j}^c} & if \; {d_j}^c \le \chi < {d_j}^u \\ 0 & if \; {d_j}^u \le \chi \end{cases}$$

2.3Expected distance [11]

The expected distance (ED) of two fuzzy numbers $\tilde{A}$ and $\tilde{B}$ is defined by

$d(\tilde{A}, \tilde{B}) = \frac{1}{2}\int_0^1 |a_\alpha - b_\alpha| + |\overline{a}_\alpha - \overline{b}_\alpha| d\alpha$ ……..(1)

Where$[\underline{a}_\alpha, \overline{a}_\alpha]$ $[\underline{b}_\alpha, \overline{b}_\alpha]$ correspond to α-cat of $\tilde{A}$ and $\tilde{B}$ respectively

3.Problem formulation

To schedule n jobs on a single machine of the minimize total completion time and maximum lateness with fuzzy due date. let N={1,2…n} set of n jobs requires p_j units of processing time and each jobs is assigned with due date D_j where D_j is triangular fuzzy number (TFN). All the jobs are available to be processed by the machine and by starts processing without interrupted. let δ be a sequence of jobs in N so that is minimized of objective function .we address the case by following membership

$$D_j(\chi) = \begin{cases} 0 & if\ \chi < {d_j}^I \\ \dfrac{\chi - {d_j}^I}{{d_j}^c - {d_j}^I} & if\ {d_j}^I \le \chi < {d_j}^c \\ \dfrac{{d_j}^u - \chi}{{d_j}^u - {d_j}^c} & if\ {d_j}^c \le \chi < {d_j}^u \\ 0 & if\ {d_j}^u \le \chi \end{cases}$$

$$\tilde{L}_j(C_j, \tilde{D_j}) = C_j - \tilde{d}_j$$

We define the distance according to $\tilde{D_j}$is triangular fuzzy number $({d_j}^I, {d_j}^c, {d_j}^u)$, by using distance measure. Let $\tilde{A} = [\underline{a}_\alpha, \overline{a}_\alpha]$ and $\tilde{B} = [\underline{b}_\alpha, \overline{b}_\alpha]$, than

$$\tilde{d}(\tilde{A}, \tilde{B}) = \frac{1}{2}\int_0^1 \{(\underline{a}_\alpha - \underline{b}_\alpha)^+ + (\overline{a}_\alpha - \overline{b}_\alpha)^+\}d\alpha + \frac{1}{2}\int_0^1 \{(\underline{a}_\alpha - \underline{b}_\alpha)^- + (\overline{a}_\alpha - \overline{b}_\alpha)^-\}d\alpha$$

Where

$$(\chi)^+ = \begin{cases} \chi & if\ \chi \ge 0, \\ 0 & if\ \chi < 0 \end{cases}$$

And

$$(\chi)^- = \begin{cases} 0 & if\ \chi \ge 0, \\ \chi & if\ \chi < 0 \end{cases}$$

By changing $\tilde{A}$ with $C_j$where $C_j$is a completion time and $\tilde{B}$ with $\tilde{D_j}$where $\tilde{D_j}$ is fuzzy due date we can evaluated the following lateness function:

$$\tilde{L}(C_j, \tilde{D_j}) = \frac{1}{2}\int_0^1 \{(C_j - \underline{d_j}_\alpha)^+ + \left(C_j - \overline{d_j}_\alpha\right)^+\}\, d\alpha + \frac{1}{2}\int_0^1 \{(C_j - \underline{d_j}_\alpha)^- + \left(C_j - \overline{d_j}_\alpha\right)^-\}\, d\alpha$$

Where $[\underline{d_j}_\alpha, \overline{d_j}_\alpha]$ according to α-cut

To derive the fuzzy lateness cost function, we have four cases:

- Case (1):
  if $C_j < {d_j}^I$
  For $C_j - ({d_j}^I + ({d_j}^c - {d_j}^I)\alpha$
  If $\alpha = 0$ then $C_j - {d_j}^I < 0$
  If $\alpha = 1$ then $C_j - {d_j}^c < 0$
  For $C_j - ({d_j}^u + ({d_j}^c - {d_j}^u)\alpha$
  If $\alpha = 0$ then $C_j - {d_j}^u < 0$
  If $\alpha = 1$ then $C_j - {d_j}^c < 0$
  Then by equation (1) we get

$$\tilde{L}(C_j, \tilde{D_j}) = \frac{1}{2}\int_0^1 \{(C_j - \underline{d_j}_\alpha)^- + \left(C_j - \overline{d_j}_\alpha\right)^-\}\, d\alpha$$

$$= \frac{1}{2}\int_0^1 \{\left(C_j - \left({d_j}^I + \left({d_j}^c - {d_j}^I\right)\alpha\right) + C_j - \left({d_j}^u + \left({d_j}^c - {d_j}^u\right)\alpha\right)\}d\alpha$$

$$= \frac{1}{2}[C_j\alpha - {d_j}^I\alpha - \frac{1}{2}{d_j}^c\alpha^2 + \frac{1}{2}{d_j}^I\alpha^2 + C_j\alpha - {d_j}^u\alpha - \frac{1}{2}{d_j}^c\alpha^2 + \frac{1}{2}{d_j}^I\alpha^2]_0^1$$
$$= \frac{1}{2}[2C_j - \frac{1}{2}{d_j}^I - {d_j}^c - \frac{1}{2}{d_j}^u]$$
$$= C_j - \frac{1}{4}[{d_j}^I + 2{d_j}^c + {d_j}^u]$$

- Case 2:
  If ${d_j}^I \le C_j < {d_j}^c$ then:
  For $C_j - ({d_j}^I + ({d_j}^c - {d_j}^I)\alpha$
  If $\alpha = 0$ then $C_j - {d_j}^I \ge 0$
  If $\alpha = 1$ then $C_j - {d_j}^c < 0$
  For $C_j - ({d_j}^u + ({d_j}^c - {d_j}^u)\alpha$
  If $\alpha = 0$ then $C_j - {d_j}^u < 0$
  If $\alpha = 1$ then $C_j - {d_j}^c < 0$
  Than $C_j - ({d_j}^c - {d_j}^I)\alpha - {d_j}^I) \ge 0$
  $C_j - {d_j}^I \ge ({d_j}^c - {d_j}^I)\alpha$ Than $\alpha \le \frac{C_j - {d_j}^I}{{d_j}^c - {d_j}^I}$
  Than $[0, \frac{C_j - {d_j}^I}{{d_j}^c - {d_j}^I}] \ge 0$, $[\frac{C_j - {d_j}^I}{{d_j}^c - {d_j}^I}, 1]$
  by using equation (1)

$$\tilde{L}(C_j, \widetilde{D}_j) = \frac{1}{2}\int_0^1 \{(C_j - \underline{d_j}_\alpha)^+ + \left(C_j - \overline{d_j}_\alpha\right)^+\} d\alpha + \frac{1}{2}\int_0^1 \{(C_j - \underline{d_j}_\alpha)^- + \left(C_j - \overline{d_j}_\alpha\right)^-\} d\alpha$$

$$= \frac{1}{2}\int_0^{\frac{C_j - {d_j}^I}{{d_j}^c - {d_j}^I}} (C_j - ({d_j}^I + ({d_j}^c - {d_j}^I)\alpha))d\alpha$$
$$+ \frac{1}{2}\int_{\frac{C_j - {d_j}^I}{{d_j}^c - {d_j}^I}}^1 (C_j - ({d_j}^I + ({d_j}^c - {d_j}^I)\alpha))d\alpha$$
$$+ \frac{1}{2}\int_0^1 (C_j - ({d_j}^u + ({d_j}^c - {d_j}^u)\alpha))d\alpha$$

$$= \frac{1}{2}[C_j\alpha - {d_j}^I\alpha - \frac{1}{2}{d_j}^c\alpha^2 + \frac{1}{2}{d_j}^I\alpha^2]_0^{\frac{C_j - {d_j}^I}{{d_j}^c - {d_j}^I}} + = \frac{1}{2}[C_j\alpha - {d_j}^I\alpha - \frac{1}{2}{d_j}^c\alpha^2 + \frac{1}{2}{d_j}^I\alpha^2]_{\frac{C_j - {d_j}^I}{{d_j}^c - {d_j}^I}}^1$$
$$+ \frac{1}{2}[C_j\alpha - {d_j}^u\alpha - \frac{1}{2}{d_j}^c\alpha^2]_0^1$$
$$= \frac{1}{2}\left[2C_j - \frac{1}{2}{d_j}^I - \frac{1}{2}{d_j}^c\right] + \frac{1}{2}\left[2C_j - \frac{1}{2}{d_j}^u - \frac{1}{2}{d_j}^c\right]$$
$$= C_j - \frac{1}{4}[{d_j}^I + 2{d_j}^c + {d_j}^u]$$

- Case (3)
  If ${d_j}^c \le C_j < {d_j}^u$ then:
  For $C_j - ({d_j}^I + ({d_j}^c - {d_j}^I)\alpha$
  If $\alpha = 0$ then $C_j - {d_j}^I > 0$

If $\alpha = 1$ then $C_j - {d_j}^c > 0$
For $C_j - ({d_j}^u + ({d_j}^c - {d_j}^u)\alpha$
If $\alpha = 0$ then $C_j - {d_j}^u < 0$
If $\alpha = 1$ then $C_j - {d_j}^c > 0$
Than $C_j - ({d_j}^u + ({d_j}^c - {d_j}^u)\alpha \geq 0$
$\Rightarrow \left({d_j}^u - {d_j}^c\right)\alpha \geq {d_j}^u - C_j$
$\Rightarrow \alpha \geq \dfrac{{d_j}^u - C_j}{{d_j}^u - {d_j}^c}$
Than $\left[0, \frac{{d_j}^u - C_j}{{d_j}^u - {d_j}^c}\right] \leq 0, \quad [\frac{{d_j}^u - C_j}{{d_j}^u - {d_j}^c}, 1] \geq 0$
Then by using equation (1)

$$\tilde{L}(C_j, \widetilde{D_j}) = \frac{1}{2}\int_0^1 \{(C_j - \underline{d_j}_\alpha)^+ + \left(C_j - \overline{d_j}_\alpha\right)^+\} d\alpha + \frac{1}{2}\int_0^1 \{(C_j - \underline{d_j}_\alpha)^- + \left(C_j - \overline{d_j}_\alpha\right)^-\} d\alpha$$

$$= \frac{1}{2}\int_0^1 [C_j - ({d_j}^I + \left({d_j}^c - {d_j}^I\right)\alpha] d\alpha + \frac{1}{2}\int_0^{\frac{{d_j}^u - C_j}{{d_j}^u - {d_j}^c}} [C_j - ({d_j}^u + \left({d_j}^c - {d_j}^u\right)\alpha]\, d\alpha$$

$$+ \frac{1}{2}\int_{\frac{{d_j}^u - C_j}{{d_j}^u - {d_j}^c}}^1 [C_j - ({d_j}^u + \left({d_j}^c - {d_j}^u\right)\alpha]\, d\alpha$$

$$= \frac{1}{2}[C_j\alpha - {d_j}^I\alpha - \frac{1}{2}\left({d_j}^c - {d_j}^I\right)\alpha^2]_0^1 + \frac{1}{2}[C_j\alpha - {d_j}^u\alpha - \frac{1}{2}\left({d_j}^c - {d_j}^u\right)\alpha^2]_0^{\frac{{d_j}^u - C_j}{{d_j}^u - {d_j}^c}}$$

$$\frac{1}{2}[C_j\alpha - {d_j}^u\alpha - \frac{1}{2}\left({d_j}^c - {d_j}^u\right)\alpha^2]_{\frac{{d_j}^u - C_j}{{d_j}^u - {d_j}^c}}^1$$

Than we get

$$C_j - \frac{1}{4}\left[{d_j}^I + 2{d_j}^c + {d_j}^u\right]$$

- Case (4)
: if ${d_j}^u < C_j$
For $C_j - ({d_j}^I + ({d_j}^c - {d_j}^I)\alpha$
If $\alpha = 0$ then $C_j - {d_j}^I > 0$
If $\alpha = 1$ then $C_j - {d_j}^c > 0$
For $C_j - ({d_j}^u + ({d_j}^c - {d_j}^u)\alpha$
If $\alpha = 0$ then $C_j - {d_j}^u > 0$
If $\alpha = 1$ then $C_j - {d_j}^c > 0$
Then by equation (1) we get

$$\tilde{L}(C_j, \widetilde{D_j}) = \frac{1}{2}\int_0^1 \{(C_j - \underline{d_j}_\alpha)^+ + \left(C_j - \overline{d_j}_\alpha\right)^+\} d\alpha$$

$$= \frac{1}{2}\int_0^1 \{\left(C_j - \left({d_j}^I + \left({d_j}^c - {d_j}^I\right)\alpha\right) + C_j - \left({d_j}^u + \left({d_j}^c - {d_j}^u\right)\alpha\right)\} d\alpha$$

$$= \frac{1}{2}[C_j\alpha - {d_j}^I\alpha - \frac{1}{2}{d_j}^c\alpha^2 + \frac{1}{2}{d_j}^I\alpha^2 + C_j\alpha - {d_j}^u\alpha - \frac{1}{2}{d_j}^c\alpha^2 + \frac{1}{2}{d_j}^I\alpha^2]_0^1$$

$$= \frac{1}{2}[2C_j - \frac{1}{2}{d_j}^I - {d_j}^c - \frac{1}{2}{d_j}^u]$$
$$= C_j - \frac{1}{4}[{d_j}^I + 2{d_j}^c + {d_j}^u]$$

Than from case (1, 2, 3, 4) we get

$$\tilde{L}(C_j, \tilde{D}_j) = C_j - \frac{1}{4}[{d_j}^I + 2{d_j}^c + {d_j}^u]$$

Where $C_j$is completion time of jobs j under a sequence δ

Using the traditional notion, we denote by

$1\backslash\tilde{D}_j = TFN\backslash\sum_{j=1}^{n} C_j + \tilde{L}_{max}$

the problem formulated by

Min F =Min$\sum_{j=1}^{n} C_j + \tilde{L}_{max}$

subject to :

$C_j \geq P_j$; j=1,2,…,n

$C_j = C_{j-1} + P_j$; j=2,3,…,n

$L_j = C_j - d_j$

…..Q

4.Solve the problem by using BAB algorithm

Consider branch and bound algorithm as the general solution of single machine problem. The problem is seemed as a tree include nodes, and each node has a possibility to emerge into a partial sequence. To select the monster partial sequence, we must calculate the lower bound of all partial sequence node with the lowest lower bound is chosen. This the procedure continued till the least node. After obtaining an order where the job on a machine is scheduling, if the nodes having the upper lower bounds then no more branching is possible the aim of this problem is to find the minimum objective function.

4.1 decomposition of the problem

To solve a problem we can make decomposition of the problem by braking it to up smaller ones, let the problem define by $1\backslash\backslash Z_i$where *i=1,2*

$Z_1 = min\sum_{j=1}^{n} C_j$

subject to :

$C_j \geq P_j$; j=1,2,…,n

$C_j = C_{j-1} + P_j$; j=2,3,…,n

And

$Z_2 = \tilde{L}_{max}(C_j, \tilde{d}_j)$

subject to :

$C_j \geq P_j$; j=1,2,…,n

$C_j = C_{j-1} + P_j$; j=2,3,…,n

$$L_j = C_j - d_j$$

4.2 Lower bound

The lower bound calculating by sequence of jobs in SPT order to get minimum value total completion time to sub problem $Z_1 = min\sum_{j=1}^{n} C_j$ and $Z_2 = \tilde{L}_{max}(C_j, \tilde{d}_j)$calculated by sequence of jobs in EDD order to get minimum maximum lateness with fuzzy due date . Hence the lower bound calculated by:

LB= $\sum_{j=1}^{n} C_j(SPT) + L_{max}(EDD)$

4.3 Upper bound

To find the upper bound can be compete the first and second upper bound by SPT and EDD order sequence respectively, then

UB (1) =$\sum_{j=1}^{n} C_j(SPT) + L_{max}(SPT)$

UB (2)= $\sum_{j=1}^{n} C_j(EDD) + L_{max}(EDD)$

UB (3) this upper bound was found by applying average high ranking methodology (AHR) Heuristic algorithm by following steps;

Step (1): We find (AHR) of fuzzy due date time (a,b,c) of all the jobs

Step (2): The second step arrange the jobs increasing order of average high ranking, if we have two jobs has same order consider the lowest due date

Step (3): We used step 2 after obtained the sequence to find the value of objective function

The upper bound competed by

UB = Min (UB1, UB2,UB3)

5.Computational results

In this section, the computational results are given in below table tested by coding then Matlab R2017a and run on core i7 at CPU @2.40GHs 4GB computer. In the table given the results of optimal values by complete enumeration method and branch and bound method for n=3,4,5,6,7,8,9,10 as the following table

n: no. of jobs,

Ex: no. of examples,

Opt (BAB): The optimal value of the function using (BAB)

Opt (CEM): The optimal value of the function using (CEM) the complete enumeration method.

NOD: Number of node

Time: The execution time of the problem (by seconds).

6.Conclusion

We solved the problem Q with fuzzy due date by using branch and bound method for several different example for each n–job and comparison between (branch and bound method) and (complete enumeration method) to show the optimal value are equal in $n \leq 10$ in this paper.

Abstract: In this work, we adopt B. spline function of two variables basis for solving linear multi-dimensional delay Volterra integral equations nonhomogeneous of the second type. We employ the two methods to approximate solution via B. spline function of two variables basis that yields linear system. Some examples are given, the results shown in tables and figures. These methods are very effective, convenient and overcome the difficulty of traditional methods. We solve this problem with the assistance of Matlab18.

1. Introduction

Integral equations are used as mathematical models for many physical situations, and integral equations also occur as reformulations of other mathematical problems. The solutions of integral equations have a major role in the field of science and engineering [1]. The theory and application of integral equations are important subject within applied mathematics. The most recent kind of equation that worth studying is the delay integral equation. These equations have many applications like a model to explain the observed periodic out breaks of certain infection diseases. Another application is electromagnetic inverse scattering. The delay arguments are consistent with the real phenomena which make the models more realistic for simulation. Finding the approximate or exact solutions of multi- dimensional delay integral equations is an important task. Save in a limited number, there difficulty in finding the analytical solutions of multi-dimensional delay integral equations. Therefore, there have been attempts to develop new methods for obtaining analytical solutions which reasonably approximate the exact solutions. Delay integral equations allow mathematicians and engineers better modeling of a wide class of systems with anomalous dynamic behavior and a better understanding of the facets of both physical phenomena and artificial processes. The multi-dimensional delay integral equations are equations in which the unknown function appears under two integral signs and dependents only on two independent variables [1,4,6].

The general form of linear multi-dimensional Volterral delay integral equation is:

$$h(x,y)u(x,y) = g(x,y) + \int_c^{d(y)} \int_a^{b(x)} k(x,y,s,t)\, u(s-\tau_1, t-\tau_2)\, dsdt \qquad (1)$$

where h is known function of x, y and k is known function of x and y called kernel of the integral equation and g is a given function often called the driving term, $\{a, c\}$ are known scalars, $\{b, d\}$ are known functions of x & y and τ_1, τ_2 are known positive numbers and u is the unknown that must be determined. Eq.(1) is classified as first kind if $h(x,y) = 0$, otherwise $h(x,y) = 1$ it is called second kind.

However, several numbers of algorithms for solving linear multi- dimensional linear Volterra delay integral equations have been investigated. M. Abdelkawy and A. Amin [7] use Jacobi collocation approximation for solving multi-dimensional volterra integral equations. Reza Abazari and Adem KJlJçman [8] adopt RDTM and comparison with DTM to study of two-dimensional Volterra integral equations. H. Brunner and J. Kauthn[9] employ collocation and iterated collocation to solve two-dimensional Volterra integral equations.

The aim of this paper, to show how the approximate methods which are based on the expansion method can be used to solve ($LMDVIE_s$) obtain approximate solutions via B. spline polynomials as basis functions.

2. A new formulation of B. spline functions of two variable $B_{ij}^{n+m}(x,y)$ and the properties

B. spline is a piecewise polynomial approximation. Schoenbdery first introduced the B. spline in 1949. This function used to find approximated solution of one dimensional linear Volterra integral differential equations [2]. Moreover, this function is used to solve one dimensional delay differential equation [5]. In this paper we used B. spline of two variables $B_{ij}^{n+m}(x,y)$ to find approximated solution of the two dimensional linear Volterra delay integral equation.

$$B_{ij}^{n+m}(x,y)=\binom{n}{i}\binom{n}{j}x^i y^i(1-x)^{n-i}(1-y)^{m-j}\ ,\quad 0\le x\le n\ ,0\le y\le m$$

where $\binom{n}{i}\binom{n}{j}=\frac{n!}{i!(n-i)!}\frac{m!}{j!(m-j)!}$, n,m are the degree of polynomials and i,j are the index of polynomials and x,y are variables.

Property (1)[3] The B. spline of degree $n+m$ in terms of the power basis is given by the following formula: $B_{ij}^{n+m}(x,y)=\sum_{k=1}^{n}\sum_{j=1}^{m}(-1)^{k-i}(-1)^{1-j}\binom{n}{k}\binom{k}{i}\binom{m}{1}\binom{1}{j}x^k y^i$

Property (2)[3] The first derivative of $B_{ij}^{n+m}(x,y)$ polynomial with respect to x is a polynomial of degree $(n+m+1)$ and is given by: $\frac{\partial B_{ij}^{n+m}(x,y)}{\partial x}=n\left(B_{i-1}^{n-1}(x)-B_i^{n-1}(x)\right)B_j^m(y)$.

Property (3)[3] The first derivative of $B_{ij}^{n+m}(x,y)$ polynomial with respect to y is a polynomial of degree $(n+m+1)$ and is given by:$\frac{\partial B_{ij}^{n+m}(x,y)}{\partial y}=m\left(B_{j-1}^{m-1}(y)-B_j^{m-1}(y)\right)B_i^n(x)$

Property (4)[3]

The first derivative of $B_{ij}^{n+m}(x,y)$ polynomial with respect to (x,y) is a polynomial of degree $(n+m-2)$ and is given by:

$$\frac{\partial^2 B_{ij}^{n+m}(x,y)}{\partial x\partial y}=nm(B_{i-1}^{n-1}(x)-B_i^{n-1}(x))((B_{j-1}^{m-1}(y)-B_j^{m-1}(y))$$

3. Expansion Methods:

The expansion method is one of the famous methods used to find an approximate solutions of the multi-dimensional integral equations, [1,2,4,6].

To illustrate that, consider multi-dimensional linear Volterra delay equation

$$u(x,y)=g(x,y)+\int_c^{d(y)}\int_a^{b(x)}k(x,y,s,t)\,u(s-\tau_1,t-\tau_2)\,ds\,dt \qquad (2)$$

Approximate the solution u of the equation as:

$$u(x,y)\cong\sum_{k=1}^{N}c_k B_k(x,y) \qquad (3)$$

By substituting Eq. (3) into Eq. (2) one can get

$$\sum_{k=1}^{N}c_k\left[B_k(x,y)-\int_c^{d(y)}\int_a^{b(x)}k(x,y,s,t)B_k\,(s-\tau_1,t-\tau_2)\,ds\,dt\right]-g(x,y)=$$
$$\varepsilon(x,y,c_1,c_2,\dots,c_N) \qquad (4)$$

Hence the error function $\varepsilon(x,y,c_1,c_2,\dots,c_N)$ will depends on x,y and on the unknown's coefficients $c_1,c_2,\dots,c_N$. The expansion method (collocation and Galerkin's) depends on finding the coefficients $c_1,c_2,\dots,c_N$ in which the error function is minimizing.

4. B. spline solving multi-dimensional linear Volterra delay integral equation using collocation method:

Consider multi-dimensional linear Volterra delay integral equation

$$u(x,y) = g(x,y) + \int_c^{d(y)} \int_a^{b(x)} k(x,y,s,t)\, u(s-\tau_1, t-\tau_2)\, ds\, dt \quad (5)$$

The collocation method requires that $\varepsilon(x_i, y_j) = 0$ where $(x_i, y_j) \in D$ and

$D = \{(x,y) | a \le x \le b,\ \ c \le y \le d\}\ for\ all\ i = 1,2,\dots,M\ ,\ j = 1,2,\dots,M$

Therefore: $\sum_{k=1}^{N} c_k\, u_k(x_i, y_j) = g(x_i, y_j)\ , i = 1,2,\dots,N\ , j = 1,2,\dots,M \quad (6)$

We can obtain system of linear equations with unknown $c_1, c_2, \dots, c_N$ which can be solved by using mat lab language to find approximate solution.

5. B. spline solving multi-dimensional linear Volterra delay integral equation using Gelarkin's method:

This method is based an approximation the unknown function u and substituting it into Eq. (2) to give following equation:

$$\sum_{k=1}^{N} c_k B_k\,(x,y) = g(x,y) - \sum_{k=1}^{N} c_k \int_c^d \int_a^b k(x,y,s,t) B_k\, u(s-\tau_1, t-\tau_2) ds\, dt = \varepsilon(x,y,c_1,c_2,\dots,c_N) \quad (7)$$

Gelarkin's method established N-conditions which are necessary for determining N-coefficients $\{c_k\}_{k=1}^{N}$ appeared in the above equation, by making the error $\varepsilon(x,y,c_1,c_2,\dots,c_N)$ orthogonal to N given linearly independent functions $\varphi_1(x,y), \varphi_2(x,y), \dots, \varphi_k(x,y)$.

$$\int_c^d \int_a^b \varphi_j(x,y)\, \varepsilon(x,y,c_1,c_2,\dots,c_N)\, dx\, dy = 0\ , \qquad j = 1,2,\dots,N \quad (8)$$

Therefor

$$\int_c^d \int_a^b \varphi_j\, (\sum_{k=1}^{N} c_k [B_k(x,y) - \int_c^d \int_a^b k(x,y,s,t) B_k\,(s-\tau_1, t-\tau_2) ds\, dt - g(x,y)) dx dy = 0 \quad (9)$$

Where $u_k(x,y) = B_k(x,y) - \int_c^d \int_a^b k(x,y,s,t) B_k\,(s-\tau_1, t-\tau_2) ds\, dt]$

Then $\sum_{k=1}^{N} c_k \int_c^d \int_a^b \varphi_j(x,y) u_k\,(x,y) dx\, d\,y = \int_c^d \int_a^b \varphi_j(x,y)\, g\,(x,y) dx\, d\,y \quad (10)$

By evaluating the above equation for each $j = 1,2,\dots,N$ one can get a system of N linear equations with N unknowns $c_1, c_2, \dots, c_N$ which can be solved by any suitable method.

6. Numerical Examples

Example1: Consider the multi-dimensional linear Volterra delay integral equation of first kind: $\frac{1}{2} y^3 x^2 + \frac{1}{2} x^3 y^2 - 2y^2 x^2 = \int_0^y \int_0^x xy\, u(s-2,t)\, dsdt$

and the exact solution is $u(x,y) = x + y$. with $N = 10,\ h = 0.1$ and $x_i = ih,\ y_i = ih,\ i = 0,1,\dots,N$.

7.Conclusions:

1.The expansion method with the aid of B. spline polynomials as a basis functions to compute the approximate solutions for multi-dimensional linear Volterra delay integral equations and B. spline polynomial gave accurate results.

2. A disadvantage of the B. spline function is its dependence up a free parameter n.

Abstract. The aim of the present work is to define a new class of closed soft sets in soft closure spaces, namely, generalized closed soft sets (gc-soft sets, for short) which are defined over an initial universe set with a fixed set of parameters. This new class is a generalization to the class of closed soft sets. A necessary condition for a gc-soft set to be a soft closed is also obtainable. Moreover, the union and intersection of two gc-soft sets are discussed. Besides, some properties of gc-soft sets in the product soft closure spaces are also studied. Also, as an application of gc-soft sets a new soft separation axiom, namely $T_{\frac{1}{2}}$-soft closure space is introduced and its basic properties are investigated.

1. Introduction

In 1999, Molodtsov [15] presented the idea of soft sets as a general mathematical method for dealing with unknown objects. The soft set theory has been applied in many ways, e.g. stability and regularization [15], research on game theory and operations [15], soft analysis [15], general topology [16] etc. Shabir and Naz [16] presented the concept of soft topological spaces which is defined over an initial universe with a fixed set of parameters. Also, Gowri and Jegadeesan [10] introduced and discussed Cech soft closure spaces. Future, in a fuzzy soft environment, Majeed [13] presented the fundamental structure of Cech fuzzy soft closure spaces. We have recently introduced the concept of soft closure spaces [7] as an extension of this definition in the ordinary set theory developed by Cech [5].

Generalized closed sets were introduced by Levine [12] in a topological space. Levine extends some important properties of closed sets to a larger set's family. Compactness, normality and completeness in a uniform space have been shown, for example, to be inherited by generalized closed sets. By using generalized closed sets Balachandran et al. [3] introduced the notion of generalized continuous maps and studied some of their properties. Kannan [11] introduced the notion of generalized closed soft sets in soft topological spaces. The definitions of generalized closed sets and generalized continuous maps have been extended by Boonpok and Khampakdee in [4] to closure spaces. Our aim in the current work is to introduce and study new notions in soft closure spaces. In Section 3, we present and study a new class of closed soft sets which is called gc-soft sets within soft closure spaces. We show this new class contains the class of closed soft sets. In Section 4, we use the definition of gc-soft sets, to define and study a new type of spaces, namely $T_{\frac{1}{2}}$-soft closure space.

2. Preliminaries

In this section, we remember some basic concepts and outcomes that various authors of soft set theory defined and discussed. In this paper, M refers to the initial universe, $P(M)$ denotes the power set of M and R is the set of all parameters for M.

Definition 2.1 [15] A mapping $F: R \to P(M)$ defines a soft set $F_R = (F, R)$ over the universe set M. So, the set $F_R = \{(r, F(r)): r \in R \; and \; F(r) \in P(M)\}$ can be used to represent F_R. $SS(M, R)$ denotes the family of all soft sets over M.

Definition 2.2 [14] A soft set F_R is said to be a null (respectively, an absolute) soft set, denoted by $\widetilde{\Phi}_R$ (respectively, $\widetilde{M}$), if for all $r \in R$, $F(R) = \emptyset$ (empty set) (respectively, $F(r) = M$).

Definition 2.3 [9] Let F_R,$G_R \in SS(M, R)$. A soft set F_R is said to be a soft subset of G_R, symbolized $F_R \sqsubseteq G_R$, if $F(r) \subseteq G(r)$ for all $r \in R$. F_R equals G_R, denoted by $F_R = G_R$ if $F_R \sqsubseteq G_R$ and $G_R \sqsubseteq F_R$.

Definition 2.4 [14] Let F_R,$G_R \in SS(M, R)$. The union of F_R and G_R is the soft set H_R given by $H(r) = F(r) \cup G(r)$ for all $r \in R$. This is represented by $F_R \sqcup G_R$. The intersection between F_R and G_R is the soft set H_R defined as $H(r) = F(r) \cap G(r)$ for all $r \in R$ and denoted by, $F_R \sqcap G_R$.

Definition 2.5 [16] The difference between two soft sets F_R and G_R over M, denoted by $F_R - G_R$ is the soft set H_R defined as $H(r) = F(r) - G(r)$ for all $r \in R$.

Definition 2.6 [16] The relative complement of a soft set F_R is denoted by F_R^c, where $F^c: R \longrightarrow P(M)$ defined as $F^c(r) = M - F(r)$, for all $r \in R$. Clearly, $F_R^c = \widetilde{M} - F_R$.

Definition 2.7 [6] The soft set $F_R \in SS(M, R)$ is called soft point in M, denoted by x_r, if for the element $r \in R$, $F(r) = \{x\}$ and $F(r') = \emptyset$ for every $r' \in R - \{r\}$.

Definition 2.8 [6] A soft point x_r is said to belong to the soft set G_R, indicate by $x_r \,\widetilde{\in}\, G_R$, if $\{x\} \subseteq G(r)$ for the parameter $r \in R$.

Definition 2.9 [2] Let $F_R \in SS(M, R)$ and $G_K \in SS(N, K)$. The Cartesian product $F_R \times G_K$ is defined by $(F \times G)_{R \times K}$ where

$$(F \times G)_{R \times K}(r, k) = F(r) \times G(k), \text{ for all } (r, k) \in R \times K.$$

By this description, the $F_R \times G_K$ soft set is a soft set over $M \times N$ and its universe parameter is $R \times K$.

The projection pairs $p_M: M \times N \longrightarrow M$, $q_R: R \times K \longrightarrow R$ and $p_N: M \times N \longrightarrow N$, $q_K: R \times K \longrightarrow K$ determine morphisms respectively (p_M, q_R) from $M \times N$ to M and (p_N, q_K) from $M \times N$ to N, where

$(p_M, q_R)(F_R \times G_K) = p_M(F \times G)_{q_R(R \times K)}$ and

$(p_N, q_K)(F_R \times G_K) = p_N(F \times G)_{q_K(R \times K)}$ [1].

Definition 2.10 [7] An operator $\tilde{u}: SS(M, R) \longrightarrow SS(M, R)$ is referred to as a soft closure operator (soft-co, for short) on M, if for all $F_R, G_R \in SS(M, R)$ the following conditions hold:

$(C1)$ $\widetilde{\Phi}_R = \tilde{u}(\widetilde{\Phi}_R)$;

$(C2)$ $F_R \sqsubseteq \tilde{u}(F_R)$;

$(C3)$ $F_R \sqsubseteq G_R \Longrightarrow \tilde{u}(F_R) \sqsubseteq \tilde{u}(G_R)$.

The triple $(M, \tilde{u}, R)$ is named a soft closure space (soft-cs, for short). It is said that soft subset F_R over M is a closed soft set (c-soft set, for short), if $F_R = \tilde{u}(F_R)$. The relative complement $\widetilde{M} - F_R$ of any c-soft set over M is said to be an open soft set (o-soft set, for short).

Proposition 2.11 [7] Let $(M,\tilde{u},R)$ be a soft-cs and $\{(F_R)_\alpha : \alpha \in I\}$ be a collection of soft subsets over M. Then

1- $\sqcup_{\alpha\in I}\,\tilde{u}((F_R)_\alpha) \sqsubseteq \tilde{u}(\sqcup_{\alpha\in I}\,(F_R)_\alpha)$.
2- $\tilde{u}(\sqcap_{\alpha\in I}\,(F_R)_\alpha) \sqsubseteq \sqcap_{\alpha\in I}\,\tilde{u}((F_R)_\alpha)$.

Definition 2.12 [7] Let $(M,\tilde{u},R)$ be a soft-cs and let $Y \subseteq M$. Then $\tilde{u}_Y : SS(Y,R) \longrightarrow SS(Y,R)$ defined by $\tilde{u}_Y(F_R) = \tilde{Y} \sqcap \tilde{u}(F_R)$ is the relative soft closure operator on Y induced by $\tilde{u}$. The triple $(Y,\tilde{u}_Y,R)$ is said to be a soft closure subspace (soft-c.subsp, for short) of $(M,\tilde{u},R)$.

Theorem 2.13 [7] If G_R is an o-soft set in $(M,\tilde{u},R)$ and $(Y,\tilde{u}_Y,R)$ be a soft- c.subsp of a soft-cs $(M,\tilde{u},R)$, then $\tilde{Y} \sqcap G_R$ is an o-soft set in $(Y,\tilde{u}_Y,R)$.

Definition 2.14 [7] The product of the family of soft-cs's $\{(\mathcal{M}_\alpha,\tilde{u}_\alpha,R_\alpha) : \alpha \in \mathcal{J}\}$ is the triple $(\prod_{\alpha\in\mathcal{J}}\mathcal{M}_\alpha, \otimes\tilde{u}, \prod_{\alpha\in\mathcal{J}}R_\alpha)$, where $\prod_{\alpha\in\mathcal{J}}\mathcal{M}_\alpha$ and $\prod_{\alpha\in\mathcal{J}}R_\alpha$ denotes to the Cartesian product of the sets $\mathcal{M}_\alpha$ and R_α, $\alpha \in \mathcal{J}$, respectively and $\otimes\tilde{u} : \mathcal{SS}(\prod_{\alpha\in\mathcal{J}}\mathcal{M}_\alpha, \prod_{\alpha\in\mathcal{J}}R_\alpha) \longrightarrow \mathcal{SS}(\prod_{\alpha\in\mathcal{J}}\mathcal{M}_\alpha, \prod_{\alpha\in\mathcal{J}}R_\alpha)$ defined as follows:
$\otimes\tilde{u}(\mathcal{F}_{\prod_{\alpha\in\mathcal{J}}R_\alpha}) = \prod_{\alpha\in\mathcal{J}}\tilde{u}_\alpha\left(\left(p_{\mathcal{M}_\alpha}, q_{R_\alpha}\right)\left(\mathcal{F}_{\prod_{\alpha\in\mathcal{J}}R_\alpha}\right)\right)$, $\forall\, \mathcal{F}_{\prod_{\alpha\in\mathcal{J}}R_\alpha} \in \mathcal{SS}(\prod_{\alpha\in\mathcal{J}}\mathcal{M}_\alpha, \prod_{\alpha\in\mathcal{J}}R_\alpha)$.

Theorem 2.15 [8] Let $\{(M_\alpha,\tilde{u}_\alpha,R_\alpha) : \alpha \in I\}$ be a collection of soft-cs's and let $v \in I$. Then, the soft projection mapping $\left(p_{M_v}, q_{R_v}\right) : (\prod_{\alpha\in I}M_\alpha, \otimes\tilde{u}, \prod_{\alpha\in I}R_\alpha) \longrightarrow (M_v,\tilde{u}_v,R_v)$ is a soft closed and soft continuous mapping.

3. The basic structures of generalized closed soft sets

In this section, we introduce the notion of generalized closed (respectively, open) soft sets in soft-cs's and study the basic properties of these sets with several examples.

Definition 3.1 A soft set $\mathcal{F}_R$ is called a generalized closed soft set (g-soft set, for short) in a soft-cs $(\mathcal{M},\tilde{u},R)$, if $\tilde{u}(\mathcal{F}_R) \sqsubseteq G_R$ whenever $\mathcal{F}_R \sqsubseteq G_R$ and G_R is an σ-soft set in $\widetilde{\mathcal{M}}$. A soft set $\mathcal{F}_R$ is called a generalized open soft set ($g\sigma$-soft set, for short), if the relative complement $\widetilde{\mathcal{M}} - \mathcal{F}_R$ is a g-soft set in $(\mathcal{M},\tilde{u},R)$.

The next example explains Definition 3.1.

Example 3.2 Let $\mathcal{M} = \{a,b,c\}$ and $R = \{r_1,r_2\}$. Define a soft-co $\tilde{u} : \mathcal{SS}(\mathcal{M},R) \longrightarrow \mathcal{SS}(\mathcal{M},R)$ as follows:

$$\tilde{u}(\mathcal{F}_R) = \begin{cases} \widetilde{\Phi}_R & if \quad \mathcal{F}_R = \widetilde{\Phi}_R, \\ \{(r_1,\{b\})\} & if \quad \mathcal{F}_R = \{(r_1,\{b\})\}, \\ \{(r_1,\{b,c\})\} & if \quad \mathcal{F}_R = \{(r_1,\{c\})\}, \\ \{(r_1,\{b,c\})\} & if \quad \mathcal{F}_R = \{(r_1,\{b,c\})\}, \\ \{(r_2,\{a\})\} & if \quad \mathcal{F}_R = \{(r_2,\{a\})\}, \\ \widetilde{\mathcal{M}} & other\ wise. \end{cases}$$

Then $(\mathcal{M},\tilde{u},R)$ is a soft-cs. Let $\mathcal{F}_R = \{(r_1,\{a,b\}),((r_2,\{a\})\} \in \mathcal{SS}(\mathcal{M},R)$. Then $\mathcal{F}_R$ is g-soft set since $\mathcal{F}_R \sqsubseteq \widetilde{\mathcal{M}}$ which is the only σ-soft set containing $\mathcal{F}_R$ and $\tilde{u}(\mathcal{F}_R) = \widetilde{\mathcal{M}} \sqsubseteq \widetilde{\mathcal{M}}$. On the other hand $\mathcal{F}_R = \{(r_1,\{c\})\}$ is not g-soft set in $(\mathcal{M},\tilde{u},R)$ since there exists an σ-soft set $\{(r_1,\{(a,c\}),(r_2,\{(a,b,c\})\}$ containing $\mathcal{F}_R = \{(r_1,\{c\})\}$ but $\tilde{u}(\mathcal{F}_R) = \{(r_1,\{b,c\})\} \not\sqsubseteq \{(r_1,\{(a,c\}),(r_2,\{(a,b,c\})\}$.

Proposition 3.3 Every c-soft set in a soft-cs $(\mathcal{M},\tilde{u},R)$ is g-soft set.

Proof. Let $\mathcal{F}_R$ be a c-soft set and let G_R be an σ-soft set such that $\mathcal{F}_R \sqsubseteq G_R$. Since $\mathcal{F}_R$ is a c-soft set, then $\tilde{u}(\mathcal{F}_R) = \mathcal{F}_R \sqsubseteq G_R$. Hence, $\mathcal{F}_R$ is $g c$-soft set. □

Corollary 3.4 Every σ-soft set in a soft-cs $(\mathcal{M}, \tilde{u}, R)$ is $g\sigma$-soft set.

As the following example shows, the converters of Proposition 3.3 and its corollary are not valid.

Example 3.5 The soft set $\{(r_1, \{a, b\}), (r_2, \{a\})\}$ in Example 3.2 is gc-soft set but is not c-soft set.

Next, we give a characterization of a $g\sigma$-soft set, but before that, we need to introduce the notion of the soft interior in soft- cs's.

Definition 3.6 Let $(\mathcal{M}, \tilde{u}, R)$ be a soft- cs and $\mathcal{F}_R \in \mathcal{SS}(\mathcal{M}, R)$. The interior of the soft set $\mathcal{F}_R$ denoted by $int(\mathcal{F}_R)$ with respect to soft-co $\tilde{u}$ is defined as $int(\mathcal{F}_R) = \widetilde{\mathcal{M}} - \tilde{u}(\widetilde{\mathcal{M}} - \mathcal{F}_R)$.

Proposition 3.7 A soft set $\mathcal{F}_R$ in a soft -cs $(\mathcal{M}, \tilde{u}, R)$ is an $g\sigma$-soft set if and only if $H_R \sqsubseteq int(\mathcal{F}_R)$ whenever $H_R \sqsubseteq \mathcal{F}_R$ and H_R is c-soft set in $(\mathcal{M}, \tilde{u}, R)$.

Proof. Let $\mathcal{F}_R$ be a $g\sigma$-soft set and $\mathcal{H}_R$ be a c-soft set such that $\mathcal{H}_R \sqsubseteq \mathcal{F}_R$. Then, $\widetilde{\mathcal{M}} - \mathcal{F}_R \sqsubseteq \widetilde{\mathcal{M}} - \mathcal{H}_R$. Since $\mathcal{F}_R$ is $g\sigma$- soft set and H_R be a c-soft set, then $\widetilde{\mathcal{M}} - \mathcal{F}_R$ and $\widetilde{\mathcal{M}} - \mathcal{H}_R$ are is gc-soft set and σ-soft set in $\mathcal{M}$, respectively. Thus, from Definition 3.1, we get $\tilde{u}(\widetilde{\mathcal{M}} - \mathcal{F}_R) \sqsubseteq \widetilde{\mathcal{M}} - H_R$. By taking the relative complement and from Definition 3.6, we get $H_R \sqsubseteq int(\mathcal{F}_R)$. Conversely, similar to the first direction. □

Remark 3.8 Let $(\mathcal{M}, \tilde{u}, R)$ be a soft-cs and $\mathcal{F}_R, H_R \in \mathcal{SS}(\mathcal{M}, R)$. Then,

1. If $\mathcal{F}_R$ is an gc-soft set in $(\mathcal{M}, \tilde{u}, R)$ and $\mathcal{F}_R \sqsubseteq H_R \sqsubseteq \tilde{u}(\mathcal{F}_R)$. Then, H_R need not to be gc-soft set.
2. If $\mathcal{F}_R$ is an $g\sigma$-soft set in $(\mathcal{M}, \tilde{u}, R)$ and $int(\mathcal{F}_R) \sqsubseteq H_R \sqsubseteq \mathcal{F}_R$. Then, H_R need not to be $g\sigma$-soft set.

The following example explains Remark 3.8.

Example 3.9 Let $\mathcal{M} = \{a, b, c\}$ and $R = \{r_1, r_2\}$. Define a soft-co $\tilde{u}: \mathcal{SS}(\mathcal{M}, R) \longrightarrow \mathcal{SS}(\mathcal{M}, R)$ as follows:

$$\tilde{u}(\mathcal{F}_R) = \begin{cases} \widetilde{\Phi}_R & if\ \mathcal{F}_R = \widetilde{\Phi}_R, \\ \{(r_1, \{b\}), (r_2, \{b\})\} & if\ \mathcal{F}_R \sqsubseteq \{(r_1, \{b\}), (r_2, \{b\})\}, \\ \{(r_1, \{a\}), (r_2, \{a\})\} & if\ \mathcal{F}_R \sqsubseteq \{(r_1, \{a\})\}, \\ \{(r_1, \{c\})(r_2, \{c\})\} & if\ \mathcal{F}_R \sqsubseteq \{(r_1, \{c\}), (r_2, \{c\})\}, \\ \widetilde{\mathcal{M}} & other\ wise. \end{cases}$$

Then $(\mathcal{M}, \tilde{u}, R)$ is soft-cs. Part (1) of Remark 3.8 is shown only, and part (2) can be obtained by taking the relative complement to the soft sets in part (1).
Let $\mathcal{F}_R = \{(r_1, \{a\})\} \in \mathcal{SS}(\mathcal{M}, R)$ be a gc-soft set and consider $H_R = \{(r_1, \{a\}), (r_2, \{a\})\}$. Clearly, $\mathcal{F}_R \sqsubseteq H_R \sqsubseteq \tilde{u}(\mathcal{F}_R)$. But H_R is not gc-soft set since $H_R \sqsubseteq \{(r_1, \{(a, c\}), (r_2, \{a, c\})\}$ is an σ-soft set and $\tilde{u}(H_R) = \widetilde{\mathcal{M}} \not\sqsubseteq \{(r_1, \{(a, c\}), (r_2, \{a, c\})\}$.

Remark 3.10 Let $(\mathcal{M}, \tilde{u}, R)$ be a soft-cs. Then,

1. The union (respectively, intersection) of two gc-soft (respectively, $g\sigma$-soft) sets need not to be gc-soft (respectively, $g\sigma$-soft) set.

2. The intersection (respectively, union) of two $\mathcal{gc}$-soft (respectively, $\mathcal{go}$-soft) sets is not $\mathcal{gc}$-soft (respectively, $\mathcal{go}$-soft) set.

We explain Remark 3.10 in the following two examples:

Example 3.11 Let $\mathcal{M} = \{a, b, c\}$ and $\mathrm{R} = \{r_1, r_2\}$. Define a soft-$co$ $\tilde{u}: \mathcal{SS}(\mathcal{M}, R) \longrightarrow \mathcal{SS}(\mathcal{M}, R)$ as follows:

$$\tilde{u}(\mathcal{F}_R) = \begin{cases} \tilde{\Phi}_R & if\ \ \mathcal{F}_R = \tilde{\Phi}_R, \\ \{(r_1, \{a\})\} & if\ \ \mathcal{F}_R = \{(r_1, \{a\})\}, \\ \{(r_2, \{b\})\} & if\ \ \mathcal{F}_R = \{(r_2, \{b\})\}, \\ \{(r_1, \{c\}), (r_2, \{c\})\} & if\ \ \mathcal{F}_R \sqsubseteq \{(r_1, \{c\}), (r_2, \{c\})\}, \\ \widetilde{\mathcal{M}} & other\ wise. \end{cases}$$

Then $(\mathcal{M}, \tilde{u}, R)$ is soft-cs. Consider $\mathcal{F}_R = \{(r_1, \{a\})\}$ and $H_R = \{(r_2, \{b\})\}$ are $\mathcal{gc}$-soft sets. However, $\mathcal{F}_R \sqcup H_R = \{(r_1, \{a\}), (r_2, \{b\})\}$ is not $\mathcal{gc}$-soft set. Since $\mathcal{F}_R \sqcup H_R \sqsubseteq \{(r_1, \{a, b\}), (r_2, \{a, b\})\}$ which is an $\mathcal{o}$-soft set but $\tilde{u}(\mathcal{F}_R \sqcup H_R) = \widetilde{\mathcal{M}} \not\sqsubseteq \{(r_1, \{a, b\}), (r_2, \{a, b\})\}$. Similarly, by taking the relative complement of $\mathcal{F}_R$ and H_R we can show the intersection of two $\mathcal{go}$-soft sets need not to be $\mathcal{go}$-soft set.

Example 3.12 Let $\mathcal{M} = \{a, b, c\}$ and $\mathrm{R} = \{r_1, r_2\}$. Define a soft-$co$ $\tilde{u}: \mathcal{SS}(\mathcal{M}, R) \longrightarrow \mathcal{SS}(\mathcal{M}, R)$ as follows:

$$\tilde{u}(\mathcal{F}_R) = \begin{cases} \tilde{\Phi}_R & if\ \ \mathcal{F}_R = \tilde{\Phi}_R, \\ \{(r_1, \{a, c\}), (r_2, \{a, b\})\} & if\ \ \mathcal{F}_R \sqsubseteq \{(r_1, \{a, c\}), (r_2, \{a, b\})\}, \\ \widetilde{\mathcal{M}} & other\ wise. \end{cases}$$

Then $(\mathcal{M}, \tilde{u}, R)$ is soft-cs. Consider $\mathcal{F}_R = \{(r_1, \{a, b\}), (r_2, \{b, c\})\}$ and let $H_R = \{(r_1, \{b, c\}), (r_2, \{a, c\})\}$ are $\mathcal{gc}$-soft sets. But $\mathcal{F}_R \sqcap H_R = \{(r_1, \{b\}), (r_2, \{c\})\}$ is not $\mathcal{gc}$-soft set because there exists an $\mathcal{o}$-soft set $\{(r_1, \{b\}), (r_2, \{c\})\}$ containing $\mathcal{F}_R \sqcap H_R$, however $\tilde{u}(\mathcal{F}_R \sqcap H_R) = \widetilde{\mathcal{M}} \not\sqsubseteq \{(r_1, \{b\}), (r_2, \{c\})\}$. Similarly, by taking the relative complement of $\mathcal{F}_R$ and H_R we can show the union of two $\mathcal{go}$-soft sets need not be $\mathcal{go}$-soft set.

Theorem 3.13 Let $\mathcal{F}_R$ be an open $\mathcal{gc}$-soft set and H_R is a c-soft set. Then $\mathcal{F}_R \sqcap H_R$ is a $\mathcal{gc}$-soft set.

Proof. Since $\mathcal{F}_R$ be an open and $\mathcal{gc}$-soft set, then $\tilde{u}(\mathcal{F}_R) \sqsubseteq \mathcal{F}_R$ and from $(\mathcal{C}2)$ of Definition 2.10, $\mathcal{F}_R \sqsubseteq \tilde{u}(\mathcal{F}_R)$, then $\tilde{u}(\mathcal{F}_R) = \mathcal{F}_R$. Hence, $\mathcal{F}_R$ is a c-soft set. Since H_R is a c-soft set, then $\mathcal{F}_R \sqcap H_R$ is a c-soft set. By Proposition 3.3, we get $\mathcal{F}_R \sqcap H_R$ is a $\mathcal{gc}$-soft set. □

Theorem 3.14 Let $(\mathcal{M}, \tilde{u}, R)$ be a soft-cs. If $\mathcal{F}_R$ is a $\mathcal{gc}$-soft set in $(\mathcal{M}, \tilde{u}, R)$, then $\tilde{u}(\mathcal{F}_R) - \mathcal{F}_R$ contains only null c-soft set.

Proof: Suppose that $\mathcal{F}_R$ is $\mathcal{gc}$-soft set in $(\mathcal{M}, \tilde{u}, R)$. Let H_R be a c-soft set in $\mathcal{M}$ such that $H_R \sqsubseteq \tilde{u}(\mathcal{F}_R) - \mathcal{F}_R$. Since $H_R \sqsubseteq \tilde{u}(\mathcal{F}_R) - \mathcal{F}_R$, then $H_R \sqsubseteq \tilde{u}(\mathcal{F}_R)$ and $H_R \sqsubseteq \widetilde{\mathcal{M}} - \mathcal{F}_R$. This implies $\mathcal{F}_R \sqsubseteq \widetilde{\mathcal{M}} - H_R$. Since $\mathcal{F}_R$ is $\mathcal{gc}$-soft set and $\widetilde{\mathcal{M}} - H_R$ is an $\mathcal{o}$-soft set, then $\tilde{u}(\mathcal{F}_R) \sqsubseteq \widetilde{\mathcal{M}} - H_R$. It follows, $H_R \sqsubseteq \widetilde{\mathcal{M}} - \tilde{u}(\mathcal{F}_R)$. Hence, we have $H_R \sqsubseteq \tilde{u}(\mathcal{F}_R) \sqcap (\widetilde{\mathcal{M}} - \tilde{u}(\mathcal{F}_R))$. Thus, $H_R = \tilde{\Phi}_{\mathrm{R}}$. □

Corollary 3.15 A $\mathcal{gc}$-soft set $\mathcal{F}_R$ is a c-soft set in $(\mathcal{M}, \tilde{u}, R)$ if and only if $\tilde{u}(\mathcal{F}_R) - \mathcal{F}_R$ is c-soft set.

Proof: If $\mathcal{F}_R$ is c-soft set, then $\tilde{u}(\mathcal{F}_R) = \mathcal{F}_R$. This implies $\tilde{u}(\mathcal{F}_R) - \mathcal{F}_R = \widetilde{\Phi}_{\mathrm{R}}$ which is a c-soft set.

Conversely, let $\mathcal{F}_R$ be a $\mathcal{gc}$-soft set. To prove $\mathcal{F}_R$ is closed. Since $\mathcal{F}_R$ be a $\mathcal{gc}$-soft set, then by Theorem 3.14, we have $\tilde{u}(\mathcal{F}_R) - \mathcal{F}_R$ contains only null c-soft set. From hypothesis, $\tilde{u}(\mathcal{F}_R) - \mathcal{F}_R$ is a c-soft set this implies $\tilde{u}(\mathcal{F}_R) - \mathcal{F}_R = \widetilde{\Phi}_{\mathrm{R}}$. Hence, $\mathcal{F}_R$ is c-soft set. □

The Corollary 3.15 offers the basis for retaining the conversion of Proposition 3.3.

Theorem 3.16 Let $\{(\mathcal{M}_\alpha, \tilde{u}_\alpha, R_\alpha): \alpha \in \mathcal{I}\}$ be a family of soft-cs's and let $\nu \in \mathcal{I}$ and let $G_{R_\nu} \sqsubseteq \widetilde{\mathcal{M}}_\nu$. Then G_{R_ν} is a $\mathcal{go}$-soft set of $(\mathcal{M}_\nu, \tilde{u}_\nu, R_\nu)$ if and only if $G_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$ is a $\mathcal{go}$- soft set of $(\prod_{\alpha\in\mathcal{I}}\mathcal{M}_\alpha, \otimes\tilde{u}, \prod_{\alpha\in\mathcal{I}} R_\alpha)$.

Proof. Let G_{R_ν} be a $\mathcal{go}$-soft set of $(\mathcal{M}_\nu, \tilde{u}_\nu, R_\nu)$. Let $\mathcal{F}_{\prod_{\alpha\in\mathcal{I}}R_\alpha}$ be a c-soft set of $(\prod_{\alpha\in\mathcal{I}}\mathcal{M}_\alpha, \otimes\tilde{u}, \prod_{\alpha\in\mathcal{I}} R_\alpha)$ such that $\mathcal{F}_{\prod_{\alpha\in\mathcal{I}}R_\alpha} \sqsubseteq G_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$. Then $(p_{\mathcal{M}_\nu}, q_{R_\nu})(\mathcal{F}_{\prod_{\alpha\in\mathcal{I}}R_\alpha}) \sqsubseteq G_{R_\nu}$. Since $(p_{\mathcal{M}_\nu}, q_{R_\nu})(\mathcal{F}_{\prod_{\alpha\in\mathcal{I}}R_\alpha})$ is c-soft set by Theorem 2.15 and since G_{R_ν} is a $\mathcal{go}$-soft set of $(\mathcal{M}_\nu, \tilde{u}_\nu, R_\nu)$, then by Proposition 3.7 $(p_{\mathcal{M}_\nu}, q_{R_\nu})(\mathcal{F}_{\prod_{\alpha\in\mathcal{I}}R_\alpha}) \sqsubseteq int_\nu(G_{R_\nu}) = \widetilde{\mathcal{M}}_\nu - \tilde{u}_\nu(\widetilde{\mathcal{M}}_\nu - G_{R_\nu})$. Therefore,

$$\begin{aligned}\mathcal{F}_{\prod_{\alpha\in\mathcal{I}}R_\alpha} &\sqsubseteq (p_{\mathcal{M}_\nu}, q_{R_\nu})^{-1}\left(\widetilde{\mathcal{M}}_\nu - \tilde{u}_\nu(\widetilde{\mathcal{M}}_\nu - G_{R_\nu})\right)\\ &= \prod_{\alpha\in\mathcal{I}}^{\widetilde{}}\mathcal{M}_\alpha - \prod_{\alpha\in\mathcal{I}}\tilde{u}_\alpha(p_{\mathcal{M}_\nu}, q_{R_\nu})(\prod_{\alpha\in\mathcal{I}}^{\widetilde{}}\mathcal{M}_\alpha - (G_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{}}\mathcal{M}_\alpha))\\ &= \prod_{\alpha\in\mathcal{I}}^{\widetilde{}}\mathcal{M}_\alpha - \otimes\tilde{u}\left(\prod_{\alpha\in\mathcal{I}}^{\widetilde{}}\mathcal{M}_\alpha - (G_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{}}\mathcal{M}_\alpha)\right) = int(G_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{}}\mathcal{M}_\alpha)\end{aligned}$$

From Proposition 3.7 $G_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$ is a $\mathcal{go}$-soft set.

Conversely, let $\mathcal{F}_{R_\nu}$ be a c-soft set of $(\mathcal{M}_\nu, \tilde{u}_\nu, R_\nu)$ such that $\mathcal{F}_{R_\nu} \sqsubseteq G_{R_\nu}$. Then $\mathcal{F}_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha \sqsubseteq G_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$. Since $G_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$ is a $\mathcal{go}$-soft set and $\mathcal{F}_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$ is c-soft set, then

$$\begin{aligned}\mathcal{F}_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha &\sqsubseteq int(G_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha)\\ &= \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha - \otimes\tilde{u}(\prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha - (G_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha))\\ &= \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha - \prod_{\alpha\in\mathcal{I}}\tilde{u}_\alpha(p_{\mathcal{M}_\alpha}, q_{R_\alpha})(\prod_{\alpha\in\mathcal{I}}^{\widetilde{}}\mathcal{M}_\alpha - (G_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha)).\end{aligned}$$

By taking the relative complement, we have

$\prod_{\alpha\in\mathcal{I}}\tilde{u}_\alpha(p_{\mathcal{M}_\alpha}, q_{R_\alpha})(\prod_{\alpha\in\mathcal{I}}^{\widetilde{}}\mathcal{M}_\alpha - (G_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha)) \sqsubseteq \prod_{\alpha\in\mathcal{I}}^{\widetilde{}}\mathcal{M}_\alpha - (\mathcal{F}_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha)$

$\prod_{\alpha\in\mathcal{I}}\tilde{u}_\alpha(p_{\mathcal{M}_\alpha}, q_{R_\alpha})((\widetilde{\mathcal{M}}_\nu - G_{R_\nu}) \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha) \sqsubseteq (\widetilde{\mathcal{M}}_\nu - \mathcal{F}_{R_\nu}) \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$. By computing the soft projection $(p_{\mathcal{M}_\nu}, q_{R_\nu})$, we get $\tilde{u}_\nu(\widetilde{\mathcal{M}}_\nu - G_{R_\nu}) \sqsubseteq \widetilde{\mathcal{M}}_\nu - \mathcal{F}_{R_\nu}$ and by taking the relative complement, it follows $\mathcal{F}_{R_\nu} \sqsubseteq \widetilde{\mathcal{M}}_\nu - \tilde{u}_\nu(\widetilde{\mathcal{M}}_\nu - G_{R_\nu}) = int(G_{R_\nu})$. Therefore, G_{R_ν} is $\mathcal{go}$-soft set of $(\mathcal{M}_\nu, \tilde{u}_\nu, R_\nu)$.

Theorem 3.17 Let $\{(\mathcal{M}_\alpha, \tilde{u}_\alpha, R_\alpha): \alpha \in \mathcal{I}\}$ be a family of soft-$cs's$, let $\nu \in \mathcal{I}$ and let $\mathcal{F}_{R_\nu} \sqsubseteq \widetilde{\mathcal{M}}_\nu$. Then, $\mathcal{F}_{R_\nu}$ is $\mathcal{gc}$-soft set of $(\mathcal{M}_\nu, \tilde{u}_\nu, R_\nu)$ if and only if $\mathcal{F}_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$ is a $\mathcal{gc}$-soft set of $(\prod_{\alpha\in\mathcal{I}}\mathcal{M}_\alpha, \otimes\tilde{u}, \prod_{\alpha\in\mathcal{I}} R_\alpha)$.

Proof. Let $\mathcal{F}_{R_\nu}$ be a $\mathcal{gc}$-soft set of $(\mathcal{M}_\nu, \tilde{u}_\nu, R_\nu)$. Then, $\widetilde{\mathcal{M}}_\nu - \mathcal{F}_{R_\nu}$ is a $\mathcal{go}$-soft set of $(\mathcal{M}_\nu, \tilde{u}_\nu, R_\nu)$. By Theorem 3.16, we have $(\widetilde{\mathcal{M}}_\nu - \mathcal{F}_{R_\nu}) \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$ is a $\mathcal{go}$-soft set of $(\prod_{\alpha\in\mathcal{I}}\mathcal{M}_\alpha, \otimes\tilde{u}, \prod_{\alpha\in\mathcal{I}} R_\alpha)$. Since

$\left(\widetilde{\mathcal{M}}_\nu - \mathcal{F}_{R_\nu}\right) \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha = \prod_{\alpha\in\mathcal{I}} \mathcal{M}_\alpha - (\mathcal{F}_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha)$ is a $\mathcal{gc}$-soft set of $(\prod_{\alpha\in\mathcal{I}} \mathcal{M}_\alpha, \otimes\tilde{u}, \prod_{\alpha\in\mathcal{I}} R_\alpha)$. Thus, $\mathcal{F}_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$ is a $\mathcal{gc}$-soft set of $(\prod_{\alpha\in\mathcal{I}} \mathcal{M}_\alpha, \otimes\tilde{u}, \prod_{\alpha\in\mathcal{I}} R_\alpha)$.

Conversely, let G_{R_ν} be an $\mathcal{o}$-soft set of $(\mathcal{M}_\nu, \tilde{u}_\nu, R_\nu)$ such that $\mathcal{F}_{R_\nu} \sqsubseteq G_{R_\nu}$. This implies $\mathcal{F}_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha \sqsubseteq G_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$. Since $\mathcal{F}_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$ is a $\mathcal{gc}$-soft set and $G_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$ is an $\mathcal{o}$-soft set of $(\prod_{\alpha\in\mathcal{I}} \mathcal{M}_\alpha, \otimes\tilde{u}, \prod_{\alpha\in\mathcal{I}} R_\alpha)$, then we get $\otimes\tilde{u}\left(\mathcal{F}_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha\right) \sqsubseteq G_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$. By calculating the soft projection for $\nu \in \mathcal{I}$, we get $\tilde{u}_\nu(\mathcal{F}_{R_\nu}) \sqsubseteq G_{R_\nu}$. Therefore, $\mathcal{F}_{R_\nu}$ is a $\mathcal{gc}$-soft set of $(\mathcal{M}_\nu, \tilde{u}_\nu, R_\nu)$. □

Theorem 3.18 Let $\{(\mathcal{M}_\alpha, \tilde{u}_\alpha, R_\alpha): \alpha \in \mathcal{I}\}$ be a family of soft-cs's. For each $\nu \in \mathcal{I}$, let $(p_{\mathcal{M}_\nu}, q_{R_\nu}): \prod_{\alpha\in\mathcal{I}} \mathcal{M}_\alpha \longrightarrow \widetilde{\mathcal{M}}_\nu$ be the soft projection mapping. Then,

1. If $\mathcal{F}_{\prod_{\alpha\in\mathcal{I}} R_\alpha}$ is a $\mathcal{gc}$-soft set of $(\prod_{\alpha\in\mathcal{I}} \mathcal{M}_\alpha, \otimes\tilde{u}, \prod_{\alpha\in\mathcal{I}} R_\alpha)$, then $(p_{\mathcal{M}_\nu}, q_{R_\nu})(\mathcal{F}_{\prod_{\alpha\in\mathcal{I}} R_\alpha})$ is a $\mathcal{gc}$-soft set of $(\mathcal{M}_\nu, \tilde{u}_\nu, R_\nu)$.
2. If $\mathcal{F}_{R_\nu}$ is a $\mathcal{gc}$-soft set of $(\mathcal{M}_\nu, \tilde{u}_\nu, R_\nu)$, then $(p_{\mathcal{M}_\nu}, q_{R_\nu})^{-1}(\mathcal{F}_{R_\nu})$ a $\mathcal{gc}$-soft set of $(\prod_{\alpha\in\mathcal{I}} \mathcal{M}_\alpha, \otimes\tilde{u}, \prod_{\alpha\in\mathcal{I}} R_\alpha)$.

Proof.

1. Let $\mathcal{F}_{\prod_{\alpha\in\mathcal{I}} R_\alpha}$ be a $\mathcal{gc}$-soft set of $(\prod_{\alpha\in\mathcal{I}} \mathcal{M}_\alpha, \otimes\tilde{u}, \prod_{\alpha\in\mathcal{I}} R_\alpha)$. Let G_{R_ν} be an $\mathcal{o}$-soft set of $(\mathcal{M}_\nu, \tilde{u}_\nu, R_\nu)$ such that $(p_{\mathcal{M}_\nu}, q_{R_\nu})(\mathcal{F}_{\prod_{\alpha\in\mathcal{I}} R_\alpha}) \sqsubseteq G_{R_\nu}$. Then by taking the inverse image for the soft projection $(p_{\mathcal{M}_\nu}, q_{R_\nu})$, we get $\mathcal{F}_{\prod_{\alpha\in\mathcal{I}} R_\alpha} \sqsubseteq (p_{\mathcal{M}_\nu}, q_{R_\nu})^{-1}(G_{R_\nu}) = G_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$. Since $\mathcal{F}_{\prod_{\alpha\in\mathcal{I}} R_\alpha}$ is a $\mathcal{gc}$-soft set and $G_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$ is an $\mathcal{o}$-soft set, then $\otimes\tilde{u}(\mathcal{F}_{\prod_{\alpha\in\mathcal{I}} R_\alpha}) \sqsubseteq G_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$. From the definition of $\otimes\tilde{u}$, it follows $\prod_{\alpha\in\mathcal{I}} \tilde{u}_\alpha(p_{\mathcal{M}_\alpha}, q_{R_\alpha})(\mathcal{F}_{\prod_{\alpha\in\mathcal{I}} R_\alpha}) \sqsubseteq G_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$. Consequently, $\tilde{u}_\nu((p_{\mathcal{M}_\alpha}, q_{R_\alpha})(\mathcal{F}_{\prod_{\alpha\in\mathcal{I}} R_\alpha})) \sqsubseteq G_{R_\nu}$. Hence, $(p_{\mathcal{M}_\nu}, q_{R_\nu})(\mathcal{F}_{\prod_{\alpha\in\mathcal{I}} R_\alpha})$ is a $\mathcal{gc}$-soft set of $(\mathcal{M}_\nu, \tilde{u}_\nu, R_\nu)$.
2. Let $\mathcal{F}_{R_\nu}$ be a $\mathcal{gc}$-soft set of $(\mathcal{M}_\nu, \tilde{u}_\nu, R_\nu)$. Then $(p_{\mathcal{M}_\nu}, q_{R_\nu})^{-1}(\mathcal{F}_{R_\nu}) = \mathcal{F}_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$. By Theorem 3.17, $\mathcal{F}_{R_\nu} \times \prod_{\alpha\in\mathcal{I}}^{\widetilde{\alpha\neq\nu}} \mathcal{M}_\alpha$ is a $\mathcal{gc}$-soft set of $(\prod_{\alpha\in\mathcal{I}} \mathcal{M}_\alpha, \otimes\tilde{u}, \prod_{\alpha\in\mathcal{I}} R_\alpha)$. Therefore, $(p_{\mathcal{M}_\nu}, q_{R_\nu})^{-1}(\mathcal{F}_{R_\nu})$ is a $\mathcal{gc}$-soft set of $(\prod_{\alpha\in\mathcal{I}} \mathcal{M}_\alpha, \otimes\tilde{u}, \prod_{\alpha\in\mathcal{I}} R_\alpha)$.□

4. $\mathcal{T}_{\frac{1}{2}}$-soft closure spaces

In this section, we introduce a new separation axiom, namely $\mathcal{T}_{\frac{1}{2}}$-soft-$cs$'s in soft-$cs$'s with the help of $\mathcal{gc}$-soft sets.

Definition 4.1 A soft-cs $(\mathcal{M}, \tilde{u}, R)$ is said to be a $\mathcal{T}_{\frac{1}{2}}$-soft-$cs$, if every $\mathcal{gc}$-soft set is a c-soft set in $\mathcal{M}$.

Example 4.2 Let $\mathcal{M} = \{a, b\}$ and R $= \{r_1, r_2\}$. Define a soft- co $\tilde{u}$: $\mathcal{SS}(\mathcal{M}, R) \longrightarrow \mathcal{SS}(\mathcal{M}, R)$ as follows:

$$\tilde{u}(\mathcal{F}_R) = \begin{cases} \tilde{\Phi}_R & if \quad \mathcal{F}_R = \tilde{\Phi}_R, \\ \{(r_1,\{a\})\} & if \quad \mathcal{F}_R = \{(r_1,\{a\})\}, \\ \{(r_1,\{\mathrm{b}\})\} & if \quad \mathcal{F}_R = \{(r_1,\{\mathrm{b}\})\}, \\ \{(r_2,\{a\})\} & if \quad \mathcal{F}_R = \{(r_2,\{a\})\}, \\ \{(r_2,\{b\})\} & if \quad \mathcal{F}_R = \{(r_2,\{b\})\}, \\ \widetilde{\mathcal{M}} & other\ wise \end{cases}$$

Then, $(\mathcal{M},\tilde{u},R)$ is $\mathcal{T}_{\frac{1}{2}}$-soft-$cs$. Since every $\mathcal{g}c$-soft set is c-soft set.

Theorem 4.3 A soft-cs $(\mathcal{M},\tilde{u},R)$ is $\mathcal{T}_{\frac{1}{2}}$-soft-$cs$ if and only if every soft point of $\mathcal{M}$ is a c-soft set or σ-soft set.

Proof. Suppose that $(\mathcal{M},\tilde{u},R)$ is a $\mathcal{T}_{\frac{1}{2}}$-soft-$cs$. Let x_r be a soft point of $\mathcal{M}$. Assume that x_r is not c-soft set. Then, $\widetilde{\mathcal{M}} - x_r$ is not σ-soft set. This implies $\widetilde{\mathcal{M}}$ is the only σ-soft set which contains $\widetilde{\mathcal{M}} - x_r$. It follows, $\tilde{u}(\widetilde{\mathcal{M}} - x_r) \sqsubseteq \widetilde{\mathcal{M}}$, and hence $\widetilde{\mathcal{M}} - x_r$ is $\mathcal{g}c$- soft set, since $(\mathcal{M},\tilde{u},R)$ is a $\mathcal{T}_{\frac{1}{2}}$-soft-$cs$, $\widetilde{\mathcal{M}} - x_r$ is c-soft set or equivalently, x_r is an σ-soft set.

Now, assume that x_r is not σ-soft set. Then, $\widetilde{\mathcal{M}} - x_r$ is not c-soft set. This implies $\widetilde{\mathcal{M}} - x_r$ is either σ-soft set or not σ-soft set. If $\widetilde{\mathcal{M}} - x_r$ is σ-soft set, then x_r is a c-soft set and the proof is complete. If $\widetilde{\mathcal{M}} - x_r$ is not σ-soft set, then $\widetilde{\mathcal{M}}$ is the only σ-soft set such that $\widetilde{\mathcal{M}} - x_r \sqsubseteq \widetilde{\mathcal{M}}$, this implies $\widetilde{\mathcal{M}} - x_r$ is $\mathcal{g}c$- soft set, this implies $\widetilde{\mathcal{M}} - x_r$ is c-soft set, then x_r is σ-soft set and this contradiction. Then $\widetilde{\mathcal{M}} - x_r$ is an σ-soft set or c-soft set.

Conversely, to prove $(\mathcal{M},\tilde{u},R)$ is $\mathcal{T}_{\frac{1}{2}}$-soft-$cs$. Let $\mathcal{F}_R$ is $\mathcal{g}c$- soft set, to prove $\mathcal{F}_R$ is a c-soft set. Suppose x_r is an c-soft set and $x_r \notin \mathcal{F}_R$ Since $\mathcal{F}_R$ is $\mathcal{g}c$- soft set, then $\tilde{u}(\mathcal{F}_R) \sqsubseteq \widetilde{\mathcal{M}} - x_r$, then $x_r \notin \tilde{u}(\mathcal{F}_R)$, This implies $\tilde{u}(\mathcal{F}_R) \sqsubseteq \mathcal{F}_R$. Then $\mathcal{F}_R$ is closed, therefore $\widetilde{\mathcal{M}}$ *is* $\mathcal{T}_{\frac{1}{2}}$-soft-$cs$. Suppose x_r is an σ-soft set and $x_r \notin \mathcal{F}_R$, then $x_r \in \widetilde{\mathcal{M}} - \mathcal{F}_R$, then $\mathcal{F}_R \sqsubseteq \widetilde{\mathcal{M}} - x_r$. This implies $\tilde{u}(\mathcal{F}_R) \sqsubseteq \tilde{u}\big(\widetilde{\mathcal{M}} - x_r\big) = \widetilde{\mathcal{M}} - x_r$, then $\tilde{u}(\mathcal{F}_R) \sqsubseteq \widetilde{\mathcal{M}} - x_r$, this implies $x_r \notin \tilde{u}(\mathcal{F}_R)$. Then $\tilde{u}(\mathcal{F}_R) \sqsubseteq \mathcal{F}_R$, then $\mathcal{F}_R$ is c-soft set. Therefore, $(\mathcal{M},\tilde{u},R)$ is $\mathcal{T}_{\frac{1}{2}}$-soft-$cs$. □

Proposition 4.4 Let $(\mathcal{M},\tilde{u},R)$ be a soft-cs and let $(\mathcal{Y},\tilde{u}_y,R)$ be a closed soft-c.subsp of $(\mathcal{M},\tilde{u},R)$. If $\mathcal{F}_R$ is $\mathcal{g}c$-soft set of $(\mathcal{Y},\tilde{u}_y,R)$, then $\mathcal{F}_R$ is $\mathcal{g}c$-soft set of $(\mathcal{M},\tilde{u},R)$.

Proof. Let $\mathcal{F}_R$ be a $\mathcal{g}c$- soft set of $(\mathcal{Y},\tilde{u}_y,R)$. Let $\mathcal{F}_R \sqsubseteq G_R$, where G_R is an σ-soft set of $\mathcal{M}$. Since $\mathcal{F}_R \in \mathcal{SS}(\mathcal{Y},R)$, then $\mathcal{F}_R \sqsubseteq \tilde{\mathcal{Y}} \sqcap G_R$. From Theorem 2.13, $\tilde{\mathcal{Y}} \sqcap G_R$ is an σ-soft set of $(\mathcal{Y},\tilde{u}_y,R)$. But $\mathcal{F}_R$ is $\mathcal{g}c$-soft set of $(\mathcal{Y},\tilde{u}_y,R)$, thus $\tilde{u}_y(\mathcal{F}_R) \sqsubseteq \tilde{\mathcal{Y}} \sqcap G_R$ which implies $\tilde{\mathcal{Y}} \sqcap \tilde{u}(\mathcal{F}_R) \sqsubseteq \tilde{\mathcal{Y}} \sqcap G_R$ and since $\tilde{\mathcal{Y}}$ is c-soft set in $\mathcal{M}$, we get $\tilde{u}(\tilde{\mathcal{Y}}) \sqcap \tilde{u}(\mathcal{F}_R) \sqsubseteq \tilde{\mathcal{Y}} \sqcap G_R$. From Proposition 2.11 part (2), it follows $\tilde{u}(\tilde{\mathcal{Y}} \sqcap \mathcal{F}_R) \sqsubseteq \tilde{\mathcal{Y}} \sqcap G_R$. This implies $\tilde{u}(\mathcal{F}_R) \sqsubseteq \tilde{\mathcal{Y}} \sqcap G_R$ and consequently, $\tilde{u}(\mathcal{F}_R) \sqsubseteq G_R$.Therefore, $\mathcal{F}_R$ is $\mathcal{g}c$- soft set of $(\mathcal{M},\tilde{u},R)$. □

Proposition 4.5 Let $(\mathcal{M},\tilde{u},R)$ be a soft-cs and $(\mathcal{Y},\tilde{u}_y,R)$ be a closed soft-c.subsp of $(\mathcal{M},\tilde{u},R)$. If $(\mathcal{M},\tilde{u},R)$ is $\mathcal{T}_{\frac{1}{2}}$- soft-$cs$, then $(\mathcal{Y},\tilde{u}_y,R)$ is $\mathcal{T}_{\frac{1}{2}}$-soft -cs.

Proof. Let $\mathcal{F}_R$ be a $\mathcal{g}c$-soft set of $(\mathcal{Y},\tilde{u}_y,R)$, to prove $\mathcal{F}_R$ is c-soft set of $(\mathcal{Y},\tilde{u}_y,R)$. Since $\mathcal{F}_R$ be a $\mathcal{g}c$-soft set of $(\mathcal{Y},\tilde{u}_y,R)$. Then by Proposition 4.4, we have $\mathcal{F}_R$ is a $\mathcal{g}c$-soft set of $\mathcal{M}$. Since $\mathcal{M}$ is $\mathcal{T}_{\frac{1}{2}}$-soft-$cs$, then $\mathcal{F}_R$ is c-soft set of $\mathcal{M}$. This implies $\mathcal{F}_R \sqcap \tilde{\mathcal{Y}}$ c-soft set of $(\mathcal{Y},\tilde{u}_y,R)$. Therefore $\mathcal{F}_R$ is c-soft set of $(\mathcal{Y},\tilde{u}_y,R)$. □

Abstract. Amazing results in many works in the field of deep convolutional neural networks using them in many fields of machine learning such as image classification control of atrial play, and image annotation. Mathematical analysis of deep convolutional neural networks (CNN) has a broad role in many applications including image classification applications. Face recognition technology has occupied a wide field in research that is still continuing in this work. Face recognition technology is being developed depending on the MATLAB program to develop the subjecting of the color image to the neural convolution network and the work of a program to reduce the time the network deals with the image to reduce the number of layers to only two layers and access the algorithm Suggested in this work. Computer vision of a color image in a face detection study. In this work, the researcher created a fast algorithm to reach the research goal based on new standards in the field of face detection. A new face detection program was designed using MATLAB, CascadeObjectDetector and trainCascadeObjectDetector the face detection devices were developed. In this work, a technique for panning and color image using the convolutional neural network for deep learning is proposed, the method used to reach the goal of this work.

1. Introduction

In recent years, the field of face recognition has taken a wide area of research due to the urgent need for security and commercial applications to demonstrate the interaction between humans and computers using measurement analysis. The work in this field varies greatly in terms of face, skin, gender, and colour [1]. The difference in the background lighting of the face and facial expressions is a reason that increases the complexity of the problem [2]. Among the many applications in the field of face detection, including recognition and monitoring of the driver's face, face recognition by means of video surveillance, or image data management, the algorithms for face detection are characterized by complexity. Face detection is complicated [3]. In [4] which it was clarified that the face detection algorithms are divided into two parts, (i) feature (ii) learning, the first is based on simple facial features without looking at the surrounding light, rotating, or standing. The face position is determined by the vertical projection of the grey level image after the image has been projected for face detection [5]. The role of the neural network appears strongly in the field of facial recognition that has the potential to deal with image data .The neural network technology is multi-layered as it is to design a file containing a recognition system that results in a completely flat structure with inputs that are completely connected to later layers in architecture due to huge interconnecting nodes in addition to the amount of input data that is ignored. This leads to training for all permutations in the input vector

[6]. The fields of science and technology have led us to develop rapidly in order to be able to reach goals that were far from being achieved in the past few decades. Many areas have made life easier, such as machine learning and artificial intelligence, to reach solutions to complex problems in modern science. Computer vision achieves algorithms on the human level in classifying and analysing images. It was presented YOLO theory to discover things and Fast YOLO, which is the fastest detector, is the fastest detector for the general purpose [7]. Face detection was achieved using PCA theory. The network was trained fast [**8**]. The performance of face detection is evaluated by the false-match rate (FMR), and the false-non-match rate (FNMR) [**9**]. Viola Jones' method was used to check the number of faces that have been treated and count the number of faces [10]. Modern technology has a role in computer vision at this time when the world is living fighting the emerging corona virus, the disease pandemic (Covid-19) due to technology, work has been completed from home to adapt to the disease [11]. Facial characteristics such as freckles and hair were identified using a new generator to present data on human faces [12]. the method Kanade Lucas Tomasi (KLT), which is a simple system where it is able to detect the face and track it where the system is able to detect the face when the head moves and tilts, with Estim Geometric Transform (EGT) function and Duration Geometric Transform (DGT)[13]. In this work, a fast algorithm was proposed based on the use of CNN and the use of the MATLAB program to classify the image and the detection of the face in two stages, the face detection without a mask that has different measurements and criteria for the detection of the face with the mask and the use of the algorithm in tracking objects in these circumstances.

2. Methodology

2.1. Research Design The purpose of this paper is to achieve the recognition of a face or a number of faces, the steps for face recognition will be achieved as shown in figure (1) in this figure a number of steps have been achieved to show the structure of the search.

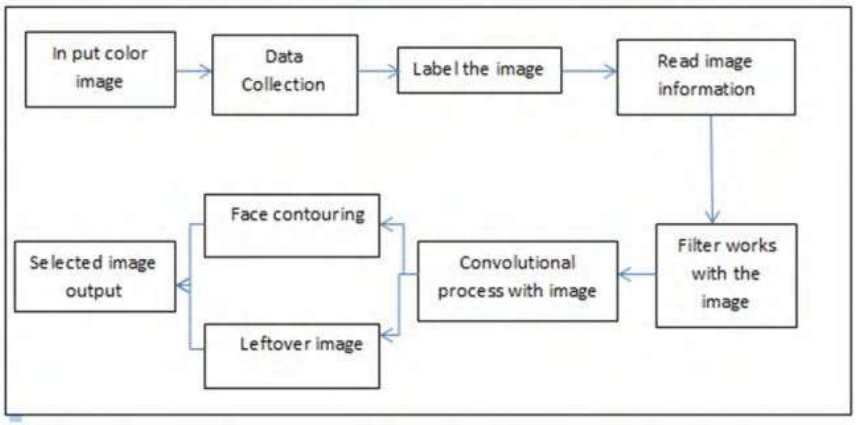

Figure 1. Shows the steps of research design with the result

The color image and face highlighting are read as cover layers are incorporated into this work. CNN is used with a mathematical technique to calculate the torsion where the person's face is determined and then the layer is fused as shown in Figure (2).

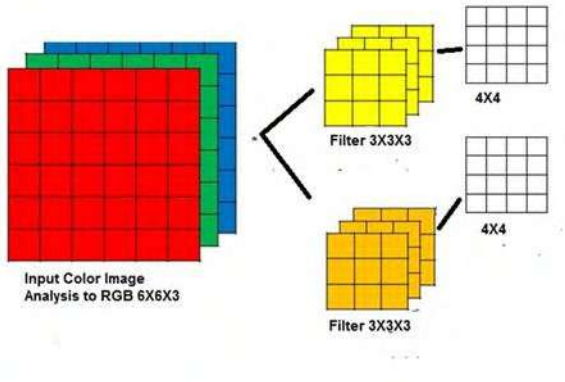

Figure 2. Convolutions on RGB image

3. Convolutional neural network method

The convolutional neural network method is unique. It combines segmentation, extraction, and classification in features. One processing unit. CNN components are 7 layers of 4 feature extraction layers and 3 layers of MLP. The feature extraction layer consists of twisting and subsample layers. Warp layer removes noise and detects lines, borders, or corners of an image file. Preventing image distortion is in the Downsampling layer, which reduces image resolution. CNN has built-in stability compared to a typical neural network (MLP). CNN excels at producing high accuracy in the identification process even though the algorithm is complex. In network training, LeNet-5 applies
The proposed algorithm will be built using MATLAB by designing a program for a learning algorithm to identify the face with a simple and easy base to reverse previously identified neural networks to implement a complex database.

4.Mathematical aspects in CNN Technology

Deep learning deals with images using computer vision and processes large numbers of images from multiple countless numbers, Computer vision relies on the convolutional neural network fed into neural networks to reveal the face,

The pictures are inserted in mathematical expressions.

As shown in figure (3), using the filter and multiplying it with the color image, the sum of the product is obtained by the item

The result of this process is a convolution that defines the volume to mathematically represent the image then; the height size denoted by m_H, the width of size is m_W, the number of channels denoted m_c. A color image RGB has three channels m_3 red, green, and blue. The filter is F

The filter is single to center each pixel in the filter that must contain the kernel N with the number of channels identical to the image, so a different filter is applied that passes on each channel, Equation (1) calculate the dimensions of the filter

Dim filter=(F,F,m_c) (1)

The image is mapped with filter the convolutional process mathematically is

$$C(I,N)_{x,y} = \sum_{i=1}^{m_H} \sum_{j=1}^{m_W} \sum_{N=1}^{m_C} N_{i,j-N} I_{x+i-1,y+j-1,N} \quad (2)$$

$$\dim\big(C(I,N)\big) = \left(\left[\frac{m_H+2P-F}{S}+1\right],\left[\frac{m_W+2P-F}{S}+1\right]\right) \quad S>0; \quad (3)$$

If $S=1$ equation (3) will be

$$(m_H+2P-F, m_W+2P-F) \quad (4)$$

Where [n] is the floor function of n P=0 is the valid CNN output size is equal output size then $P=\frac{F-1}{2}$ is the same CNN, if F=1, this means 1×1Convolution.

The merging and reduction process distinguishes the image by specifying its information on each channel, which affects the dimensions (m_H, m_W) and maintains the number of channels after passing the filter.

$$\dim\big(P(I,N)\big) = \left(\left[\frac{m_H+2P-F}{S}+1\right], \left[\frac{m_W+2P-F}{S}+1\right], m_C\right) \quad S>0; \tag{5}$$

If $S=1$ equation (5) will be

$$(m_H+2P-F, m_W+2P-F, m_C) \tag{6}$$

After the training process, using CNN leads to the reduction of a number of layers Figure (4) shows how a process F led to the reduction of the three layers

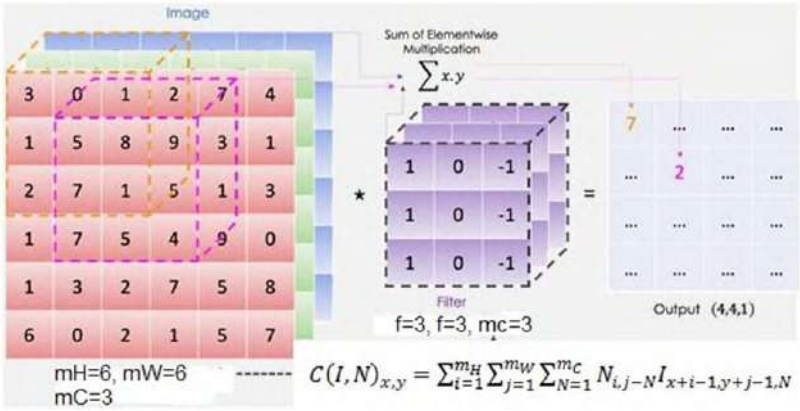

Figure 3. the convolutional neural network in color image

Using filters on the input image using the activation function £,

4.1. Mathematical algorithm in convolutional process In 1th layer

Input image with $r^{[l]}$, $r^{[l-1]}$ and size $\left(m_H^{[l-1]}, m_W^{[l-1]}, m_C^{[l-1]}\right)$, Padding $p^{[1]}$, stride $s^{[l]}$, number of filters $m_C^{(l)}$ where each $F^{(m)}$ has the dimension $\left[f^l, f^l, m_C^{[l-1]}\right]$, and activation function $£^{[l]}$.

Output $r^{[l]}$ with size $\left(m_H^{(l)}, m_W^{(l)}, m_C^{(l)}\right)$ $\forall\, m \in \left[1,2,\dots,m_C^{[l]}\right]$

Step1: the convolution step CNN

$$conv(r^{[l-1]}, F^{[l-1]})_{x,y} = £^{[l]}\left(\sum_{i=1}^{m_H^{[l-1]}}\sum_{j=1}^{m_W^{[l-1]}}\sum_{K=1}^{m_C^{[l-1]}} F_{i,j,K}^{(m)} r_{x+i-1,y+j-1,f}^{[l-1]} + s_m^{[l]}\right)$$

$$\dim\left(conv\left(r^{[l-1]}, F^{(m)}\right)\right) = (m_H^{[l]}, m_W^{[l]}) \tag{7}$$

$$r^{[l]} = £^{[l]}\left(conv(r^{[l-1]}, F^{[1]})\right), £^{[l]}\left(conv(r^{[l-1]}, F^{[2]})\right), \dots, £^{[l]}\left(conv(r^{[l-1]}, F^{[m_c^{[l]}]})\right)$$

Where

$$m_{H/W}^{[l-1]} = \left[\frac{m_{H/W}^{[l-1]}+2P^{[l]}-f^{[l]}}{S^{[l]}}+1\right]; S>0 \tag{8}$$

$$= m_{H/W}^{[l-1]} + 2P^{[l]} - f^{[l]}; S=0$$

$m_C^{[l]}$ = number of filters

The learned parameters at the l^{th} layer filters with $(f \times f \times m) \times m_C^{[l]}$ parameters

Bias with $(1 \times 1 \times 1) \times m_C$ parameters (broad casting)

Figure (4) and Figure (5) represent the shrinkage of the convolutional layer

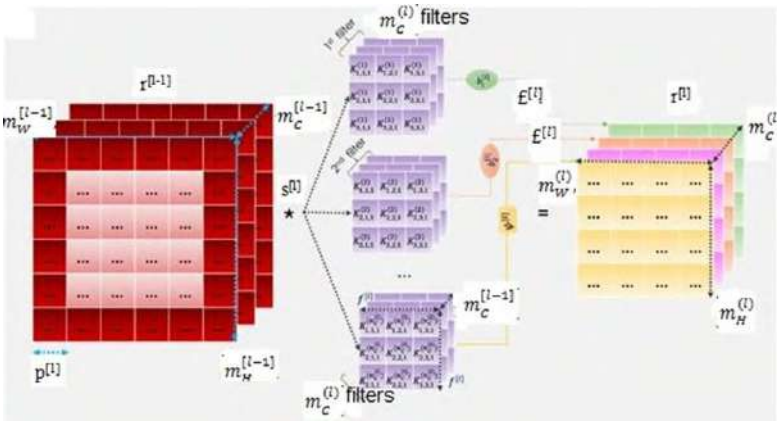

Figure4. The convolutional layer

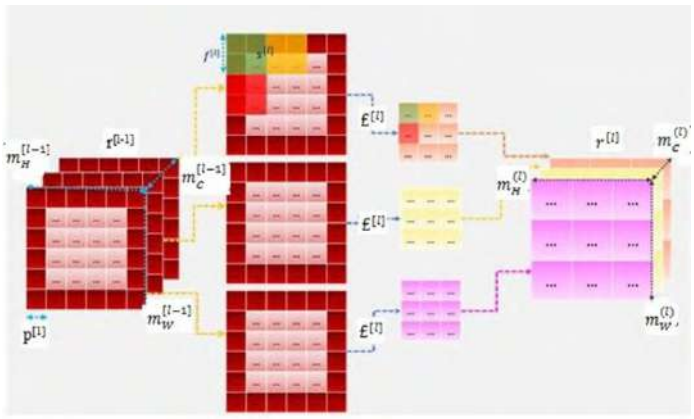

Figure5. The convolutional layer

4.2. Fully Connected layer

The definition of a fully connected layer is the layer that enters its vector and then another layer is created from a limited number of neurons

Then j^{th} node with i^{th} layer the equation is achieved (9)

$$W_j^{[i]} = \sum_{j=1}^{m_{i-1}} w_{j,1}^{[i]} + s_j^{[i]} \quad (9)$$

$$r_j^{[i]} = £^{[i]}\left(w_j^{[i]}\right) \quad (10)$$

The input $r^{[i-1]}$ might be the result of convolution or a pooling layer with the dimensions $\left(m_H^{[i-1]}, m_W^{[i-1]}, m_C^{[i-1]}\right)$ in order to be able to plug it into the fully connected layer; we flatten the tensor to one dimension vector having the dimension $\left(m_H^{[i-1]} \times m_W^{[i-1]} \times m_C^{[i-1]}, 1\right)$ thus $m_{i-1} = m_H^{[i-1]} \times m_W^{[i-1]} \times m_C^{[i-1]}$

The learned parameters at the l^{th} layer are weights $w_{j,1}$ with $m_{l-1} \times m_l$

Parameters bias with m_l parameters, Figure (6) shows the fully connected layer

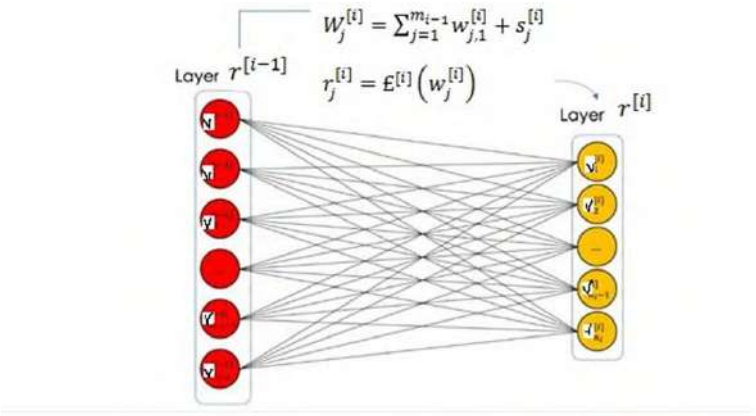

Figure6. Shows the fully connected layer

Figure (7) shows the previous steps that illustrate the chain of operations by which a convolutional neural network is constructed

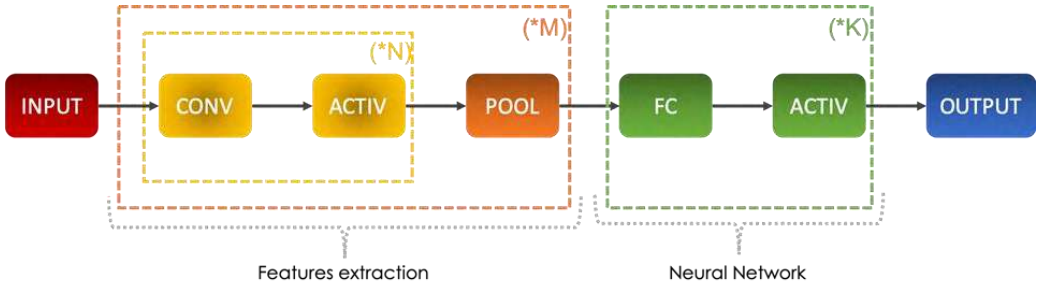

Figure 7. Shows the steps of convolution neural network CNN

The process is repeated for a certain number of convolutions. The image features are extracted that the entire connected neural network is equipped with the image features followed by the activation functions that aim to reduce (m_H, m_W, m_C) the depth in the network Figure (8) shows the three dimensions of the convolutional neural network

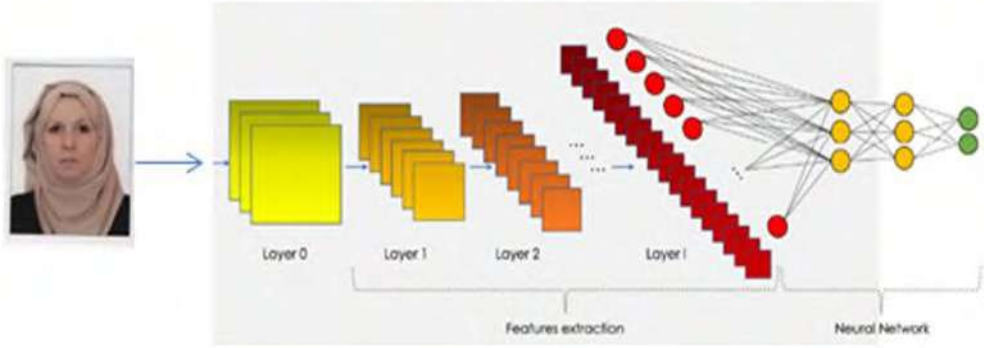

Figure8. Using the filter and multiplying it with the color image

5. Faces Detection Steps

The identification of a person is done through facial identification, depending on the biological characteristics that the person possesses. This method has many challenges

1. Lighting fixture

When the light source causes brightness, which affects the brightness of the image because the light surrounding the face causes the lack of quality performance to distinguish the face

2.Facial Expressions:

The person's feelings are evident in a facial expression that displays messages such as anger represented by frowning by pulling the eyebrows close together, which requires a good algorithm to recognize faces in a variety of expressions

3. Confirmation of Positioning:

When the person's face is fixed, it leads to obscuring some of the facial features that he wishes to mask in the image.

4. Partial structural component:

means partial support, the structural components, including size, color, and shapes such as mustaches, glasses, and beards are considered partial components

The computer interface deals with the image database to detect the face with its measurements, where the image is recognized, i.e. on the face as a file, in addition to video monitoring. In this work, the Matlab program is used to identify the face

A fast program is designed to recognize the face of the color image

6. Face recognition using MATLAB

Face recognition is a complex technology that is most often when unlocking your phone or passing through a high-tech monitoring system. Here comes the question about how to use MATLAB in face recognition?

The recognition of human faces is carried out using technology in particular, computer vision technology to distinguish facial features taken from photo and video clips. To get the best results, an algorithm was proposed to identify the face and compare it with the face data. By using MATLAB code, face, eyes, nose, and mouth recognition is achieved through the built-in Cascade Object Detector function in the toolbox.

7. Fast facial algorithm

A program was designed to determine the face, where good results were obtained and in quick steps.
Figure (9) shows how to use the MATLAB program to identify the face
The proposed algorithm, with the help of MATLAB, to identify the face, the following steps show the stages of the face detection of the image
Input color Image
Step1: analyses image to 3 layers RGB
Step 2: processed filter 3×3 After you treat the filter with the image, the
image size is reduced
Step3: In this step, the object properties are determined after
Vision. Cascade Object Detector is created
face Detector = vision. Cascade Object Detector ();
step4: In this step, you call the object with the arguments (as if it
behaves as a function).
Space5: Facial information is identified and read
Location of the Face = step (face Detector, the Image);
output the image with face detected

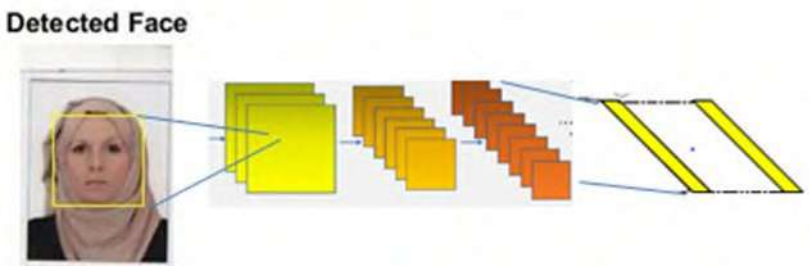

Figure 9a. Shows face identification

With location face is [19, 40, 50, 20], height of image 255 and width 128

Figure 9b. Shows face identification

With location face is [105,68,51,51]

8. Discuss the results

In this section, the results obtained for the correct rate of face detection are presented. the new algorithm shows its efficiency by presenting the results obtained. In this work, a modern version of MATLAB was used to design a face detection program for several people in one image, and the best results were obtained. Figure (10) and Figure (11) show the efficiency of the proposed algorithm to detect the face of a number of people and distinguish their faces with the label. The correct rate of the proposed algorithm is 98%, an image containing 3 members and the image is ($432 \times 980 \times 3$ unit8) with Boxing Faces is and table (1) shows Bounding Box values which comprises of [x, y, Height, Width] of faces to be detected Figure (10) The sample to which the proposed algorithm is applied

Figure 10. shows the efficiency of the proposed algorithm to detect the face of a number of people and distinguish their faces.

Table (1) shows Bounding Box values

X	Y	width	Height
442	150	115	115
125	28	150	150
571	31	267	267

Figure (11) shows the efficiency of the proposed algorithm to detect the face of a number of masked people and distinguish their faces.

9.Conclusion

In this paper, a new algorithm was built for face detection technology by segmenting the color image into RGB in which a neural network is used, where the face area of a person was detected through a comparison between the input and output image, the correctness of the face detection rate 98%.

With the implementation of the algorithm in the MATLAB program, good results were obtained for the indications of the algorithm.

a new technique for identifying the face of color images was presented after analyzing the image and dividing it into three layers resulting from the neural network that helps to detect the features of the face, and by using the MATLAB program, a classification technique is applied to detect the face, which satisfactory results were obtained after using the basic equations.

The algorithm was applied to the images without a mask, and the other stage was with the mask. As for the last, the experiment was on the image with the mask and glasses, and the algorithm was applied with high and fast technology, as the algorithm proved its efficiency because the examples showed that the new algorithm is valid under the new circumstances.

Univalence Criteria for Holomorphic Functions Involving Srivastava-Attiya Operator

Univalence Criteria for Holomorphic Functions Involving Srivastava-Attiya Operator

Huda F. Hussian, Abdul Rahman S. Juma

Department of Mathematics, University of Anbar, Ramadi, Iraq

E-mail: dr_juma@hotmail.com

Abstract. The purpose of present paper is to introduce and investigate the univalence criteria of holomorphic functions by employ a basically general form of Srivastava-Attiya operator. In specific, we derive several sufficient conditions of univalence for the generalized Srivastava-Attiya operator .Furthermore, number of famous univalent conditions would follow across specializing the parameters involved.Relevant connections with other related previous works are also indicating.

1. Introduction

Let $\mathcal{A}$ be the class of functions f of the form

$$f(z) = z + \sum_{k=2}^{\infty} a_k z^k , \quad (1)$$

which are holomorphic in the open unit disk $U = \{z \in \mathbb{C} : |z| < 1\}$.

Let S be the subclass of $\mathcal{A}$, which consists of functions of the form (1) that are univalent and normalized by the conditions

$$f(0) = 0 \quad \text{and} \quad f'(0) = 1 \text{ in U.}$$

In geometric function theory, the Univalence of complex functions considered as substantial property. However, it is complicated, and in many situations impossible to show immediately that a certain complex function is univalent. because of that many authors found different kinds of sufficient conditions of univalence. On of the most substantial of these conditions of univalence in the domains U and the exterior of the closed unit disk is the well-known criterion of Becker [2].Becker us the generalized Loewner differential equation and theory of Loewner chains cleverly. Extension of these criterias were given by Deniz and Orhan [4], Ali et al. [1] and Nehari [6].

For $f \in \mathcal{A}$, the generalized Srivastava-Attiya operator $\psi^{s,a,\beta}_{(\beta_p),(\alpha_q),b} : \mathcal{A} \to \mathcal{A}$ is defined by

$$\psi^{s,a,\beta}_{(\beta_p),(\alpha_q),b} f(z) = z + \sum_{k=2}^{\infty} \frac{\prod_{i=1}^{P}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}} \left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right) \left(\frac{a+1}{a+k}\right)^s a_k z^k \quad (2)$$

$(\beta_i \in \mathbb{C}(i = 1, \dots, p);\ \alpha_i \in \mathbb{C} \setminus Z_0^-(i = 1, \dots, q); z \in U; p \le q + 1;$ $\min\{\mathcal{R}(a), \mathcal{R}(s)\} > 0; \beta > 0$ when $\mathcal{R}(b) > 0$ and $S \in \mathbb{C}; a \in \mathbb{C}\setminus Z_0^-$ when $b = 0$). For more details see [9,10]

In this paper, we derive sufficient conditions of univalence for the generalized Srivastava-Attiya operator $\psi^{s,a,\beta}_{(\beta_p),(\alpha_q),b} f(z)$.

Furthermore, a number of known univalent conditions would follow across specializing the parameters involved. We will use the following lemmas to prove our results.

Lemma1.1 [2] Let $f \in \mathcal{A}$. If for all $z \in U$

$$(1-|z|^2)\left|\frac{z\,f'(z)}{f''(z)}\right| \le 1, \tag{3}$$

then f is univalent in U.

Lemma1.2 [7] Let $f \in \mathcal{A}$. If for all $z \in U$

$$\left|\frac{z^2\,f'(z)}{f^2(z)}-1\right| \le 1, \tag{4}$$

then f is univalent in U.

Lemma1.3 [11] Let be real number $\eta > \frac{1}{2}$ and $f \in \mathcal{A}$. If for all z $\in U$

$$(1-|z|^{2\eta})\left|\frac{z\,f''(z)}{f'(z)}+1-\eta\right| \le \eta, \tag{5}$$

then f is univalent in U.

Lemma 1.4 [5] If $f \in S$. If for all $z \in U$,

$$\frac{z}{f(z)} = 1+\sum_{k=1}^{\infty} b_k z^k, \tag{6}$$

then $\sum_{k=1}^{\infty}(k-1)|b_k| \le 1$.

Lemma 1.5 [8] Let $v \in \mathbb{C}, \mathcal{R}e(v) \ge 0$ and $f \in \mathcal{A}$. If for all $z \in U$

$$\frac{1-|z|^{2\mathcal{R}e(v)}}{\mathcal{R}e(v)}\left|\frac{z\,f''(z)}{f'(z)}\right| \le 1, \tag{7}$$

then a function

$$T_v(z) = \left(v\int_0^z y^{v-1}\,f'(y)dy\right)^{\frac{1}{v}}$$

is univalent in U.

2. Main Results

In this section, we determine the sufficient conditions to get univalence for holomorphic functions by using the Srivastava – Attiya operator.

Theorem 2.1 Let $f \in \mathcal{A}$. If for all $z \in U$

$\sum_{k=1}^{\infty}\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^s [k(2k-1)]\,|a_k| \le 1$,

then $\psi^{s,a,\beta}_{(\beta_p),(\propto_q),b}f(z)$ is univalent in U. (8)

Proof . Let $f \in \mathcal{A}$. Then for all $z \in U$, we have

$$(1-|z|^2)\left|\frac{z\left(\psi^{s,a,\beta}_{(\beta_p),(\propto_q),b}f(z)\right)''}{\left(\psi^{s,a,\beta}_{(\beta_p),(\propto_q),b}f(z)\right)'}\right| \le (1-|-z|^2)\frac{|z|\left|\left(\psi^{s,a,\beta}_{(\beta_p),(\propto_q),b}f(z)\right)''\right|}{\left|\left(\psi^{s,a,\beta}_{(\beta_p),(\propto_q),b}f(z)\right)'\right|}$$

$$\leq (1+|z|^2)\frac{|z|\left|\left[z+\sum_{k=2}^{\infty}\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}a_k\,z^k\right]''\right|}{\left|\left[z+\sum_{k=2}^{\infty}\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}a_k\,z^k\right]'\right|}$$

$$=(1+|z|^2)\frac{|z|\left|\sum_{k=2}^{\infty}\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}k(k-1)\,z^{k-2}\right|}{|1|-\left|\sum_{k=2}^{\infty}\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\cdot\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\cdot\left(\frac{a+1}{a+k}\right)^{s}k\,a_k\,z^{k-1}\right|}$$

$$\leq (1+|z|^2)\frac{|z|\left[\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}k(k-1)\,|a_k|\,|z^{k-2}|\right]}{\left[1-\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}k\,|a_k|\,|z^{k-1}|\right]}$$

$$\leq \frac{2\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}k(k-1)|a_k|}{1-\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}k\,|a_k|}$$

Applying Lemma 1.1,we get

$$\frac{2\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}k(k-1)|a_k|}{1-\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}k\,|a_k|}\leq 1$$

then

$$2\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}k(k-1)|a_k|$$
$$\leq 1-\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}k\,|a_k|,$$

therefor,

$$\left[2\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}k(k-1)|a_k|\right.$$
$$\left.+\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}k|a_k|\right]\leq 1,$$

and we have

$$\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}|a_k|\,[k(2k-1)]\leq 1$$

Theorem 2.2 Let $f\in\mathcal{A}$. If for all $z\in U$

$$\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}|a_k|\leq\frac{1}{\sqrt{7}},\qquad(9)$$

then $\psi^{s,a,\beta}_{(\beta_p),(\propto_q),b}f(z)$ is univalent in U.

Proof. Let $f\in\mathcal{A}$. We must show that

$$\left|\frac{z^2\left(\psi^{s,a,\beta}_{(\beta_p),(\propto_q),b}f(z)\ \right)'}{2\left(\psi^{s,a,\beta}_{(\beta_p),(\propto_q),b}f(z)\ \right)^2}\right| \le 1\ ,$$

thus

$$\left|\frac{z^2\left(\psi^{s,a,\beta}_{(\beta_p),(\propto_q),b}f(z)\ \right)'}{2\left(\psi^{s,a,\beta}_{(\beta_p),(\propto_q),b}f(z)\ \right)^2}\right| = \frac{\left|\, z^2\left(\psi^{s,a,\beta}_{(\beta_p),(\propto_q),b}f(z)\right)'\,\right|}{2\left|\left(\psi^{s,a,\beta}_{(\beta_p),(\propto_q),b}f(z)\right)^2\right|}$$

$$\le \frac{|z|^2\left|\left[z+\sum_{k=2}^{\infty}\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^s a_k\, z^k\right]'\right|}{2\left|\left[z+\sum_{k=2}^{\infty}\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^s a_k\, z^k\right]^2\right|}$$

$$\le \frac{|z|^2\left|1+\sum_{k=2}^{\infty}\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^s k\, a_k\, z^{k-1}\right|}{2\left|\left[z^2+2z\sum_{k=2}^{\infty}\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^s a_k\, z^k\right]+\left(\sum_{k=2}^{\infty}\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^s a_k z^k\right)^2\right|}$$

$$\le \frac{|z|^2\left[1+\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\cdot\left(\frac{a+1}{a+k}\right)^s k|a_k|\,|z^{k-1}|\right]}{2\left[\,|z|^2-2|-z|\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^s|\,a_k\,|\,|z^k|\right]-|-\sum_{k=2}^{\infty}\left(\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^s|\,|a_k|\,|z^k|\right)^2}$$

Applying Lemma 1.3,we get

$$\frac{2\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}k(k-1)|a_k|}{1-\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}k|a_k|}+|1-\eta|\leq\eta,$$

then

$$\frac{2\sum_{k=2}^{\infty} \left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right| \left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s} k(k-1)|a_k|}{1-\sum_{k=2}^{\infty} \left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right| \left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s} k|a_k|} \leq 2\eta-1,$$

therefor,

$$2\sum_{k=2}^{\infty} \left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right| \left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s} k(k-1)|a_k| + 2\eta\sum_{k=2}^{\infty} \left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right| \left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s} k|a_k| - \sum_{k=2}^{\infty} \left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right| \left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s} k|a_k| \leq 2\eta-1,$$

and we have

$$\sum_{k=2}^{\infty} \left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right| \left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s} k|a_k| \,[2(k-1)+(2\eta-1)] \leq 2\eta-1.$$

As applications of Theorems 2.1, 2.2, and 2.3, we have the following Theorem.

Theorem 2.4 Let $f \in \mathcal{A}$. If for all $z \in U$. One of inequality (9-11) holds then $\sum_{k=1}^{\infty}(k-1)\,|b_k| \leq 1,$ ...(11)

where $\frac{z}{\psi^{s,a,\beta}_{(\beta_p),(\propto_q),b} f(z)} = 1+\sum_{k=1}^{\infty}(k-1)\,b_k\,z^k$

Proof. Let $f \in \mathcal{A}$. Then in view of theorems 2.1 , 2.2 , 2.3

$\psi^{s,a,\beta}_{(\beta_p),(\propto_q),b} f(z)$ is univalent in U.

Using Theorem 2.1,

$$(1-|z|^2)\left|\frac{z\left(\psi^{s,a,\beta}_{(\beta_p),(\propto_q),b} f(z)\right)''}{\left(\psi^{s,a,\beta}_{(\beta_p),(\propto_q),b} f(z)\right)'}\right| = (1-|z|^2)\left|\frac{z\left(\psi^{s,a,\beta+2}_{(\beta_p)(\propto_q),b} f(z)\right)}{\psi^{s,a,\beta+1}_{,(\beta_p)(\propto_q),b} f(z)}\right|$$

$$= (1-|z|^2)\left|\frac{z\ \psi^{s,a,\beta+1}_{(\beta_p),(\propto_q),b} f(z)}{\psi^{s,a,\beta}_{(\beta_p)(\propto_q),b,} f(z)}\right|$$

$$= (1-|z|^2)\left|\frac{z}{\psi^{s,a,\beta}_{(\beta_p),(\propto_q),b} f(z)}\ \psi^{s,a,\beta+1}_{(\beta_p)(\propto_q),b} f(z)\right|$$

$$= (1-|z|^2)\left|\left[1+\sum_{k=1}^{\infty} b_k\,z^k\right]\left[z+\sum_{k=2}^{\infty}\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s} a_k\,z^k\right]'\right|$$

$$\leq (1-|-z|^2).\left[1+\sum_{k=1}^{\infty}|\,b_k\,|\,|\,z^k\,|\right]\left[|\,1\,|-|\right. - \left.\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s} k\,|\,|\,a_k\,|\,|\,z^{k-1}\,|\right]$$

$$\leq \left(1+|\,z\,|^{2}\right)\left[1+\sum_{k=1}^{\infty}|\,b_k\,|\,|\,z^k\,|\right]\left[1\right. - \left.\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s} k\,|\,|\,a_k\,|\,|\,z^{k-1}\,|\right]$$

$$\leq 2\left[1-\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\propto_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s} k|a_k|\right][1+\sum_{k=1}^{\infty}|b_k|]$$

$$\leq 2\left[1+\sum_{k=1}^{\infty}|b_k|-\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}k|a_k|\right]+$$
$$\left(\sum_{k=1}^{\infty}|b_k|\right)\left(-\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}k|a_k|\right).$$

Applying Lemma 1.4, we get

$$2\left[1+\sum_{k=1}^{\infty}|b_k|-2\sum_{k=1}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}|a_k|-\right.$$
$$\left.2\left(\sum_{k=1}^{\infty}|b_k|\right)\left(\sum_{k=1}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}|a_k|\right)\right]\leq 1,$$

therefor,

$$2\left[1+\sum_{k=1}^{\infty}|b_k|-2\sum_{k=1}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}|a_k|-\right.$$
$$\left.2\left(\sum_{k=1}^{\infty}|b_k|\right)\left(\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}|a_k|\right)\right]\leq\frac{(k-1)|b_k|}{(k-1)|b_k|},$$

and we have

$$\sum_{k=1}^{\infty}(k-1)|b_k|^2\leq 1$$

Theorem 2.5 Let $f\in\mathcal{A}$. If for all $z\in U$

$$\sum_{k=1}^{\infty}k[2(k-1)+\mathcal{R}e(v)]\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}}\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}|a_k|\leq\mathcal{R}e(v),\mathcal{R}e(v)>0 \qquad (12)$$

then

$$G_v(z)=\left(v\int_0^z y^{v-1}\left[\psi^{s,a,\beta}_{(\beta_p),(\alpha_q),b}f(z)\right]'dy\right)^{\frac{1}{v}}\text{ is univalent in }U$$

Proof**.** Let $f\in\mathcal{A}$. Then for all $z\in U$

$$\frac{1-|z|^{2\mathcal{R}e(v)}}{\mathcal{R}e(v)}\cdot\left|\frac{z\left(\psi^{s,a,\beta}_{(\beta_p),(\alpha_q),b}f(z)\right)''}{\left(\psi^{s,a,\beta}_{(\beta_p),(\alpha_q),b}f(z)\right)'}\right|\leq\frac{1-|-z|^{2\mathcal{R}e(v)}}{\mathcal{R}e(v)}\cdot\frac{|z|\left|\left(\psi^{s,a,\beta}_{(\beta_p),(\alpha_q),b}f(z)\right)''\right|}{\left|\left(\psi^{s,a,\beta}_{(\beta_p),(\alpha_q),b}f(z)\right)'\right|}$$

$$\leq\frac{1+|Z|^{2\mathcal{R}e(v)}}{\mathcal{R}e(v)}\cdot\frac{|z|\left|\left[z+\sum_{k=2}^{\infty}\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}}\cdot\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\cdot\left(\frac{a+1}{a+k}\right)^{s}a_kz^k\right]''\right|}{\left|\left[z+\sum_{k=2}^{\infty}\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}}\cdot\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\cdot\left(\frac{a+1}{a+k}\right)^{s}a_kz^k\right]'\right|}$$

$$=\frac{1+|z|^{2\mathcal{R}e(v)}}{\mathcal{R}e(v)}\cdot\frac{|z|\left|1+\sum_{k=2}^{\infty}\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}}\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}k(k-1)a_kz^{k-2}\right|}{|1|-\left|-\sum_{k=2}^{\infty}\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}}\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}k\,a_kz^{k-1}\right|}$$

$$\leq\frac{1+|z|^{2\mathcal{R}e(v)}}{\mathcal{R}e(v)}\cdot\frac{|z|\left[\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}k(k-1)\,|a_k|\,|z^{k-2}|\right]}{1-\sum_{k=2}^{\infty}\left|\frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}}\right|\left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s}k|\,a_k|\,|z^{k-1}|}$$

$$\leq \frac{2\sum_{k=2}^{\infty} \left| \frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}} \right| \left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s} k(k-1)|a_k|}{\mathcal{R}e(v)\left[1-\sum_{k=2}^{\infty} \left| \frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}} \right| \left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s} k|\, a_k|\right]}$$

Applying Lemma 1.5, we get

$$\frac{2\sum_{k=2}^{\infty} \left| \frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}} \right| \left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s} k(k-1)|a_k|}{\mathcal{R}e(v)\left[1-\sum_{k=2}^{\infty} \left| \frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}} \right| \left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s} k|\, a_k|\right]} \leq 1$$

then

$$2\sum_{k=2}^{\infty} \left| \frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}} \right| \left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s} k(k-1)|a_k| \leq \mathcal{R}e(v)\left[1-\sum_{k=2}^{\infty} \left| \frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}} \right| \left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s} k|\, a_k|\right],$$

therefor,

$$2\sum_{k=2}^{\infty} \left| \frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}} \right| \left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s} k(k-1)|a_k| + \mathcal{R}e(v)\sum_{k=2}^{\infty} \left| \frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}} \right| \left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s} k|\, a_k| \leq \mathcal{R}e(v),$$

and we have

$$\sum_{k=2}^{\infty} \left| \frac{\prod_{i=1}^{p}(1+\beta_i)_{k-1}}{\prod_{i=1}^{q}(1+\alpha_i)_{k-1}} \right| \left(\frac{B(a+k,b,s,\beta)}{B(a+1,b,s,\beta)}\right)\left(\frac{a+1}{a+k}\right)^{s} k[2(k-1)+\mathcal{R}e(v)]\,|a_k| \leq \mathcal{R}e(v).$$

New Methods of Computing the Conjugate of Young Diagram

New Methods of Computing the Conjugate of Young Diagram

Fatmah Ahmed Basher, Ammar Seddiq Mahmood

Department of Mathematics, College of Education for Pure Science, University Of Mosul, Mosul-Iraq

E-mail: fatima.esp87@student.uomosul.edu.iq

Abstract. Since the appearance of Young's diagram, it has played a fundamental and pivotal role in many fields of mathematics, perhaps the most prominent of which is algebra, graph theory, number theory…etc, and many closely related relationships, perhaps among them The most prominent is called conjugation. Many people try to find a mathematical method to find the value of the hash value in its conjugated form. Here, we will propose two new methods for the same purpose.

1. Introduction

Let g be a positive integer. "A composition of g is a sequence $\delta = (\delta_1, \delta_2, \dots, \delta_n) = ({\theta_1}^{\gamma_1}, {\theta_2}^{\gamma_2}, \dots, {\theta_m}^{\gamma_m})$ (where γ_z is the number of times θ_z appeared, z=1, 2, …, m) of non-negative integers such that $|\delta| = \sum_{j=1}^{n} \delta_j = \sum_{z=1}^{m} \theta_z{}^{\gamma_z} = g$. The composition is called a partition of g if $\delta_j \geq \delta_{j+1}$ or $\theta_j > \theta_{j+1}, \forall\, j \geq 1$. A Young diagram of a composition δ is the subset $[\delta] = \{(\tau, \sigma): 1 \leq \sigma \leq \delta_\tau \text{ and } \tau \geq 1\}$ of $N \times N$. The elements of $[\delta]$ are called the nodes of $\delta; [1]$". For example if $\delta = (4,4,5,1,1,1,2) = (4^2, 5, 1^3, 2)$, then

Figure 1. Young diagram of $(4,4,5,1,1,1,2)$

$[\delta] =$ 
Over the years, many researchers have provided different definitions of the topic conjugate, but it was focused mainly on calculating the parts as if it was manually without making clear mathematical relationships as:

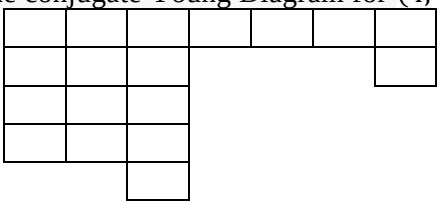
Definition 1.1: [1] For any partition δ , let δ' be the partition which is conjugate to δ by $(\delta_1', \delta_2', \dots)$ where $\delta_{h'}$ is equal to the number of nodes in column h of $[\delta]$. For example, let $\delta = (7, 3^2, 2)$ then

Figure 2. Young Diagram and conjugate for $\delta = (7, 3^2, 2)$

$[\delta] =$  $\rightarrow$ $[\delta'] =$ 
Definition 1.2: [2] The conjugate of any composition is defined by $[\delta'] = [(\sigma, \tau)\ in\ \delta' : (\tau, \sigma) in\ \delta]$
Definition 1.3: [3] The conjugate partition obtained by reflecting the Young diagram along the main diagonal.

It is natural to ask why conjugation on partitions is better than composition because we often do not know the corresponding representation of the utility. An example of conjugate diagram 1 is:

Figure 3. The conjugate Young Diagram for $(4, 4, 5, 1, 1, 1, 2)$



In this article, we will introduce a different method from the previously mentioned method, this time through the original partition without counting according to the definitions 1.1-1.3. Note that any $X^0\ \ or\ \ 0^X$ does not have any effect on this paper.

2. The New Rules

Logically speaking, the calculation of the number of cases is performed after Young's diagram is drawn and then the conjugation process is performed. The idea used is whether there is a method to find the conjugation directly through the original partition, so we studied this possibility from two aspects. first of all:

Rule 2.1: The new representation for conjugate any partition $\delta = (\delta_1, \delta_2, \dots, \delta_n)$ is

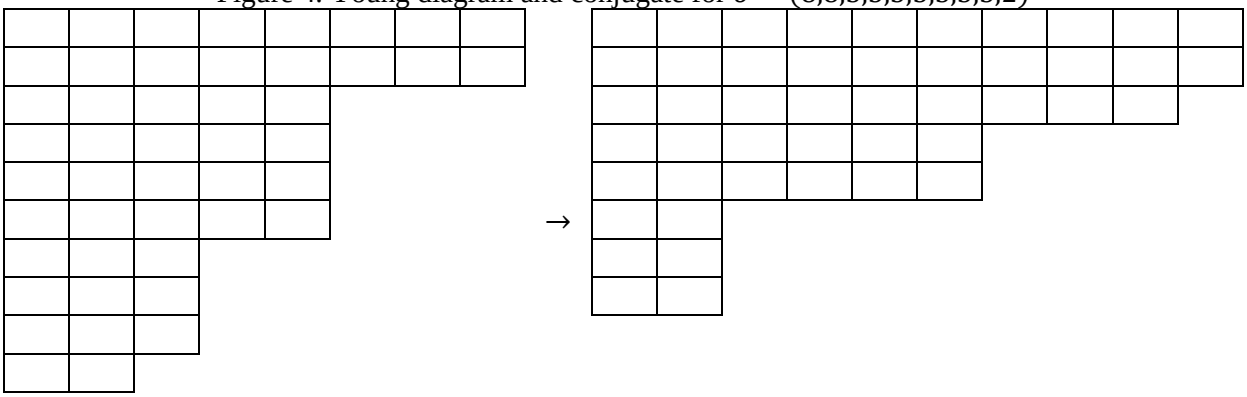
$$\delta' = (n^{\delta_n}, (n-1)^{\delta_{n-1}-\delta_n}, (n-2)^{\delta_{n-2}-\delta_{n-1}}, \dots, \big(n-(n-1)\big)^{\delta_1-\delta_2}).$$

Proof: According to the principle of inversion of the main diagonal, it is natural to focus on the last value of n, because it will play a decisive role here, in order to know the remaining conjugate states that will appear later, but will be divided by δ_n In order to repeat, because there is nothing behind it, so in the original partition, it appeared here last after it started to reverse. By repeating this situation in the next item, then we have $(n-1)$ but this time we must exclude $\delta_{n-1} - \delta_n$ in the same way until the last items■

For example, let $\delta = (8,8,5,5,5,5,3,3,3,2)$, then n =10 and

$$\delta' = (n^{\delta_{10}} = 10^2,\ (n-1)^{\delta_9-\delta_{10}} = 9^1, (n-2)^{\delta_8-\delta_9} = 8^0,$$
$$(n-3)^{\delta_7-\delta_8} = 7^0,\ (n-4)^{\delta_6-\delta_7} = 6^2,\quad (n-5)^{\delta_5-\delta_6} = 5^0,$$
$$(n-6)^{\delta_4-\delta_5} = 4^0,\ (n-7)^{\delta_3-\delta_4} = 3^0,$$
$$(n-8)^{\delta_2-\delta_3} = 2^3,\ (n-9)^{\delta_1-\delta_2} = 1^0)$$
$$= (10^2, 9, 6^2, 2^3).$$

Figure 4. Young diagram and conjugate for $\delta = (8,8,5,5,5,5,3,3,3,2)$



Rule 2.2: The new representation for conjugate any partition $\delta = ({\theta_1}^{\gamma_1}, {\theta_2}^{\gamma_2}, \dots, {\theta_m}^{\gamma_m})$ is
$\delta' = \left((\gamma_1 + \gamma_2 + \cdots + \gamma_m)^{\theta_m},\ (\gamma_1 + \gamma_2 + \cdots + \gamma_{m-1})^{\theta_{m-1}-\theta_m}, \cdots,\ (\gamma_1 + \gamma_2)^{\theta_2-\theta_3},\ (\gamma_1)^{\theta_1-\theta_2}\right)$.

Proof: This method, focuses on the number of iterations in the partition, which will represent the number of rows representing the partition, and when the concept of the conjugate is used, it will form columns in it. On the other hand, since the changes are made according to the main diagonal, this means that we will focus on the values in the main partition, but follow the principle of $(\boldsymbol{\theta_{(m-(k-1))}} - \boldsymbol{\theta_{(m-(k-2))}})$ where $k = 1, 2, \cdots, m$, respectively■

From the above example, when $\delta = (8,8,5,5,5,5,3,3,3,2) = (8^2, 5^4, 3^3, 2)$ then

$$\delta' = \left((\gamma_1 + \gamma_2 + \cdots + \gamma_m)^{\theta_m},\ (\gamma_1 + \gamma_2 + \cdots + \gamma_{m-1})^{\theta_{m-1}-\theta_m}, \cdots,\ (\gamma_1 + \gamma_2)^{\theta_2-\theta_3},\ (\gamma_1)^{\theta_1-\theta_2}\right)$$
$$= ((2+4+3+1)^2,\ (2+4+3)^{3-2},\ (2+4)^{5-3},\ 2^{8-5})$$
$$= (10^2, 9, 6^2, 2^3).$$

It is natural to ask the following questions: What is the difference between the two rules? What are the benefits of using them? Is it possible to imitate this usage application? The answers to all these questions will completely overlap as shown below:

"When a partition is given without duplicates, it is better to use Rule 2.1, and if a partition is given its frequency, it is easier to use the second rule. Similarly, these two cases are correct, but the first case is studied through a case in the original partition (that is, row by row) before the conjugate is expressed, while the second case is to study each equal rows in the measurement, so if it happens very often, it is not logical to study them row by row but to study them in groups and faster. This method can be used as an encrypted message, especially after the method proposed by Mahmood and Mahmood [4]-[5] or Mahmood in [6] by representing each English letter according to its division (by using the definition of e-abacus diagram of James [7]; defining $\beta_i = \delta_i + b - i,\ 1 \le i \le b$. The set $\{\beta_1, \beta_2, \cdots, \beta_b\}$ is said to be the set of β - number for π, see [1]. Let e be a positive integer number greater than or equal to 2, we can represent numbers by a diagram called *e*-abacus diagram, see[7], as shown:

Table 1. *e*-abacus diagram

Runner 1	**Runner 2**	⋯	**Runner *e***
0	1	⋯	*e*-1
e	*e*+1	⋯	2*e*-1
2*e*	2*e*+1	⋯	3*e*-1
⋮	⋮	⋯	⋮

where every β will be represented by a (■) and the rest of the sites by (-). In fact, the definition of the *e*-abacus diagram will lead us to the fact that the presence of an infinite number of diagrams are all suitable for any partition according to the value of *e*., when e=5), which means that we will get a word that is difficult to read. This is what we will explain in the third section of this research".

3. Application

Mahmood and Mahmood in [4] represented the English letters as follows*:*

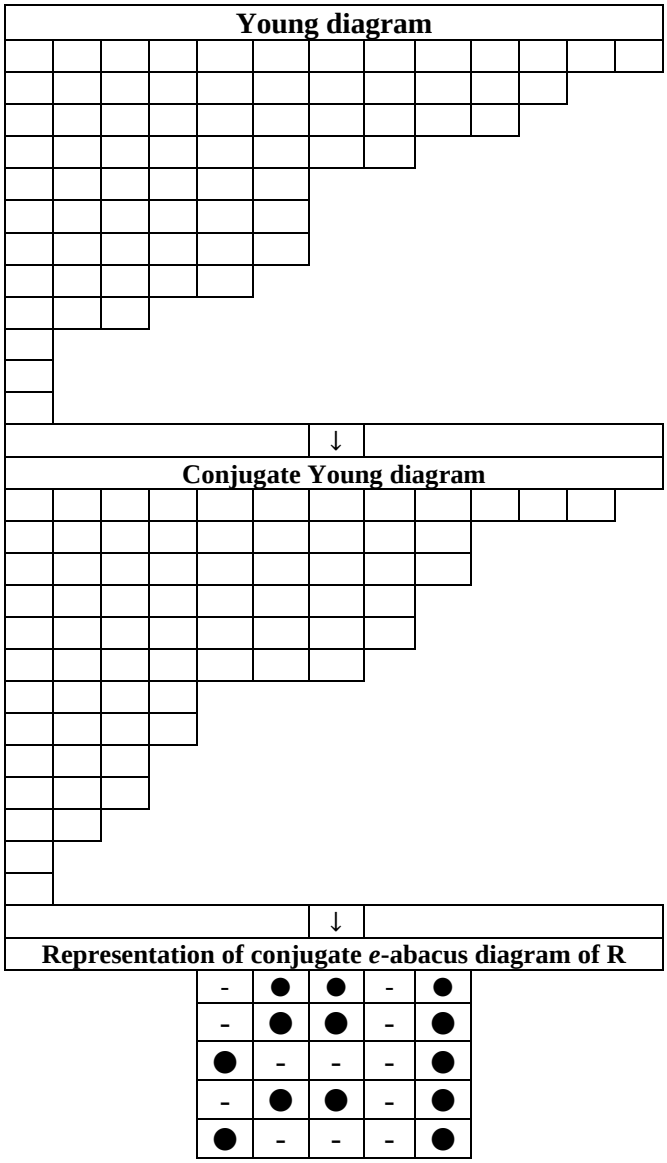
Table 2. The Partition for each English Letters

Letter	partition
A	$(11, 8^2, 5^7, 2, 1^3)$
B	$(11^3, 19,8, 6^3, 5,3, 1^3)$
C	$(13^3, 12,9, 5^2, 2, 1^3)$
D	$(12^3, 11,9,8,6,5,3, 1^3)$
E	$(12^4, 8, 6^3, 2, 1^4)$
F	$(12,8, 6^3, 2, 1^4)$
G	$(11^3, 10, 7^4, 6,2, 1^3)$
H	$(13,11,10,8, 7^4, 6,4,3,1)$
I	$(15^3, 12,8,4, 1^3)$
J	$(14,11,10,8,4, 1^3)$
K	$(15,13,11,10, 7^2, 5,4,3,1)$
L	$(17^4, 13,9,5,1)$
M	$(12, 9^2, 8, 7^2, 6, 5^2, 4,3,2,1)$
N	$(11,9, 8^2, 7, 6^4, 5, 4^2, 3,1)$
O	$(12^3, 11, 8^2, 5^2, 2, 1^3)$
P	$(11^3, 8, 6^3, 5,3, 1^3)$
Q	$(11^4, 10^2, 8^2, 5^2, 2, 1^3)$
R	$(13,11,10,8, 6^3, 5,3, 1^3)$
S	$(13^3, 12, 7^2, 2, 1^3)$
T	$(14,10,6,2, 1^5)$
U	$(14^2, 12,10,9,7,6,4,3,1)$
V	$(16,13,12,11, 8^2, 5)$
W	$(14,13,12,11, 10^2, 9, 8^2, 5)$
X	$(13,10,9,8,5,2,1)$
Y	$(16,12, 9^3, 8,5)$
Z	$(13^5, 10,7,4, 1^4)$

If we choose the letter R, then we have the following:

Figure 5. All Changes Made to the Letter R

using the definition of *e*-abacus diagram by James in [5]				
-	●	●	●	-
-	●	-	-	●
-	●	●	●	-
-	●	-	-	●
-	●	-	-	●
		↓		



Also if we use Rules 2.1 or 2.2 for the letter Q then we have, the representation of partition about the letter Q is $(11^4, 10^2, 8^2, 5^2, 2, 1^3)$, then $Q' = ((4+2+2+2+1+4)^1, (4+2+2+2+1)^{2-1}, (4+2+2+2)^{5-2}, (4+2+2)^{8-5}, (4+2)^{10-8}, 4^{11-10}) = (14, 11, 10^3, 8^3, 6^2, 4)$

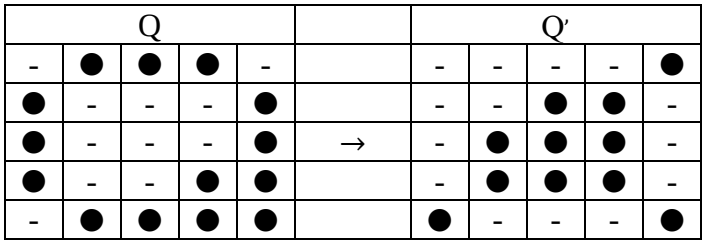


Figure 6. The letter Q (before and after use Rule 2.1 or 2.2)

Now, if we choose any word, for example (TIME), then:

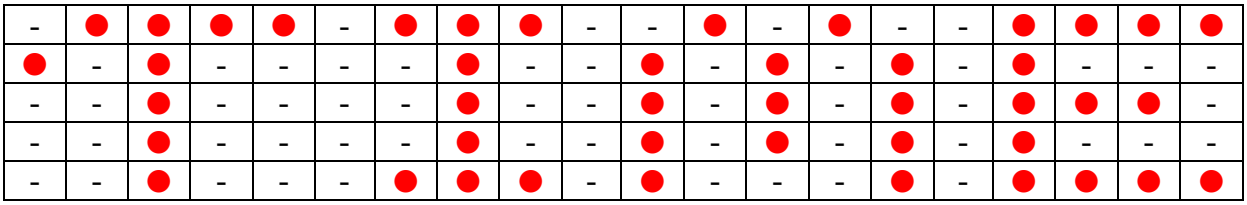

Figure 7. Partition of (TIME)

The conjugate of partition (TIME) if we use Rules 2.1 or 2.2 and *e*-abacus diagram is:

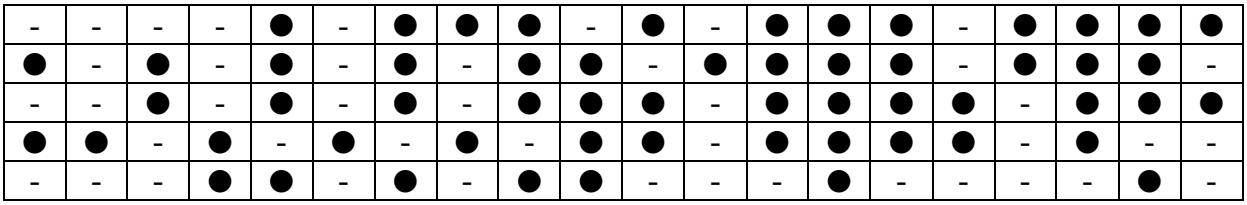

Figure 8. Conjugate of Partition of (TIME)

Acknowledgment

At the end of preparing this research, we sincerely thank the President of the University of Mosul and the Dean of Pure Science Education for their hard work.

Global Convergence Condition for a New Spectral Conjugate Gradient Method for Large-Scale Optimization

Global Convergence Condition for a New Spectral Conjugate Gradient Method for Large-Scale Optimization

Abstract. The spectral conjugate gradient (SCG) method is an effective method to solve large-scale nonlinear unconstrained optimization problems. In this work, a new spectral conjugate gradient method is proposed with a strong Wolfe-Powell line search (SWP). The idea of the new one is using the β^{BZA} formula which is proposed by Baluch and et al., with suitable parameter φ denoted by (SCGBZA). Under the usual assumptions, the descent properties and overall global convergence of the proposed method (SCGBZA) are proved. The proposed method is numerically proven to be effective.

1. Introduction

Conjugate gradient (CG) and SCG methods are the most effective categories for solving large-scale nonlinear unconstrained optimization problems, this is because they have the advantage of fast convergence, low storage and simple iterations [1]. Now consider the nonlinear unconstrained optimization problems

$$\min f(x), \quad x \in \mathcal{R}^n, \tag{1}$$

where $f: \mathcal{R}^n \to \mathcal{R}$ a smooth function, and its gradient vector is usually represented by $g(x) = \nabla f(x)$. The initial point $x_0 \in \mathcal{R}^n$ is usually calculated through iterative process. The new point calculated as follows:

$$x_{n+1} = x_n + \gamma_n d_n, \qquad n = 0,1,2,3, \ldots \tag{2}$$

and the direction

$$d_{n+1} = \begin{cases} -g_{n+1}, & n = 0 \\ -g_{n+1} + \beta_n d_n, & n \geq 1 \end{cases} \tag{3}$$

Where $\beta_n \in \mathcal{R}$ is the parameter, and $\gamma_n > 0$ is the line search generated by inexact line search (ILS). In this work, we use (SWP) defined by:

$$f(x_n + \gamma_n d_n) \leq f(x_n) + \tau g_n^T d_n \tag{4}$$

$$|g(x_n + \gamma_n d_n)^T d_n| \leq -\delta g_n^T d_n \tag{5}$$

Generally, the above parameters τ *and* μ are required to satisfy $0 < \tau < 0.5 < \delta < 1$. In order to generate different (CG) methods, we have different choices for the parameter β_n. The most commonly used formula for parameters are Hestenes Stiefel method (HS) [2], Fletcher-Reeves method (FR) [3], Polak-Ribiere – Polyak method (PR) [4, 5], Conjugate – Descent method (CD) [6], Liu – Storey method (LS) [7] and Dai-Yuan method (DY) [8]. The parameters of these β_n are as follows:

$$\beta_n^{HS} = \frac{g_{n+1}^T y_n}{y_n^T d_n}; \qquad \beta_n^{FR} = \frac{\|g_{n+1}\|^2}{\|g_n\|^2}; \qquad \beta_n^{PRP} = \frac{g_{n+1}^T y_n}{\|g_n\|^2};$$

$$\beta_n^{CD} = \frac{\|g_{n+1}\|^2}{y_n^T d_n}; \qquad \beta_n^{LS} = \frac{g_{n+1}^T y_n}{-g_n^T d_n}; \qquad \beta_n^{DY} = \frac{\|g_{n+1}\|^2}{y_n^T d_n}.$$

Respectively, where $\|.\|$ is the standard Euclidean norm and $y_n = g_{n+1} - g_n$.

Another way to solve the CG problem (1) is the SCG method. The main difference between the spectral gradient method and the gradient method is the calculation of the search direction [9]. The search direction of the spectral gradient method is defined by the following formula:

$$d_{n+1} = -\varphi_n g_{n+1} + \beta_n d_n \tag{6}$$

Where φ_n is a parameter which is known as a spectral gradient. Observe that if $\varphi_n = 1$, then (6) reduced to (3).

SCG was first proposed by Barazilai and Borwein [10] in 1988. Further, Raydan [11] introduced the SCG method for potential large-scale unconstrained optimization. The main merit of this method is that only the gradient directions is used for each search, while the nonmonotone strategy can ensures global convergence. Birgin and Martines [12] concluded that their SCG method was globally convergent. However, there is actually no guarantee that the SCG method will generate descanting direction. Therefore, Andrei [13] proposed a reduced proportion under the Wolfe line search. Based on the improved a CG algorithm which was proposed by Jiang et al., [14], an SCG method with sufficient descent feature based on the modified CG algorithm that proposed by Zhang et al. [15]. Many authors engaged in the development of the SCG methods, for more information, please refer to [16-21].

2. New algorithm and the descent property

The SCG method is obtained by combining the CG search direction and a scalar spectral parameter.

Baluch et al. [22] in their paper, they constructed a modified three-term HS method in the following direction:

$$d_{n+1} = -g_{n+1} + \beta_n^{BZA} d_n - \varphi_n^{BZA} y_n \tag{7}$$

Note that the suggested formula β_n^{BZA} actually modifies the classic β^{HS} formula by adding $\mu\left|g_{n+1}^T d_n\right|$ in the denominator of HS, the proposed β formula formulated as:

$$\beta_n^{BZA} = \frac{g_{n+1}^T (g_{n+1} - g_n)}{d_n^T y_n + \mu\left|g_{n+1}^T d_n\right|} \tag{8}$$

with $\mu = 2$, and the parameter φ formulated as:

$$\varphi_n^{BZA} = \frac{g_{n+1}^T d_n}{d_n^T y_n + \mu\left|g_{n+1}^T d_n\right|} \tag{9}$$

If the line search is exact, then (8) reduce to the classical HS formula, and (7) reduce to (3).

In this work, we can summarize the direction defined as follows:

$$d_{n+1} = \begin{cases} -g_{n+1}, & n = 0 \\ -\varphi_n^{MBZA} g_{n+1} + \beta_n^{BZA} d_n, & n \geq 1 \end{cases} \tag{10}$$

Where β_n^{BZA} defined in (8), and φ_n it defined as follows:

$$\varphi_n^{MBZA} = 1 - \frac{g_{n+1}^T d_n}{d_n^T y_n + \mu\left|g_{n+1}^T d_n\right|} \tag{11}$$

with $\mu = 0.5$. If the line search is exact, $\varphi_n = 1$, (10) reduce to (3). The process of our proposed SCG method is described in the following algorithm:

3. Algorithm of SCG

Step 1: Choose an initial point $x_1 \in \mathcal{R}^n$, $\varepsilon \geq 0, \varepsilon = 10^{-6}$, $\mu = 0.5$, set $d_1 = -g_1$, n=1.

Step 2: Check convergence, if $\|g_n\| \leq \varepsilon$, then stop; otherwise, continue.

Step 3: Use (4) and (5) to determine the step size $\gamma_n > 0$.

Step 4: Calculate the new point x_{n+1} using (2), $g_{n+1} = g(x_{n+1})$, if $\|g_{n+1}\| \leq \varepsilon$, then stop; otherwise, continue.

Step 5: Calculate the direction d_{n+1} given in (10), β_n^{BZA} and φ_n^{MBZA} are given in (8) and (11) respectively.

Step 6: If the Powel restart criteria

$$\left|g_{n+1}^T g_n\right| \geq 0.2\|g_{n+1}\|^2 \quad (12)$$

is satisfied, set $d_{n+1} = -g_{n+1}$ go to 3; otherwise, continue.

Step 7: Increase n and go to 3.

In order to ensure that the SCG algorithm proposed in (10) has sufficient descent property, which plays an important role in the global convergence analysis under the SWP in (4) and (5), we need the following assumptions:

4. Assumption (A).

1- $f(x)$ is restricted from below on the level set $\Psi = \{x \in \mathcal{R}^n, f(x) \leq f(x_0)\}$, where x_0 is the starting point. i.e., there is a constant $\eta > 0$, which means $\|x_n\| \leq \eta \ \forall x \in \Psi$ [23].

2- $f(x)$ is continuously differentiable in a certain neighborhood N of Ψ, and its gradient is Lipschitz continuous, i.e., there is a constant $\mathcal{L} > 0$, such that

$$\|g(x) - g(y)\| \leq \mathcal{L}||x - y||, \ \forall x, y \in \mathrm{N}. \quad (13)$$

Now using Assumption (A), there exists a positive constant $(\bar{\omega}, \omega, \bar{\rho}$ & $\rho)$, such that:
$0 < \bar{\omega} \leq \|g_{n+1}\| \leq \omega, and \ 0 < \bar{\rho} \leq \|g_n\| \leq \rho \ \forall x \in \Psi$ [23].

Theorem (1): Suppose that assumption (A) holds. Assuming that the sequences $\{g_n\}\, and\, \{d_n\}$ be generated by the algorithm SCG, and the step size γ_n is obtained by SWP. Then, the proposed method has sufficient descent direction i.e.

$$g_{n+1}^T d_{n+1} \leq -\upsilon\|g_{n+1}\|^2 \quad (14)$$

Proof: Multiplying the both sides of the direction defined in (10) by g_{n+1}^T and substituting β_n^{BZA} and φ_n^{MBZA} in (8) and (11) respectively, we get

$$g_{n+1}^T d_{n+1} = -\left(1 - \frac{g_{n+1}^T d_n}{d_n^T y_n + \mu|g_{n+1}^T d_n|}\right)\|g_{n+1}\|^2 + \frac{g_{n+1}^T d_n}{d_n^T y_n + \mu|g_{n+1}^T d_n|} g_{n+1}^T d_n \quad (15)$$

From (5), we have

$$\delta_1 g_n^T d_n \leq g_{n+1}^T d_n \leq -\delta_2 g_n^T d_n \quad (16)$$

$$d_n^T y_n = d_n^T g_{n+1} - d_n^T g_n \geq \delta_1 g_n^T d_n - g_n^T d_n = -(1 - \delta_1) g_n^T d_n$$

i.e.

$$d_n^T y_n \geq -(1 - \delta_1) g_n^T d_n \ . \quad (17)$$

We have

$$g_{n+1}^T y_n = g_{n+1}^T (g_{n+1} - g_n) = \|g_{n+1}\|^2 - g_{n+1}^T g_n.$$

By the one side of Powell restart criteria (12), we obtain

$$\Rightarrow g_{n+1}^T y_n \leq \|g_{n+1}\|^2 + 0.2\|g_{n+1}\|^2 = 1.2\ \|g_{n+1}\|^2. \quad (18)$$

Using (16), (17) and (18) in (15), we get

$$g_{n+1}^T d_{n+1} \le -\left(1-\frac{(-\delta_2 d_n^T g_n)}{(1-\delta_1)(-d_n^T g_n)-\mu\delta_1(-d_n^T g_n)}\right)\|g_{n+1}\|^2 + \frac{1.2\|g_{n+1}\|^2(-\delta_2 g_n^T d_n)}{(1-\delta_1)(-d_n^T g_n)-\mu\delta_1(-d_n^T g_n)}$$

$$= -\left(1-\frac{\delta_2}{[1-(1+\mu)\delta_1]}\right)\|g_{n+1}\|^2 - \frac{1.2\delta_2}{[1-(1+\mu)\delta_1]}\|g_{n+1}\|^2$$

$$= -\left(1-\frac{2.2\delta_2}{[1-(1+\mu)\delta_1]}\right)\|g_{n+1}\|^2 .$$

$\Rightarrow g_{n+1}^T d_{n+1} \le -\upsilon\|g_{n+1}\|^2$, with $\upsilon = \left(1-\frac{2.2\delta_2}{[1-(1+\mu)\delta_1]}\right)$.■ (19)

Therefore, the proposed algorithm satisfies the sufficient descent condition with SWP conditions.

5. The Global Convergence Property.

In this section, we will prove another important condition, called global convergence property. In the following lemma, we review the well-known Zoutendijk condition [24], which plays an important role in the proof of the global convergence analysis of SCG method.

Lemma [25]:

Let assumption (A) holds. Suppose any iteration method (2) and (3), and γ_n is obtained by the SWP (4) and (5). If

$$\sum_{n\ge 1}\frac{1}{\|d_n\|^2} = \infty, \quad (20)$$

Then

$$\lim_{n\to\infty} inf\|g_n\| = 0. \quad (21)$$

Theorem (2): Consider that assumption (A) is satisfied. The sequences $\{x_n\}$ and $\{d_n\}$ generated by the algorithm SCG, γ_n is obtained by SWP and d_n is the descent direction. Then

$$\lim_{n\to\infty} inf\|g_n\| = 0$$

Proof: As

$$\beta_n^{BZA} = \frac{g_{n+1}^T(g_{n+1}-g_n)}{d_n^T y_n+\mu|g_{n+1}^T d_n|},$$

The authors in [22] assumed that $z = [(1-\delta_1)\gamma_n z_1 + \mu\delta_1 z_1]$, and where $0<\delta_1<1$, $z_1>0$ and $\mu = 0.5$, so $z>0$. Therefore,

$$|\beta_n^{BZA}| \le \frac{\mathcal{L}\|g_{n+1}\|}{z_2\|d_n\|} \Rightarrow |\beta_n^{BZA}|.\|d_n\| \le \frac{\mathcal{L}\|g_{n+1}\|}{z_2} \quad (22)$$

Now,

$$|1-\varphi_n^{MBZA}| \le \left|1-\frac{g_{n+1}^T d_n}{d_n^T y_n+\mu|g_{n+1}^T d_n|}\right|$$

$$\le 1+\frac{\|g_{n+1}\|.\|d_n\|}{(1-\delta_1)\gamma_n z_1.\|d_n\|^2+\mu\delta_1 z_1.\|d_n\|^2}$$

$$\le 1+\frac{\|g_{n+1}\|.\|d_n\|}{[(1-\delta_1)\gamma_n z_1+\mu\delta_1 z_1].\|d_n\|^2}$$

$$\le 1+\frac{\|g_{n+1}\|}{z.\|d_n\|} \quad (23)$$

Assume that $A = \left(1+\frac{\omega}{z.b}+\frac{\mathcal{L}}{z_2}\right)$

Now, combining (22) and (23) with (10), we get

$$\|d_{n+1}\| \le |1-\varphi_n^{MBZA}|.\|g_{n+1}\| + |\beta_n^{BZA}|.\|d_n\|$$

$$\le 1+\frac{\|g_{n+1}\|}{z.\|d_n\|}\|g_{n+1}\| + \frac{\mathcal{L}\|g_{n+1}\|}{z_2}$$

$$= \left(1 + \frac{\omega}{z.b} + \frac{\mathcal{L}}{z_2}\right) \|g_{n+1}\|$$
$$\leq A.\omega$$
$$\|d_{n+1}\| \leq E \Rightarrow \|d_{n+1}\|^2 \leq B^2. \quad (24)$$

By taking the summation to the both sides of (24), we get

$$\Rightarrow \sum_{n\geq 1} \frac{1}{\|d_{n+1}\|^2} \geq \frac{1}{B^2} \sum_{n\geq 1} 1 = +\infty$$
$$\Rightarrow \lim_{n\to\infty} inf \|g_n\| = 0. \blacksquare$$

The new proposed algorithm has achieved global convergence.

6. Results and Discussion

We will report the results of several test functions in this section. Some test functions are selected analyze the new method. These functions are considered from CUTEr [26] and Andrei [27]. Using SWP line search, a comparison was made between the new SCG method and the classical BZACG method based on the number of iterations (NOI) and number of function evaluation (NOF). Set $\tau = 0.01$ and $\delta = 0.7$, the stopping criterion of this algorithm was $\|g_{n+1}\| \leq 10^{-6}$. If the number of iterations exceeds 600, the method is considered to have failed. All codes are written in double-precision FORTRAN 77 language and compiled into Visual (Fortran 6.6) (default compiler settings). Under Table1, we have compiled the names of test functions used and the numerical results between the BZACG algorithm and the SCG algorithm.

7. Conclusion

In this work, we prove the sufficient descent property and the global convergence property of the newly proposed spectral conjugate gradient method through strong Wolfe–Powell line search. The numerical results show that SCG algorithm outperforms BZA conjugate gradient method in terms in the number of iterations and the number of function evaluations.

On fuzzy soft normal operators

On fuzzy soft normal operators

Dr.Salim Dawood , Ali Qassim Jabur

Abstract. In this paper, we study and discuss a new type of normal operator which is fuzzy soft normal operator and given some properties with the characterization of this operator. Also, theorems related on fuzzy soft normal operator have been given. In addition, we introduce the relation between this operator and other types.

1. Introduction

Zadeh [1] suggested an expansion of the theory of the set, which is idea of fuzzy sets to cope with insecurity in 1965. A fuzzy set on a $domain\ \mathcal{X}$ is defined by membership function $From\ \mathcal{X}\ to$ [0,1]. Also In 1999, Molodtsov [2] introduced new types of sets were said to be soft set. The soft set is a mathematical instrument for uncertainty in modelling by associating a collection with a set of parameters, i.e., it is a parameterized family of Universal Set sub-sets. After that, many researchers also presented new, expanded ideas based on soft sets were introduced by researchers, and examples were given for them and researched their characteristics, such as soft point [3], Soft normed Spaces [4], Soft Inner Product Spaces [5] and Soft Hilbert space [6].

And many searchers made mix between fuzzy set and soft set to get definition fuzzy soft set, for example Maji [7]. This definition has been applied and some concepts are being given, like Fuzzy soft point [8] and fuzzy soft normed spaces [9].

Currently, the fuzzy soft inner product spaces and fuzzy soft Hilbert space [10] were introduced by Faried et al. Additionally the Fuzzy soft linear operator [11]. Finally, they defined the fuzzy soft self-adjoint operator [12] and studied its properties.

The aim of this work submitted a new type of normal operator is called fuzzy soft normal operator, and given some theorem relating to this operator with properties. Well as the relation between this operator and anther types like fuzzy soft self-adjoint operator.

2. Basic concepts

Definition 2.1 [1]**:** Let $\widehat{\mathbf{A}}$ be a fuzzy set over universe set $\boldsymbol{\mathcal{X}}$ is a set characterized by a membership function $\boldsymbol{\mu}_{\widehat{\mathbf{A}}}: \boldsymbol{\mathcal{X}} \longrightarrow \mathfrak{T}$, where $\mathfrak{T} = [\mathbf{0}, \mathbf{1}]$ and $\widehat{\mathbf{A}}$ represented by an ordered pairs $\widehat{\mathbf{A}} = \{(\mathbf{x}, \boldsymbol{\mu}_{\widehat{\mathbf{A}}}(\mathbf{x})) | \mathbf{x} \in \boldsymbol{\mathcal{X}},\ \boldsymbol{\mu}_{\widehat{\mathbf{A}}}(\mathbf{x}) \in \mathfrak{T}\}$ or $\widehat{\mathbf{A}} = \left\{\frac{\boldsymbol{\mu}_{\widehat{\mathbf{A}}}(\mathbf{x})}{\mathbf{x}} : \mathbf{x} \in \boldsymbol{\mathcal{X}}\right\}$

$\mu_{\widehat{A}}(x)$ is said to be degree of membership of x in $\widehat{A}$

And $\mathfrak{T}^{\mathcal{X}} = \{\widehat{A} :\ \widehat{A}\text{is a function from } \mathcal{X} \text{ into } \mathfrak{T}\}$

Definitions 2.2 [**2**]: Let $\boldsymbol{\mathcal{X}}$ be a universe set, and **E** be a set of parameters, $\boldsymbol{\mathcal{P}}(\boldsymbol{\mathcal{X}})$ the power set of $\boldsymbol{\mathcal{X}}$ and $\mathbf{A} \subseteq \mathbf{E}$. Suppose that $\boldsymbol{\mathcal{G}}$ is a mapping given by $\boldsymbol{\mathcal{G}}: \mathbf{A} \to \boldsymbol{\mathcal{P}}(\boldsymbol{\mathcal{X}})$, where $\mathcal{G}_{\mathbf{A}} = \{\boldsymbol{\mathcal{G}}(\mathbf{e}) \in \boldsymbol{\mathcal{P}}(\boldsymbol{\mathcal{X}}): \mathbf{e} \in \mathbf{A}\}$.
The pair $(\mathcal{G}, \mathrm{A})$ or $\mathcal{G}_{\mathrm{A}}$ is called soft set over $\mathcal{X}$ with respect to A.

Definition 2.3 [**7**]: The soft set $(\boldsymbol{\mathcal{G}}, \mathbf{A})$ is called fuzzy soft set $(\boldsymbol{\mathcal{FS}} - \mathbf{set})$ over a universe set $\boldsymbol{\mathcal{X}}$,whenever $\boldsymbol{\mathcal{G}}$ is a mapping $\boldsymbol{\mathcal{G}}: \mathbf{A} \to \boldsymbol{\mathfrak{T}}^{\boldsymbol{\mathcal{X}}}$,and $\{\boldsymbol{\mathcal{G}}(\mathbf{e}) \in \boldsymbol{\mathfrak{T}}^{\boldsymbol{\mathcal{X}}}: \mathbf{e} \in \mathbf{A}\}$
The family of all $\mathcal{FS}-$ sets, symbolized by $\mathcal{FSS}(\widetilde{\mathcal{X}})$
Definition 2.4 [**8**]: The $\boldsymbol{\mathcal{FS}} - \mathbf{set}$ $(\boldsymbol{\mathcal{G}}, \mathbf{A}) \in \boldsymbol{\mathcal{FSS}}(\widetilde{\boldsymbol{\mathcal{X}}})$ is called fuzzy soft point over $\boldsymbol{\mathcal{X}}$, symbolized by $((\mathbf{x}_{\boldsymbol{\mu}_{\mathcal{G}(\mathrm{e})}}, \mathbf{A})$ or $\tilde{\mathbf{x}}_{\boldsymbol{\mu}_{\mathcal{G}(\mathrm{e})}})$, if $\mathbf{e} \in \mathbf{A}$ and $\mathbf{x} \in \boldsymbol{\mathcal{X}}$,

$$\mu_{\mathcal{G}(\mathrm{e})}(\mathrm{x}) = \begin{cases} \lambda & , \text{if } \mathrm{x} = \mathrm{x}_0 \in \mathcal{X} \text{ and } \mathrm{e} = \mathrm{e}_0 \in \mathrm{A} \\ 0 & , \text{if } \mathrm{x} \in \mathcal{X} - \{\mathrm{x}_0\} \text{ or } \mathrm{e} \in \mathrm{A} - \{\mathrm{e}_0\} \end{cases} \text{, where } \lambda \in (0,1]$$

Remark 2.5 [**8**]: $\boldsymbol{\mathcal{C}}(\mathbf{A})$ is the family of all $\boldsymbol{\mathcal{FS}} - \mathbf{Complex}$ numbers and $\boldsymbol{\mathcal{R}}(\mathbf{A})$ is also the family of all $\boldsymbol{\mathcal{FS}} - \mathbf{Real}$ numbers

Definition 2.6 [**9**]: Let $\widetilde{\boldsymbol{\mathcal{X}}}$ be $\boldsymbol{\mathcal{FS}} - \mathbf{vector\ space}$. Then, a mapping $\|\widetilde{.}\|: \widetilde{\boldsymbol{\mathcal{X}}} \to \boldsymbol{\mathcal{R}}(\mathbf{A})$ is called fuzzy soft norm on $\widetilde{\boldsymbol{\mathcal{X}}}$ $(\boldsymbol{\mathcal{FSN}})$ if $\|\widetilde{.}\|$ satisfies the following conditions:
(1) $\left\| \widetilde{\tilde{\mathrm{x}}_{\mu_{\mathcal{G}(\mathrm{e})}}} \right\| \geq \tilde{0}, \forall\, \tilde{\mathrm{x}}_{\mu_{\mathcal{G}(\mathrm{e})}} \in \widetilde{\mathcal{X}}$,and $\left\| \widetilde{\tilde{\mathrm{x}}_{\mu_{\mathcal{G}(\mathrm{e})}}} \right\| = \tilde{0} \Leftrightarrow \tilde{\mathrm{x}}_{\mu_{\mathcal{G}(\mathrm{e})}} = \tilde{\theta}$
(2) $\left\| \tilde{\mathrm{r}} \cdot \widetilde{\tilde{\mathrm{x}}_{\mu_{\mathcal{G}(\mathrm{e})}}} \right\| = |\tilde{\mathrm{r}}| \left\| \widetilde{\tilde{\mathrm{x}}_{\mu_{\mathcal{G}(\mathrm{e})}}} \right\|, \forall\, \tilde{\mathrm{x}}_{\mu_{\mathcal{G}(\mathrm{e})}} \in \widetilde{\mathcal{X}}, \forall\, \tilde{\mathrm{r}} \in \mathcal{C}(\mathrm{A})$.
(3) $\left\| \tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}} \widetilde{+ \tilde{\mathrm{y}}_{\mu_{2_{\mathcal{G}(\mathrm{e}_2)}}}} \right\| \leq \left\| \widetilde{\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}} \right\| + \left\| \widetilde{\tilde{\mathrm{y}}_{\mu_{2_{\mathcal{G}(\mathrm{e}_2)}}}} \right\|, \forall\, \tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}, \tilde{\mathrm{y}}_{\mu_{2_{\mathcal{G}(\mathrm{e}_2)}}} \in \widetilde{\mathcal{X}}$.
The $\mathcal{FS}-$ vector space with $\mathcal{FSN}$ $\|\widetilde{.}\|$ is called fuzzy soft normed vector space $(\mathcal{FSN}-\text{space})$, and symbolized by $\left(\widetilde{\mathcal{X}}, \widetilde{\|.\|}\right)$.

Definition 2.7 [**10**]: Let $\widetilde{\boldsymbol{\mathcal{X}}}$ be $\boldsymbol{\mathcal{FS}}\mathbf{V} - \mathbf{space}$. Then, the mapping $\widetilde{\langle .,. \rangle} : \widetilde{\boldsymbol{\mathcal{X}}} \times \widetilde{\boldsymbol{\mathcal{X}}} \to (\boldsymbol{\mathcal{C}}(\mathbf{A})\ \mathbf{or}\ \boldsymbol{\mathcal{R}}(\mathbf{A}))$ is called fuzzy soft inner product on $\widetilde{\boldsymbol{\mathcal{X}}}$ $(\boldsymbol{\mathcal{FS}}\mathfrak{T})$ if $\widetilde{\langle .,. \rangle}$ satisfies :
(1) $\langle \tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}, \widetilde{\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}} \rangle \geq \tilde{0}$, for all $\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}} \in \widetilde{\mathcal{X}}$ and $\langle \tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}, \widetilde{\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}} \rangle = \tilde{0} \iff \tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}} = \tilde{\theta}$
(2) $\langle \tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}, \widetilde{\tilde{\mathrm{y}}_{\mu_{2_{\mathcal{G}(\mathrm{e}_2)}}}} \rangle = \overline{\langle \tilde{\mathrm{y}}_{\mu_{2_{\mathcal{G}(\mathrm{e}_2)}}}, \widetilde{\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}} \rangle}$ $, \forall\, \tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}, \tilde{\mathrm{y}}_{\mu_{2_{\mathcal{G}(\mathrm{e}_2)}}} \in \widetilde{\mathcal{X}}$, where bar denotes complex conjugate of the $\mathcal{FS}-$ complex number.
(3) $\langle \tilde{\alpha} \tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}, \widetilde{\tilde{\mathrm{y}}_{\mu_{2_{\mathcal{G}(\mathrm{e}_2)}}}} \rangle = \tilde{\alpha} \langle \tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}, \widetilde{\tilde{\mathrm{y}}_{\mu_{2_{\mathcal{G}(\mathrm{e}_2)}}}} \rangle$, for all $\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}, \tilde{\mathrm{y}}_{\mu_{2_{\mathcal{G}(\mathrm{e}_2)}}} \in \widetilde{\mathcal{X}}$ and for all $\tilde{\alpha} \in \mathrm{C}(\mathrm{A})$.
(4) $\langle \tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}} + \widetilde{\tilde{\mathrm{y}}_{\mu_{2_{\mathcal{G}(\mathrm{e}_2)}}}}, \tilde{\mathrm{z}}_{\mu_{3_{\mathcal{G}(\mathrm{e}_3)}}} \rangle = \langle \tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}, \widetilde{\tilde{\mathrm{z}}_{\mu_{3_{\mathcal{G}(\mathrm{e}_3)}}}} \rangle + \langle \tilde{\mathrm{y}}_{\mu_{2_{\mathcal{G}(\mathrm{e}_2)}}}, \widetilde{\tilde{\mathrm{z}}_{\mu_{3_{\mathcal{G}(\mathrm{e}_3)}}}} \rangle$
For all $\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}, \tilde{\mathrm{y}}_{\mu_{2_{\mathcal{G}(\mathrm{e}_2)}}}, \tilde{\mathrm{z}}_{\mu_{3_{\mathcal{G}(\mathrm{e}_3)}}} \in \widetilde{\mathcal{X}}$
The $\mathcal{FS}-$ vector space $\widetilde{\mathcal{X}}$ with $\mathcal{FS}\mathfrak{T}$ $\widetilde{\langle .,. \rangle}$ is called fuzzy soft inner product space $(\mathcal{FS}\mathfrak{T}-\text{space})$, and symbolized by $\left(\widetilde{\mathrm{X}}, \widetilde{\langle .,. \rangle}\right)$

Definition 2.8 [**13**]: A sequence of $\boldsymbol{\mathcal{FS}}-$ $\mathbf{vectors}$ $\left\{\tilde{\mathbf{x}}^{\mathbf{n}}_{\boldsymbol{\mu}_{\mathbf{n}\boldsymbol{\mathcal{G}}(\mathbf{e_n})}}\right\}$ in $\boldsymbol{\mathcal{FSN}} - \mathbf{space}$ $\left(\widetilde{\mathbf{X}}, \widetilde{\|\cdot\|}\right)$ is called fuzzy soft convergent and converges to $\tilde{\mathbf{x}}^{\mathbf{o}}_{\boldsymbol{\mu}_{\mathbf{0}\boldsymbol{\mathcal{G}}(\mathbf{e_0})}}$ if $\lim_{\mathbf{n}\to\infty} \left\| \tilde{\mathbf{x}}^{\mathbf{n}}_{\boldsymbol{\mu}_{\mathbf{n}\boldsymbol{\mathcal{G}}(\mathbf{e_n})}} \widetilde{- \tilde{\mathbf{x}}^{\mathbf{o}}_{\boldsymbol{\mu}_{\mathbf{0}\boldsymbol{\mathcal{G}}(\mathbf{e_0})}}} \right\| = \tilde{\mathbf{0}}$ i.e. $\forall \tilde{\boldsymbol{\epsilon}} > \tilde{\mathbf{0}}$, $\exists \mathbf{n_o} \in \mathbf{N}$ such that $\left\| \tilde{\mathbf{x}}^{\mathbf{n}}_{\boldsymbol{\mu}_{\mathbf{n}\boldsymbol{\mathcal{G}}(\mathbf{e_n})}} \widetilde{- \tilde{\mathbf{x}}^{\mathbf{o}}_{\boldsymbol{\mu}_{\mathbf{0}\boldsymbol{\mathcal{G}}(\mathbf{e_0})}}} \right\| < \tilde{\boldsymbol{\epsilon}}$, $\forall \mathbf{n} \geq \mathbf{n_o}$.
It if denoted by $\lim_{\mathrm{n}\to\infty} \tilde{\mathrm{x}}^{\mathrm{n}}_{\mu_{\mathrm{n}\mathcal{G}(\mathrm{e_n})}} = \tilde{\mathrm{x}}^{\mathrm{o}}_{\mu_{0\mathcal{G}(\mathrm{e_0})}}$ or $\tilde{\mathrm{x}}^{\mathrm{n}}_{\mu_{\mathrm{n}\mathcal{G}(\mathrm{e_n})}} \to \tilde{\mathrm{x}}^{\mathrm{o}}_{\mu_{0\mathcal{G}(\mathrm{e_0})}}$ as $\mathrm{n} \to \infty$

Definition 2.9 [**13**]: A sequence of $\boldsymbol{\mathcal{FS}-}$ **vectors** $\left\{\tilde{\mathbf{x}}^{\mathbf{n}}_{\boldsymbol{\mu}_{\mathbf{n}\mathcal{G}(\mathbf{e_n})}}\right\}$ in $\boldsymbol{\mathcal{FSN}-}$**space** $\left(\widetilde{\mathbf{X}}, \widetilde{\|\cdot\|}\right)$ is called fuzzy soft Cauchy sequence, if $\forall \tilde{\boldsymbol{\epsilon}} > \tilde{\mathbf{0}}$, $\exists \mathbf{n_o} \in \mathbf{N}$ such that $\left\|\tilde{\mathbf{x}}^{\mathbf{n}}_{\boldsymbol{\mu}_{\mathbf{n}\mathcal{G}(\mathbf{e_n})}} \widetilde{-} \tilde{\mathbf{x}}^{\mathbf{m}}_{\boldsymbol{\mu}_{\mathbf{m}\mathcal{G}(\mathbf{e_m})}}\right\| < \tilde{\boldsymbol{\epsilon}}$, $\forall \mathbf{n}, \mathbf{m} \geq \mathbf{n_o}$, $\mathbf{n} > \mathbf{m}$.
That is to say that $\left\|\tilde{\mathrm{x}}^{\mathrm{n}}_{\mu_{\mathrm{n}\mathcal{G}(\mathrm{e_n})}} \widetilde{-} \tilde{\mathrm{x}}^{\mathrm{m}}_{\mu_{\mathrm{m}\mathcal{G}(\mathrm{e_m})}}\right\| \to \tilde{0}$ as $\mathrm{n}, \mathrm{m} \to \infty$
Definition 2.10 [**13**]: The $\boldsymbol{\mathcal{FSN}-}$**space** $\left(\widetilde{\mathbf{X}}, \widetilde{\|\cdot\|}\right)$ is called fuzzy soft complete ($\boldsymbol{\mathcal{FS}-}$**complete**) if every $\boldsymbol{\mathcal{FS}-}$ **Cauchy sequence** is $\boldsymbol{\mathcal{FS}-}$ **convergent sequence** in it.

Definition 2.11 [**10**]: The $-$**space** $\left(\widetilde{\boldsymbol{\mathcal{X}}}, \widetilde{\langle .,. \rangle}\right)$, if it is $\boldsymbol{\mathcal{FS}-}$**complete** in the induced $\boldsymbol{\mathcal{FSN}}$ $\left\|\widetilde{\tilde{\mathbf{x}}_{\boldsymbol{\mu}_{\mathcal{G}(\mathbf{e})}}}\right\| = \sqrt{\langle \tilde{\mathbf{x}}_{\boldsymbol{\mu}_{\mathcal{G}(\mathbf{e})}}, \widetilde{\tilde{\mathbf{x}}_{\boldsymbol{\mu}_{\mathcal{G}(\mathbf{e})}}} \rangle}$ is called fuzzy soft Hilbert space ($\boldsymbol{\mathcal{FSH}-}$**space**), and symbolized by $\left(\widetilde{\boldsymbol{\mathcal{H}}}, \widetilde{\langle .,. \rangle}\right)$.

Definition 2.12 [**11**]: Let $\widetilde{\boldsymbol{\mathcal{H}}}$ **be** $\boldsymbol{\mathcal{FSH}-}$**space** and $\tilde{\boldsymbol{\mathcal{T}}}: \widetilde{\boldsymbol{\mathcal{H}}} \to \widetilde{\boldsymbol{\mathcal{H}}}$ be a fuzzy soft operator ($\boldsymbol{\mathcal{FS}-}$**operator**) .Then $\tilde{\boldsymbol{\mathcal{T}}}$ is called fuzzy soft linear operators ($\boldsymbol{\mathcal{FS}}\mathbf{L}-$**operator**) if:
1. $\tilde{\mathcal{T}}\left(\tilde{\mathrm{x}}_{\mu_{1\mathcal{G}(\mathrm{e}_1)}} + \tilde{\mathrm{y}}_{\mu_{2\mathcal{G}(\mathrm{e}_2)}}\right) = \tilde{\mathcal{T}}\left(\tilde{\mathrm{x}}_{\mu_{1\mathcal{G}(\mathrm{e}_1)}}\right) + \tilde{\mathcal{T}}\left(\tilde{\mathrm{y}}_{\mu_{2\mathcal{G}(\mathrm{e}_2)}}\right), \forall\, \tilde{\mathrm{x}}_{\mu_{1\mathcal{G}(\mathrm{e}_1)}}, \tilde{\mathrm{y}}_{\mu_{2\mathcal{G}(\mathrm{e}_2)}} \in \widetilde{\mathcal{H}}$
2. $\tilde{\mathcal{T}}\left(\tilde{\beta}\tilde{\mathrm{x}}_{\mu_{1\mathcal{G}(\mathrm{e}_1)}}\right) = \tilde{\beta}\tilde{\mathcal{T}}\left(\tilde{\mathrm{x}}_{\mu_{1\mathcal{G}(\mathrm{e}_1)}}\right), \forall\, \tilde{\mathrm{x}}_{\mu_{1\mathcal{G}(\mathrm{e}_1)}} \in \widetilde{\mathcal{H}}$ and $\tilde{\beta} \in \mathcal{C}(\mathrm{A})$
i.e. $\tilde{\mathcal{T}}\left(\tilde{\alpha}\tilde{\mathrm{x}}_{\mu_{1\mathcal{G}(\mathrm{e}_1)}} + \tilde{\beta}\tilde{\mathrm{y}}_{\mu_{2\mathcal{G}(\mathrm{e}_2)}}\right) = \tilde{\alpha}\tilde{\mathcal{T}}\left(\tilde{\mathrm{x}}_{\mu_{1\mathcal{G}(\mathrm{e}_1)}}\right) + \tilde{\beta}\tilde{\mathcal{T}}\left(\tilde{\mathrm{y}}_{\mu_{2\mathcal{G}(\mathrm{e}_2)}}\right)$, for all $\tilde{\mathrm{x}}_{\mu_{1\mathcal{G}(\mathrm{e}_1)}}, \tilde{\mathrm{y}}_{\mu_{2\mathcal{G}(\mathrm{e}_2)}} \in \widetilde{\mathcal{H}}$ and $\tilde{\alpha}, \tilde{\beta}$ any fuzzy soft scalars

Definition 2.13 [**11**]: Let $\widetilde{\boldsymbol{\mathcal{H}}}$ **be** $\boldsymbol{\mathcal{FSH}-}$**space** and $\tilde{\boldsymbol{\mathcal{T}}}: \widetilde{\boldsymbol{\mathcal{H}}} \to \widetilde{\boldsymbol{\mathcal{H}}}$ be $\boldsymbol{\mathcal{FS}-}$**operator** is called fuzzy soft bounded operator ($\boldsymbol{\mathcal{FSB}-}$**operator**) ,if $\exists\, \tilde{\mathbf{m}} \in \boldsymbol{\mathcal{R}}(\mathbf{A})$ such that $\left\|\widetilde{\tilde{\boldsymbol{\mathcal{T}}}\left(\widetilde{\tilde{\mathbf{x}}_{\boldsymbol{\mu}_{\mathbf{1}\mathcal{G}(\mathbf{e_1})}}}\right)}\right\| \leq \tilde{\mathbf{m}} \left\|\widetilde{\tilde{\mathbf{x}}_{\boldsymbol{\mu}_{\mathbf{1}\mathcal{G}(\mathbf{e_1})}}}\right\|$, for all $\tilde{\mathbf{x}}_{\boldsymbol{\mu}_{\mathbf{1}\mathcal{G}(\mathbf{e_1})}} \in \widetilde{\boldsymbol{\mathcal{H}}}$
Now, the collection of all $\mathcal{FS}-$liner and bounded operators denoted by $\widetilde{\mathrm{B}}(\widetilde{\mathcal{H}})$.

Definitions 2.14: Let $\widetilde{\boldsymbol{\mathcal{H}}}$**and** $\widetilde{\boldsymbol{\mathcal{K}}}$ be two $\boldsymbol{\mathcal{FSH}-}$**space**, then
1- The range of $\mathcal{FS}-$operator $\tilde{\mathcal{T}}: \widetilde{\mathcal{H}} \to \widetilde{\mathcal{K}}$ denoted by $\mathrm{Ran}(\tilde{\mathcal{T}})$ and $\mathrm{Ran}(\tilde{\mathcal{T}}) = \left\{\tilde{\mathcal{T}}\left(\tilde{\mathrm{x}}_{\mu_{1\mathcal{G}(\mathrm{e}_1)}}\right) \in \widetilde{\mathcal{K}} : \tilde{\mathrm{x}}_{\mu_{1\mathcal{G}(\mathrm{e}_1)}} \in \widetilde{\mathcal{H}}\right\}$.
2- The null (Kernel) of $\mathcal{FS}-$operator $\tilde{\mathcal{T}}: \widetilde{\mathcal{H}} \to \widetilde{\mathcal{K}}$ denoted by $\mathrm{Ker}(\tilde{\mathcal{T}})$ and $\mathrm{Ker}(\tilde{\mathcal{T}}) = \left\{\tilde{\mathrm{x}}_{\mu_{1\mathcal{G}(\mathrm{e}_1)}} \in \widetilde{\mathcal{H}} : \tilde{\mathcal{T}}\left(\tilde{\mathrm{x}}_{\mu_{1\mathcal{G}(\mathrm{e}_1)}}\right) = \tilde{0}\right\}$.

Example 2.15 [**11**]: The $\boldsymbol{\mathcal{FS}-}$**operator** $\tilde{\mathbf{I}}: \widetilde{\boldsymbol{\mathcal{H}}} \to \widetilde{\boldsymbol{\mathcal{H}}}$ defined by $\tilde{\mathbf{I}}\left(\tilde{\mathbf{x}}_{\boldsymbol{\mu}_{\mathbf{1}\mathcal{G}(\mathbf{e_1})}}\right) = \tilde{\mathbf{x}}_{\boldsymbol{\mu}_{\mathbf{1}\mathcal{G}(\mathbf{e_1})}}$, $\forall\, \tilde{\mathbf{x}}_{\boldsymbol{\mu}_{\mathbf{1}\mathcal{G}(\mathbf{e_1})}} \in \widetilde{\boldsymbol{\mathcal{H}}}$. And it is called fuzzy soft identity operator

Definition 2.16 [**11**]: Let $\widetilde{\boldsymbol{\mathcal{H}}}$ be $\boldsymbol{\mathcal{FSH}-}$**space** and $\tilde{\boldsymbol{\mathcal{T}}}: \widetilde{\boldsymbol{\mathcal{H}}} \to \widetilde{\boldsymbol{\mathcal{H}}}$ be $\boldsymbol{\mathcal{FSB}-}$**operator**, then The fuzzy soft adjoint operator $\tilde{\boldsymbol{\mathcal{T}}}^*$ is defined by
$\langle \tilde{\mathcal{T}}\tilde{\mathrm{x}}_{\mu_{1\mathcal{G}(\mathrm{e}_1)}}, \tilde{\mathrm{y}}_{\mu_{2\mathcal{G}(\mathrm{e}_2)}} \rangle = \langle \tilde{\mathrm{x}}_{\mu_{1\mathcal{G}(\mathrm{e}_1)}}, \widetilde{\tilde{\mathcal{T}}^*}\, \tilde{\mathrm{y}}_{\mu_{2\mathcal{G}(\mathrm{e}_2)}} \rangle$, $\forall\, \tilde{\mathrm{x}}_{\mu_{1\mathcal{G}(\mathrm{e}_1)}}, \tilde{\mathrm{y}}_{\mu_{2\mathcal{G}(\mathrm{e}_2)}} \in \widetilde{\mathcal{H}}$

Theorem 2.17 [**11**]: Let $\tilde{\boldsymbol{\mathcal{T}}}, \tilde{\mathbf{R}} \in \widetilde{\mathbf{B}}(\widetilde{\boldsymbol{\mathcal{H}}})$,where $\widetilde{\boldsymbol{\mathcal{H}}}$ is $\boldsymbol{\mathcal{FSH}-}$**space** and $\tilde{\boldsymbol{\beta}} \in \boldsymbol{\mathcal{C}}(\mathbf{A})$, then $\tilde{\boldsymbol{\mathcal{T}}}^{**} = \tilde{\boldsymbol{\mathcal{T}}}$, $\left(\tilde{\boldsymbol{\beta}}\tilde{\boldsymbol{\mathcal{T}}}\right)^* = \widetilde{\tilde{\boldsymbol{\beta}}}\tilde{\boldsymbol{\mathcal{T}}}^*$, $\left(\tilde{\boldsymbol{\mathcal{T}}} + \tilde{\mathbf{R}}\right)^* = \tilde{\boldsymbol{\mathcal{T}}}^* + \tilde{\mathbf{R}}^*$ and $\left(\tilde{\boldsymbol{\mathcal{T}}}\tilde{\mathbf{R}}\right)^* = \tilde{\mathbf{R}}^*\tilde{\boldsymbol{\mathcal{T}}}^*$.

Theorem 2.18 [**11**]: if $\widetilde{\mathcal{T}} \in \widetilde{\mathbf{B}}(\widetilde{\mathcal{H}})$,where $\widetilde{\mathcal{H}}$ is $\mathcal{FSH}-\mathbf{space}$, then $\widetilde{\|\widetilde{\mathcal{T}}^*\|} = \widetilde{\|\widetilde{\mathcal{T}}\|}$ and $\widetilde{\|\widetilde{\mathcal{T}}^*\widetilde{\mathcal{T}}\|} = \widetilde{\|\widetilde{\mathcal{T}}\|}^{\mathbf{2}}$

Definition 2.19 [**12**]: The $\mathcal{FS}-\mathbf{operator}$ $\widetilde{\mathcal{T}}$ of $\mathcal{FSH}-\mathbf{space}$ $\widetilde{\mathcal{H}}$ is called fuzzy soft self adjoint ($\mathcal{FS}-\mathbf{self\ adjoint\ operator}$) if $\widetilde{\mathcal{T}} = \widetilde{\mathcal{T}}^*$.

Theorem 2.20 [**12**-14]: If $\widetilde{\mathcal{T}}$ is $\mathcal{FS}-\mathbf{operator}$ on $\mathcal{FSH}-\mathbf{space}$ $\widetilde{\mathcal{H}}$ can be expressed by $\widetilde{\mathcal{T}} = \widetilde{\mathbf{R}} + \mathbf{i}\widetilde{\mathcal{S}}$, where $\widetilde{\mathbf{R}}\ \mathbf{and}\ \widetilde{\mathcal{S}}$ are $\mathcal{FS}-\mathbf{self\ adjoint\ operator}$ on $\widetilde{\mathcal{H}}$.

3. Main results

Definition 3.1: Let $\widetilde{\mathcal{T}}$ is $\mathcal{FS}-\mathbf{operator}$ of $\mathcal{FSH}-\mathbf{space}$ $\widetilde{\mathcal{H}}$ is called a fuzzy soft normal operator ($\mathcal{FSN}-\mathbf{operator}$) if $\widetilde{\mathcal{T}}\widetilde{\mathcal{T}}^* = \widetilde{\mathcal{T}}^*\widetilde{\mathcal{T}}$.

Remark 3.2: It is clear every $\mathcal{FS}-\mathbf{self\ adjoint\ operator}$ is $\mathcal{FSN}-\mathbf{operator}$

Theorem 2.3: If $\widetilde{\mathcal{T}}\ \mathbf{and}\ \widetilde{\mathcal{S}}$ are $\mathcal{FSN}-\mathbf{operators}$ on $\mathcal{FSH}-\mathbf{space}$ $\widetilde{\mathcal{H}}$ with the property that either commutes with the fuzzy soft adjoint of the other, then $\widetilde{\mathcal{T}}+\widetilde{\mathcal{S}}$ and $\widetilde{\mathcal{T}}\widetilde{\mathcal{S}}$ are also $\mathcal{FSN}-\mathbf{operator}$.

Proof: since $\tilde{\mathcal{T}}$, $\tilde{\mathcal{S}}$ are $\mathcal{FSN}-\text{operator}$, then
$\tilde{\mathcal{T}}\tilde{\mathcal{T}}^* = \tilde{\mathcal{T}}^*\tilde{\mathcal{T}}$ and $\tilde{\mathcal{S}}\tilde{\mathcal{S}}^* = \tilde{\mathcal{S}}^*\tilde{\mathcal{S}}$ (1)
And given that $\tilde{\mathcal{T}}\tilde{\mathcal{S}}^* = \tilde{\mathcal{S}}^*\tilde{\mathcal{T}}$and $\tilde{\mathcal{S}}\tilde{\mathcal{T}}^* = \tilde{\mathcal{T}}^*\tilde{\mathcal{S}}$ (2)
Now to show that $\tilde{\mathcal{T}}+\tilde{\mathcal{S}}$ is $\mathcal{FSN}-\text{operator}$, we have

$$\begin{aligned}
\left(\tilde{\mathcal{T}}+\tilde{\mathcal{S}}\right)\left(\tilde{\mathcal{T}}+\tilde{\mathcal{S}}\right)^* &= \left(\tilde{\mathcal{T}}+\tilde{\mathcal{S}}\right)\left(\tilde{\mathcal{T}}^*+\tilde{\mathcal{S}}^*\right)\\
&= \tilde{\mathcal{T}}\tilde{\mathcal{T}}^*+\tilde{\mathcal{T}}\tilde{\mathcal{S}}^*+\tilde{\mathcal{S}}\tilde{\mathcal{T}}^*+\tilde{\mathcal{S}}\tilde{\mathcal{S}}^*\\
&= \tilde{\mathcal{T}}^*\tilde{\mathcal{T}}+\tilde{\mathcal{S}}^*\tilde{\mathcal{T}}+\tilde{\mathcal{T}}^*\tilde{\mathcal{S}}+\tilde{\mathcal{S}}^*\tilde{\mathcal{S}} \qquad \text{from(1) and (2)}\\
&= \tilde{\mathcal{T}}^*\left(\tilde{\mathcal{T}}+\tilde{\mathcal{S}}\right)+\tilde{\mathcal{S}}^*\left(\tilde{\mathcal{T}}+\tilde{\mathcal{S}}\right)\\
&= \left(\tilde{\mathcal{T}}^*+\tilde{\mathcal{S}}^*\right)\left(\tilde{\mathcal{T}}+\tilde{\mathcal{S}}\right)\\
&= \left(\tilde{\mathrm{T}}+\tilde{\mathrm{S}}\right)^*\left(\tilde{\mathcal{T}}+\tilde{\mathcal{S}}\right)
\end{aligned}$$

Therefor $\left(\tilde{\mathcal{T}}+\tilde{\mathcal{S}}\right)\left(\tilde{\mathcal{T}}+\tilde{\mathcal{S}}\right)^* = \left(\tilde{\mathcal{T}}+\tilde{\mathcal{S}}\right)^*\left(\tilde{\mathcal{T}}+\tilde{\mathcal{S}}\right)$
And so $\tilde{\mathcal{T}}+\tilde{\mathcal{S}}$ is $\mathcal{FSN}-\text{operator}$
And now to prove $\tilde{\mathcal{T}}\tilde{\mathcal{S}}$ is $\mathcal{FSN}-\text{operator}$ we have

$$\begin{aligned}
\left(\tilde{\mathcal{T}}\tilde{\mathcal{S}}\right)\left(\tilde{\mathcal{T}}\tilde{\mathcal{S}}\right)^* &= \tilde{\mathcal{T}}\tilde{\mathcal{S}}\tilde{\mathcal{S}}^*\tilde{\mathcal{T}}^* = \tilde{\mathcal{T}}\left(\tilde{\mathcal{S}}\tilde{\mathcal{S}}^*\right)\tilde{\mathcal{T}}^*\\
&= \tilde{\mathcal{T}}\left(\tilde{\mathcal{S}}^*\tilde{\mathcal{S}}\right)\tilde{\mathcal{T}}^* \qquad \text{by (1)}\\
&= \left(\tilde{\mathcal{T}}\tilde{\mathcal{S}}^*\right)\left(\tilde{\mathcal{S}}\tilde{\mathcal{T}}^*\right)\\
&= \left(\tilde{\mathcal{S}}^*\tilde{\mathcal{T}}\right)\left(\tilde{\mathcal{T}}^*\tilde{\mathcal{S}}\right) \qquad \text{by (2)}\\
&= \tilde{\mathcal{S}}^*\left(\tilde{\mathcal{T}}\tilde{\mathcal{T}}^*\right)\tilde{\mathcal{S}}\\
&= \tilde{\mathcal{S}}^*\left(\tilde{\mathcal{T}}^*\tilde{\mathcal{T}}\right)\tilde{\mathcal{S}} \qquad \text{by (1)}\\
&= \left(\tilde{\mathcal{S}}^*\tilde{\mathcal{T}}^*\right)\left(\tilde{\mathcal{T}}\tilde{\mathcal{S}}\right) = \left(\tilde{\mathcal{T}}\tilde{\mathcal{S}}\right)^*\left(\tilde{\mathcal{T}}\tilde{\mathcal{S}}\right)
\end{aligned}$$

Therefore $\left(\tilde{\mathcal{T}}\tilde{\mathcal{S}}\right)\left(\tilde{\mathcal{T}}\tilde{\mathcal{S}}\right)^* = \left(\tilde{\mathcal{T}}\tilde{\mathcal{S}}\right)^*\left(\tilde{\mathcal{T}}\tilde{\mathcal{S}}\right)$
Therefor $\tilde{\mathcal{T}}\tilde{\mathcal{S}}$ is $\mathcal{FSN}-\text{operator}$.
Theorem 3.4: An $\mathcal{FS}-\mathbf{operator}$ $\widetilde{\mathcal{T}}$ of $\mathcal{FSH}-\mathbf{space}$ $\widetilde{\mathcal{H}}$ is $\mathcal{FSN}-\mathbf{operator}$ if and only if $\left\|\widetilde{\widetilde{\mathcal{T}}\tilde{\mathbf{x}}_{\boldsymbol{\mu}_{1_{\mathcal{G}(\mathbf{e}_1)}}}}\right\| = \left\|\widetilde{\widetilde{\mathcal{T}}^*\tilde{\mathbf{x}}_{\boldsymbol{\mu}_{1_{\mathcal{G}(\mathbf{e}_1)}}}}\right\|$ for every $\tilde{\mathbf{x}}_{\boldsymbol{\mu}_{1_{\mathbf{G}(\mathbf{e}_1)}}}$.
Proof:
$\tilde{\mathcal{T}}$ is $\mathcal{FSN}-\text{operator} \Leftrightarrow \tilde{\mathcal{T}}\tilde{\mathcal{T}}^* = \tilde{\mathcal{T}}^*\tilde{\mathcal{T}} \Leftrightarrow \tilde{\mathcal{T}}\tilde{\mathcal{T}}^* - \tilde{\mathcal{T}}^*\tilde{\mathcal{T}} = \tilde{0}$

$$\Leftrightarrow \langle \widetilde{\left(\tilde{\mathcal{T}}\tilde{\mathcal{T}}^{*}-\tilde{\mathcal{T}}^{*}\tilde{\mathcal{T}}\right)}\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}},\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}\rangle=\tilde{0}\quad\forall\,\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}$$

$$\Leftrightarrow \langle \widetilde{\tilde{\mathcal{T}}\tilde{\mathcal{T}}^{*}\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}},\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}\rangle=\langle \widetilde{\tilde{\mathcal{T}}^{*}\tilde{\mathcal{T}}\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}},\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}\rangle\quad\forall\,\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}$$

$$\Leftrightarrow \langle \widetilde{\tilde{\mathcal{T}}^{*}\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}},\widetilde{\tilde{\mathcal{T}}^{*}\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}}\rangle=\langle \widetilde{\tilde{\mathcal{T}}\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}},\widetilde{\tilde{\mathcal{T}}^{*}\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}}\rangle\ \forall\,\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}$$

$$\Leftrightarrow \langle \widetilde{\tilde{\mathcal{T}}^{*}\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}},\widetilde{\tilde{\mathcal{T}}^{*}\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}}\rangle=\langle \widetilde{\tilde{\mathcal{T}}\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}},\widetilde{\tilde{\mathcal{T}}\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}}\rangle\ \forall\,\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}$$

$$\Leftrightarrow \left\|\widetilde{\tilde{\mathcal{T}}\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}}\right\|^{2}=\left\|\widetilde{\tilde{\mathcal{T}}^{*}\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}}\right\|^{2},\forall\,\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}$$

$$\Leftrightarrow \left\|\widetilde{\tilde{\mathcal{T}}\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}}\right\|=\left\|\widetilde{\tilde{\mathcal{T}}^{*}\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}}\right\|,\forall\,\tilde{\mathrm{x}}_{\mu_{1_{\mathcal{G}(\mathrm{e}_1)}}}$$

Theorem 3.5: If $\widetilde{\mathcal{T}}=\widetilde{\mathbf{R}}+\tilde{\imath}\widetilde{\mathcal{S}}$ is $\mathcal{FSN}-\mathbf{operator}$ on $\mathcal{FSH}-\mathbf{space}\ \widetilde{\mathcal{H}}$ if and only if its fuzzy soft real and imaginary parts commute.

Proof:
Let $\tilde{\mathrm{R}}$ and $\tilde{\mathcal{S}}$ be the fuzzy soft real and imaginary parts of $\tilde{\mathcal{T}}$, then by theorem (2.20) we get $\tilde{\mathrm{R}}$ and $\tilde{\mathcal{S}}$ are $\mathcal{FS}-$ self adjoint operator and $\tilde{\mathcal{T}}=\tilde{\mathrm{R}}+\tilde{\imath}\tilde{\mathcal{S}}$
We have $\tilde{\mathcal{T}}^{*}=\left(\tilde{\mathrm{R}}+\tilde{\imath}\tilde{\mathcal{S}}\right)^{*}=\tilde{\mathrm{R}}^{*}+\left(\tilde{\imath}\tilde{\mathcal{S}}\right)^{*}=\tilde{\mathrm{R}}^{*}+\bar{\tilde{\imath}}\tilde{\mathcal{S}}^{*}$ by(2.17)
$=\tilde{\mathrm{R}}^{*}-\tilde{\imath}\tilde{\mathcal{S}}^{*}=\tilde{\mathrm{R}}-\tilde{\imath}\tilde{\mathcal{S}}$
Now $\tilde{\mathcal{T}}\tilde{\mathcal{T}}^{*}=\left(\tilde{\mathrm{R}}+\tilde{\imath}\tilde{\mathcal{S}}\right)\left(\tilde{\mathrm{R}}-\tilde{\imath}\tilde{\mathcal{S}}\right)$
$=\tilde{\mathrm{R}}^{2}+\tilde{\mathcal{S}}^{2}+\tilde{\imath}\left(\tilde{\mathcal{S}}\tilde{\mathrm{R}}-\tilde{\mathrm{R}}\tilde{\mathcal{S}}\right)$ ……(3)
And $\tilde{\mathcal{T}}^{*}\tilde{\mathcal{T}}=\left(\tilde{\mathrm{R}}-\tilde{\imath}\tilde{\mathrm{S}}\right)\left(\tilde{\mathrm{R}}+\tilde{\imath}\tilde{\mathrm{S}}\right)$
$=\tilde{\mathrm{R}}^{2}+\tilde{\mathcal{S}}^{2}+\tilde{\imath}\left(\tilde{\mathrm{R}}\tilde{\mathcal{S}}-\tilde{\mathcal{S}}\tilde{\mathrm{R}}\right)$ ……(4)
Since $\tilde{\mathcal{T}}$ is $\mathcal{FS}\mathrm{N}-$operator, i.e. $\tilde{\mathcal{T}}\tilde{\mathcal{T}}^{*}=\tilde{\mathcal{T}}^{*}\tilde{\mathcal{T}}$, then from (3) and (4) we have $\tilde{\mathrm{R}}^{2}+\tilde{\mathcal{S}}^{2}+\tilde{\imath}\left(\tilde{\mathcal{S}}\tilde{\mathrm{R}}-\tilde{\mathrm{R}}\tilde{\mathcal{S}}\right)=\tilde{\mathrm{R}}^{2}+\tilde{\mathcal{S}}^{2}+\tilde{\imath}\left(\tilde{\mathrm{R}}\tilde{\mathcal{S}}-\tilde{\mathcal{S}}\tilde{\mathrm{R}}\right)$
$\Rightarrow\tilde{\mathcal{S}}\tilde{\mathrm{R}}-\tilde{\mathrm{R}}\tilde{\mathcal{S}}=\tilde{\mathrm{R}}\tilde{\mathcal{S}}-\tilde{\mathcal{S}}\tilde{\mathrm{R}}$
$\Rightarrow 2\tilde{\mathcal{S}}\tilde{\mathrm{R}}=2\tilde{\mathrm{R}}\tilde{\mathcal{S}}$
$\Rightarrow\tilde{\mathcal{S}}\tilde{\mathrm{R}}=\tilde{\mathrm{R}}\tilde{\mathcal{S}}\quad\Rightarrow\tilde{\mathrm{R}}$ and $\tilde{\mathcal{S}}$ are commute
Conversely, suppose that $\tilde{\mathrm{R}}$ and $\tilde{\mathcal{S}}$ are commute i.e. $\tilde{\mathcal{S}}\tilde{\mathrm{R}}=\tilde{\mathrm{R}}\tilde{\mathcal{S}}$
Then from (3) and (4) we get
$\tilde{\mathcal{T}}\tilde{\mathcal{T}}^{*}=\tilde{\mathrm{R}}^{2}+\tilde{\mathcal{S}}^{2}$ ……..(5)
$\tilde{\mathcal{T}}^{*}\tilde{\mathcal{T}}=\tilde{\mathrm{R}}^{2}+\tilde{\mathcal{S}}^{2}$ …….(6)
Then from (5) and (6) we see that $\tilde{\mathcal{T}}\tilde{\mathcal{T}}^{*}=\tilde{\mathcal{T}}^{*}\tilde{\mathcal{T}}$
$\Rightarrow\tilde{\mathcal{T}}$ is $\mathcal{FS}\mathrm{N}-$operators .

Theorem 3.6: If $\widetilde{\mathcal{T}}$ is $\mathcal{FSN}-\mathbf{operator}$ on $\mathcal{FSH}-\mathbf{space}\ \widetilde{\mathcal{H}}$ and $\tilde{\alpha}\in\mathbf{C}(\mathbf{A})$, then $\widetilde{\mathcal{T}}-\tilde{\alpha}\tilde{\mathbf{I}}$ is also $\mathcal{FSN}-\mathbf{operator}$.

Proof:
Since $\tilde{\mathcal{T}}$ is $\mathcal{FS}\mathrm{N}-$operator ,therefor $\tilde{\mathcal{T}}\tilde{\mathcal{T}}^{*}=\tilde{\mathcal{T}}^{*}\tilde{\mathcal{T}}$.
Also $\left(\tilde{\mathcal{T}}-\tilde{\alpha}\tilde{\mathrm{I}}\right)^{*}=\tilde{\mathcal{T}}^{*}-(\tilde{\alpha}\tilde{\mathrm{I}})^{*}=\tilde{\mathcal{T}}^{*}-\bar{\tilde{\alpha}}\tilde{\mathrm{I}}^{*}=\tilde{\mathcal{T}}^{*}-\bar{\tilde{\alpha}}\tilde{\mathrm{I}}$
Now $\left(\tilde{\mathcal{T}}-\tilde{\alpha}\tilde{\mathrm{I}}\right)\left(\tilde{\mathcal{T}}-\tilde{\alpha}\tilde{\mathrm{I}}\right)^{*}=\left(\tilde{\mathcal{T}}-\tilde{\alpha}\tilde{\mathrm{I}}\right)\left(\tilde{\mathcal{T}}^{*}-\bar{\tilde{\alpha}}\tilde{\mathrm{I}}\right)$
$=\tilde{\mathcal{T}}\tilde{\mathcal{T}}^{*}-\bar{\tilde{\alpha}}\tilde{\mathcal{T}}-\tilde{\alpha}\tilde{\mathcal{T}}^{*}+|\tilde{\alpha}|^{2}\tilde{\mathrm{I}}$ …….. (7)
Also $\left(\tilde{\mathcal{T}}-\tilde{\alpha}\tilde{\mathrm{I}}\right)^{*}\left(\tilde{\mathcal{T}}-\tilde{\alpha}\tilde{\mathrm{I}}\right)=\left(\tilde{\mathcal{T}}^{*}-\bar{\tilde{\alpha}}\tilde{\mathrm{I}}\right)\left(\tilde{\mathcal{T}}-\tilde{\alpha}\tilde{\mathrm{I}}\right)$
$=\tilde{\mathcal{T}}^{*}\tilde{\mathcal{T}}-\tilde{\alpha}\tilde{\mathcal{T}}^{*}-\bar{\tilde{\alpha}}\tilde{\mathcal{T}}+|\tilde{\alpha}|^{2}\tilde{\mathrm{I}}$ …… (8)
Since $\tilde{\mathcal{T}}\tilde{\mathcal{T}}^{*}=\tilde{\mathcal{T}}^{*}\tilde{\mathcal{T}}$, therefor the right hand sides of (7) and (8) are equal
Hence $\left(\tilde{\mathcal{T}}-\tilde{\alpha}\tilde{\mathrm{I}}\right)\left(\tilde{\mathcal{T}}-\tilde{\alpha}\tilde{\mathrm{I}}\right)^{*}=\left(\tilde{\mathcal{T}}-\tilde{\alpha}\tilde{\mathrm{I}}\right)^{*}\left(\tilde{\mathcal{T}}-\tilde{\alpha}\tilde{\mathrm{I}}\right)$

And so $\tilde{\mathcal{T}} - \tilde{\alpha}\tilde{I}$ is $\mathcal{FS}\mathrm{N} - \text{operator}$

Definition 3.7: A $\boldsymbol{\mathcal{FS} - \text{operator } \tilde{\mathbf{U}}}$ of $\boldsymbol{\mathcal{FSH} - \text{space } \widetilde{\mathcal{H}}}$ is called a fuzzy soft unitary operator ($\boldsymbol{\mathcal{FS}\mathbf{U} - \text{operator}}$) if $\tilde{\mathbf{U}}\tilde{\mathbf{U}}^{*} = \tilde{\mathbf{U}}^{*}\tilde{\mathbf{U}} = \tilde{\mathbf{I}}$.

Example 3.8: Every $\boldsymbol{\mathcal{FS}\mathbf{U} - \text{operator}}$ is $\boldsymbol{\mathcal{FS}\mathbf{N} - \text{operators}}$.

Theorem 3.9: A $\boldsymbol{\mathcal{FS} - \text{operators } \tilde{\mathbf{U}}}$ of $\boldsymbol{\mathcal{FSH} - \text{space } \widetilde{\mathcal{H}}}$,then the following are all equivalent :

(1) $\tilde{\mathcal{T}}^{*}\tilde{\mathcal{T}} = \tilde{I}$
(2) $\langle \tilde{\mathcal{T}}\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}, \widetilde{\tilde{\mathcal{T}}\tilde{y}_{\mu_{2_{\mathcal{G}(e_2)}}}} \rangle = \langle \tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}, \widetilde{\tilde{y}_{\mu_{2_{\mathcal{G}(e_2)}}}} \rangle$,for all$\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}$ and $\tilde{y}_{\mu_{2_{\mathcal{G}(e_2)}}}$
(3) $\left\| \widetilde{\tilde{\mathcal{T}}\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}} \right\| = \left\| \widetilde{\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}} \right\|$,for all $\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}$

Proof:
(1) ⇒ (2) It given that $\tilde{\mathcal{T}}^{*}\tilde{\mathcal{T}} = \tilde{I}$, we have

$$\langle \tilde{\mathcal{T}}\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}, \tilde{\mathcal{T}}\tilde{y}_{\mu_{2_{\mathcal{G}(e_2)}}} \rangle = \langle \tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}, \widetilde{\tilde{\mathcal{T}}^{*}\tilde{\mathcal{T}}}\tilde{y}_{\mu_{2_{\mathcal{G}(e_2)}}} \rangle$$
$$= \langle \tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}, \widetilde{\tilde{I}\tilde{y}_{\mu_{2_{\mathcal{G}(e_2)}}}} \rangle = \langle \tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}, \widetilde{\tilde{y}_{\mu_{2_{\mathcal{G}(e_2)}}}} \rangle$$

Therefor $\langle \tilde{\mathcal{T}}\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}, \widetilde{\tilde{\mathcal{T}}\tilde{y}_{\mu_{2_{\mathcal{G}(e_2)}}}} \rangle = \langle \tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}, \widetilde{\tilde{y}_{\mu_{2_{\mathcal{G}(e_2)}}}} \rangle$
(2) ⇒ (3) it given that $\langle \tilde{\mathcal{T}}\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}, \widetilde{\tilde{\mathcal{T}}\tilde{y}_{\mu_{2_{\mathcal{G}(e_2)}}}} \rangle = \langle \tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}, \widetilde{\tilde{y}_{\mu_{2_{\mathcal{G}(e_2)}}}} \rangle$, for all $\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}$ and $\tilde{y}_{\mu_{2_{\mathcal{G}(e_2)}}}$.
Taking $\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}} = \tilde{y}_{\mu_{2_{\mathcal{G}(e_2)}}}$, we have

$$\langle \tilde{\mathcal{T}}\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}, \widetilde{\tilde{\mathcal{T}}\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}} \rangle = \langle \tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}, \widetilde{\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}} \rangle$$
$$\Rightarrow \left\| \widetilde{\tilde{\mathcal{T}}\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}} \right\|^{2} = \left\| \widetilde{\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}} \right\|^{2}$$
$$\Rightarrow \left\| \widetilde{\tilde{\mathcal{T}}\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}} \right\| = \left\| \widetilde{\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}} \right\|, \text{ for all } \tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}$$

(3) ⇒ (1) it given that $\left\| \widetilde{\tilde{\mathcal{T}}\tilde{x}_{\mu_{1_{\mathrm{G}(e_1)}}}} \right\| = \left\| \widetilde{\tilde{x}_{\mu_{1_{\mathrm{G}(e_1)}}}} \right\|$, for all $\tilde{x}_{\mu_{1_{\mathrm{G}(e_1)}}}$
Therefor $\left\| \widetilde{\tilde{\mathcal{T}}\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}} \right\|^{2} = \left\| \widetilde{\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}} \right\|^{2}$

$$\Rightarrow \langle \tilde{\mathcal{T}}\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}, \widetilde{\tilde{\mathcal{T}}\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}} \rangle = \langle \tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}, \widetilde{\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}} \rangle$$
$$\Rightarrow \langle \tilde{\mathcal{T}}^{*}\tilde{\mathcal{T}}\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}, \widetilde{\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}} \rangle = \langle \tilde{I}\,\tilde{x}_{\mu_{1_{\mathrm{G}(e_1)}}}, \widetilde{\tilde{x}_{\mu_{1_{\mathrm{G}(e_1)}}}} \rangle$$
$$\Rightarrow \langle (\tilde{\mathcal{T}}^{*}\tilde{\mathcal{T}} - \tilde{I})\widetilde{\tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}}, \tilde{x}_{\mu_{1_{\mathrm{G}(e_1)}}} \rangle = \tilde{0} \text{ , for all } \tilde{x}_{\mu_{1_{\mathcal{G}(e_1)}}}$$
$$\Rightarrow \tilde{\mathcal{T}}^{*}\tilde{\mathcal{T}} - \tilde{I} = \tilde{0}. \text{ Therefor } \tilde{\mathcal{T}}^{*}\tilde{\mathcal{T}} = \tilde{I}$$

4. Conclusion

The combination of fuzzy and soft sets gives us original results that are more extended, generalized and precised. Few researchers have studied some of the principles of these general extensions such as fuzzy soft normed spaces, fuzzy soft Hilbert space and fuzzy soft linear operators. In our study, a special type of fuzzy soft linear operators, which is the fuzzy soft normal operator and fuzzy soft unitary operator has been introduced and explored.

Mean Square Analytical Solution for Beta Statistical Function with Second-Order Random Differential Equation

Mean Square Analytical Solution for Beta Statistical Function with Second-Order Random Differential Equation

Abeer Majeed Jasim

Abstract. In this paper, the second-order random differential equation was solved using the new iterative method (NIM). This NIM is based on an integrated equation with the resulting solutions are a series of powers. There are many examples that demonstrate that the method is an effective and accurate technique.

1.Introduction

Most scientific problem biology, engineering and physical phenomena roccur in the form of random differential equations (RDE) [1,2,3]. Recently, several random differential models are by mean square calculus [4,5,6,7,8,9,10,11,12,13,14]. The second-order random differential equations(RDE) are an ordinary differential equations which contain random constant or random variables. We can describe this kind of equations as follows

$$L[\tilde{u}(t)] + N[\tilde{u}(t)] = \tilde{g}(t), \quad (1)$$

$$\tilde{u}(0) = \gamma_0, \quad \left.\frac{d\tilde{u}(t)}{dt}\right|_{t=0} = \gamma_1, \quad (2)$$

where $\tilde{u}(t)$ *is* an unknown function, N [$\tilde{u}$ (*t, D*)] is a nonlinear operator, $\tilde{g}(t)$ is the source in homogeneous term, and D, γ_0 and γ_1 are random variables. The triple trprobabilistic space ($\Omega, \tilde{F}$, $\tilde{P}$) rand $L_2 = L_2(\Omega, \tilde{F}, \tilde{P})$ is the set of second-order random variables. The random variable $\tilde{u}$: $\Omega \to R$, if $E[\tilde{u}^2] < \infty$, where $E[\cdot]$ is an expectation operator. The norm $\|.\|_2$ and random variable $\tilde{u}$ can be defined as follow:

$$\|\tilde{u}\|_2 = (E[\tilde{u}^2])^{1/2}, \quad (3)$$

Now, ifr $(L^2, \|\tilde{u}\|_2)$ is an Banach space, T represent the space of times, and $\tilde{u}(t) \in L_2$ is random variable for each $t \in T$ then, we can that $\{\tilde{u}(t), t \in T\}$. The expansion of the term $\tilde{u}(t)$ as follow:

$$\tilde{u}_N(t) = \sum_{i=0}^{N} \tilde{u}(t) t^i, \quad (4)$$

By using the independence variable D, γ_0 and γ_1 we obtain

$$E[\tilde{u}(t)] = \sum_{i=0}^{N} E[\tilde{u}(i)]\, t^i, \quad (5)$$

$$Var[\tilde{u}(t)] = \sum_{i=0}^{N} \sum_{i=0}^{N} E[\tilde{u}(i), \tilde{u}(j)]\, t^{i+j}, \quad (6)$$

$$cov[\tilde{u}(i), \tilde{u}(j)] = E[\tilde{u}(i), \tilde{u}(j)] - E[\tilde{u}(i)]E[\tilde{u}(j)], \quad (7)$$

The following Lemmas indicate to converge the sequences $\{\tilde{u}_N\}$ $\{E[\tilde{u}_N]\}$,$\{Var[\tilde{u}_N]\}$ as:

Lemma 1.1 [3] A sequence of second- order random variables $\{\tilde{u}_n, n \geq 0\}$ *converges to*r $\{\tilde{u} \in L_2\}$,*if*

$$\lim_{n\to\infty} \|\tilde{u}_n - \tilde{u}\| = \lim_{n\to\infty} (E[\tilde{u}_n - \tilde{u}])^{1/2}, \quad (8)$$

Lemma 1.2 [3] If the sequence of $\tilde{u}_N(t)$ can say be converges to $\tilde{u}(t)$, then

- $E[\tilde{u}_N(t)] \to E[\tilde{u}]$,
- $Var[\tilde{u}_N(t)] \to Var[\tilde{u}(t)]$,

Lemma1.3 [3] If $\tilde{u}_N$ and $\tilde{v}_N$ two sequences of random variables $\tilde{u}$ and $\tilde{v}$, respectively which mean that $\tilde{v}_N = \tilde{v}$ then

1. $\lim_{N\to\infty} [\tilde{u}_N \tilde{v}_N] = [\tilde{u}\tilde{v}]$,
2. $\lim_{N\to\infty} [\tilde{u}_N{}^2] = [\tilde{u}^2],\ if\ \tilde{u} = \tilde{v}$,
3. $\lim_{N\to\infty} E[\tilde{u}_N\ \tilde{v}_N] = E[\tilde{u}\tilde{v}]$,
4. $\lim_{N\to\infty} Var[\tilde{u}_N \tilde{v}_N] = Var[\tilde{u}\tilde{v}]$,

The objective rof this work is to find the meanrsquare solutions for second-order random initial value problems. Also, tables are presented for comparing the exact solution(ES). The comparative study has also been made with the previous results and found to be excellent compatibility. Several numerical examples are implemented to show the efficiency of the NIM.

2. The New Iterative Method

The coefficients of power series of assuming solution are important bases to construct the analytical approximate solution formula. Therefore, they can be computed in a differentiation way. To illustrate the computation for these coefficients and derivation the new algorithm(NIM), we summarize the details of a new analytical method in the following steps:

Step 1: Considering the ordinary differential equation **(**ORE)as follows:

$$\tilde{u}^{(n)}(t) = G(\tilde{u}(t), \tilde{u}'(t), \tilde{u}''(t), \tilde{u}'''(t), .., \tilde{u}^{(n-1)}(t)), \quad (9)$$

Where G is a function of $\tilde{u}$ and its derivatives, $\tilde{u}$ is an unknown function and t denotes spatial independent variable. Integrating Equation (9) n-times with respect to t on $[0, t]$ yield

$$\tilde{u}(t) = \sum_{i=1}^{n} \frac{t^{i-1}}{(i-1)!}\, \tilde{u}(0)^{(i-1)} + L^{-1}K[\tilde{u}(t)], \quad (10)$$

where

$$K[\tilde{u}(t)] = G\left(\tilde{u}(t), \tilde{u}'(t), \tilde{u}''(t), .., \tilde{u}^{(n-1)}(t)\right), L^{-1}(.) = \int_0^t ... \int_0^t (.)(dt)^n, \quad (11)$$

Step 2 : Assume that

$$K[\tilde{u}] = \sum_{n=1}^{\infty} \frac{d^{n-1}K[\tilde{u}_0(t)]}{dt^{n-1}}, \quad (12)$$

the Equation (12) can be rewriting as follows

$$K[\tilde{u}(t)] = K[\tilde{u}_0(t)] + K'[\tilde{u}_0(t)] + K''[\tilde{u}_0(t)] + \cdots, \quad (13)$$

substituting Equation(13) in Equation (10), we obtain

$$\tilde{u}(t) = \tilde{u}_0(t) + \tilde{u}_1(t) + \tilde{u}_2(t) + \cdots, \quad (14)$$

where

$$\tilde{u}_0 = \sum_{i=1}^{\infty} \frac{t^{i-1}}{(i-1)!} \tilde{u}^{(i-1)}(0), \tilde{u}_1 = L^{-1}K[\tilde{u}_0(t)],\ \ \tilde{u}_2 = L^{-1}K'[\tilde{u}_0(t),$$

$$\tilde{u}_4 = L^{-1}K''[\tilde{u}_0(t)],\ \ \tilde{u}_5 = L^{-1}K'''[\tilde{u}_0(t), ..., \quad (15)$$

Step 3 : The derivatives of K with respect to t which is the crucial part of the new algorithm method(NIM). Let start calculating $K[\check{u}(t)]$, $K'[\tilde{u}(t)]$, ...,

$$K[\tilde{u}\ (t] = \left(\tilde{u}(t), \frac{d\tilde{u}(t)}{dt}, \frac{d^2\tilde{u}(t)}{dt^2}, \frac{d^3\tilde{u}(t)}{dt^3}, \ldots, \frac{d^{n-1}\tilde{u}(t)}{dt^{n-1}}\right), \quad (16)$$

$$K'[\tilde{u}(t)] = \sum_{i=1}^{n} K_{\tilde{u}^{(i-1)}}(\tilde{u}_t)^{(i-1)}, \quad (17)$$

$$K''[\tilde{u}(t)] = \sum_{j=1}^{n}\sum_{i=1}^{n} K_{\tilde{u}^{(j-1)}u^{(i-1)}}(\tilde{u}_t)^{(j-1)}(\tilde{u}_t)^{(i-1)} + \sum_{i=1}^{n} K_{\tilde{u}^{(i-1)}}(\tilde{u}_{tt})^{(i-1)}, \quad (18)$$

$$K'''[\tilde{u}(t)] = \sum_{k=1}^{n}\sum_{j=1}^{n}\sum_{i=1}^{n} K_{\tilde{u}^{(k-1)}\tilde{u}^{(j-1)}\tilde{u}^{(i-1)}}(\tilde{u}_t)^{(k-1)}(\tilde{u}_t)^{(j-1)}(\tilde{u}_t)^{(i-1)} + 3.\sum_{j=1}^{n}\sum_{i=1}^{n} K_{\tilde{u}^{(j-1)}\tilde{u}^{(i-1)}}(\tilde{u}_{tt})^{(j-1)}(\tilde{u}_t)^{(i-1)} + \sum_{i=1}^{n} K_{\tilde{u}^{(i-1)}}(\tilde{u}_{ttt})^{(i-1)}, \quad (19)$$

The assumption that the operator K and the solution $\tilde{u}(t)$ are analytic functions(AS), then the mixed derivatives are equivalence. We note that the derivatives function to $\tilde{u}$ unknown, so we suggest the following hypothesis

$$\tilde{u}_t = \tilde{u}_1(t) = L^{-1}K[\tilde{u}_0(t)], \tilde{u}_{tt} = \tilde{u}_2(t) = L^{-1}K'[\tilde{u}_0(t)],$$
$$\tilde{u}_{ttt} = \tilde{u}_3(t) = L^{-1}K''[\tilde{u}_0(t)], \ \tilde{u}_{tttt} = \tilde{u}_4(t) = L^{-1}K'''[\tilde{u}_0(t)], \quad (20)$$

Therefore Equations(16)- (19) are evaluated by

$$K[\tilde{u}_0(t)] = \left(\tilde{u}_0(t), \frac{d\tilde{u}_0(t)}{dt}, \frac{d^2\tilde{u}_0(t)}{dt^2}, \frac{d^3\tilde{u}_0(t)}{dt^3}, \dots, \frac{d^{n-1}\tilde{u}_0(t)}{dt^{n-1}}, \frac{d^n\tilde{u}_0(t)}{dt^n}\right), \quad (21)$$

$$K'[\tilde{u}_0(t)] = \sum_{i=1}^{n} K_{\tilde{u}_0{}^{(i-1)}}(\tilde{u}_1)^{(i-1)}, \quad (22)$$

$$K''[\tilde{u}_0] = \sum_{j=1}^{n}\sum_{i=1}^{n} K_{\tilde{u}_0{}^{(j-1)}\tilde{u}_0{}^{(i-1)}}(\tilde{u}_1)^{(j-1)}(\tilde{u}_1)^{(i-1)} + \sum_{i=1}^{n} K_{\tilde{u}_0{}^{(i-1)}}(\tilde{u}_2)^{(i-1)}, \quad (23)$$

$$K'''[\tilde{u}_0(t)] = \sum_{k=1}^{n}\sum_{j=1}^{n}\sum_{i=1}^{n} K_{\tilde{u}_0{}^{(k-1)}\tilde{u}_0{}^{(j-1)}\tilde{u}_0{}^{(i-1)}}(\tilde{u}_1)^{(k-1)}(\tilde{u}_1)^{(j-1)}(\tilde{u}_1)^{(i-1)} + 3.\sum_{j=1}^{n}\sum_{i=1}^{n} K_{\tilde{u}_0{}^{(j-1)}u_0{}^{(i-1)}}(\tilde{u}_1)^{(j-1)}(\tilde{u}_1)^{(i-1)} + \sum_{i=1}^{n} K_{\tilde{u}_0{}^{(i-1)}}(\tilde{u}_3)^{(i-1)}, \quad (24)$$

Step(4): Substitution of Equations (21)-(24) in Equation (14), the required analytical approximate solution can be gotten for the equation (9).

3 .Test Application

The NIM described in the previous section is implemented for solving the second-order random differential Equation (1) for approximating the expectation $E(\tilde{u}(t))$ and $Var[\tilde{u}(t)]$ be considered from the required information as follows:

3.1.Example

Consider therrandom initialrvalue problem

$$\frac{d^2\tilde{u}(t)}{dt^2} + D^2\tilde{u}(t) = 0, \ \tilde{u}(0) = \gamma_0, \quad \left.\frac{d\tilde{u}(t)}{dt}\right|_{t=0} = \gamma_1, \quad (25)$$

where D^2 is a Beta random variable, $D^2 \sim Be(\tilde{\alpha} = 2, \tilde{\beta} = 1)$, and independently of the initial conditions γ_0, γ_1 which satisfy $E[\gamma_0] = 1, E[\gamma_1] = 1, E[\gamma_0^2] = 2, E[\gamma_1^2] = 3, \ and \ E[\gamma_0\gamma_1] = 0,$
To obtain the expectation $E[\check{u}(t)]$ and the variance $\mathrm{Var}[\check{u}(t)]$, we can construct the following

$$K[\tilde{u}(t)] = -D^2\tilde{u}(t), \quad \tilde{g}(t) = 0, \ L^{-1} = \int_0^t \int_0^t (dt)^2, \tag{26}$$

The solution of the given equation involves the extraction of the components of $\tilde{u}(t)$. So solving the approximate analytical series be as listed

$$\tilde{u}(t) = \tilde{u}_0(t) + \tilde{u}_1(t) + \tilde{u}_2(t) + \cdots, \tag{27}$$

initial conditions are used when the inverse operator L^{-1} is applied on Equation (25) to obtain

$$\tilde{u}_0(t) = \gamma_0 + \gamma_1 t, \tag{28}$$

For the components of $\tilde{u}(t)$, can be easily be found by the following iterative process:

$$\tilde{u}_0(t) = \gamma_0 + \gamma_1 t, \quad \tilde{u}_1(t) = -L^{-1}D^2\tilde{u}_0(t), \tag{29}$$

$$\tilde{u}_1(t) = L^{-1}K[\tilde{u}_0(t)], \qquad \tilde{u}_2(t) = L^{-1}\frac{dK[\tilde{u}_0(t)]}{dt}, \tag{30}$$

$$\tilde{u}_3(t) = L^{-1}\frac{d^2K[\tilde{u}_0(t)]}{dt^2}, \qquad \tilde{u}_4(t) = L^{-1}\frac{d^3K[\tilde{u}_0(t)]}{dt^3}, \tag{31}$$

Now, we start to calculation the derivatives of K with respect to t which consider is the basic part of the iterative method $K'[\tilde{u}(t)], K''[\tilde{u}(t)], K'''[\tilde{u}(t)], ...$

$$K[\tilde{u}(t)] = -D^2\tilde{u}(t), \tag{32}$$

$$\mathrm{K'[\tilde{u}(t)]} = \frac{\mathrm{dK[\tilde{u}(t)]}}{\mathrm{dt}} = \mathrm{K_{\tilde{u}}.\tilde{u}_t}, \tag{33}$$

$$K''[\tilde{u}(t)] = \frac{d^2K[\tilde{u}(t)]}{dt^2} = K_{\tilde{u}\tilde{u}}.(\tilde{u}_t)^2 + \mathrm{K_{\tilde{u}}.\tilde{u}_{tt}}, \tag{34}$$

$$K'''[\tilde{u}(t)] = \frac{d^3K[\tilde{u}(t)]}{dt^3} = K_{\tilde{u}\tilde{u}\tilde{u}}.(\tilde{u}_t)^3 + 3.\mathrm{K_{\tilde{u}\tilde{u}}}.\tilde{u}_t.\tilde{u}_{tt} + \mathrm{K_{\tilde{u}}.\tilde{u}_{ttt}}, \tag{35}$$

we note that the derivatives of $\tilde{u}$ with respect t that are given in (20) can be computed by Equations(32)-(35) as

$$K[\tilde{u}_0(t)] = -D^2\tilde{u}_0(t), \tag{36}$$

$$\mathrm{K'[\tilde{u}_0(t)]} = \frac{\mathrm{dK[\tilde{u}_0(t)]}}{\mathrm{dt}} = \mathrm{K_{\tilde{u}}.\tilde{u}_1}, \tag{37}$$

$$K''[\tilde{u}_0(t)] = \frac{d^2K[\tilde{u}_0(t)]}{dt^2} = K_{\tilde{u}_0\tilde{u}_0}.(\tilde{u}_1)^2 + \mathrm{K_{\tilde{u}_0}.\tilde{u}_2}, \tag{38}$$

$$K'''[\tilde{u}_0(t)] = \frac{d^3K[\tilde{u}_0(t)]}{dt^3} = K_{\tilde{u}_0\tilde{u}_0\tilde{u}_0}.(\tilde{u}_1)^3 + 3.\mathrm{K_{\tilde{u}_0\tilde{u}_0}}.\tilde{u}_1.\tilde{u}_2 + \mathrm{K_{\tilde{u}_0}.\tilde{u}_3} \tag{39}$$

$$\vdots$$

now, we need to extract the first derivatives of K as follows

$$K_{\tilde{u}_0} = -D^2, \quad K_{\tilde{u}_0\tilde{u}_0} = 0, \quad K_{\tilde{u}_0\tilde{u}_0\tilde{u}_0} = 0, ..., \tag{40}$$

After performing the above iterative method, ther components $\tilde{u}(t)$ are obtained as follows:

$$\tilde{u}_0(t) = \gamma_0 + \gamma_1 t, \tag{41}$$

$$\tilde{u}_1(t) = -\frac{1}{2}\gamma_0 D^2 t^2 - \frac{1}{6}\gamma_1 D^2 t^3, \tag{42}$$

$$\tilde{u}_2(t) = \frac{1}{24}\gamma_0 D^4 t^4 + \frac{1}{120}\gamma_1 D^4 t^5, \tag{43}$$

$$\tilde{u}_3(t) = -\frac{1}{750}\gamma_0 D^6 t^6 - \frac{1}{5040}\gamma_1 D^6 t^7, \tag{44}$$

$$\tilde{u}_4(t) = \frac{1}{40320}\gamma_0 D^8 t^8 + \frac{1}{362880}\gamma_1 D^8 t^9, \tag{45}$$

$$\tilde{u}_5(t) = -\frac{1}{3628800}\gamma_0 D^{10}t^{10} - \frac{1}{1239916800}\gamma_1 D^{10}t^{11}, \quad (46)$$

The analytical approximate solution (AAS)is

$$\tilde{u}(t) = \gamma_0 + \gamma_1 t - \frac{1}{2}\gamma_0 D^2 t^2 - \frac{1}{6}\gamma_1 D^2 t^3 + \frac{1}{24}\gamma_0 D^4 t^4 + \frac{1}{120}\gamma_1 D^4 t^5 - \frac{1}{750}\gamma_0 D^6 t^6 - \frac{1}{5040}\gamma_1 D^6 t^7 + \frac{1}{40320}\gamma_0 D^8 t^8 + \frac{1}{3992880}\gamma_1 D^8 t^9 + \cdots, \quad (47)$$

The analytical approximte (AA) mean E[ŭ(t)] and variance Var[ŭ(t)] arer

$$E[\tilde{u}(t)] = E[\gamma_0] + E[\gamma_1]t - \frac{1}{2}E[\gamma_0]D^2t^2 - \frac{1}{6}E[\gamma_1]D^2t^3 + \frac{1}{24}E[\gamma_0]D^4t^4 + \frac{1}{120}E[\gamma_1 D^4t^5 - \frac{1}{750}E[\gamma_0]D^6t^6\mathrm{r} - \frac{1}{5040}E[\gamma_1]D^6t^7 + \frac{1}{40320}E[\gamma_0]D^8t^8 + \frac{1}{3992880}E[\gamma_1]D^8t^9 + \cdots, \quad (48)$$

Sincer $D^2 \sim Be(\tilde{\alpha} = 2, \tilde{\beta} = 1)$ can define the expectation of D as follows:

$$E[D^2] = \frac{\tilde{\alpha}}{\tilde{\alpha}+\tilde{\beta}} = \frac{2}{3}, \quad (49)$$

$$E[D^4] = \frac{\tilde{\alpha}(\tilde{\alpha}+1)}{(\tilde{\alpha}+\tilde{\beta}+1)(\tilde{\alpha}+\tilde{\beta})} = \frac{1}{2}, \quad (50)$$

$$E[D^6] = \frac{\tilde{\alpha}(\tilde{\alpha}+1)(\tilde{\alpha}+2)}{(\tilde{\alpha}+\tilde{\beta})(\tilde{\alpha}+\tilde{\beta}+1)(\tilde{\alpha}+\tilde{\beta}+1)(} = \frac{2}{5} \quad (51)$$

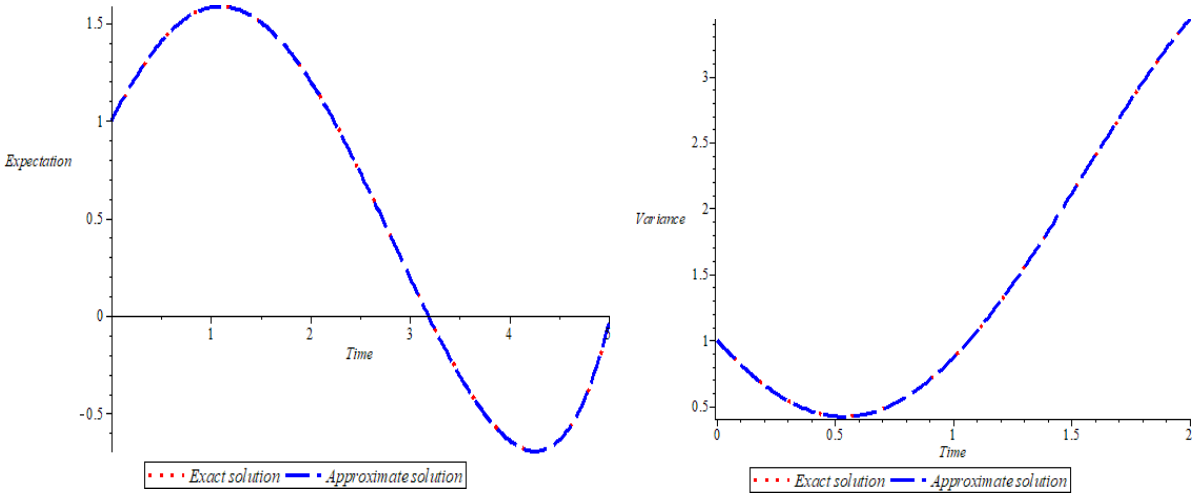
$$E[D^8] = \frac{\tilde{\alpha}(\tilde{\alpha}+1)(\tilde{\alpha}+2)(\tilde{\alpha}+3)}{(\tilde{\alpha}+\tilde{\beta})(\tilde{\alpha}+\tilde{\beta}+1)(\tilde{\alpha}+\tilde{\beta}+2)(\tilde{\alpha}+\tilde{\beta}+3)} = \frac{1}{3} \quad (52)$$

$$E[D^{10}] = \frac{\tilde{\alpha}(\tilde{\alpha}+1)(\tilde{\alpha}+2)(\tilde{\alpha}+3)(\tilde{\alpha}+4)}{(\tilde{\alpha}+\tilde{\beta})(\tilde{\alpha}+\tilde{\beta}+1)(\tilde{\alpha}+\tilde{\beta}+2)(\tilde{\alpha}+\tilde{\beta}+3)(\tilde{\alpha}+\tilde{\beta}+4)} = \frac{1}{3} \quad (53)$$

In addition $E[\gamma_0] = 1, E[\gamma_1] = 1, E[\gamma_0^2] = 2, E[\gamma_1^2] = 3, and\ E[\gamma_0\gamma_1] = 0,$ and $Var[\tilde{u}(t)] = E[\tilde{u}^2(t)] - E[\tilde{u}(t)]^2$, we obtain

$$E[\tilde{u}(t)] = 1 + t - \frac{1}{3}t^2 - \frac{1}{9}t^3 + \frac{1}{48}t^4 + \frac{1}{240}t^5 - \frac{1}{1800}t^6 - \frac{1}{12600}t^7 + \frac{1}{120960}t^8 + \frac{1}{362880}t^{59} + \cdots, \quad (54)$$

$$Var[\tilde{u}(t)] = 1 - 2t + \frac{4}{3}t^2 + \frac{8}{9}t^3 - \frac{19}{72}t^4 - \frac{67}{540}t^5 + \frac{103}{4050}t^6 + \frac{41}{4725}t^7 + \frac{247}{172800}t^8 + \cdots, \quad (55)$$



(a) (b)

Figure 1: (a) The behavior of E[$\tilde{u}$ (t)] and (b) The behavior of Var[$\tilde{u}$ (t)].

3.2.Example

Consider the random initial value problem

$$\frac{d^2\tilde{u}(t)}{dt^2} + D\ t\tilde{u}(t) = 0,\ \tilde{u}(0) = \gamma_0,\quad \left.\frac{d\tilde{u}(t)}{dt}\right|_{t=0} = \gamma_1, \tag{56}$$

where D is a Beta random variable, $D \sim Be(\tilde{\alpha} = 2,\ \tilde{\beta} = 3)$, and independently of the initial conditions γ_0, γ_1 which satisfy $E[\gamma_0] = 1, E[\gamma_1] = 2, E[\gamma_0^2] = 2,\ and\ E[\gamma_1^2] = 5,$

To obtain the expectation $E[\check{u}(t)]$ and the variance Var$[\check{u}(t)]$, we can construct the following

$$K[\tilde{u}(t)] = -D\ t\,\tilde{u}(t),\quad \tilde{g}(t) = 0,\ L^{-1} = \int_0^t \int_0^t (dt)^2, \tag{57}$$

The solution of the given equation involves the extraction of the components of $\tilde{u}(t)$. So solving the approximate analytical series (AAS) be as listed

$$\tilde{u}(t) = \tilde{u}_0(t) + \tilde{u}_1(t) + \tilde{u}_2(t) + \cdots, \tag{58}$$

Initial conditions are used when the inverse operator L^{-1} is applied on Equation (56) rto obtain

$$\tilde{u}_0(t) = \gamma_0 + \gamma_1 t,$$

for the components of $\tilde{u}(t)$, canr be easily be found by the following iterative process:

$$\tilde{u}_0(t) = \gamma_0 + \gamma_1 t, \quad \tilde{u}_1(t) = -L^{-1} D\, t\tilde{u}_0(t), \tag{59}$$

$$\tilde{u}_1(t) = L^{-1}K[\tilde{u}_0(t), \qquad \tilde{u}_2(t) = L^{-1}\frac{dK[\tilde{u}_0(t)]}{dt}, \tag{60}$$

$$\tilde{u}_3(t) = L^{-1}\frac{d^2K[\tilde{u}_0(t)]}{dt^2}, \qquad \tilde{u}_4(t) = L^{-1}\frac{d^3K[\tilde{u}_0(t)]}{dt^3}, \tag{61}$$

Now, we start to calculation the derivatives of *K with respect to t which consider is the basic part of the iterative method* $K'[\tilde{u}(t)], K''[\tilde{u}(t)], K'''[\tilde{u}(t)]$, ...

$$K[\tilde{u}(t)] = -Dt\tilde{u}(t), \tag{62}$$

$$\mathrm{K}'[\tilde{\mathrm{u}}(\mathrm{t})] = \frac{\mathrm{dK}[\tilde{\mathrm{u}}(\mathrm{t})]}{\mathrm{dt}} = \mathrm{K}_{\tilde{\mathrm{u}}}.\tilde{\mathrm{u}}_{\mathrm{t}}, \tag{63}$$

$$K''[\tilde{\mathrm{u}}(\mathrm{t})] = \frac{d^2\mathrm{K}[\tilde{\mathrm{u}}(\mathrm{t})]}{\mathrm{d}t^2} = K_{\tilde{u}\tilde{u}}.(\tilde{\mathrm{u}}_{\mathrm{t}})^2 + \mathrm{K}_{\tilde{\mathrm{u}}}.\tilde{\mathrm{u}}_{\mathrm{tt}}, \tag{64}$$

$$K'''[\tilde{\mathrm{u}}(\mathrm{t})] = \frac{d^3\mathrm{K}[\tilde{\mathrm{u}}(\mathrm{t})]}{\mathrm{d}t^3} = K_{\tilde{u}\tilde{u}\tilde{u}}.(\tilde{\mathrm{u}}_{\mathrm{t}})^3 + 3.\mathrm{K}_{\tilde{\mathrm{u}}\tilde{\mathrm{u}}}.\tilde{u}_t.\tilde{\mathrm{u}}_{\mathrm{tt}} + \mathrm{K}_{\tilde{\mathrm{u}}}.\tilde{\mathrm{u}}_{\mathrm{ttt}}, \tag{65}$$

⋮

we note that the derivatives of $\tilde{u}$ with respect t that are given in (20) can be computed by Equations(62)-(65) as

$$K[\tilde{u}_0(t)] = -D\tilde{u}_0(t), \tag{66}$$

$$\mathrm{K}'[\tilde{u}_0(\mathrm{t})] = \frac{\mathrm{dK}[\tilde{u}_0(\mathrm{t})]}{\mathrm{dt}} = \mathrm{K}_{\tilde{\mathrm{u}}}.\tilde{\mathrm{u}}_1, \tag{67}$$

$$K''[\tilde{u}_0(\mathrm{t})] = \frac{d^2\mathrm{K}[\tilde{u}_0(\mathrm{t})]}{\mathrm{d}t^2} = K_{\tilde{u}_0\tilde{u}_0}.(\tilde{\mathrm{u}}_1)^2 + \mathrm{K}_{\tilde{u}_0}.\tilde{\mathrm{u}}_2, \tag{68}$$

$$K'''[\tilde{u}_0(\mathrm{t})] = \frac{d^3\mathrm{K}[\tilde{u}_0(\mathrm{t})]}{\mathrm{d}t^3} = K_{\tilde{u}_0\tilde{u}_0\tilde{u}_0}.(\tilde{\mathrm{u}}_1)^3 + 3.\mathrm{K}_{\tilde{u}_0\tilde{u}_0}.\tilde{\mathrm{u}}_1.\tilde{\mathrm{u}}_2 + \mathrm{K}_{\tilde{u}_0}.\tilde{\mathrm{u}}_3, \tag{69}$$

⋮

now, we need to extract the first derivatives of K as follows

$$K_{\tilde{u}_0} = -Dt, \quad K_{\tilde{u}_0\tilde{u}_0} = 0, \quad K_{\tilde{u}_0\tilde{u}_0\tilde{u}_0} = 0, ..., \tag{70}$$

After performing the above iterative method, the components $\tilde{u}(t)$ are obtained as follows:

$$\tilde{u}_0(t) = \gamma_0 + \gamma_1 t, \tag{71}$$

$$\tilde{u}_1(t) = -\frac{1}{6}\gamma_0 Dt^3 - \frac{1}{12}\gamma_1 Dt^4, \tag{72}$$

$$\tilde{u}_2(t) = \frac{1}{180}\gamma_0 D^2t^6 + \frac{1}{504}\gamma_1 D^2t^7, \tag{73}$$

$$\tilde{u}_3(t) = -\frac{1}{12960}\gamma_0 D^3t^9 - \frac{1}{45360}\gamma_1 D^3t^{10}, \tag{74}$$

$$\tilde{u}_4(t) = \frac{1}{1710720}\gamma_0 D^4t^{12} + \frac{1}{7076160}\gamma_1 D^4t^{13}, \tag{75}$$

$$\tilde{u}_5(t) = -\frac{1}{359251200}\gamma_0 D^5t^{15} - \frac{1}{1698278400}\gamma_1 D^5t^{16}, \tag{76}$$

⋮

The analytical approximate solution (AAS) is

$$\tilde{u}(t) = \gamma_0 + \gamma_1 t - \frac{1}{2}\gamma_0 D^2t^2 - \frac{1}{6}\gamma_1 D^2t^3 + \mathrm{rr}\frac{1}{24}\gamma_0 D^4t^4 + \frac{1}{120}\gamma_1 D^4t^5 - \frac{1}{750}\gamma_0 D^6t^6 - \frac{1}{5040}\gamma_1 D^6t^7 + \frac{1}{40320}\gamma_0 D^8t^8 + \frac{1}{3992880}\gamma_1 D^8t^9 + \cdots, \tag{77}$$

The analytical approximate mean E[ŭ(t)] and variance Var[ŭ(t)] arer

$$E[\tilde{u}(t)] = E[\gamma_0] + E[\gamma_1]t - \frac{1}{2}E[\gamma_0]D^2t^2 - \frac{1}{6}E[\gamma_1]D^2t^3 + \frac{1}{24}E[\gamma_0]D^4t^4 + \frac{1}{120}E[\gamma_1 D^4t^5 - \frac{1}{750}E[\gamma_0]D^6t^6 - \frac{1}{5040}E[\gamma_1]\,D^6t^7 + \frac{1}{40320}[\gamma_0]D^8t^8 + \frac{1}{3992880\mathrm{r}}E[\gamma_1]D^8t^9 + \cdots, \tag{78}$$

Since $D \sim Be(\tilde{\alpha} = 2, \tilde{\beta} = 3)$ can define the expectation of D as follows:

$$E[D] = \frac{\tilde{\alpha}}{\tilde{\alpha}+\tilde{\beta}} = \frac{2}{5} \quad , \tag{79}$$

$$E[D^2] = \frac{\tilde{\alpha}(\tilde{\alpha}+1)}{(\tilde{\alpha}+\tilde{\beta}+1)(\tilde{\alpha}+\tilde{\beta})} = \frac{1}{5} \quad , \tag{80}$$

$$E[D^3] = \frac{\tilde{\alpha}(\tilde{\alpha}+1)(\tilde{\alpha}+2)}{(\tilde{\alpha}+\tilde{\beta})(\tilde{\alpha}+\tilde{\beta}+1)(\tilde{\alpha}+\tilde{\beta}+1)} = \frac{4}{35} \tag{81}$$

$$E[D^4] = \frac{\tilde{\alpha}(\tilde{\alpha}+1)(\tilde{\alpha}+2)(\tilde{\alpha}+3)}{(\tilde{\alpha}+\tilde{\beta})(\tilde{\alpha}+\tilde{\beta}+1)(\tilde{\alpha}+\tilde{\beta}+2)(\tilde{\alpha}+\tilde{\beta}+3)} = \frac{1}{14} \tag{82}$$

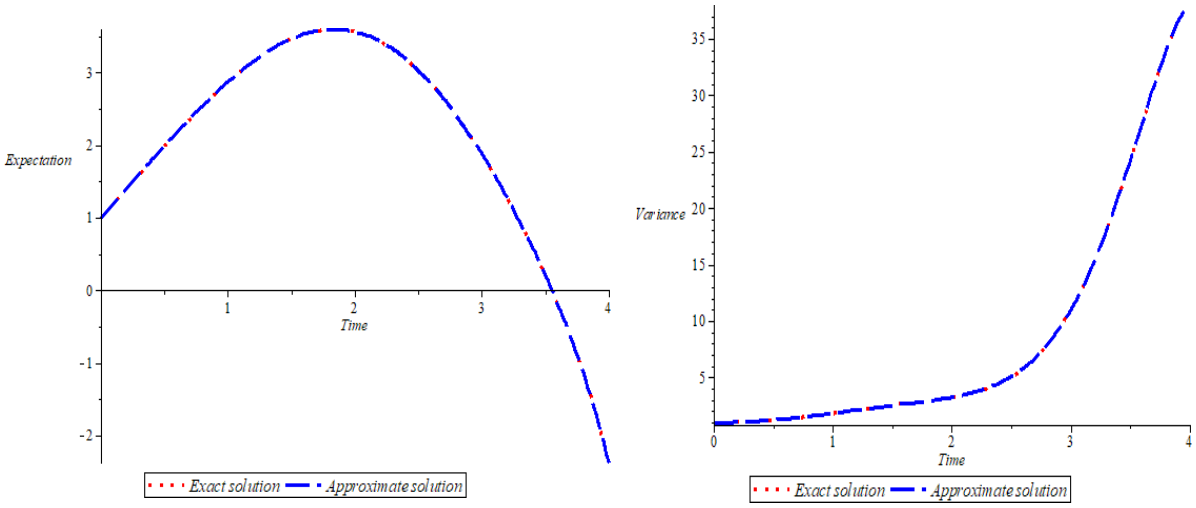
$$E[D^5] = \frac{\tilde{\alpha}(\tilde{\alpha}+1)(\tilde{\alpha}+2)(\tilde{\alpha}+3)(\tilde{\alpha}+4)}{(\tilde{\alpha}+\tilde{\beta})(\tilde{\alpha}+\tilde{\beta}+1)(\tilde{\alpha}+\tilde{\beta}+2)(\tilde{\alpha}+\tilde{\beta}+3)(\tilde{\alpha}+\tilde{\beta}+4)} = \frac{1}{3} \tag{83}$$

Type equation here.

Inraddition $E[\gamma_0] = 1, E[\gamma_1] = 1, E[\gamma_0^2] = 2, E[\gamma_1^2] = 5,$ and $Var[\tilde{u}(t)] = E[\tilde{u}^2(t)] - E[\tilde{u}(t)]^2$, we obtian

$$E[\tilde{u}(t)] = 1 + 2t - \frac{1}{15}t^3 - \frac{1}{15}t^4 + \frac{1}{900}t^6 + \frac{1}{1260}t^7 - \frac{1}{113400}t^9 - \frac{1}{\text{r}198450}t^{10} + \cdots, \tag{84}$$

$$Var[\tilde{u}(t)] = 1 + t^2 + \frac{2}{15}t^3 - \frac{1}{15}t^5 + \frac{2}{225}t^6 + \frac{1}{450}t^7 + \frac{83}{25200}t^8 - \text{r}\frac{83}{283500}t^8 - \cdots, \tag{85}$$



(a) (b)

3.3.Example
Consider the random initial value problem

$$\frac{d^2\tilde{u}(t)}{dt^2} + 2D\frac{d\tilde{u}(t)}{dt} + D^2\tilde{u}(t) = 0,\ \tilde{u}(0) = \gamma_0,\quad \left.\frac{d\tilde{u}(t)}{dt}\right|_{t=0} = \gamma_1, \tag{86}$$

where D is a Beta random variable, $D \sim Be(\tilde{\alpha}= 2,\ \tilde{\beta} = 1)$, and independently of the initial coditions γ_0, γ_1 whichrsatisfy $E[\gamma_0] = 1, E[\gamma_1] = 1, E[\gamma_0^2] = 2,\ and\ E[\gamma_1^2] = 1,$

To obtain the expectation $E[\check{u}(t)]$ and the variance $Var[\check{u}(t)]$, we can construct the following

$$K[\tilde{u}(t)] = -2D\frac{d\tilde{u}(t)}{dt} - D^2\tilde{u}(t),\quad \tilde{g}(t) = 0,\ L^{-1} = \int_0^t\int_0^t (dt)^2, \tag{87}$$

The solution of the given equationin volves the extraction of the components of $\tilde{u}(t)$. So solving the approximate analytical series (AAS) be as listed

$$\tilde{u}(t) = \tilde{u}_0(t) + \tilde{u}_1(t) + \tilde{u}_2(t) + \cdots, \tag{88}$$

initial conditions are use the inverse operator L^{-1} is applied on Equation (86) to obtain

$$\tilde{u}_0(t) = \gamma_0 + \gamma_1 t, \tag{89}$$

for the components of $\tilde{u}(t)$, can be easily be found by the following iterative process:

$$\tilde{u}_0(t) = \gamma_0 + \gamma_1 t,\quad \tilde{u}_1(t) = -L^{-1}D\frac{d\tilde{u}_0(t)}{dt} - L^{-1}D^2\tilde{u}_0(t), \tag{90}$$

$$\tilde{u}_1(t) = L^{-1}K[\tilde{u}_0(t)],\qquad \tilde{u}_2(t) = L^{-1}\frac{dK[\tilde{u}_0(t)]}{dt}, \tag{91}$$

$$\tilde{u}_3(t) = L^{-1}\frac{d^2K[\tilde{u}_0(t)]}{dt^2},\qquad \tilde{u}_4(t) = L^{-1}\frac{d^3K[\tilde{u}_0(t)]}{dt^3}, \ldots, \tag{92}$$

Now, we start to calculationr the derivatives of K with respect to t which consider is the basic part of the iterative method(NIM) $K'[\tilde{u}(t)], K''[\tilde{u}(t)], K'''[\tilde{u}(t)]$, ...

$$K[\tilde{u}(t)] = -D\tilde{u}'^{(t)} - D^2\tilde{u}(t), \tag{93}$$

$$K'[\tilde{u}\ (t)] = \sum_{i=1}^{2} K_{\tilde{u}^{(i-1)}}(\tilde{u}_t)^{(i-1)}, \tag{94}$$

$$K''[\tilde{u}\ (t)] = \sum_{j=1}^{2}\sum_{i=1}^{2} K_{\tilde{u}^{(j-1)}u^{(i-1)}}\ (\tilde{u}_t)^{(j-1)}(\tilde{u}_t)^{(i-1)} + \sum_{i=1}^{2} K_{\tilde{u}^{(i-1)}}(\tilde{u}_{tt})^{(i-1)}, \tag{95}$$

$$K[\tilde{u}\ (t)] = \sum_{k=1}^{2}\sum_{j=1}^{2}\sum_{i=1}^{2} K_{\tilde{u}^{(k-1)}\tilde{u}^{(j-1)}\tilde{u}^{(i-1)}}\ (\tilde{u}_t)^{(k-1)}(\tilde{u}_t)^{(j-1)}(\tilde{u}_t)^{(i-1)} + 3.\sum_{j=1}^{2}(\tilde{u}_{tt})^{(j-1)}(\tilde{u}_t)^{(i-1)} + \sum_{i=1}^{2} K_{\tilde{u}^{(i-1)}}(\tilde{u}_{ttt})^{(i-1)}, \tag{96}$$

$$\vdots$$

we note that the derivatives of $K[\tilde{u}(t)]$ *w*ith respect *t* that are given in (20), can be computed by Equations(93)-(96) as

$$K[\tilde{u}_0(t)] = -D\tilde{u}_0 - D^2\tilde{u}_0(t), \quad (97)$$

$$K'[\tilde{u}_0(t)] = \sum_{i=1}^{2} K_{\tilde{u}_0{}^{(i-1)}}(\tilde{u}_1)^{(i-1)}, \quad (98)$$

$$K''[\tilde{u}_0(t)] = \sum_{j=1}^{2}\sum_{i=1}^{2} K_{\tilde{f}_0{}^{(j-1)}\tilde{f}_0{}^{(i-1)}}\left(\tilde{f}_1\right)^{(j-1)}\left(\tilde{f}_1\right)^{(i-1)} + \sum_{i=1}^{2} K_{\tilde{f}_0{}^{(i-1)}}(\tilde{f}_2)^{(i-1)}, \quad (99)$$

$$K'''[\tilde{u}_0(t)] = \sum_{k=1}^{2}\sum_{j=1}^{2}\sum_{i=1}^{2} K_{\tilde{f}_0{}^{(k-1)}\tilde{f}_0{}^{(j-1)}\tilde{f}_0{}^{(i-1)}}(\tilde{f}_1)^{(k-1)}\left(\tilde{f}_1\right)^{(j-1)}\left(\tilde{f}_1\right)^{(i-1)}$$

s

$$+3.\sum_{j=1}^{2}\sum_{i=1}^{2} K_{\tilde{f}_0{}^{(j-1)}\tilde{f}_0{}^{(i-1)}}(\tilde{f}_2)^{(j-1)}(\tilde{f}_1)^{(i-1)} + \sum_{\mathrm{i}=1}^{2} \mathrm{K}_{\tilde{\mathrm{f}}_0{}^{(\mathrm{i}-1)}}(\tilde{\mathrm{f}}_3)^{(\mathrm{i}-1)}, \quad (100)$$

now, we need to extract the first derivatives of K as follows

$$K_{\tilde{u}_0} = -D^2, \quad K_{\tilde{u}_0\tilde{u}_0} = 0, \quad K_{\tilde{u}_0\tilde{u}_0\tilde{u}_0} = 0, \ldots,$$
$$K_{\tilde{u}_0'} = -2D, \quad K_{\tilde{u}_0'\tilde{u}_0'} = 0, \quad K_{\tilde{u}_0'\tilde{u}_0'\tilde{u}_0'} = 0, \ldots, \quad (101)$$

After performing the above iterative method (NIM), the components $\tilde{u}(t)$ are obtained as follows:

$$\tilde{u}_0(t) = \gamma_0 + \gamma_1 t, \quad (102)$$
$$\tilde{u}_1(t) = -D\gamma_1 t^2 - \tfrac{1}{2}\gamma_0 D^2 t^3 - \tfrac{1}{6}\gamma_1 D^2 t^4, \quad (103)$$
$$\tilde{u}_2(t) = \tfrac{1}{3}\gamma_0 D^3 t^3 + \tfrac{2}{3}\gamma_1 D^2 t^3 + \tfrac{1}{24}\gamma_0 D^4 t^4 + \tfrac{1}{6}\gamma_1 D^3 t^4 + \tfrac{1}{120}\gamma_1 D^4 t^5, \quad (104)$$
$$\tilde{u}_3(t) = -\tfrac{1}{3}\gamma_1 D^3 t^3 - \tfrac{1}{6}\gamma_0 D^4 t^4 - \tfrac{1}{30}\gamma_0 D^4 t^4 - \tfrac{1}{10}\gamma_1 D^4 t^5 - \tfrac{1}{720}\gamma_0 D^6 t^6 - \tfrac{1}{120}\gamma_1 D^5 t^6 - \tfrac{1}{5040}\gamma_1 D^6 t^7, \quad (105)$$
$$\vdots$$

The analytical approximate solution (AAS) is

$$\tilde{u}(t) = \gamma_0 + \gamma_1 t - D\gamma_1 t^2 - \frac{1}{2}\gamma_0 D^2 t^3 - \frac{1}{6}\gamma_1 D^2 t^4 + \frac{1}{3}\gamma_0 D^3 t^3 + \frac{2}{3}\gamma_1 D^2 t^3 + \tfrac{1}{24}\gamma_0 D^4 t^4 + \tfrac{1}{6}\gamma_1 D^3 t^4 + \tfrac{1}{120}\gamma_1 D^4 t^5 - \tfrac{1}{3}\gamma_1 D^3 t^3 - \tfrac{1}{6}\gamma_0 D^4 t^4 + \cdots, \quad (106)$$

The analytical approximate (AA) mean $E[\check{u}(t)]$ and variance Var[ŭ(t)] are

$$E[\tilde{u}(t)] = E[\gamma_0] + E[\gamma_1]t - [D]E[\gamma_1]t^2 - \frac{1}{2}E[\gamma_0]E[D^2]t^3 - \frac{1}{6}E[\gamma_1]E[D^2]t^4 + \tfrac{1}{3}E[\gamma_0]E[D^3]t^3 + \tfrac{2}{3}E[\gamma_1]E[D^2]t^3 + \tfrac{1}{24}E[\gamma_0]E\left[D^4\right]t^4 + \tfrac{1}{6}E[\gamma_1]E[D^3]t^4 + \tfrac{1}{120}E[\gamma_1 E[D^4]t^5 - \tfrac{1}{3}E[\gamma_1]E[D^3]t^3 - \tfrac{1}{6}E[\gamma_0]E[D^4]t^4 + \cdots,$$

Since $D \sim Be(\tilde{\alpha} = 2, \tilde{\beta} = 1)$ can define the expectation of D as follows:

$$E[D] = \frac{\tilde{\alpha}}{\tilde{\alpha}+\tilde{\beta}} = \frac{2}{3}, \quad (107)$$
$$E[D^2] = \frac{\tilde{\alpha}(\tilde{\alpha}+1)}{(\tilde{\alpha}+\tilde{\beta}+1)(\tilde{\alpha}+\tilde{\beta})} = \frac{1}{2}, \quad (108)$$
$$E[D^3] = \frac{\tilde{\alpha}(\tilde{\alpha}+1)(\tilde{\alpha}+2)}{(\tilde{\alpha}+\tilde{\beta})(\tilde{\alpha}+\tilde{\beta}+1)(\tilde{\alpha}+\tilde{\beta}+1)} = \frac{2}{5} \quad (109)$$
$$E[D^4] = \frac{\tilde{\alpha}(\tilde{\alpha}+1)(\tilde{\alpha}+2)(\tilde{\alpha}+3)}{(\tilde{\alpha}+\tilde{\beta})(\tilde{\alpha}+\tilde{\beta}+1)(\tilde{\alpha}+\tilde{\beta}+2)(\tilde{\alpha}+\tilde{\beta}+3)} = \frac{1}{3} \quad (110)$$
$$E[D^5] = \frac{\tilde{\alpha}(\tilde{\alpha}+1)(\tilde{\alpha}+2)(\tilde{\alpha}+3)(\tilde{\alpha}+4)}{(\tilde{\alpha}+\tilde{\beta})(\tilde{\alpha}+\tilde{\beta}+1)(\tilde{\alpha}+\tilde{\beta}+2)(\tilde{\alpha}+\tilde{\beta}+3)(\tilde{\alpha}+\tilde{\beta}+4)} = \frac{2}{7} \quad (111)$$
$$\vdots$$

In addition $E[\gamma_0] = 1, E[\gamma_1] = 1, E[\gamma_0^2] = 2, E[\gamma_1^2] = 1,$ and $Var[\tilde{u}(t)] = E[\tilde{u}^2(t)] - E[\tilde{u}(t)]^2,$

we obtain

$$E[\tilde{u}(t)] = 1 + t - \frac{11}{12}t^2 + \frac{23}{60}t^3 - \frac{13}{120}t^4 + \frac{59}{2520}t^5 - \frac{83}{20160}t^6 + \frac{37}{60480}t^7 - \frac{143}{1814400}t^8 + \cdots, \quad (112)$$

$$Var[\tilde{u}(t)] = 1 - \frac{1}{2}t^2 + \frac{4}{15}t^3 + \frac{103}{720}t^4 - \frac{649}{2520}t^5 + \frac{8959}{50400}t^6 - \frac{3133}{37800}t^7 + \frac{517}{17280}t^8 - \frac{5923}{665280}t^9 + \cdots, \quad (113)$$

4.Conclusion

In this article, NIM is employed to computerthe expectation approximation $E[\tilde{u}(t)]$ and variance approximation Var[$\tilde{u}(t)$] of second- order random differential equation(SORDE).The results rpresent which obtains from the proposed method represents graphs that can be seen clearly in Figure 1-3. These

figures show that the solutions we obtained are compatible with the exactr solution. Finally, ther NIM is avery effective and powerful tool for the second-order random differential equation.

Stress-Strength Reliability for $P(T < X < Z)$ using Dagum Distribution

Stress-Strength Reliability for $P(T < X < Z)$ using Dagum Distribution

Department of Mathematics, College of Education ,Mustansiriyah University, Baghdad, Iraq

E-mail: alimutair43@gmail.com

Abstract. In this paper, the reliability formula of the stress-strength model is derived for probability P(T<X<Z) of a component having strength X falling between two stresses T and Z, that these stresses and strength variables have Dagum distribution with unknown shape parameters and known common scale parameters. Three methods for estimating the Dagum parameters are discussed which are the Maximum Likelihood, Regression method and Method of Moment, and the comparison between these estimation method based on a simulation study by the mean square error criteria for each of the small, medium and large samples. The most important conclusion is that this comparison confirms that the performance of the maximum likelihood estimator works better for most of the experiments studied.

1. Introduction

In the reliability studies the stress-strength model describes the life of a component which has a random strength X and is subjected to random stress Y. This idea arises in the classical stress-strength reliability, where the person is interested in estimating the probability $P(X < Y)$ that can be interpreted as the probability of failure of the component, when the applied stress Y is greater than its strength X [5]. An important case is the estimation of $R = P(T < X < Z)$ which represents the situation where the strength X should not only be greater than stress T but also be smaller than stress Z. For example, there are many devices that do not work when the temperatures are high or when they are low. Similarly, person's blood pressure should lie within two limits, systolic and diastolic [6]. The stress-strength model of $P(T < X < Z)$ have wide applications in various subareas of engineering, psychology, genetics, clinical trials and so on [9]. Singh (1980) presented the minimum variance unbiased (MVU), Maximum Likelihood and empirical estimator of $R = P(T < X < Z)$, where T,Z and X are mutually independent random variables and follows the normal distribution [11]. Dutta and Sriwastav (1986) deal with the estimation of R when T,Z and X are exponential random variables [3]. In 1988, Ivshin investigated the MLE and UMVUE of R when T,Z and X either uniform or exponential random variable with the unknown location parameter [7]. In 2013, Hassan et al. focused on the estimate of $R = P(T < X < Z)$, where T and Z be a random stress and X be a random strength have weibull distribution in presence of k outlies [6]. In 2019, Salman et al. focused on the estimate of $R = P(T < X < Z)$, when T,Z and X are independent and that these stress and strength variables have Inverted Kumaraswamy distribution [5].

Dagum distribution was introduced by Dagum in (1977). This distribution was widely used in various fields such as, income and wealth data, meteorological data, reliability and survival analysis. The Dagum distribution (Dag) is also called the inverse Burr XII distribution [2],[4].

For any random variable X that follows Dagum distribution the cumulative density function (cdf) is given by:[2]

$$F(x) = \left(1 + \lambda x^{-\delta}\right)^{-\beta} \quad ; x > 0; \beta, \lambda, \delta > 0 \tag{1}$$

and the probability density function (pdf) :

$$\mathrm{f}(x) = \beta\lambda\delta x^{-\delta-1}\left(1 + \lambda x^{-\delta}\right)^{-\beta-1} \quad ; x > 0; \beta, \lambda, \delta > 0 \tag{2}$$

where λ is the scale parameter and the shape parameters are β, δ.

Since $\mathrm{f}(x)$ is probability densty function, then we can rewrite equation (2) as:

$$\int_0^\infty \lambda\delta x^{-\delta-1}\left(1 + \lambda x^{-\delta}\right)^{-\beta-1} dx = \frac{1}{\beta} \tag{3}$$

The main aim of this paper is to obtain a mathematical formula for the reliability R of the probability that a component's strength is between two stresses based on Dagum distribution in section 2. In order to find the estimators of the shape parameters $(\beta, \beta_1, \beta_2)$ for the three random variables, three different estimation methods (Maximum Likelihood, Regression Method and Moment Method) are used and then the reliability parameter is estimated in section 3. A simulation study was conducted to compare the performance of the three different estimators of the reliability in section 4, based on twelve experiments of shape parameter values and at different sample sizes of (15) for small, (30) for medium and (90) for large sample sizes. The comparison is made by the Mean Square Error (MSE), and the conclusions are discussed in section 5.■

2.Reliability Formulation

The reliability formula of the stress-strength model that the probability of a component strength falling in between two stresses, is given by:[1]

$$\begin{aligned} R &= P(T < X < Z) \\ &= \int_0^\infty P(T < x, Z > x / X = x) dF_x(x) \\ &= \int_0^\infty H_T(x)\left(1 - G_Z(x)\right)\mathrm{f(x)dx} \\ &= \int_0^\infty H_T(x)\mathrm{f(x)}dx - \int_0^\infty H_T(x)G_Z(x)\mathrm{f(x)}dx \end{aligned} \tag{4}$$

Let T and Z be independent random stress variables with distribution functions $H_T(t)$, $G_Z(z)$ following $\mathrm{Dag}(\beta_1, \lambda, \delta)$ and $\mathrm{Dag}(\beta_2, \lambda, \delta)$ respectively. And let X be a random strength variable, assumed that X independent from T and Z following $\mathrm{Dag}(\beta, \lambda, \delta)$ with (cdf) $F_x(x)$, then:

$$H_T(t) = \left(1 + \lambda t^{-\delta}\right)^{-\beta_1} \quad t > 0; \beta_1, \lambda, \delta > 0 \tag{5}$$

$$G_Z(z) = \left(1 + \lambda z^{-\delta}\right)^{-\beta_2} \quad z > 0; \beta_2, \lambda, \delta > 0 \tag{6}$$

Also $\mathrm{f}(x) = \beta\lambda\delta x^{-\delta-1}\left(1 + \lambda x^{-\delta}\right)^{-\beta-1} \quad x > 0; \beta, \lambda, \delta > 0$

Now, from equation (4):

$$\begin{aligned} R = {} & \int_0^\infty \left(1 + \lambda x^{-\delta}\right)^{-\beta_1} \beta\lambda\delta x^{-\delta-1}\left(1 + \lambda x^{-\delta}\right)^{-\beta-1} dx \\ & - \int_0^\infty \left(1 + \lambda x^{-\delta}\right)^{-\beta_1}\left(1 + \lambda x^{-\delta}\right)^{-\beta_2} \beta\lambda\delta x^{-\delta-1}\left(1 + \lambda x^{-\delta}\right)^{-\beta-1} dx \\ R = {} & \beta\int_0^\infty \lambda\delta x^{-\delta-1}\left(1 + \lambda x^{-\delta}\right)^{-(\beta+\beta_1)-1} dx - \beta\int_0^\infty \lambda\delta x^{-\delta-1}\left(1 + \lambda x^{-\delta}\right)^{-(\beta+\beta_1+\beta_2)-1} dx \end{aligned}$$

Similarly, from equation (3) we can get:

$$R = \frac{\beta}{\beta+\beta_1} - \frac{\beta}{\beta+\beta_1+\beta_2} = \frac{\beta\beta_2}{(\beta+\beta_1)(\beta+\beta_1+\beta_2)} \quad (7)$$

The behavior of reliability is illustrated in the following figures with different values of the three distribution shape parameters. The reliability behavior is illustrated in the following figures with different values of the three shape parameters of the distribution. The purpose of explaining this behavior is to know how much confidence we have in the component to work under certain conditions and to continue doing this work according to the special terms of the model.

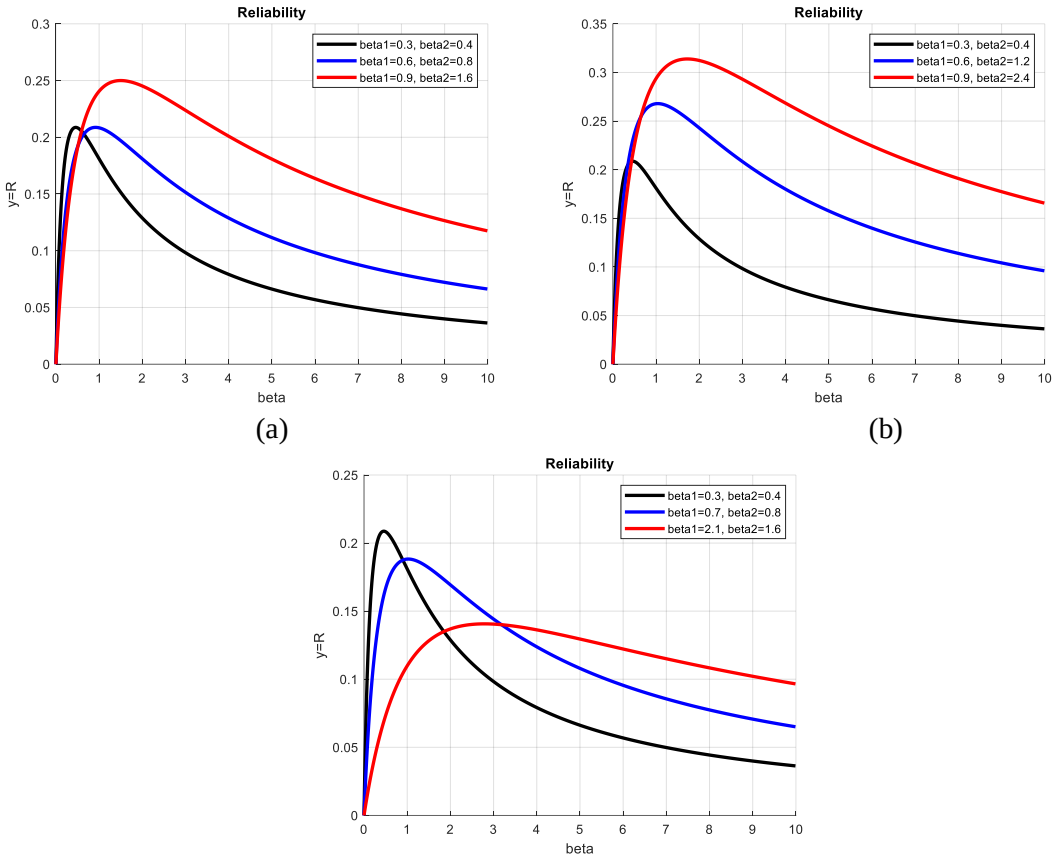

Figure 1 : The Reliability curve against parameter β

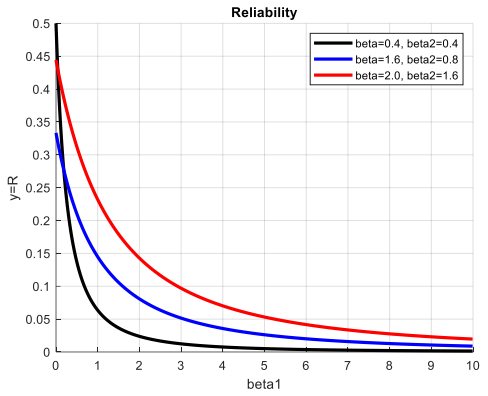
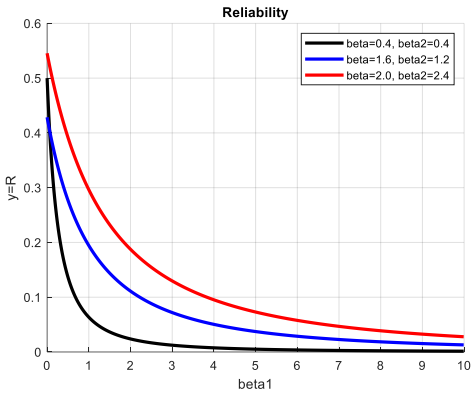
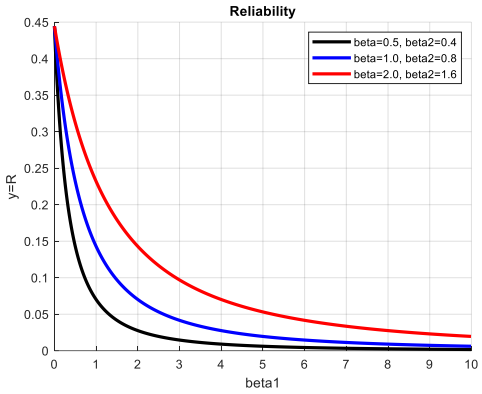
Figure (1-a,b,c) shows the change of reliability curve by the effect of different values of the strength parameter β as a function of the parameters $(\beta, \beta_1, \beta_2)$, in three different cases for the values of the two parameters β_1, β_2, where reliability value increasing with the increasing in the value of the strength shape parameter β, then it gradually decreases.



(a)



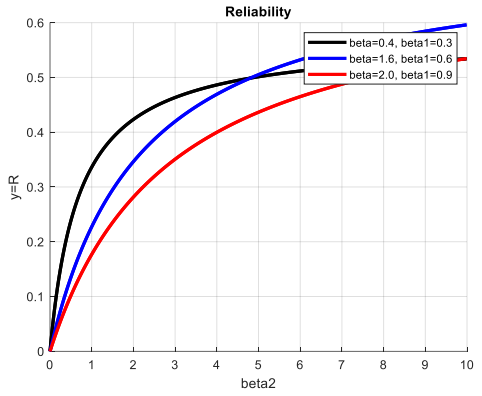
(b)



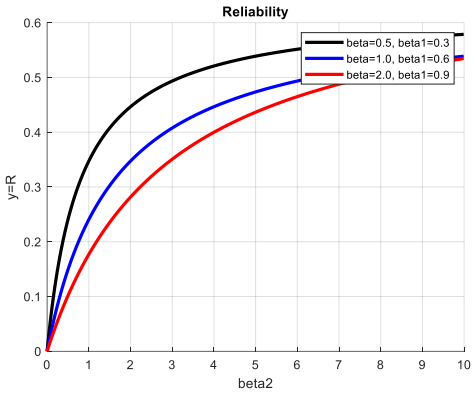
(c)

Figure 2 : The Reliability curve against parameter β_1

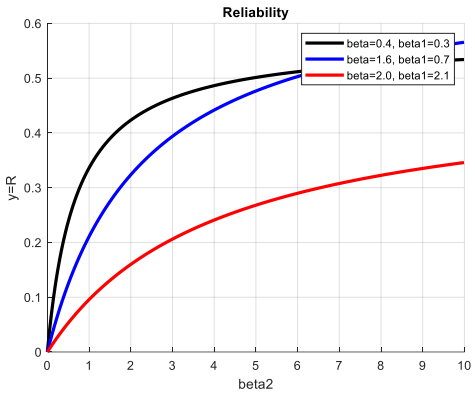
Figure (2-a,b,c) shows the effect of the stress parameter value β_1 on the change of the reliability curve as a function of the parameters $(\beta, \beta_1, \beta_2)$, in three different cases for the values of the two parameters β, β_2, where reliability value decreasing and its decrease is steep with increasing value of stress shape parameter β_1.



(a)



(b)



(c)

Figure 3 : The Reliability curve against parameter β_2

Figure (3-a,b,c) shows the effect of the stress parameter value β_2 on the change of the reliability curve as a function of the parameters $(\beta, \beta_1, \beta_2)$, in three different cases for the values of the two parameters β, β_1, where reliability value increasing with increasing value of stress shape parameter β_2 , but it reaches a certain point and then begins to decrease.

3.Estimation Method:

In this section three different estimation methods are used to find the estimator of the Dagum unknown shape parameter; β, β_1, β_2 and the Reliability; R of the stress-strength model. These methods are Maximum Likelihood, Regression Method and Method of Moment. These methods are used to arrive at the best reliability estimate.

3.1. Maximum likelihood estimator (ML)

The maximum likelihood method is the most widely used method for parameter estimation. There is no doubt that the success of the method stems from many desirable characteristics including consistency, asymptotic, efficiency, invariance and simply its intuitive appeal [2]. Let $x_1, x_2, \dots, x_n$ be a random strength sample of size (n) from $Dag(\beta, \lambda, \delta)$ where β is unknown parameter and λ, δ are known. Then the ML function is given by :[4]

$$L(x_1, x_2, \dots, x_n; \beta, \lambda, \delta) = (\beta\lambda\delta)^n \prod_{i=1}^{n} x_i^{-\delta-1} \left(1 + \lambda x_i^{-\delta}\right)^{-\beta-1} \quad (8)$$

Then the natural logarithm function for equation (8) can be written as:

$$\begin{aligned} \ln L &= n\ln(\beta\lambda\delta) - (\delta+1)\sum_{i=1}^{n}\ln(x_i) - (\beta+1)\sum_{i=1}^{n}\ln(1+\lambda x_i^{-\delta}) \\ &= n\ln\beta + n\ln\lambda + n\ln\delta - \delta\sum_{i=1}^{n}\ln(x_i) - \sum_{i=1}^{n}\ln(x_i) \\ &\quad -\beta\sum_{i=1}^{n}\ln\left(1+\lambda x_i^{-\delta}\right) - \sum_{i=1}^{n}\ln\left(1+\lambda x_i^{-\delta}\right) \end{aligned} \quad (9)$$

By differentiate (9) with respect to the unknown parameter β and equating the result to zero, we obtain:

$$\frac{\partial \ln L}{\partial \beta} = \frac{n}{\beta} - \sum_{i=1}^{n}\ln\left(1+\lambda x_i^{-\delta}\right)$$
$$\frac{n}{\hat{\beta}} - \sum_{i=1}^{n}\ln\left(1+\lambda x_i^{-\delta}\right) = 0$$
$$\frac{n}{\hat{\beta}} = \sum_{i=1}^{n}\ln\left(1+\lambda x_i^{-\delta}\right)$$

$$\hat{\beta}_{ML} = \frac{n}{\sum_{i=1}^{n} \ln(1+\lambda x_i^{-\delta})} \quad (10)$$

In the same way , let $t_1, t_2, \dots, t_m$ and $z_1, z_2, \dots, z_m$ be a stress random samples of size (m) from $Dag(\beta_1, \lambda, \delta)$ and $Dag(\beta_2, \lambda, \delta)$, respectively and the ML estimator of the unknown parameters β_1, β_2 are :[4]

$$\hat{\beta}_{1ML} = \frac{m}{\sum_{j=1}^{m} \ln\left(1+\lambda t_j^{-\delta}\right)} \quad (11)$$

$$\hat{\beta}_{2ML} = \frac{m}{\sum_{k=1}^{m} \ln(1+\lambda z_k^{-\delta})} \quad (12)$$

By substituting (10), (11) and (12) in equation (7), we can obtain the ML reliability estimator based on invariance property as:

$$\hat{R}_{ML} = \frac{\hat{\beta}_{2ML}\hat{\beta}_{ML}}{(\hat{\beta}_{1ML}+\hat{\beta}_{ML})(\hat{\beta}_{1ML}+\hat{\beta}_{2ML}+\hat{\beta}_{ML})}$$

3.2. Regression Method (Rg)

Linear Regression is one of the important procedures that use auxiliary information to construct estimators with good efficiency. The standard regression equation [8]:

$$z_i = a + bu_i + e_i \quad (13)$$

Where z_i is dependent variable, u_i is independent variable and e_i is the error term and represent identically distributed random variable and a,b are called regression coefficients where a is the intercept and b is the slop [10].

Let $x_1, x_2, \dots, x_n$ be a random strength sample of size (n) from $Dag(\beta, \lambda, \delta)$. Then the Rg estimators of the unknown parameter β, can be obtained by taking the natural logarithm to equation (1):

$$\ln\left(F(x_i)\right) = -\beta \ln\left(1 + \lambda x_i^{-\delta}\right) \quad (14)$$

Substituted plotting position P_i instead of $F(x_i)$ in equation (14), we get:

$$\ln(P_i) = -\beta \ln\left(1 + \lambda x_i^{-\delta}\right) \quad (15)$$

Where $P_i = \frac{i}{n+1}$, $i = 1,2, \dots, n$

By the comparison between equation (15) and equation (13), we can get:

$$z_i = \ln(P_i)\,,\ a = 0\,,\ b = \beta\,,\ u_i = -\ln\left(1 + \lambda x_i^{-\delta}\right) \quad (16)$$

Where b can be estimated by minimizing the summation of squared error with respect to b, then we get:[5]

$$\hat{b} = \frac{n\sum_{i=1}^{n} z_i u_i - \sum_{i=1}^{n} z_i \sum_{i=1}^{n} u_i}{n\sum_{i=1}^{n} [u_i]^2 - \left[\sum_{i=1}^{n} u_i\right]^2} \quad (17)$$

By substitution (16) in (17), the Rg estimator for the unknown parameter β, $\hat{\beta}_{\mathrm{Rg}}$ is:

$$\hat{\beta}_{\mathrm{Rg}} = \frac{-n\sum_{i=1}^{n} \ln(P_i) \ln\left(1+\lambda x_i^{-\delta}\right) + \sum_{i=1}^{n} \ln(P_i) \sum_{i=1}^{n} \ln\left(1+\lambda x_i^{-\delta}\right)}{n\sum_{i=1}^{n} \left[\ln\left(1+\lambda x_i^{-\delta}\right)\right]^2 - \left[\sum_{i=1}^{n} \ln\left(1+\lambda x_i^{-\delta}\right)\right]^2} \quad (18)$$

In the same step above, we will estimate the unknown parameters $\beta_1$and β_2 as follows:

$$\hat{\beta}_{1\mathrm{Rg}} = \frac{-m\sum_{j=1}^{m} \ln(P_j) \ln\left(1+\lambda t_j^{-\delta}\right) + \sum_{j=1}^{m} \ln(P_j) \sum_{j=1}^{m} \ln\left(1+\lambda t_j^{-\delta}\right)}{m\sum_{j=1}^{m} \left[\ln\left(1+\lambda t_j^{-\delta}\right)\right]^2 - \left[\sum_{j=1}^{m} \ln\left(1+\lambda t_j^{-\delta}\right)\right]^2} \quad (19)$$

$$\hat{\beta}_{2\mathrm{Rg}} = \frac{-m\sum_{k=1}^{m} \ln(P_k) \ln\left(1+\lambda z_k^{-\delta}\right) + \sum_{k=1}^{m} \ln(P_k) \sum_{k=1}^{m} \ln\left(1+\lambda z_k^{-\delta}\right)}{m\sum_{k=1}^{m} \left[\ln\left(1+\lambda z_k^{-\delta}\right)\right]^2 - \left[\sum_{k=1}^{m} \ln\left(1+\lambda z_k^{-\delta}\right)\right]^2} \quad (20)$$

Where $P_j = \frac{j}{m+1}$, $j = 1,2, \dots, m$ and $P_k = \frac{k}{m+1}$, $k = 1,2, \dots, m$

By substitution equations (18),(19) and (20) in equation (7), we obtain the Rg estimator for reliability approximately as:

$$\hat{R} = \frac{\hat{\beta}_{2Rg}\hat{\beta}_{Rg}}{(\hat{\beta}_{1Rg}+\hat{\beta}_{Rg})(\hat{\beta}_{1Rg}+\hat{\beta}_{2Rg}+\hat{\beta}_{Rg})}$$

3.3. Method of Moment (MOM)

The Method of Moment was introduced by Pearson in (1894). It was one of the first methods used to estimate a population parameter [8]. To derived the method of moment estimators of parameters of Dagum, let $x_1, x_2, \dots, x_n$ be a strength random sample of size (n) from $Dag(\beta, \lambda, \delta)$ and let $t_1, t_2, \dots, t_m$ and $z_1, z_2, \dots, z_m$ be a stress random samples of size (m) from $Dag(\beta_1, \lambda, \delta)$ and $Dag(\beta_2, \lambda, \delta)$, respectively. Then their population means when $\delta > 1$ are given by:[2]

$$E(x) = \beta\, \lambda^{\frac{1}{\delta}}\, B\left(1-\frac{1}{\delta}, \beta+\frac{1}{\delta}\right)$$
$$E(t) = \beta_1\, \lambda^{\frac{1}{\delta}}\, B\left(1-\frac{1}{\delta}, \beta_1+\frac{1}{\delta}\right)$$
$$E(z) = \beta_2\, \lambda^{\frac{1}{\delta}}\, B\left(1-\frac{1}{\delta}, \beta_2+\frac{1}{\delta}\right)$$

According to the method of moment, equating the samples mean with the corresponding populations mean, then the moment estimators of β, β_1, β_2 are:

$$\hat{\beta}_{MOM} = \frac{\bar{x}}{\lambda^{\frac{1}{\delta}} B\left(1-\frac{1}{\delta}, \beta_0+\frac{1}{\delta}\right)} \quad (21)$$

$$\hat{\beta}_{1MOM} = \frac{\bar{t}}{\lambda^{\frac{1}{\delta}} B\left(1-\frac{1}{\delta}, \beta_{1_0}+\frac{1}{\delta}\right)} \quad (22)$$

$$\hat{\beta}_{2MOM} = \frac{\bar{z}}{\lambda^{\frac{1}{\delta}} B\left(1-\frac{1}{\delta}, \beta_{2_0}+\frac{1}{\delta}\right)} \quad (23)$$

By substitution equation (21),(22) and (23) in equation (7), we can obtain the approximate estimator of R as bellow:

$$\hat{R}_{MOM} = \frac{\hat{\beta}_{2MOM}\hat{\beta}_{MOM}}{(\hat{\beta}_{1MOM}+\hat{\beta}_{MOM})(\hat{\beta}_{1MOM}+\hat{\beta}_{2MOM}+\hat{\beta}_{MOM})}$$

4.Simulation study

In this section, a simulation study is used to determine the best estimate of the reliability with unknown parameters of the Dagum distribution, and to performance the three different estimates from the maximum likelihood, regression method and the method of moment; where the estimators of regression was used as initial value, are evaluated by using the mean square error criteria (MSE), with different sample sizes (15,30,90) and $(\lambda = 2, 4, 0.5; \delta = 2, 1.2, 5)$, for four different experiments in each case of the parameters value λ and δ.

For the twelve different experiments, a simulation study is conducted by using MATLAB 2020 to compare the performance of the reliability estimators by the following steps:

Step1: Generating the random values of the random variables by the inverse function according to the following formula: $x = \left[\left(F(x)^{-1/\beta} - 1\right)/\lambda\right]^{-1/\delta}$

Step2: Calculate the mean by the equation: Mean $= \frac{\sum_{i=1}^{N} \hat{R}_i}{N}$

Step3: The comparison of estimation methods is done by using the mean square error criteria: MSE$= \frac{1}{N}\sum_{i=1}^{N}\left(\hat{R}_i - R\right)^2$, where N the number of replication in each experiment is 1000.

The results are recorded in the following tables from 1 to 3. The comparison of these estimator's performance based on the MSE values, has been observed as:

1- In table (1) and for experiments (1), (2), (3) and (4), the value of MSE decreases with increasing sample sizes for each of MLE, Rg and MOM. The best value of MSE is MLE, followed by Rg, MOM.
2- In table (2) and for experiments (5), (6), (7) and (8), the value of MSE decreases with increasing sample sizes for each of MLE, Rg and MOM. The best value of MSE is MLE, followed by Rg, MOM.
3- In table (3) and for experiments (10) and (11), the value of MSE decreases with increasing sample sizes for each of MLE, Rg and MOM. The best value of MSE is MLE, followed by Rg, MOM, but in the case of experiments (9) and (12), the best value of MSE was for the MOM, followed by MLE, Rg.

Thus, the estimators of the maximum likelihood method give better performance than those of the regression and moment methods through the small values of the MSE for most of the experiments, except for experiments (9) and (12) in which the moment method is the best.

5.Conclusion

In this paper, three methods are used to estimate reliability P (T< X< Z) as each of T, Z and X follow the Dagum distribution with different parameters, and these methods are the maximum likelihood, regression method and method of moment. A simulation study was conducted, and through the results that appeared in the twelve experiments, it was found that the estimators of the maximum likelihood method give better performance than those of the regression and moment methods through the small values of the MSE for most of the experiments, except for experiments (9) and (12) in which the moment method is the best. Thus, the simulation results confirm that the performance of the maximum likelihood estimator is much better than the estimators of the regression and moment methods for most experiments and for various sample sizes.

Reliability of n-Cascade Stress-Strength P(X<Y<Z) System for four different distributions

Reliability of n- Cascade Stress -Strength P(X<Y<Z) System for four different distributions

Abstract. In this paper, the n- cascade with P(X<Y<Z) is used to find the reliability of stress-strength system, where X and Z are the strengths of a component subjected to stress Y. The n-cascade stress-strength system reliability expression is obtained for four different distributions which are [Exponential Pareto, Inverted Exponential, Exponentiated Invers Rayleigh, Frechet]. For some specific values of the parameters of the distribution, the numerical values of the four different reliabilities have also been computed, provided, and discussed.

1. Introduction

The reliability of the stress-strength system model component is defined as the probability that the stress Yworking on it, is not greater than strength$X$, where both x and y are random variables, so$R = P(X \geq Y)$. But here we consider the case that a component (or system) can work only when the stressY on it is lies between two certain values of components (or systems) strengths (say X and Z), i.e. stress is within certain limits see [4],[6] and [7].

Under this system, the reliability can be defined as:

$R = P(X < Y < Z)$

Where $X$and Z are the component strengths (DMGO calls them lower and upper strengths), and Y is the stress on this component all X, Y, and Z are random variables.

In the source, Singh [7] has considered the reliability estimation under the assumption that the strength of a component y lies in an interval between two stress (X_1 and X_2). i.e. $R = P(X_1 < Y < X_2)$

The main aim of this paper is to obtain the reliability of the n-cascade stress-strength systemR_n, where stress on the component is subjected to two strengths. The general model reliability is illustrated in **section2**, the reliabilities obtained for four different distributions [Exponential Pareto, Inverted Exponential, Exponentiated Invers Rayleigh, Frechet] are given in section3. Finally, the results and discussions of some numerical values of the reliabilities are given in section4.

2. n-Cascade with P(X<Y<Z) System Reliability

After every failure in the cascade system, the stress is modified by a factor (k)[5]. Let $y_i; i = 1, \dots, n$ be the stress on n-components, then

$y_2 = ky_1$, $y_3 = ky_2 = k^2y_1$, …, $y_i = k^{i-1}y_1$

The ith component works if the stress $k^{i-1}y_1$ lie in the interval (x_i, z_i) the lower and upper strength of $i = 1, \dots, n$ components, respectively. Whenever it falls outside these two limits, the component fails and another from standby takes the place of the failed component and the system continues to work until the n component in cascade fails [4]. Assuming the components work independently then.

$R_n = R(1) + R(2) + \cdots + R(n)$ … (1)

Where $R(r)$ is the marginal reliability of rth component.

Let $x_i, z_i \; and \; y_i; i = 1,2, \dots, n$ are independent random variables with F(x) , H(z) cumulative distribution functions (cdf) and g(y_1) probability density function (pdf), then

$$R(1) = P(x < y_1 < z) = P(y_1 > x) - P(y_1 > x, y_1 > z)$$

$$= \int_{y_1} F_x(y_1) g(y_1) dy_1 - \int_{y_1} F_x(y_1) H_z(y_1) g(y_1) dy_1 \quad \dots (2)$$

And

$$R(2) = P(x < y_1 < z)^c P(x < y_2 < z)$$

$$= [1 - R(1)][P((y_2 = ky_1) > x) - P(ky_1 > x, ky_1 > z)]$$

$$= [1 - R(1)] \left[\int_{y_1} F_x(ky_1) g(y_1) dy_1 - \int_{y_1} F_x(ky_1) H_z(ky_1) g(y_1) dy_1 \right] \dots (3)$$

Similarly

$$R(3) = [1 - R(1)][1 - R(2)]$$

$$\left[\int_{y_1} F_x(k^2y_1) g(y_1) dy_1 - \int_{y_1} F_x(k^2y_1) H_z(k^2y_1) g(y_1) dy_1\right] \quad \dots (4)$$

In general

$$R(n) = \big(1 - R(1)\big)\big(1 - R(2)\big) \dots (1 - R(n-1))$$

$$\left[\int_{y_1} F_x(k^{n-1}y_1) g(y_1) dy_1 - \int_{y_1} F_x(k^{n-1}y_1) H_z(k^{n-1}y_1) g(y_1) dy_1\right] \quad \dots (5)$$

3. Specific Distributions

In this section, we involve four different distributions for the random stress and strengths variables to obtain the mathematical expressions of reliabilities in equations (2-5) and then n-cascade system reliability in the equation (1).

3.1. Exponential Pareto Distribution (EPD)

Let the strengths random variables $X$and Z are independent identically distributed with EPD $(\rho, \lambda_1, \theta)$ and EPD $(\rho, \lambda_2, \theta)$, respectively, with cumulative distribution function (cdf) given as[2] and [3]:

$$F(x) = 1 - e^{-\lambda_1 \left(\frac{x}{\rho}\right)^{\theta}}, \qquad x > 0$$

$$H(z) = 1 - e^{-\lambda_2 \left(\frac{z}{\rho}\right)^{\theta}}, \qquad z > 0$$

And let $y_1$be EP (ρ, λ, θ) random stress variable with probability density function (pdf) given as:

$$g(y_1) = \frac{\lambda\theta}{\rho}\left(\frac{y_1}{\rho}\right)^{\theta-1} e^{-\lambda\left(\frac{y_1}{\rho}\right)^{\theta}}, \qquad y_1 > 0$$

Where $\int_{y_1}\left(\frac{y_1}{\rho}\right)^{\theta-1} e^{-\lambda\left(\frac{y_1}{\rho}\right)^{\theta}} dy_1 = \frac{\rho}{\lambda\theta}$

Since $g(y_1)$ is pd function.
Then from equation (2), we have.

$R(1) = A_1 - B_1$

Then

$$A_1 = \int_{y_1}\left(1 - e^{-\lambda_1\left(\frac{y_1}{\rho}\right)^{\theta}}\right)\frac{\lambda\theta}{\rho}\left(\frac{y_1}{\rho}\right)^{\theta-1} e^{-\lambda\left(\frac{y_1}{\rho}\right)^{\theta}} dy_1$$

$$= 1 - \frac{\lambda\theta}{\rho}\int_{y_1}\left(\frac{y_1}{\rho}\right)^{\theta-1} e^{-(\lambda+\lambda_1)\left(\frac{y_1}{\rho}\right)^{\theta}} dy_1$$

$$= 1 - \frac{\lambda\theta}{\rho}\frac{\rho}{(\lambda+\lambda_1)\theta} = 1 - \frac{\lambda}{(\lambda+\lambda_1)}$$

$$B_1 = \int_{y_1} F_x(y_1)H_z(y_1)g(y_1)dy_1$$

$$= \int_{y_1}\left(1 - e^{-\lambda_1\left(\frac{y_1}{\rho}\right)^{\theta}}\right)\left(1 - e^{-\lambda_2\left(\frac{y_1}{\rho}\right)^{\theta}}\right)g(y_1)dy_1$$

$$= \int_{y_1}\left(1 - e^{-\lambda_1\left(\frac{y_1}{\rho}\right)^{\theta}} - e^{-\lambda_2\left(\frac{y_1}{\rho}\right)^{\theta}} + e^{-(\lambda_1+\lambda_2)\left(\frac{y_1}{\rho}\right)^{\theta}}\right)g(y_1)dy_1$$

$$= 1 - \frac{\lambda\theta}{\rho}\int_{y_1}\left(\frac{y_1}{\rho}\right)^{\theta-1} e^{-(\lambda+\lambda_1)\left(\frac{y_1}{\rho}\right)^{\theta}} dy_1 - \frac{\lambda\theta}{\rho}\int_{y_1}\left(\frac{y_1}{\rho}\right)^{\theta-1} e^{-(\lambda+\lambda_2)\left(\frac{y_1}{\rho}\right)^{\theta}} dy_1$$

$$+ \frac{\lambda\theta}{\rho}\int_{y_1}\left(\frac{y_1}{\rho}\right)^{\theta-1} e^{-(\lambda+\lambda_1+\lambda_2)\left(\frac{y_1}{\rho}\right)^{\theta}} dy_1$$

$$= 1 - \frac{\lambda\theta}{\rho}\frac{\rho}{(\lambda+\lambda_1)\theta} - \frac{\lambda\theta}{\rho}\frac{\rho}{(\lambda+\lambda_2)\theta} + \frac{\lambda\theta}{\rho}\frac{\rho}{(\lambda+\lambda_1+\lambda_2)\theta}$$

$$B_1 = 1 - \frac{\lambda}{(\lambda+\lambda_1)} - \frac{\lambda}{(\lambda+\lambda_2)} + \frac{\lambda}{(\lambda+\lambda_1+\lambda_2)}$$

Then, we get

$$R(1) = 1 - \frac{\lambda}{(\lambda+\lambda_1)} - 1 + \frac{\lambda}{(\lambda+\lambda_1)} + \frac{\lambda}{(\lambda+\lambda_2)} - \frac{\lambda}{(\lambda+\lambda_1+\lambda_2)}$$

$$= \frac{\lambda}{(\lambda+\lambda_2)} - \frac{\lambda}{(\lambda+\lambda_1+\lambda_2)}$$

And now from equation (3), we have

$$R(2) = [1 - R(1)][A_2 - B_2]$$

$$A_2 = \int_{y_1} F_x(ky_1)g(y_1)dy_1 = \int_{y_1}\left(1 - e^{-\lambda_1\left(\frac{ky_1}{\rho}\right)^{\theta}}\right)g(y_1)dy_1$$

$$= 1 - \frac{\lambda\theta}{\rho}\int_{y_1}\left(\frac{y_1}{\rho}\right)^{\theta-1} e^{-(\lambda+k^{\theta}\lambda_1)\left(\frac{y_1}{\rho}\right)^{\theta}} dy_1$$

$$= 1 - \frac{\lambda\theta}{\rho}\frac{\rho}{(\lambda+k^{\theta}\lambda_1)\theta}$$

$$= 1 - \frac{\lambda}{(\lambda+k^{\theta}\lambda_1)}$$

$$B_2 = \int_{y_1} F_x(ky_1)H_z(ky_1)g(y_1)dy_1$$

$$= \int_{y_1}\left(1 - e^{-\lambda_1\left(\frac{ky_1}{\rho}\right)^{\theta}}\right)\left(1 - e^{-\lambda_2\left(\frac{ky_1}{\rho}\right)^{\theta}}\right)g(y_1)dy_1$$

$$= \int_{y_1}\left(1 - e^{-k^{\theta}\lambda_1\left(\frac{y_1}{\rho}\right)^{\theta}} - e^{-k^{\theta}\lambda_2\left(\frac{y_1}{\rho}\right)^{\theta}} + e^{-k^{\theta}(\lambda_1+\lambda_2)\left(\frac{y_1}{\rho}\right)^{\theta}}\right)g(y_1)dy_1$$

$$B_2 = 1 - \frac{\lambda\theta}{\rho}\int_{y_1}\left(\frac{y_1}{\rho}\right)^{\theta-1} e^{-(\lambda+k^{\theta}\lambda_1)\left(\frac{y_1}{\rho}\right)^{\theta}}dy_1 - \frac{\lambda\theta}{\rho}\int_{y_1}\left(\frac{y_1}{\rho}\right)^{\theta-1} e^{-(\lambda+k^{\theta}\lambda_2)\left(\frac{y_1}{\rho}\right)^{\theta}}dy_1$$

$$+ \frac{\lambda\theta}{\rho}\int_{y_1}\left(\frac{y_1}{\rho}\right)^{\theta-1} e^{-(\lambda+k^{\theta}(\lambda_1+\lambda_2))\left(\frac{y_1}{\rho}\right)^{\theta}}dy_1$$

$$B_2 = 1 - \frac{\lambda\theta}{\rho}\frac{\rho}{(\lambda+k^{\theta}\lambda_1)\theta} - \frac{\lambda\theta}{\rho}\frac{\rho}{(\lambda+k^{\theta}\lambda_2)\theta} + \frac{\lambda\phi}{\rho}\frac{\rho}{(\lambda+k^{\theta}(\lambda_1+\lambda_2))\theta}$$

$$B_2 = 1 - \frac{\lambda}{(\lambda+k^{\theta}\lambda_1)} - \frac{\lambda}{(\lambda+k^{\theta}\lambda_2)} + \frac{\lambda}{(\lambda+k^{\theta}(\lambda_1+\lambda_2))}$$

So, $R(2) = \big(1 - R(1)\big)\left(1 - \frac{\lambda}{(\lambda+k^{\theta}\lambda_1)} - 1 + \frac{\lambda}{(\lambda+k^{\theta}\lambda_1)} + \frac{\lambda}{(\lambda+k^{\theta}\lambda_2)} - \frac{\lambda}{(\lambda+k^{\theta}(\lambda_1+\lambda_2))}\right)$

$$R(2) = \big(1 - R(1)\big)\left(\frac{\lambda}{(\lambda+k^{\theta}\lambda_2)} - \frac{\lambda}{(\lambda+k^{\theta}(\lambda_1+\lambda_2))}\right)$$

Then, $R(3) = [1 - R(1)][1 - R(2)]$

$$R(3) = \big(1 - R(1)\big)\big(1 - R(2)\big)\left(\frac{\lambda}{(\lambda+k^{2\theta}\lambda_2)} - \frac{\lambda}{(\lambda+k^{2\theta}(\lambda_1+\lambda_2))}\right)$$

So,

$$R(n) = \big(1 - R(1)\big)\big(1 - R(2)\big)\ldots\big(1 - R(n-1)\big)\left(\frac{\lambda}{(\lambda + k^{(n-1)\theta}\lambda_2)} - \frac{\lambda}{(\lambda + k^{(n-1)\theta}(\lambda_1 + \lambda_2))}\right)$$

Substituting the values of$R(r), r = 1,2,\ldots,n$; we can obtainR_n , the reliability of the system.

$$R(4) = \big(1 - R(1)\big)\big(1 - R(2)\big)\big(1 - R(3)\big)\left(\frac{\lambda}{(\lambda+k^{3\theta}\lambda_2)} - \frac{\lambda}{(\lambda+k^{3\theta}(\lambda_1+\lambda_2))}\right)$$

3.2. Inverted Exponential Distribution (IED)

The random variables $X$and$Z$ are strengths independent identically distributed with $x\sim$IE(α_1) and $z\sim$ IE(α_2), respectively, with cdf given as[8]:

$$F(\mathrm{x}) = \mathrm{e}^{-\left(\frac{\alpha_1}{\mathrm{x}}\right)}, \qquad \mathrm{x} > 0$$

$$\mathrm{H}(z) = e^{-\left(\frac{\alpha_2}{z}\right)}, \qquad z > 0$$

And let $y_1\sim$ IE(α) be a random stress variable with pdf given as:

$$g(y_1) = \frac{\alpha}{y_1^2} e^{-\left(\frac{\alpha}{y_1}\right)}, \quad y_1 > 0$$

Where $\int_{y_1} \frac{1}{y_1^2} e^{-\left(\frac{\alpha}{y_1}\right)} dy_1 = \frac{1}{\alpha}$

Since $g(y_1)$ is pd function, then from equation2 we have.

$R(1) = A_1 - B_1$

So,

$$A_1 = \int_{y_1} e^{-\left(\frac{\alpha_1}{y_1}\right)} \frac{\alpha}{y_1^2} e^{-\left(\frac{\alpha}{y_1}\right)} dy_1 = \alpha \int_{y_1} \frac{1}{y_1^2} e^{-\left(\frac{\alpha+\alpha_1}{y_1}\right)} dy_1 = \frac{\alpha}{\alpha+\alpha_1}$$

$$B_1 = \int_{y_1} e^{-\left(\frac{\alpha_1}{y_1}\right)} e^{-\left(\frac{\alpha_2}{y_1}\right)} \frac{\alpha}{y_1^2} e^{-\left(\frac{\alpha}{y_1}\right)} dy_1 = \alpha \int_{y_1} \frac{1}{y_1^2} e^{-\left(\frac{\alpha+\alpha_1+\alpha_2}{y_1}\right)} dy_1 = \frac{\alpha}{\alpha+\alpha_1+\alpha_2}$$

$$R(1) = \frac{\alpha}{\alpha+\alpha_1} - \frac{\alpha}{\alpha+\alpha_1+\alpha_2} = \frac{\alpha\alpha_2}{(\alpha+\alpha_1)(\alpha+\alpha_1+\alpha_2)}$$

And now from equation (3), we have

$R(2) = [1 - R(1)][A_2 - B_2]$

$$A_2 = \int_{y_1} F_x(ky_1) g(y_1) dy_1 = \int_{y_1} e^{-\left(\frac{\alpha_1}{ky_1}\right)} \frac{\alpha}{y_1^2} e^{-\left(\frac{\alpha}{y_1}\right)} dy_1 = \alpha \int_{y_1} \frac{1}{y_1^2} e^{-\left(\frac{\alpha+\frac{\alpha_1}{k}}{y_1}\right)} dy_1$$

$$= \frac{\alpha}{\alpha+\frac{\alpha_1}{k}}$$

$$B_2 = \int_{y_1} F_x(ky_1) H_z(ky_1) g(y_1) dy_1$$

$$= \int_{y_1} e^{-\left(\frac{\alpha_1}{ky_1}\right)} e^{-\left(\frac{\alpha_2}{ky_1}\right)} \frac{\sigma}{y_1^2} e^{-\left(\frac{\alpha}{y_1}\right)} dy_1 = \alpha \int_{y_1} \frac{1}{y_1^2} e^{-\left(\frac{\alpha_1+\alpha_2}{y_1}+\alpha\right)} dy_1 = \frac{\alpha}{\alpha+\frac{\alpha_1+\alpha_2}{k}}$$

So

$$R(2) = \left(1 - \frac{\alpha\alpha_2}{(\alpha+\alpha_1)(\alpha+\alpha_1+\alpha_2)}\right)\left(\frac{\alpha}{\alpha+\frac{\alpha_1}{k}} - \frac{\alpha}{\alpha+\frac{\alpha_1+\alpha_2}{k}}\right)$$

And

$$R(3) = \big(1 - R(1)\big)\big(1 - R(2)\big)\left(\frac{\alpha}{\alpha+\frac{\alpha_1}{k^2}} - \frac{\alpha}{\alpha+\frac{\alpha_1+\alpha_2}{k^2}}\right)$$

So

$$R(n) = \big(1 - R(1)\big)\big(1 - R(2)\big) \dots \big(1 - R(n-1)\big)\left(\frac{\alpha}{\alpha+\frac{\alpha_1}{k^{(n-1)}}} - \frac{\alpha}{\alpha+\frac{\alpha_1+\alpha_2}{k^{(n-1)}}}\right)$$

3.3. Exponentiated Inverse Rayleigh Distribution (EIRD)

Let the random variables *X*and*Z* are strengths independent identically distributed with x~EIR (ϱ_1, ϕ_1) and z~EIR (ϱ_2, ϕ_2), respectively, with cdf given as[1]:

$$F(x) = \left(e^{-\left(\frac{\phi}{x^2}\right)}\right)^{\varrho} = e^{-\left(\frac{\varrho\phi}{x^2}\right)}, \quad x > 0$$

$$H(z) = e^{-\left(\frac{\varrho\phi}{z^2}\right)}, \qquad z > 0$$

And, let y_1 be EIR (ϱ, ϕ) random stress variable with pdf given as:

$$g(y_1) = \frac{2\varrho\phi}{{y_1}^3} e^{-\left(\frac{\varrho\phi}{{y_1}^2}\right)} , \qquad y_1 > 0$$

Where $\int_{y_1} \frac{1}{{y_1}^3} e^{-\left(\frac{\varrho\phi}{{y_1}^2}\right)} dy_1 = \frac{1}{2\varrho\phi}$

Since $g(y_1)$ is pd function, then from equation (2), we have.

$$R(1) = A_1 - B_1$$

$$A_1 = \int_{y_1} e^{-\left(\frac{\varrho_1\phi_1}{{y_1}^2}\right)} \frac{2\varrho\phi}{y_1^3} e^{-\left(\frac{\varrho\phi}{y_1^2}\right)} dy_1 = 2\varrho\phi \int_{y_1} \frac{1}{y_1^3} e^{-\left(\frac{\varrho\phi+\varrho_1\phi_1}{y_1^2}\right)} dy_1 = \frac{\varrho\phi}{\varrho\phi+\varrho_1\phi_1}$$

$$B_1 = \int_{y_1} e^{-\left(\frac{\varrho_1\phi_1}{{y_1}^2}\right)} e^{-\left(\frac{\varrho_2\phi_2}{{y_1}^2}\right)} \frac{2\varrho\phi}{y_1^3} e^{-\left(\frac{\varrho\phi}{y_1^2}\right)} dy_1 = 2\varrho\phi \int_{y_1} \frac{1}{{y_1}^3} e^{-\left(\frac{\varrho\phi+\varrho_1\phi_{1+}\varrho_2\phi_2}{{y_1}^2}\right)} dy_1$$

$$= \frac{\varrho\phi}{\varrho\phi+\varrho_1\phi_{1+}\varrho_2\phi_2}$$

So

$$R(1) = \frac{\varrho\varrho_2\phi\phi_2}{(\varrho\phi+\varrho_1\phi_1)(\varrho\phi+\varrho_1\phi_{1+}\varrho_2\phi_{2)}}$$

And now from equation (3), we have

$$R(2) = [1 - R(1)][A_2 - B_2]$$

$$A_2 = \int_{y_1} F_x\,(ky_1) g(y_1) dy_1 = \int_{y_1} e^{-\left(\frac{\varrho_1\phi_1}{(ky_1)^2}\right)} \frac{2\varrho\phi}{y_1^3} e^{-\left(\frac{\varrho\phi}{y_1^2}\right)} dy_1$$

$$= 2\varrho\phi \int_{y_1} \frac{1}{y_1^3} e^{-\left(\frac{\varrho\phi+\frac{\varrho_1\phi_1}{k^2}}{y_1^2}\right)} dy_1 = \frac{\varrho\phi}{\varrho\phi+\frac{\varrho_1\phi_1}{k^2}}$$

$$B_2 = \int_{y_1} e^{-\left(\frac{\varrho_1\phi_1}{(ky_1)^2}\right)} e^{-\left(\frac{\varrho_2\phi_2}{(ky_1)^2}\right)} \frac{2\varrho\phi}{y_1^3} e^{-\left(\frac{\varrho\phi}{y_1^2}\right)} dy_1 = \frac{\varrho\phi}{\varrho\phi+\frac{\varrho_1\phi_1}{k^2}+\frac{\varrho_2\phi_2}{k^2}}$$

So

$$R(2) = \left(1 - \frac{\varrho\varrho_2\phi\phi_2}{(\varrho\phi+\varrho_1\phi_1)(\varrho\phi+\varrho_1\phi_{1+}\varrho_2\phi_{2)}}\right)\left(\frac{\varrho\phi}{\varrho\phi+\frac{\varrho_1\phi_1}{k^2}} - \frac{\varrho\phi}{\varrho\phi+\frac{\varrho_1\phi_1}{k^2}+\frac{\varrho_2\phi_2}{k^2}}\right)$$

Then, $R(3) = \big(1 - R(1)\big)\big(1 - R(2)\big)\left(\frac{\varrho\phi}{\varrho\phi+\frac{\varrho_1\phi_1}{(k^2)^2}} - \frac{\varrho\phi}{\varrho\phi+\frac{\varrho_1\phi_1+\varrho_2\phi_2}{(k^2)^2}}\right)$

And, $R(4) = \big(1 - R(1)\big)\big(1 - R(2)\big)\big(1 - R(3)\big)\left(\frac{\varrho\phi}{\varrho\phi+\frac{\varrho_1\phi_1}{(k^3)^2}} - \frac{\varrho\phi}{\varrho\phi+\frac{\varrho_1\phi_1+\varrho_2\phi_2}{(k^3)^2}}\right)$

So

$$R(n) = \big(1 - R(1)\big)\big(1 - R(2)\big) \dots \big(1 - R(n-1)\big)\left(\frac{\varrho\phi}{\varrho\phi + \frac{\varrho_1\phi_1}{\left(k^{(n-1)}\right)^2}} - \frac{\varrho\phi}{\varrho\phi + \frac{\varrho_1\phi_1 + \varrho_2\phi_2}{\left(k^{(n-1)}\right)^2}} \right)$$

3.4. Frechet Distribution (FD)

Let the random variables X and Z are strengths independent identically distributed with $x \sim$ F (δ_1, β) and $z \sim$ F (δ_2, β), respectively, with cdf given as[6]:

$F(x) = e^{-\delta x^{-\beta}}$, $x > 0$

$H(z) = e^{-\delta z^{-\beta}}$, $z > 0$

And, let y_1 be F (δ, β) random stress variable with pdf given as:

$$g(y_1) = \delta\beta y_1^{-(\beta+1)} e^{-\delta y_1^{-\beta}} , \quad y_1 > 0$$

Where $\int_{y_1} y_1^{-(\beta+1)} e^{-\delta y_1^{-\beta}} dy_1 = \frac{1}{\delta\beta}$

Since $g(y_1)$ is pd function, then from equation (2), we have.

$R(1) = A_1 - B_1$

$$A_1 = \int_{y_1} e^{-\delta_1 y_1^{-\beta}} \delta\beta y_1^{-(\beta+1)} e^{-\delta y_1^{-\beta}} dy_1 = \delta\beta \int_{y_1} y_1^{-(\beta+1)} e^{-(\delta+\delta_1) y_1^{-\beta}} dy_1$$

$$= \frac{\delta}{\delta+\delta_1}$$

$$B_1 = \int_{y_1} e^{-\delta_1 y_1^{-\beta}} e^{-\delta_2 y_2^{-\beta}} \delta\beta y_1^{-(\beta+1)} e^{-\delta y_1^{-\beta}} dy_1 \quad = \delta\beta \int_{y_1} y_1^{-(\beta+1)} e^{-(\delta+\delta_1+\delta_2) y_1^{-\beta}} dy_1 = \frac{\delta}{\delta+\delta_1+\delta_2}$$

And

$$R(1) = \frac{\delta\delta_2}{(\delta+\delta_1)(\delta+\delta_1+\delta_2)}$$

And now from equation (3), we have

$R(2) = [1 - R(1)][A_2 - B_2]$

$$A_2 = \int_{y_1} F_x(ky_1) g(y_1) dy_1 = \int_{y_1} e^{-\delta_1 (ky_1)^{-\beta}} \delta\beta y_1^{-(\beta+1)} e^{-\delta y_1^{-\beta}} dy_1$$

$$= \delta\beta \int_{y_1} y_1^{-(\beta+1)} e^{-(\delta+\delta_1 k^{-\beta}) y_1^{-\beta}} dy_1 = \frac{\delta}{\delta+\delta_1 k^{-\beta}}$$

$$B_2 = \int_{y_1} F_x(ky_1) H_z(ky_1) g(y_1) dy_1 \quad = \int_{y_1} e^{-\delta_1 (ky_1)^{-\beta}} e^{-\delta_2 (ky_1)^{-\beta}} \delta\beta y_1^{-(\beta+1)} e^{-\delta y_1^{-\beta}} dy_1$$

$$= \delta\beta \int_{y_1} y_1^{-(\beta+1)} e^{-(\delta+\delta_1 k^{-\beta}+\delta_1 k^{-\beta}) y_1^{-\beta}} dy_1 = \frac{\delta}{\delta+\delta_1 k^{-\beta}+\delta_2 k^{-\beta}}$$

So

$$R(2) = \big(1 - R(1)\big)\left(\frac{\delta\delta_2 k^{-\beta}}{(\delta+\delta_1 k^{-\beta})(\delta+\delta_1 k^{-\beta}+\delta_2 k^{-\beta})}\right)$$

Then, $R(3) = \big(1 - R(1)\big)\big(1 - R(2)\big)\left(\frac{\delta\delta_2 (k^2)^{-\beta}}{(\delta+\delta_1 (k^2)^{-\beta})(\delta+\delta_1 (k^2)^{-\beta}+\delta_2 (k^2)^{-\beta})}\right)$

So

$$R(n) = \big(1 - R(1)\big)\big(1 - R(2)\big) \dots \big(1 - R(n-1)\big) \left(\frac{\delta\delta_2 \big(k^{(n-1)}\big)^{-\beta}}{\big(\delta + \delta_1 \big(k^{(n-1)}\big)^{-\beta}\big)\big(\delta + \delta_1 \big(k^{(n-1)}\big)^{-\beta} + \delta_2 \big(k^{(n-1)}\big)^{-\beta}\big)} \right)$$

Then, $R_n = R(1) + R(2) + \cdots + R(n)$

4. Numerical Evaluation and Results

For the four different distribution and by specific values of the parameters involved in mathematical expressions of $R(r), r = 1,2,3,4$ the system reliability R_n and the marginal reliabilities $R(1)$, $R(2), R(3)$ *and* $R(4)$ (i.e. n=4) are evaluated and recorded in the following cases.

4.1. For Exponential Pareto Distribution (EPD)

- $\boldsymbol{\lambda_1 = 0.9, \lambda_2 = 2.4}$ ***and*** $\boldsymbol{k = 3}$
  When drawing the parameter **λ** against reliability and for the different values of parameter **θ**, we notice that the curves start from one point with good reliability with a small value, where the curve escalates to the largest value, and then it begins to decrease and stability, so that the decrease with the increase in the value of parameter **λ**, but when the value of Parameter **θ** to greater values, reliability begins to decrease gradually until steady state is reached and then decreasing.
- $\boldsymbol{\lambda_1 = 0.9, \lambda_2 = 2.4}$ ***and*** $\boldsymbol{k = 3}$
  And at the same default values for both parameters $\boldsymbol{\lambda_1}$ and λ_2 and the coefficient $\boldsymbol{k}$, the reliability graph against parameter **θ** at the different values of parameter **λ**, gave a direct decreasing form at the small value of parameter **λ** and when increasing it led to a very slight increase in reliability (An indication of the increased achievement required in the system) and from then the direct drop to the state of decreasing, while at the greater value of the parameter **λ**, it gave a significant increase in reliability until it reached the inflection point with a considerable distance and then begins to decrease.
- $\boldsymbol{\lambda = 0.9, k = 3}$
  For indicators that plot reliability against parameter **θ** with different values for each of the parameters$\boldsymbol{\lambda_1}$ and$\boldsymbol{\lambda_2}$, when the values of the parameter $\boldsymbol{\lambda_1}$ exceed the values of the parameter$\boldsymbol{\lambda_2}$, the reliability is decreasing with slight stability in the second case.

The reliability behavior is as shown in the following figures with different values of shape parameters for the Exponential Pareto Distribution.

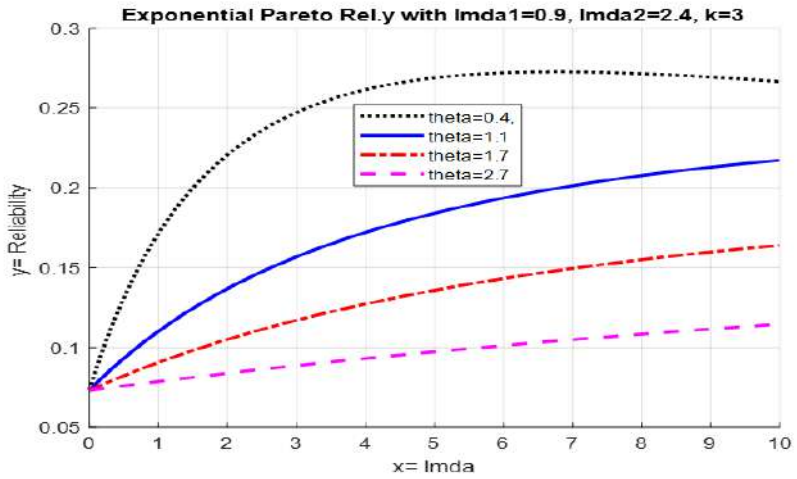

Figure 1. The Reliability curve against parameter λ

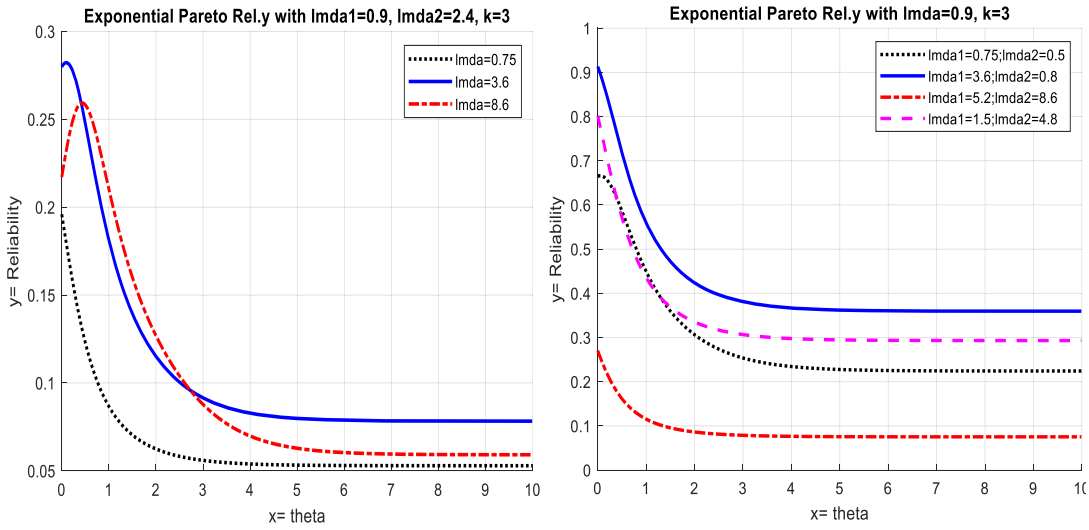
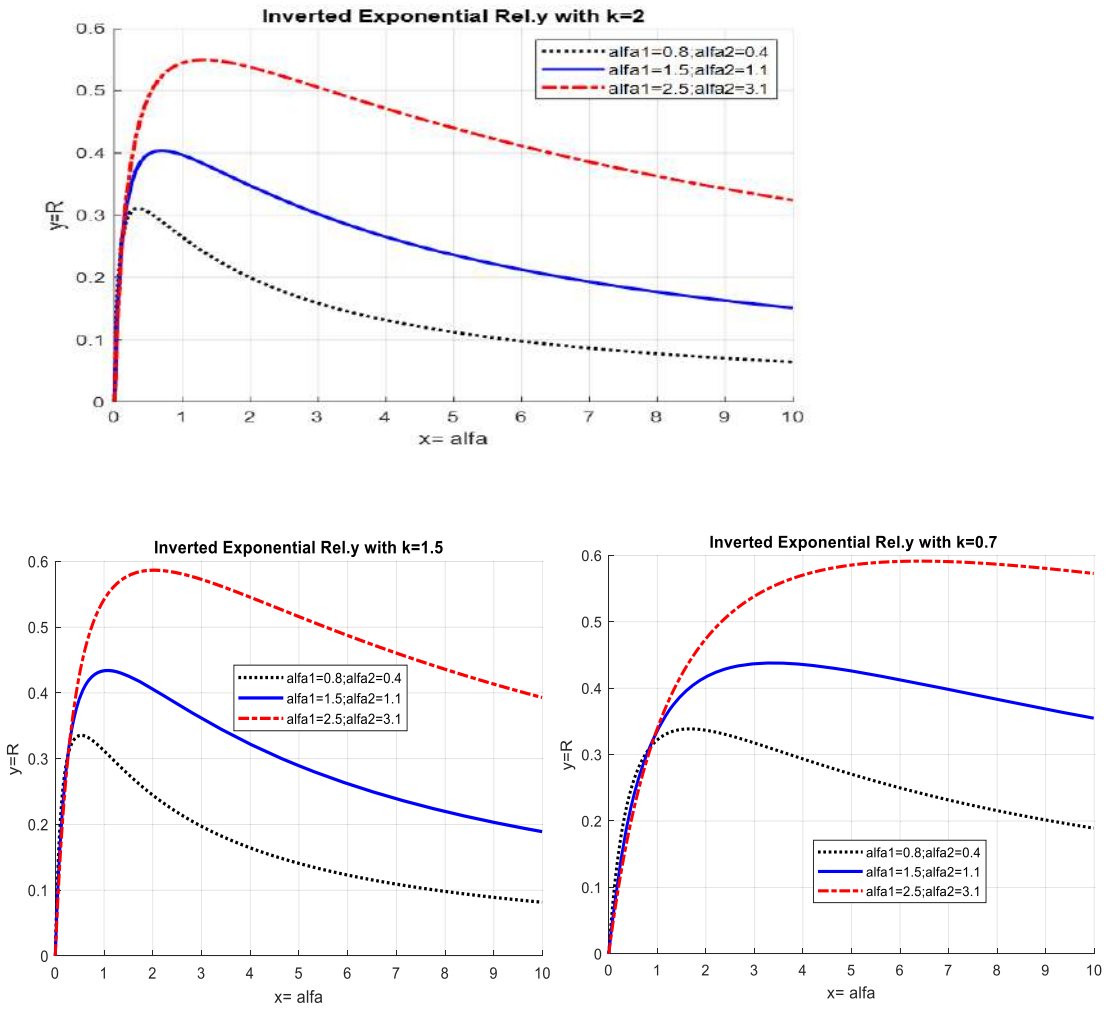


Figures 2. The Reliability curve against parameter θ

4.2. For Inverted Exponential Distribution (IED)

- **k=2**
  When drawing the relationship between reliability $\boldsymbol{R}$ with parameter $\boldsymbol{\alpha}$ for different values of two parameters $\boldsymbol{\alpha_1}$ and $\boldsymbol{\alpha_2}$, it gave a form that initially increased the reliability $\boldsymbol{R}$ sharply from the point of origin and then inflection to decrease after $\boldsymbol{R}$ exceeded the value (0.5) that is **k**=2.
- **k=1.5**
  As for the lower value of the coefficient **k** ,the figures remained the same but with increasing the value of the inflection to decreasing and approaching (0.6) for the case $\boldsymbol{\alpha_1} = 0.8$ and $\boldsymbol{\alpha_2} = 0.4$, also for the other two.
- **k=0.7**
  With a smaller value than the previous state of the coefficient **k,** the shapes were more deploy and better than their predecessors. Therefore, we note that as the value of **k** decreases the chance of reliability increases and it takes a longer period of time before the process of decreasing begins.

The reliability behavior is as shown in the following figures with different values of coefficients for the Inverted Exponential Distribution.



Figures 3. The Reliability curve against parameter α

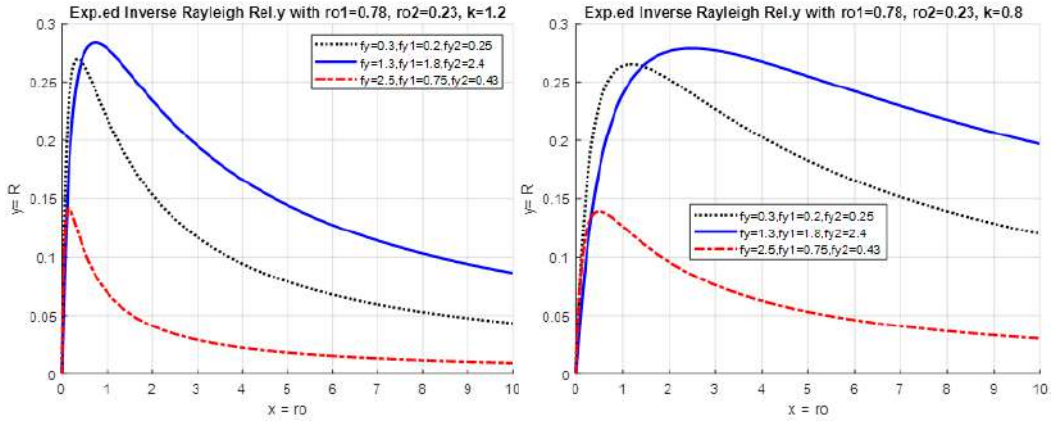
4.3. For Exponentiated Inverse Rayleigh Distribution (EIRD)

- $\boldsymbol{\varrho_1 = 0.78}$, $\boldsymbol{\varrho_2 = 0.23}$, $\boldsymbol{k = 1.2}$
  Here we notice the reliability value starting from the origin point it increases rapidly with the small values of the parameter $\boldsymbol{\varrho}$ takes a sharp inflection point at the value of ($\boldsymbol{\varrho}$ =0.8), and then starts decreasing rapidly when ($\boldsymbol{k} = 1.2$)**.**
- $\boldsymbol{\varrho_1 = 0.78}$, $\boldsymbol{\varrho_2 = 0.23}$, $\boldsymbol{k = 0.8}$
  When the value decreases to ($\boldsymbol{k}$ = 0.8), the curve of the inflection from increasing to decreasing becomes wider and continues to the middle of the parameter value$\boldsymbol{\varrho}$, before it begins to decrease.
- $\boldsymbol{\phi_1 = 10.3, \phi_2 = 7.2}$, $\boldsymbol{k = 1.5}$
  For the parameter $\boldsymbol{\phi}$ at different values of the parameters $\boldsymbol{\varrho}$, $\boldsymbol{\varrho_1}$, $\boldsymbol{\varrho_2}$ and constant values of the two parameters $\boldsymbol{\phi_1}$, $\boldsymbol{\phi_2}$ and $\mathbf{k}$ =1.5, the reliability curve increases with increasing the values of this parameter, and it begins with a constant distance to a significant distance and then decreases and is similar in that the increasing and overlapping values of the parameters $\boldsymbol{\varrho}$, $\boldsymbol{\varrho_1}$, $\boldsymbol{\varrho_2}$. As for the case of a

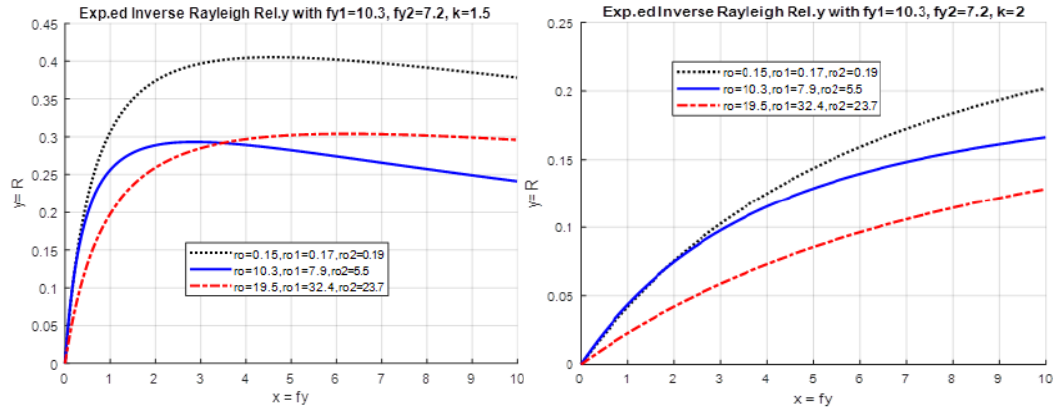
decrease, which is the second case referred to by the continuous line it gives a decrease faster than the previous two.

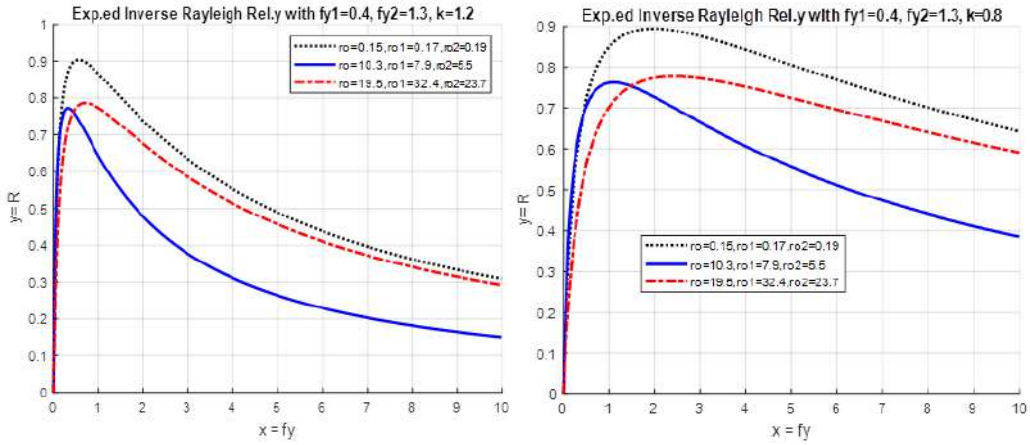
- $\boldsymbol{\phi_1 = 10.3, \phi_2 = 7.2\,, k = 2}$
  As the value **k** increases to 2, the reliability is in the form of increasing curves symmetrical with the possibility of decreasing at values greater than (10) for the parameter$\boldsymbol{\phi}$.
- $\boldsymbol{\phi_1 = 0.4, \phi_2 = 1.3\,, k = 1.2}$ **and** $\boldsymbol{\phi_1 = 0.4, \phi_2 = 1.3\,, k = 0.8}$
  In Figures (5) and (6) respectively, lower values were given for the two parameters $\boldsymbol{\phi_1, \phi_2}$, so that draws the reliability against a parameter $\boldsymbol{\phi}$, we notice that it gave a fast decrease in Fig.5, while in Fig.6 it was a lower decrease.

The reliability behavior is as shown in the following figures with different values of shape parameters for the Exponentiated Inverse Rayleigh Distribution.



Figures 4. The Reliability curve against parameter ϱ



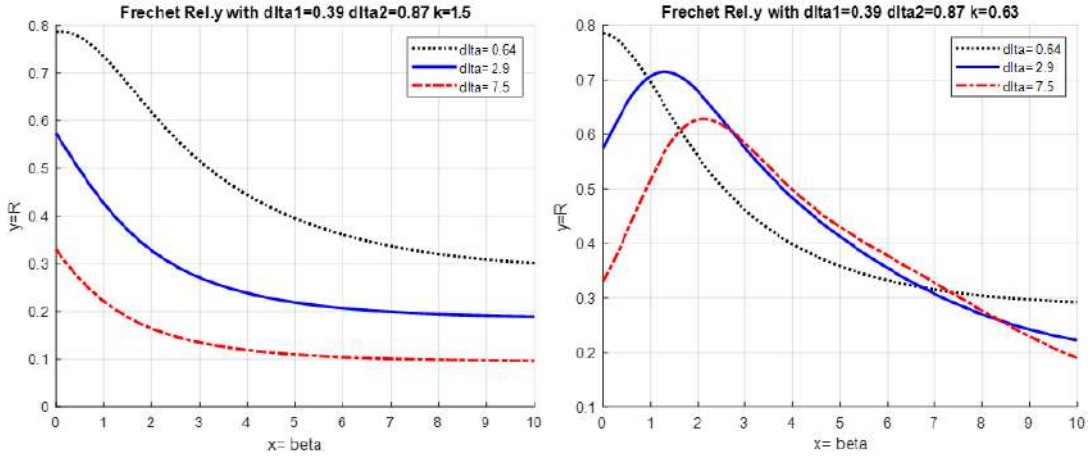


Figures 5. The Reliability curve against parameter ϕ

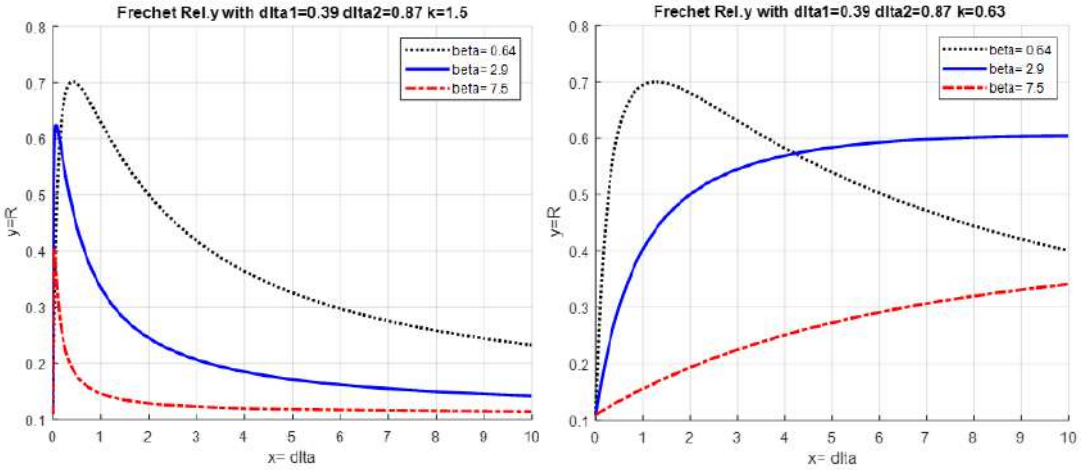
4.4. For Frechet Distribution (FD)

- $\boldsymbol{\delta_1 = 0.39, \delta_2 = 0.87, k = 1.5}$
  When drawing the delta parameter$\boldsymbol{\delta}$ against different values of the beta parameter$\boldsymbol{\beta}$, we note that the reliability value does not start from the origin point and increases converging until a sharp inflection point of decreasing reliability values at (**k** = 1.5).
- $\boldsymbol{\delta_1 = 0.39, \delta_2 = 0.87, k = 0.63}$
  When the value of the coefficient decreases to (**k** = 0.63), we observe the difference and divergence of the curves. so the best reversal condition is when plotting reliability against parameter $\boldsymbol{\beta}$ at certain values of parameter $\boldsymbol{\delta}$.
- $\boldsymbol{\delta_1 = 0.39, \delta_2 = 0.87, k = 1.5}$ **and** $\boldsymbol{\delta_1 = 0.39, \delta_2 = 0.87, k = 0.63}$
  In figures (3) and (4), we observe a constant and continuous decrease in reliability when the coefficient value is $\boldsymbol{k} = 1.5$, while we have inflection from increasing to decreasing non-convex at $\boldsymbol{k} = 0.63$, respectively.

The reliability behavior is as shown in the following figures with different values of shape parameters for the Frechet Distribution.



Figures 6. The Reliability curve against parameter β



Figures 7. The Reliability curve against parameter $\boldsymbol{\delta}$

5. Conclusion

Formulas for system reliability were found for four different distributions, and it found that there are various effects of the special distributions forms for each of the stress and strength variables.

Abstract. In some real-world applications, performance assessment often has to be considered under uncertainty with fuzzy input and output. Data envelopment analysis (DEA) is a new and effective approach to measuring the relative efficiency of decision-making units concerned with performance evaluation. Recently, DEA has studied with fuzzy input and output. In this paper, we present a computational procedure using a robust ranking method to formulate and solve fuzzy DEA models. Based on this approach, we convert the fuzzy DEA input and output from fuzzy form to crisp. Also, a case study has been presented as in [6] to assess the performance of eight manufacturing enterprises with fuzzy data.

1. Introduction

The performance evaluation is one of the basic tools for measuring the quality of functional processes. Therefore, it has taken the attention of many researchers in quality and business affairs, because of its great importance in directing the organizational activity towards the horizon of success. The performance appraisal was defined as "The method by which the actual performance level is measured to obtain sufficient information and analyze it, so it is a tool for measuring human effort at work and diagnosing the level of quality in this performance" [1].

The performance evaluation is a periodic procedure in which the performance of the employee is examined and measured, in order to identify his strengths and weaknesses and to find ways to improve his performance and raise the level of certification for him, and this is done through the use of many models for performance evaluation, which are quantifiable and give accurate indicators for performance [2].

Many performance evaluation researchers or organization owners differ in defining specific steps for the performance evaluation process, due to the difference in the nature of work, such as the organization's philosophy, environment, and type of work, or because of the size of job responsibility, which varies between one job and another. But most of these opinions agree that the performance evaluation passes the following steps [3]:

- Monitor performance problems.
- Examination and search for the causes of these problems.
- Determine the best way to overcome them.
- Follow up on the implementation of treatment methods.
- Business development, continuous improvement, and development.

The performance evaluation is the guiding guide that gives a complete perception about the strengths and weaknesses of the employees in their job positions that they have been assigned to accomplish, so

it is considered a tool for measuring the quality of the employee's productivity during a certain period and indicating the extent of his contribution to achieving the goals of the organization. Therefore, the performance evaluation is characterized by the following features [4].

- It helps the boss to measure the employees' performance accurately
- It helps to optimize energies and resources.
- Helps reduce waste and wastes in work, which helps reduce labor costs
- It makes the outputs high quality and flawless.
- It is considered a guide to leadership in making appropriate decisions.
- It provides leadership with detailed and accurate performance reports in a record period.
- It reduces the frequency of the same mistakes and becomes a useful guide from previous experiences.

The methods of performance evaluation are continuously updating and continue developing as a result of the expansion of studies on this topic, and the organizations' desire to achieve efficiency in all parts of the organization, and to achieve competitive advantage by raising the level of the job performance of the human resource within the organization, so modern organizations rely on performance evaluation on standards Essential in the evaluation process such as effectiveness, efficiency, profits, competitive advantage, quality of job life, creativity, innovation and quality [5]. On the other hand, Data envelopment analysis (DEA) has been recently used to conduct the performance assessment under certainty and uncertainty. Many researchers studied different algorithms and solution methods for deterministic and fuzzy DEA model. For more details we refer to [6], [7],[8],[9],[10],[11].

In this paper, we present a computational approach to formulate and solve the fuzzy dea (FDEA) model using the robust ranking method.

2. Preliminaries

In this section, some basic concepts of fuzzy numbers are given. This material can be found in [12], [13], [14], [15] and [16].

2.1 Basic Definitions

Definition 1 "Let W be a classical set of objects. Then,

$\widetilde{B} = \{(x, \mu_{\widetilde{B}}(x): x \in W\}$, where $\mu_{\widetilde{B}} : W \to [0,1]$

Is called a fuzzy set in W. Also, $\mu_{\widetilde{B}}$ is known as the membership function".

Definition 2 "Let $\widetilde{B}$ be a fuzzy set in W and $\beta \in [0,1], \beta \in \boldsymbol{\mathcal{R}}$. Then, $B^{\beta} = \{x \in W : \mu_{\widetilde{B}}(x) \geq \beta\}$ is called an β -level set or β -cut form of $\widetilde{B}$".

2.2 Types of Fuzzy Numbers

Two well-known fuzzy numbers are described as follows.

2.2.1 Triangular Fuzzy Number

Definition 3 " $\widetilde{B} = (b_1, b_2, b_3)$, is said to be a triangular fuzzy number if its membership function, $\mu_{\widetilde{B}}(x)$, is given by"

$$\mu_{\tilde{B}}(x) = \begin{cases} 0 & , \quad x < b_1 \\ \dfrac{(x - b_1)}{(b_2 - b_1)} & , \quad b_1 \leq x \leq b_2 \\ \dfrac{(b_3 - x)}{(b_3 - b_2)} & , \quad b_2 \leq x \leq b_3 \\ 0 & , \quad x > b_3 \end{cases}$$

Definition 4 "Let $\widetilde{A} = (a, b, c)$ be a triangular fuzzy number". "Then, its $\beta-$cut $A^{\lambda}$is defined as follows":
"$A^{\beta} = [a + (b - a)\beta, c - (c - b)\beta], 0 \leq \beta \leq 1.$"

2.2.2 Trapezoidal Fuzzy Number

Definition 5 "$\widetilde{B} = (b_1, b_2, b_3, b_4)$, is said to be a trapezoidal fuzzy number if its membership function, $\mu_{\widetilde{B}}(x)$, is given by"

$$\mu_{\widetilde{B}}(x) = \begin{cases} \dfrac{(x - b_1)}{(b_2 - b_1)} & , \quad b_1 \leq x < b_2 \\ 1 & , \quad b_2 \leq x \leq b_3 \\ \dfrac{(x - b_4)}{(b_3 - b_4)} & , \quad b_3 < x \leq b_4 \\ 0 & , \quad otherwise \end{cases}$$

Definition 6 "Let $\widetilde{A} = (a, b, c, d)$ be a trapezoidal fuzzy number. Then, its $\beta-$cut A^{λ} is as follows":
$A^{\beta} = [a + (b - a)\beta, d - (d - c)\beta], 0 \leq \beta \leq 1$

2.3 Arithmetic Operation for Trapezoidal Fuzzy Numbers

i. "Let $\widetilde{A}_1 = (a_1, b_1, c_1, d_1)$ and $\widetilde{A}_2 = (a_2, b_2, c_2, d_2)$ be two trapezoidal fuzzy numbers. Then, $\widetilde{A}_1 \oplus \widetilde{A}_2 = (a_1 + a_2, b_1 + b_2, c_1 + c_2, d_1 + d_2)$."
ii. "Let $\widetilde{A}_1 = (a_1, b_1, c_1, d_1)$ and $\widetilde{A}_2 = (a_2, b_2, c_2, d_2)$ be two trapezoidal fuzzy numbers. Then, $\widetilde{A}_1 \Theta \widetilde{A}_2 = (a_1 - d_2, b_1 - c_2, c_1 - b_2, d_1 - a_2)$."
iii. "Let $\widetilde{A}_1 = (a_1, b_1, c_1, d_1)$ and $\widetilde{A}_2 = (a_2, b_2, c_2, d_2)$. Then, $\widetilde{A}_1 \otimes \widetilde{A}_2 = (a_1a_2, b_1b_2, c_1c_2, d_1d_2)$."
iv. "Let $\widetilde{A} = (a_1, b_1, c_1, d_1$. Then,

$$\gamma\tilde{A} = \begin{cases} (\gamma a, \gamma b, \gamma c, \gamma d) & \gamma \geq 0 \\ (\gamma d, \gamma c, \gamma b, \gamma a) & \gamma \leq 0. \end{cases}"$$

3. Robust ranking method

The robust ranking method is one of the important methods used to solve different types of optimization problems such as assignment problems, transportation problems, and linear programming problems, and so on. See for e.g. [13], [14], [15], [16], [17], and [18].
If $\tilde{x}$ be a fuzzy number, then R ($\tilde{x}$) represents the robust ranking approach for:

1. Trapezoidal case:

$R(\tilde{x}) = \int_0^1 0.5\left(s_{\alpha}^{l}, s_{\alpha}^{u}\right) d\alpha$;
where $\left(s_{\alpha}^{l}, s_{\alpha}^{u}\right) = [(x_2 - x_1)\alpha + x_1, x_4 - (x_4 - x_3)\alpha]$ represents the α-cut for the trapezoidal fuzzy number $\tilde{x} = (x_1, x_2, x_3, x_4)$. Then $R(x_1, x_2, x_3, x_4) = \int_0^1 0.5[(x_2 - x_1)\alpha + x_1, x_4 - (x_4 - x_3)\alpha]\, d\alpha$.

2. Triangular case:

$R(\tilde{x}) = \int_0^1 0.5\left(s_{\alpha}^{l}, s_{\alpha}^{u}\right) d\alpha$;
where $\left(s_{\alpha}^{l}, s_{\alpha}^{u}\right) = [(x_2 - x_1)\alpha + x_1, x_3 - (x_3 - x_2)\alpha]$ represents the α-cut for the triangular fuzzy number $\tilde{x} = (x_1, x_2, x_3)$. Then $R(x_1, x_2, x_3) = \int_0^1 0.5[(x_2 - x_1)\alpha + x_1, x_3 - (x_3 - x_2)\alpha]\, d\alpha$.

4. The formulation of fuzzy data envelopment analysis (FDEA) model

The most well-known formulation of CCR model is based on linear programming formulation. For more information about new linear programming formulation we refer to [19],[20],[21],[22],[23], and [24]. In this section, we will present the formulation of (FDEA) model as follows.

4.1 Mathematical model

(FDEA) model can be formulated in [6] and [7] as follows:

$Max\ Z(u,v) = \frac{V^T \tilde{y}_0}{u^T \tilde{x}_0}$

$s.t.\ V^T \tilde{y}_j \le u^T \tilde{x}_j, j = 1,2,\dots,n$, and $u \ge 0,\ v \ge 0$

This model is equivalent to the following linear model.

$Max\ Z(u,v) = V^T \tilde{y}_0$

$s.t.\ V^T \tilde{y}_j \le u^T \tilde{x}_j, j = 1,2,\dots,n,\ u^T \tilde{x}_0 = 1$, and $u \ge 0,\ v \ge 0$

4.2 Computational procedure for solving (FDEA)

Now, we present the following computational procedure for solving (FDEA) model.

Step1-Based on the input and the output of the model, form the fuzzy linear programming model.

Step2- Transform all fuzzy coefficients in the fuzzy linear programming model into crisp coefficients using the robust ranking method.

Step 3- Form the crisp linear programming model.

Step 4- Find the optimal solution of the crisp model using Win QSB solver.

5. Case study

In this section, we present an example to demonstrate a robust ranking approach.

This example is taken from [6] "where eight manufacturing enterprises (DMUs) are to be evaluated in terms of two inputs and two outputs".

Solution:

Step 1. Form the linear programming model based on the data in [6] as follows:

For the first manufacturing enterprise:

$Max\ U(u,v) = (2120,2170,2210)u_1 + 1870u_2,\ S.t.$

$(14500,14790,14860)v_1 + (3.1,4.1,4.9)v_2 = 1$

$$\frac{(1420,1460,1500)u_1 + 1340u_2}{(12470,12720,12790)v_1 + (1.2,2.1,3.0)v_2} \le 1$$

$$\frac{(2510,2570,2610)u_1 + 2360u_2}{(17900,18260,18400)v_1 + (3.3,4.3,5.0)v_2} \le 1$$

$$\frac{(2300,2350,2400)u_1 + 2020u_2}{(14970,15270,15400)v_1 + (2.7,3.7,4.6)v_2} \le 1$$

$$\frac{(1480,1520,1560)u_1 + 1550u_2}{(13980,14260,14330)v_1 + (1.0,1.8,2.7)v_2} \le 1$$

$$\frac{(1990,2030,2100)u_1 + 1760u_2}{(14030,14310,14400)v_1 + (1.6,2.6,3.6)v_2} \le 1$$

$$\frac{(2200,2260,2300)u_1 + 1980u_2}{(16540,16870,17000)v_1 + (2.4,3.4,4.4)v_2} \le 1$$

$$\frac{(2400,2460,2520)u_1 + 2250u_2}{(17600,17960,18100)v_1 + (2.6,3.6,4.6)v_2} \le 1$$

$u_1,\ u_2,\ v_1,\ v_2,\ \ge 0$

Similarly, we do other seven manufacturing enterprises.
Step 2. Using the robust ranking method, the fuzzy coefficients become as follows:

Table 1. Crisp inputs and outputs for the presented example**.**

Enterprises	Inputs		Outputs	
(DMUS)	MC	NOE	GOV	PQ
A	2167.5	1870	14735	4.05
B	1460	1340	12675	2.1
C	2565	2360	18205	4.225
D	2350	2020	15227.5	3.675
E	1520	1550	14207.5	1.875
F	2037.5	1760	14262.5	2.6
G	2255	1980	16820	3.4
H	2460	2250	17905	3.6

Step 3. Form the crisp linear programming model as follows.

$$Max\ U(u,v) = \ 2167.5u_1 + 1870u_2,\ S.t.$$

$$14735v_1 + 4.05v_2 = 1$$

$$\frac{1460u_1 + 1340u_2}{12675v_1 + 2.1v_2} \leq 1$$

$$\frac{2565u_1 + 2360u_2}{18205v_1 + 4.225v_2} \leq 1$$

$$\frac{2350u_1 + 2020u_2}{15227.5v_1 + 3.675v_2} \leq 1$$

$$\frac{1520u_1 + 1550u_2}{14207.5v_1 + 1.875v_2} \leq 1$$

$$\frac{2037.5u_1 + 1760u_2}{14262.5v_1 + 2.6v_2} \leq 1$$

$$\frac{2255u_1 + 1980u_2}{16820v_1 + 3.4v_2} \leq 1$$

$$\frac{2460u_1 + 2250u_2}{17905v_1 + 3.6v_2} \leq 1$$

$$u_1,\ u_2,\ v_1,\ v_2,\ \geq 0$$

Step 4. The optimal solution of the crisp model using Win QSB solver is obtained as follows.

Table 2. Efficiency scores for eight manufacturing enterprises.

No.	DMU	Score	Rank		Average	0.9522
1	A	1	1		Max	1
2	B	1	1		Min	0.8829
3	C	0.9551	5		St Dev	0.0466
4	D	0.9076	7			
5	E	1	1			

6	F	0.8829	8			
7	G	0.9582	4			
8	H	0.9136	6			

Conclusion

To conduct performance assessments in fuzzy environments from different perspectives, a computational procedure has been presented for some ranking functions to formulate and solve fuzzy DEA models. Based on robust ranking formulas, we convert the fuzzy DEA input and output from fuzzy form to crisp. Furthermore, a case study has presented as in [6] to assess the performance of the given (DMUs) which are to be evaluated in terms of the two inputs and the two outputs. So that will facilitate to make accurate decisions for the performance evaluation and decreasing the period of decision-making procedures

Abstract. Let M be a right module over a commutative ring R with identity. The spectrum of secondary modules is defined in this paper. Some connections between the algebraic properties of these modules and the topological properties of their spectrum are investigated.

1. Introduction

Throughout this work, all rings will be commutative rings with identity elements and all modules will be unitary right modules. A non-zero submodule N is called second if for any $a \in R$, $Na = N$ or $Na = 0$ [1]. Quasi-Zariski topology $\zeta^s(M) = \{V^s(A) \mid A$ is a submodule of $M\}$ is defined by using the set of all second submodules of a non-zero module M denoted by $spec^s(M)$ where $V^s(A) = \{N \in spec^s(M) \mid N \subseteq A\}$ and M is called a module have quasi-Zariski topology or a cotop module or a top^s-module [2] and [3]. A non-zero submodule N is called secondary if for any $a \in R$, $Na = N$ or $Na^t = 0$ for some positive integer t [4].

Our concern in these papers is to study the set of all secondary submodules of a non-zero module M which is called the secondary spectrum of M denoted by $spec^y(M)$ and topologize $spec^y(M)$.

In section two, we define $V^y(A)$ is the set of all secondary submodules of M contained in a submodule A and we call it the variety of A and denoted by $V^y(A) = \{N \in spec^y(M) \mid N \subseteq A\}$. Also we define the set of all secondary submodules of M not contained in A and denoted by $X^y(A) = \{N \in spec^y(M) \mid N \nsubseteq A\} = spec^y(M) - V^y(A)$. We give several examples of the sets $V^y(A)$ and $X^y(A)$. Among other results we show that $V^y(A)$ of an atomic module M have a maximal element (Proposition 2.7). Next, we define modules have $\circledast$ condition by using the concept of varieties of submodules. Various properties and examples of this concept are produced (Remarks and Examples 2.10) and we give a characterization of this class of modules (Theorem 2.11). In section three, $spec^y(M)$ is topologized to get the class of top^y-modules. We give a description of top^y-modules (Theorem 3.9). Many results about this type of modules are given in this section (Proposition 3.12, Proposition 3.13. and Proposition 3.17).

In what follows, $\mathbb{Z}$, $\mathbb{Q}$, $\mathbb{Z}_{p^\infty}$, $\mathbb{Z}_n$, " $\subseteq$ " we denote respectively, integers, rational numbers, the p-Prufer group, the residue ring modulo n and inclusion.

2. Secondary Spectrum and $\circledast$ condition

Definition (2.1) [2]: M is secondless module if M has no second submodules.

Definition (2.2): M is secondaryless module if M has no secondary submodules.

Proposition (2.3): Every secondaryless module is secondless.
Proof. Let M be a secondaryless module. Suppose M is not secondless implies that M contains a second submodule N so that N is secondary which is contradict that $spec^{y}(M) = \emptyset$.

Remarks and Examples (2.4):

(1) Clearly, if M is secondaryless module (and hence secondless) then $spec^{y}(M) = V^{y}(M) = V^{y}(A) = \{\emptyset\}$ for each submodule A of . As special case, $M = \mathbb{Z}$ as $\mathbb{Z}$-module.

(2) If M is simple module then $spec^{y}(M) = V^{y}(M) = \{M\}$, $V^{y}(< 0 >) = \{\emptyset\}$ and $X^{y}(M) = \{\emptyset\}$, $X^{y}(< 0 >) = spec^{y}(M) = \{M\}$. For instance, $M = \mathbb{Z}_p$ as $\mathbb{Z}$-module.

(3) Consider $\mathbb{Z}_4 = \mathbb{Z}_{2^2}$ as $\mathbb{Z}$-module where $spec^{y}(\mathbb{Z}_4) = V^{y}(\mathbb{Z}_4) = \{< \bar{2} >, \mathbb{Z}_4\}$, $V^{y}(< \bar{2} >) = \{< \bar{2} >\}$ $V^{y}(< \bar{0} >) = \{\emptyset\}$ and $X^{y}(\mathbb{Z}_4) = \{\emptyset\}$, $X^{y}(< \bar{2} >) = \{\mathbb{Z}_4\}$ and $X^{y}(< \bar{0} >) = spec^{y}(\mathbb{Z}_4) = \{< \bar{2} >, \mathbb{Z}_4\}$.

(4) Consider $\mathbb{Z}_8 = \mathbb{Z}_{2^3}$ as $\mathbb{Z}$-module where $spec^{y}(\mathbb{Z}_8) = V^{y}(\mathbb{Z}_8) = \{< \bar{4} >, < \bar{2} >, \mathbb{Z}_8\}$, $V^{y}(< \bar{4} >) = \{< \bar{4} >\}$, $V^{y}(< \bar{2} >) = \{< \bar{4} >, < \bar{2} >\}$, $V^{y}(< \bar{0} >) = \{\emptyset\}$ and $X^{y}(\mathbb{Z}_8) = \{\emptyset\}$ and $X^{y}(< \bar{4} >) = \{< \bar{2} >, \mathbb{Z}_8\}$, $X^{y}(< \bar{2} >) = \{\mathbb{Z}_8\}$, $X^{y}(< \bar{0} >) = spec^{y}(\mathbb{Z}_8)$.

(5) $\mathbb{Z}_9 = \mathbb{Z}_{3^2}$ as $\mathbb{Z}$-module where $spec^{y}(\mathbb{Z}_9) = spec^{y}(\mathbb{Z}_{3^2}) = \{< \bar{3} >, \mathbb{Z}_9\}$

(6) $spec^{y}(\mathbb{Z}_{p^n}) = \{< \overline{p^t} > \mid t = 0,1, \dots, n-1\}$, where $\mathbb{Z}_{p^n}$ as $\mathbb{Z}$-module for some p a prime number and n is a positive integer. For example, $\mathbb{Z}_{16} = \mathbb{Z}_{2^4}$ as $\mathbb{Z}$-module where $spec^{y}(\mathbb{Z}_{16}) = spec^{y}(\mathbb{Z}_{2^4}) = \{< \overline{2^t} > \mid t = 0,1, \dots, 3\}, = \{< \overline{2^0} >, < \overline{2^1} >, < \overline{2^2} >, < \overline{2^3} >\} = \{\mathbb{Z}_{16}, < \bar{2} >, < \bar{4} >, < \bar{8} >\}$. For more example, see examples (3), (4) and (5).

(7) Since every submodule in $\mathbb{Z}_{p^n}$ and $\mathbb{Z}_{p^m}$ as $\mathbb{Z}$-modules are of the form $< \overline{p^t} >$ and $< \overline{p^s} >$ respectively where n, m are fixed positive integers and t, s are any positive integers and p is a prime number so every submodule of $\mathbb{Z}_{p^n} \oplus \mathbb{Z}_{p^m}$ can be written $< (\overline{p^t}\, r,\ \overline{p^s}\, d) >$ where $\mathbb{Z}_{p^n} \oplus \mathbb{Z}_{p^m} = \{(\overline{p^t}\, r,\ \overline{p^s}\, d) \mid$ for some positive integers t and s and $r, d \in \mathbb{Z}$ $\}$ as $\mathbb{Z}$-module and hence $V^{y}(< (\overline{p^t}\, r,\ \overline{p^s}\, d) >) = \{< (\overline{p^c}\, r, \overline{p^k}\, d) > \neq < 0,0 >\}$ for each positive integers $c \leq t$ and $k \leq s$.

(8) $spec^{y}(\mathbb{Z}_p \oplus \mathbb{Z}_p) = V^{y}(\mathbb{Z}_p \oplus \mathbb{Z}_p) = \{0 \oplus \mathbb{Z}_p, \mathbb{Z}_p \oplus 0, \mathbb{Z}_p \oplus \mathbb{Z}_{p,} < (\bar{1}, \bar{1}) >\}$, $V^{y}(\mathbb{Z}_p \oplus 0) = \{\mathbb{Z}_p \oplus 0\}$, $V^{y}(0 \oplus \mathbb{Z}_p) = \{0 \oplus \mathbb{Z}_p\}$, $V^{y}(< (\bar{1}, \bar{1}) >) = \{< (\bar{1}, \bar{1}) >\}$ and $V^{y}(0 \oplus 0) = \{\emptyset\}$ and $X^{y}(\mathbb{Z}_p \oplus \mathbb{Z}_p) = \{\emptyset\}$, $X^{y}(\mathbb{Z}_p \oplus 0) = \{\mathbb{Z}_p \oplus \mathbb{Z}_p, 0 \oplus \mathbb{Z}_p, < (\bar{1}, \bar{1}) >\}$, $X^{y}(0 \oplus \mathbb{Z}_p) = \{\mathbb{Z}_p \oplus \mathbb{Z}_p, \mathbb{Z}_p \oplus 0, < (\bar{1}, \bar{1}) >\}$, $X^{w}(< (\bar{1}, \bar{1}) >) = \{0 \oplus \mathbb{Z}_p, \mathbb{Z}_p \oplus 0, \mathbb{Z}_p \oplus \mathbb{Z}_p\}$ and $X^{y}(0 \oplus 0) = spec^{y}(\mathbb{Z}_p \oplus \mathbb{Z}_p)$.

(9) $spec^{y}(\mathbb{Z}_6) = V^{y}(\mathbb{Z}_6) = \{< \bar{2} >, < \bar{3} >\}$, $V^{y}(< \bar{2} >) = \{< \bar{2} >\}$, $V^{y}(< \bar{3} >) = \{< \bar{3} >\}$, $V^{y}(< \bar{0} >) = \{\emptyset\}$ and $X^{y}(\mathbb{Z}_6) = \{\emptyset\}$, $X^{y}(< \bar{2} >) = \{< \bar{3} >\}$, $X^{y}(< \bar{3} >) = \{< \bar{2} >\}$, $X^{y}(< \bar{0} >) = spec^{y}(\mathbb{Z}_6)$ where $\mathbb{Z}_6$ as $\mathbb{Z}$-module.

(10) $spec^{y}(\mathbb{Z}_{12}) = V^{y}(\mathbb{Z}_{12}) = \{< \bar{4} >, < \bar{6} >, < \bar{3} >\}$, $V^{y}(< \bar{2} >) = \{< \bar{4} >, < \bar{6} >\}$, $V^{y}(< \bar{3} >) = \{< \bar{6} >, < \bar{3} >\}$ $V^{y}(< \bar{6} >) = \{< \bar{6} >\}$, $V^{y}(< \bar{4} >) = \{< \bar{4} >\}$, $V^{y}(< \bar{0} >) = \{\emptyset\}$ $X^{y}(\mathbb{Z}_{12}) = \{\emptyset\}$, $X^{y}(< \bar{2} >) = \{< \bar{3} >\}$ $X^{y}(< \bar{3} >) = \{< \bar{4} >\}$, $X^{y}(< \bar{6} >) = \{< \bar{4} >, < \bar{3} >\}$ $X^{y}(< \bar{4} >) = \{< \bar{6} >, < \bar{3} >\}$ and $X^{y}(< \bar{0} >) = spec^{y}(\mathbb{Z}_{12})$ where $\mathbb{Z}_{12}$ as $\mathbb{Z}$-module.

(11) $spec^{y}(\mathbb{Z}_{p^\infty}) = V^{y}(\mathbb{Z}_{p^\infty}) = \left\{< \frac{1}{p^n} + \mathbb{Z} > \mid n = 1,2, \dots.\right\} \cup \{\mathbb{Z}_{p^\infty}\}$ where every submodule of $\mathbb{Z}_{p^\infty}$ of the form $< \frac{1}{p^n} + \mathbb{Z} >= \{r.\left(\frac{1}{p^n} + \mathbb{Z}\right) \mid r \in \mathbb{Z}\}$, $V^{y}\left(< \frac{1}{p^n} + \mathbb{Z} >\right) = \{< \frac{1}{p^m} + \mathbb{Z} > \mid m = 1,2, \dots. n\}$, $V^{y}\left(0_{\mathbb{Z}_{p^\infty}}\right) = \emptyset$ and $X^{y}(\mathbb{Z}_{p^\infty}) = \{\emptyset\}$,

$X^y\left(<\frac{1}{p^n}+\mathbb{Z}>\right)=\left\{<\frac{1}{p^m}+\mathbb{Z}>, \mathbb{Z}_{p^\infty}\right\}$ for each positive integer $m>n$ and $X^y\left(0_{\mathbb{Z}_{p^\infty}}\right)=spec^y\left(\mathbb{Z}_{p^\infty}\right)$ where $\mathbb{Z}_{p^\infty}$ as $\mathbb{Z}$-module.

(12) $spec^y\left(\mathbb{Z}_{p^\infty}\oplus\mathbb{Z}_{p^\infty}\right)=V^y\left(\mathbb{Z}_{p^\infty}\oplus\mathbb{Z}_{p^\infty}\right)=\{\mathbb{Z}_{p^\infty}\oplus\mathbb{Z}_{p^\infty}, \mathbb{Z}_{p^\infty}\oplus 0, <\frac{1}{p^n}+\mathbb{Z}>\oplus 0,\ 0\oplus\mathbb{Z}_{p^\infty},\ 0\oplus<\frac{1}{p^m}+\mathbb{Z}>, <(\frac{1}{p^n}+\mathbb{Z},\frac{1}{p^m}+\mathbb{Z})>\}$, $V^y\left(\mathbb{Z}_{p^\infty}\oplus 0\right)=\{\mathbb{Z}_{p^\infty}\oplus 0, <\frac{1}{p^n}+\mathbb{Z}>\oplus 0\}$, $V^y\left(0\oplus\mathbb{Z}_{p^\infty}\right)=\{0\oplus\mathbb{Z}_{p^\infty},\ 0\oplus<\frac{1}{p^m}+\mathbb{Z}>\}$ for each positive integer n,m and $V^y\left(<\frac{1}{p^n}+\mathbb{Z}>\oplus 0\right)=\{<\frac{1}{p^i}+\mathbb{Z}>\oplus 0\}$, $V^y\left(0\oplus<\frac{1}{p^m}+\mathbb{Z}>\right)=\{0\oplus<\frac{1}{p^j}+\mathbb{Z}>\}$ and $V^y\left(<(\frac{1}{p^n}+\mathbb{Z},\frac{1}{p^m}+\mathbb{Z})>\right)=\{<(\frac{1}{p^i}+\mathbb{Z},\frac{1}{p^j}+\mathbb{Z})>, <(\frac{1}{p^i}+\mathbb{Z},0)>, <(0,\frac{1}{p^j}+\mathbb{Z})>\}$ for each positive integers $i\le n$, $j\le m$ and p any prime numbers where $\mathbb{Z}_{p^\infty}\oplus\mathbb{Z}_{p^\infty}$ as $\mathbb{Z}$-module.

(13) Let $p\neq q$ any prime numbers then $spec^y\left(\mathbb{Z}_{p^\infty}\oplus\mathbb{Z}_{q^\infty}\right)=V^y\left(\mathbb{Z}_{p^\infty}\oplus\mathbb{Z}_{q^\infty}\right)=\left\{\mathbb{Z}_{p^\infty}\oplus\mathbb{Z}_{q^\infty}, \mathbb{Z}_{p^\infty}\oplus 0, <\frac{1}{p^n}+\mathbb{Z}>\oplus 0,\ 0\oplus\mathbb{Z}_{q^\infty},\ 0\oplus<\frac{1}{q^m}+\mathbb{Z}>\right\}$, $V^y\left(\mathbb{Z}_{p^\infty}\oplus 0\right)=\left\{\mathbb{Z}_{p^\infty}\oplus 0, <\frac{1}{p^n}+\mathbb{Z}>\oplus 0\right\}$, $V^y\left(0\oplus\mathbb{Z}_{q^\infty}\right)=\left\{0\oplus\mathbb{Z}_{q^\infty},\ 0\oplus<\frac{1}{q^m}+\mathbb{Z}>\right\}$ for each positive integer n and m, $V^y\left(<\frac{1}{p^n}+\mathbb{Z}>\oplus 0\right)=\left\{<\frac{1}{p^i}+\mathbb{Z}>\oplus 0\right\}$, $V^y\left(0\oplus<\frac{1}{q^m}+\mathbb{Z}>\right)=\left\{0\oplus<\frac{1}{q^j}+\mathbb{Z}>\right\}$, $V^y\left(<\frac{1}{p^n}+\mathbb{Z},\ \frac{1}{q^m}+\mathbb{Z}>\right)=\left\{<\frac{1}{p^i}+\mathbb{Z}>\oplus 0,\ 0\oplus<\frac{1}{q^j}+\mathbb{Z}>\right\}$ for each positive integers $i\le n,\ j\le m$ where $\mathbb{Z}_{p^\infty}\oplus\mathbb{Z}_{q^\infty}$ as $\mathbb{Z}$-module.

(14) $spec^y\left(\mathbb{Z}_{p^\infty}\oplus<\frac{1}{p}+\mathbb{Z}>\right)=V^y\left(\mathbb{Z}_{p^\infty}\oplus<\frac{1}{p}+\mathbb{Z}>\right)=\{\mathbb{Z}_{p^\infty}\oplus 0, <\frac{1}{p^n}+\mathbb{Z}>\oplus 0, <\frac{1}{p^n}+\mathbb{Z}>\oplus<\frac{1}{p}+\mathbb{Z}>, 0\oplus<\frac{1}{p}+\mathbb{Z}>\}$, $V^y\left(\mathbb{Z}_{p^\infty}\oplus 0\right)=\{\mathbb{Z}_{p^\infty}\oplus 0, <\frac{1}{p^n}+\mathbb{Z}>\oplus 0\}$,$V^y\left(0\oplus<\frac{1}{p}+\mathbb{Z}>\right)=\{0\oplus<\frac{1}{p}+\mathbb{Z}>\}$, $V^y\left(<\frac{1}{p^n}+\mathbb{Z}>\oplus 0\right)=\{<\frac{1}{p^i}+\mathbb{Z}>\oplus 0\}$, $V^y\left(<\frac{1}{p^n}+\mathbb{Z}>\oplus<\frac{1}{p}+\mathbb{Z}>\right)=\{<\frac{1}{p^i}+\mathbb{Z}>\oplus<\frac{1}{p}+\mathbb{Z}>, <\frac{1}{p^i}+\mathbb{Z}>\oplus 0,\ 0\oplus<\frac{1}{p}+\mathbb{Z}>\}$for each positive integer $i\le n$ and any prime number p where $\mathbb{Z}_{p^\infty}\oplus<\frac{1}{p}+\mathbb{Z}>$ as $\mathbb{Z}$-module.

Recall that M is called an atomic module if every non-zero submodule A of M, then A contains a simple submodule [4].

Proposition (2.5): Let M be an atomic module. For any submodule A of M, if $V^y(A)=\emptyset$ then $A=0$.

Proof. Assume $V^y(A)=\emptyset$ Suppose that $A\neq 0$ so there exists a simple submodule B of M such that $B\subseteq A$ implies $B\in V^y(A)$ and thus $V^y(A)\neq\emptyset$ which is a contradiction so that $A=0$.

Definition (2.6): N is called a maximal submodule under A if N is a maximal element in $V^y(A)$.

Before we give the following result, we refer that the set $[N:_R M]=\{r\in R$ and $Mr\subseteq N\}$ is an ideal of the ring R where M is an R-module and N is a submodule of M.

Proposition (2.7): Let M be an atomic R-module. Then for every non-zero submodule A of M, there exists $N\in spec^y(M)$ such that N is maximal under A.

Proof. Suppose that $0\neq A$ is a submodule of M thus $S(A)=\{B\in S(M)\,|\,B\subseteq A\}\neq\emptyset$ where $S(M)$ is the set of all simple submodules of M. Since $S(M)\subseteq spec^y(M)$ implies $S(A)\subseteq V^y(A)$ means that $V^y(A)\neq\emptyset$. Let $N_1\subseteq N_2\subseteq\cdots$ be an ascending chain in $V^y(A)$

means N_i is a secondary submodule of M for each $= 1,2, \dots$. We claim $\bigcup_{i=1}^{\infty} N_i = N$ is a maximal submodule under A. To prove this, since $N_i \subseteq A$ for each $i = 1,2, \dots$ implies that $N \subseteq A$. Next we show that $[0:_R N] = \bigcap_{i=1}^{\infty}[0:_R N_i]$ for each submodule $N_i \not\supseteq N$ in M. Let $I = [0:_R N]$ then $NI = 0$ so we have $N_i I \subseteq NI = 0$ and hence $I \subseteq [0:_R N_i]$ for each i thus $I \subseteq \bigcap_{i=1}^{\infty}[0:_R N_i]$. The reverse inclusion, let $a \in \bigcap_{i=1}^{\infty}[0:_R N_i]$ then $a \in [0:_R N_i]$ implies $N_i a = 0$ for each i so that for each $n \in N = \bigcup_{i=1}^{\infty} N_i$ then $n \in N_i$ for some i and $na = 0$ it follows that $Na = 0$ means $a \in [0:_R N]$ as desired. Now we show that $\bigcap_{i=1}^{\infty}[0:_R N_i]$ is a primary ideal of R. Let $ab \in \bigcap_{i=1}^{\infty}[0:_R N_i]$ then $ab \in [0:_R N_i]$ so we already have $a \in [0:_R N_i]$ or $b^t \in [0:_R N_i]$ because N_i is a secondary submodule so that $[0:_R N_i]$ is a primary ideal and thus $a \in \bigcap_{i=1}^{\infty}[0:_R N_i]$ or $b^t \in \bigcap_{i=1}^{\infty}[0:_R N_i]$. This means $\bigcap_{i=1}^{\infty}[0:_R N_i] = [0:_R N]$ is a primary ideal and hence N is a secondary submodule. By Zorn's lemma, $V^y(A)$ has maximal N as desired.

Definition (2.8): We call that M is a module satisfies $\circledast$ condition if for any two submodules A and B of M with $V^y(A) = V^y(B)$ implies $A = B$. Equivalently, M satisfies $\circledast$ condition if for any two submodules $A \neq B$ implies $V^y(A) \neq V^y(B)$.

Theorem (2.9): If every non-zero submodule of M is secondary then M satisfies $\circledast$ condition.
Proof. If $A \neq 0 \neq N$ such that $V^y(A) = V^y(N)$ so we have $A \in V^y(A) = V^y(N)$ and hence $A \subseteq N$. Similarly, $N \in V^y(N) = V^y(A)$ implies $N \subseteq A$ and thus $N = A$ as desired.

Remarks and Examples (2.10):

(1) $\mathbb{Z}_6$ as $\mathbb{Z}$-module satisfies $\circledast$ condition because for any two submodules $A \neq B$ in $\mathbb{Z}_6$ implies $V^y(A) \neq V^y(B)$, however $\mathbb{Z}_6$ is not a secondary submodule.
(2) Every simple module satisfies $\circledast$ condition.
(3) Every submodule of $\mathbb{Z}$ does not satisfies $\circledast$ condition since for each submodule A of $\mathbb{Z}$, $V^y(A) = \emptyset$.
(4) Let $N \subseteq H \subseteq M$ be submodules of a module M. If N satisfies $\circledast$ condition then H need not be satisfies $\circledast$ condition. For example, the submodule $< \bar{4} >$ is a simple submodule of $< \bar{2} >$ in $\mathbb{Z}_{12}$ as $\mathbb{Z}$-module, then $< \bar{4} >$ satisfies $\circledast$ condition while $< \bar{2} >$ not satisfies $\circledast$ condition because $V^y(< \bar{4} >) = V^y(< \bar{2} >) = \{< \bar{4} >\}$.
(5) If a module satisfies $\circledast$ condition then every submodule is also satisfies $\circledast$ condition.

Proof. Let M be a module satisfies $\circledast$ condition with $V^y(A) = V^y(B)$ where A and B are submodules of M contained in N so we have $A = B$ in N.

Theorem (2.11): We have the following equivalent

(1) M is a module satisfies $\circledast$ condition.
(2) Every non-zero submodule of M can be represented as sum of secondary submodules.

Proof. (1) $\Rightarrow$ (2) Let $0 \neq N$ be a submodule of M, then $V^y(N) \neq \emptyset$ because if not then $V^y(N) = \emptyset = V^y(0)$ so by $\circledast$ condition $N = 0$ which is a contradiction. Let $B \in V^y(\sum_{A \in V^w(N)} A)$. Since for each $A \in V^y(N)$ we have $A \subseteq N$ follows $B \subseteq (\sum_{A \in V^y(N)} A) \subseteq N$ and so $B \in V^y(N)$. Now, let $B \in V^y(N)$ and thus $B \subseteq \sum_{A \in V^w(N)} A$ implies $B \in V^y(\sum_{A \in V^y(N)} A)$ that is $V^y(N) = V^y(\sum_{A \in V^y(N)} A)$ so by $\circledast$ condition we get $N = \sum_{A \in V^y(N)} A$.
(2) $\Rightarrow$ (1) Let $V^y(N) = V^y(A)$ for any submodules N and A of M so by hypothesis, $N = \sum_{i \in \Lambda} N_i$ and $A = \sum_{j \in \Lambda} A_j$ where N_i and A_j are secondary of M for each $i, j \in \Lambda$. Now, since $N_i \subseteq N$ and $A_j \subseteq A$ for each $i, j \in \Lambda$ implies that $N_i \in V^y(N)$ and $A_j \in V^y(A)$ and hence $N = \sum_{N_i \in V^y(N)} N_i$ and $A = \sum_{A_j \in V^y(A)} A_j$. Let $B \subseteq N$ then for some i, we have $B = \sum_{N_i \in V^y(N)} N_i = \sum_{N_i \in V^y(A)} N_i \subseteq A$ so that $B \subseteq A$ and vice versa if $B \subseteq A$ then similarly we have $B \subseteq N$ and hence $N = A$ as desired.

Recall that M is called a semisimple module if every submodule of M is a sum of simple submodules [5].

So we have already the following

Corollary (2.12): Every semisimple module satisfies $\circledast$ condition.

The converse of Corollary (2.12) is not hold in general

Example (2.13): $\mathbb{Z}_4$ as $\mathbb{Z}$-module satisfies $\circledast$ condition but $\mathbb{Z}_4$ is not semisimple.

Recall that M is called multiplication when each submodule N of M, we have $N = MI$ for an ideal I of R [6].

Corollary (2.14): When M is a faithful finitely generated multiplication R-module. The following are equivalent

(1) M satisfies $\circledast$ condition.

(2) R satisfies $\circledast$ condition.

Proof. (1) $\Rightarrow$ (2) Let I and J be ideals of R such that $V^{\mathcal{Y}}(I) = V^{\mathcal{Y}}(J)$. We claim that $V^{\mathcal{Y}}(MI) = V^{\mathcal{Y}}(MJ)$. Let $N \in V^{\mathcal{Y}}(MI)$ then $N \subseteq MI$ implies $N = MK$ for ideal K of R so we have $MK \subseteq MI$. So by [6, Theorem 3.1], we have $K \subseteq I$ and thus $K \in V^{\mathcal{Y}}(I) = V^{\mathcal{Y}}(J)$ and hence $K \subseteq J$ that is $MK \subseteq MJ$. Therefore $N \in V^{\mathcal{Y}}(MJ)$ and similarly for the reverse inclusion. Hence R satisfies the $\circledast$ condition.

(3) $\Rightarrow$ (1) The proof is similar way.

(4)

Example (2.15): $\mathbb{Z}_4$ as $\mathbb{Z}$-module satisfies $\circledast$ condition but $\mathbb{Z}$ is not satisfies $\circledast$ condition where $ann_{\mathbb{Z}}(\mathbb{Z}_4) = 4\mathbb{Z}$ that is, $\mathbb{Z}_4$ is not faithful. This shows that the faithful condition in Corollary (2.14) cannot be dropped.

Proposition (2.16): Let A and B be submodules of M. If $A \subseteq B$ then $V^{\mathcal{Y}}(A) \subseteq V^{\mathcal{Y}}(B)$ and hence $X^{\mathcal{Y}}(A) \supseteq X^{\mathcal{Y}}(B)$.

Proof. Let $N \in V^{\mathcal{Y}}(A)$ then $N \subseteq B$ and so $N \in V^{\mathcal{Y}}(B)$. Now, $X^{\mathcal{Y}}(B) = spec^{\mathcal{Y}}(M) - V^{\mathcal{Y}}(B) \supseteq spec^{\mathcal{Y}}(M) - V^{\mathcal{Y}}(A) = X^{\mathcal{Y}}(A)$.

Proposition (2.17): Let A and B be submodules of M where any cyclic submodule of M is secondary. If $V^{\mathcal{Y}}(A) \subseteq V^{\mathcal{Y}}(B)$ then $A \subseteq B$.

Proof. Let $m \in A$ then $R_m \subseteq A$ (where R_m is the cyclic submodule generated by the element m) implies $R_m \in V^{\mathcal{Y}}(A) \subseteq V^{\mathcal{Y}}(B)$ so that $R_m \subseteq B$ means that $m \in B$ as desired.

Corollary (2.18): Let M be a module with every cyclic submodule is secondary. Then M satisfies $\circledast$ condition.

Proof. Let $V^{\mathcal{Y}}(A) = V^{\mathcal{Y}}(B)$ so the rest follows by Proposition (2.17) as required.

Example (2.19): $\mathbb{Z}_6$ as $\mathbb{Z}$-module satisfies $\circledast$ condition and $\mathbb{Z}_6$ is a cyclic submodule of $\mathbb{Z}_6$ but it is not secondary.

3. Top$^{\mathcal{Y}}$-module

For every submodule A of M if we collect all varieties $V^{\mathcal{Y}}(A)$ of $spec^{\mathcal{Y}}(M)$ in the set denoted by $\zeta^{\mathcal{Y}}(M)$ then $\zeta^{\mathcal{Y}}(M)$ always contains the empty set and $spec^{\mathcal{Y}}(M)$. And $\zeta^{\mathcal{Y}}(M)$ closed under the intersections for any collection of submodules $\{A_\alpha\}_{\alpha\in\Lambda}$ of M, that is, $\bigcap_{\alpha\in\Lambda} V^{\mathcal{Y}}(A_\alpha) = V^{\mathcal{Y}}(A)$ for some submodule A of M. It is not hard to see that $\bigcap_{\alpha\in\Lambda} V^{\mathcal{Y}}(A_\alpha) = V^{\mathcal{Y}}(\bigcap_{\alpha\in\Lambda} A_\alpha)$ for any collection of submodules $\{A_\alpha\}_{\alpha\in\Lambda}$ of M. Further, $V^{\mathcal{Y}}(A) \cup V^{\mathcal{Y}}(B) \subseteq V^{\mathcal{Y}}(A + B)$ for any two submodules A and B of M. If the other inclusion in the last relation is hold, then $\zeta^{\mathcal{Y}}(M)$ will be a topology on $spec^{\mathcal{Y}}(M)$ and hence the ordered pair $(spec^{\mathcal{Y}}(M), \zeta^{\mathcal{Y}}(M))$ is a topological space. For in this case, the varieties $V^{\mathcal{Y}}(A)$ will be

closed sets in $(spec^{\mathcal{Y}}(M), \zeta^{\mathcal{Y}}(M))$ and $X^{\mathcal{Y}}(A) = spec^{\mathcal{Y}}(M) - V^{\mathcal{Y}}(A)$ are the open sets so that if $\tau^{\mathcal{Y}}(M)$ is the set of all open sets $X^{\mathcal{Y}}(A)$ then $(spec^{\mathcal{Y}}(M), \tau^{\mathcal{Y}}(M))$ is a topological space in that situation above. This led us to give the following concept.

Definition (3.1): M is called a top$^{\mathcal{Y}}$-module if for any submodules A and B of M there exists a submodule C of M such that $V^{\mathcal{Y}}(A) \cup V^{\mathcal{Y}}(B) = V^{\mathcal{Y}}(C)$. In other word, M is a top$^{\mathcal{Y}}$-module if $\zeta^{\mathcal{Y}}(M)$ is closed under finite unions.

Remarks and Examples (3.2):

(1) When M is simple module then $\zeta^{\mathcal{Y}}(M) = \{spec^{\mathcal{Y}}(M), \emptyset\} = \tau^{\mathcal{Y}}(M)$ is an indiscrete topology on $spec^{\mathcal{Y}}(M)$ and so that M is a top$^{\mathcal{Y}}$-module. Especially, take $M = \mathbb{Z}_p$ as $\mathbb{Z}$-module.

(2) Clearly, if M is a secondaryless module (and hence secondless) then $(spec^{\mathcal{Y}}(M), \tau^{\mathcal{Y}}(M))$ is a trivial topological space and hence M is a top$^{\mathcal{Y}}$-module.

(3) Let $\mathbb{Z}_4$ be a $\mathbb{Z}$-module. Then $\zeta^{\mathcal{Y}}(\mathbb{Z}_4) = \{spec^{\mathcal{Y}}(\mathbb{Z}_4), \{< \bar{2} >\}, \emptyset\} = \tau^{\mathcal{Y}}(\mathbb{Z}_4)$ i is topology on $spec^{\mathcal{Y}}(\mathbb{Z}_4)$ and hence $\mathbb{Z}_4$ is a top$^{\mathcal{Y}}$-module.

(4) Let $\mathbb{Z}_8$ as a $\mathbb{Z}$-module. Then $\zeta^{\mathcal{Y}}(\mathbb{Z}_8) = \{spec^{\mathcal{Y}}(\mathbb{Z}_8), \{< \bar{4} >, < \bar{2} >\}, \{< \bar{4} >\} \emptyset\} = \tau^{\mathcal{Y}}(\mathbb{Z}_8)$ is topology on $spec^{\mathcal{Y}}(\mathbb{Z}_8)$ and hence $\mathbb{Z}_8$ is a top$^{\mathcal{Y}}$-module.

(5) Let $\mathbb{Z}_6$ as a $\mathbb{Z}$-module. Then $\zeta^{\mathcal{Y}}(\mathbb{Z}_6) = \{spec^{\mathcal{Y}}(\mathbb{Z}_6), \emptyset, \{< \bar{2} >\}, \{< \bar{3} >\}\} = \tau^{\mathcal{Y}}(\mathbb{Z}_6)$ implies $(spec^{\mathcal{Y}}(\mathbb{Z}_6), \tau^{\mathcal{Y}}(\mathbb{Z}_6))$ is a discrete topological space so $\mathbb{Z}_6$ is a top$^{\mathcal{Y}}$-module.

(6) Let $\mathbb{Z}_{12}$ as a $\mathbb{Z}$-module. Then $\zeta^{\mathcal{Y}}(\mathbb{Z}_{12}) = \{spec^{\mathcal{Y}}(\mathbb{Z}_{12}), \emptyset, \{< \bar{4} >\}, \{< \bar{6} >\}, \{< \bar{4} >, < \bar{6} >\}, \{< \bar{3} >, < \bar{6} >\} = \tau^{\mathcal{Y}}(\mathbb{Z}_{12})$ is topology on $spec^{\mathcal{Y}}(\mathbb{Z}_{12})$.

(7) Let $\mathbb{Z}_{p^\infty}$ as $\mathbb{Z}$-module. Then $\zeta^{\mathcal{Y}}(\mathbb{Z}_{p^\infty}) = \{spec^{\mathcal{Y}}(\mathbb{Z}_{p^\infty}), \emptyset, \{< \frac{1}{p^m} + \mathbb{Z} > | m = 1,2, \dots . n\}\}$ for some positive integers n and m.It is not hard to check that $\zeta^{\mathcal{Y}}(\mathbb{Z}_{p^\infty})$ is closed under finite unions. It follows that $\mathbb{Z}_{p^\infty}$ is a top$^{\mathcal{Y}}$-module.

(8) Let $\mathbb{Z}_p \oplus \mathbb{Z}_p$ as $\mathbb{Z}$-module for any p a prime number. Then $\zeta^{\mathcal{Y}}(\mathbb{Z}_p \oplus \mathbb{Z}_p) = \{spec^{\mathcal{Y}}(\mathbb{Z}_p \oplus \mathbb{Z}_p), \emptyset, \{\mathbb{Z}_p \oplus 0\}, \{0 \oplus \mathbb{Z}_p\}, \{< (\bar{1}, \bar{1}) >\}\}$ implies $\tau^{\mathcal{Y}}(\mathbb{Z}_p \oplus \mathbb{Z}_p) = \{spec^{\mathcal{Y}}(\mathbb{Z}_p \oplus \mathbb{Z}_p), \emptyset, \{\mathbb{Z}_p \oplus \mathbb{Z}_p, \mathbb{Z}_p \oplus 0 < (\bar{1}, \bar{1}) >, \}, \{\mathbb{Z}_p \oplus \mathbb{Z}_p, 0 \oplus \mathbb{Z}_p, < (\bar{1}, \bar{1}) >\}, \{0 \oplus \mathbb{Z}_p, \mathbb{Z}_p \oplus 0, \mathbb{Z}_p \oplus \mathbb{Z}_p\}\}$. We see that $\zeta^{\mathcal{Y}}(\mathbb{Z}_p \oplus \mathbb{Z}_p)$ is not closed under finite union because there not exists a submodule C of M, $V^{\mathcal{Y}}(\mathbb{Z}_p \oplus 0) \cup V^{\mathcal{Y}}(0 \oplus \mathbb{Z}_p) = V^{\mathcal{Y}}(C)$,and hence $(spec^{\mathcal{Y}}(\mathbb{Z}_p \oplus \mathbb{Z}_p), \zeta^{\mathcal{Y}}(\mathbb{Z}_p \oplus \mathbb{Z}_p))$ is not a top$^{\mathcal{Y}}$-module that is, $\mathbb{Z}_p \oplus \mathbb{Z}_p$ is not a topological space with respect to $\zeta^{\mathcal{Y}}(\mathbb{Z}_p \oplus \mathbb{Z}_p)$.

(9) Similarly of (8), $\mathbb{Z}_{p^\infty} \oplus \mathbb{Z}_{p^\infty}$, $\mathbb{Z}_{p^\infty} \oplus \mathbb{Z}_{q^\infty}$ and $\mathbb{Z}_{p^\infty} \oplus < \frac{1}{p} + \mathbb{Z} >$ are not top$^{\mathcal{Y}}$-module.

(10) Direct sum of top$^{\mathcal{Y}}$-modules may not be top$^{\mathcal{Y}}$. For example, $\mathbb{Z}_p$ as $\mathbb{Z}$-module is a top$^{\mathcal{Y}}$-module for any a prime number p but $\mathbb{Z}_p \oplus \mathbb{Z}_p$ is not a top$^{\mathcal{Y}}$-module by (8).

(11) If M is a top$^{\mathcal{Y}}$-module, then M need not be satisfies $\circledast$ condition. For example, $\mathbb{Z}$ is a top$^{\mathcal{Y}}$- $\mathbb{Z}$-module but $\mathbb{Z}$ is not satisfies $\circledast$ condition.

(12) If M satisfies $\circledast$ condition then M need not be a top$^{\mathcal{Y}}$-module. For example, $\mathbb{Z}_p \oplus \mathbb{Z}_p$ as $\mathbb{Z}$-module satisfies the $\circledast$ condition but it is not a top$^{\mathcal{Y}}$-module.

Definition (3.3) [7]: Let M be a module and A is a submodule of M. The socle of A is defined to be the sum of all second submodules of M contained in A denoted by $soc(A)$. In case A does not contain any second submodule, the socle of A is defined to be the zero submodule. If $A = soc(A)$, then A is called socle submodule of M.

Definition (3.4) [2]: A second submodule N of a module M is called extraordinary if whenever A and B are socle submodules of M such that $N \subseteq A + B$, then $N \subseteq A$ or $N \subseteq B$. So we can give the following

Definition (3.5): Let M be a module and A is a submodule of M. The secondary socle of A is defined to be the sum of all secondary submodules of M contained in A denoted by $Y.soc(A)$. In case A does not contain any secondary submodule, the secondary socle of A is defined to be the zero submodule. If $A = Y.soc(A)$, then A is called secondary socle submodule of M.

Note (3.6): It is clear that $soc(A) \subseteq Y.soc(A) \subseteq A$ for any submodule A of M

Definition (3.7): A secondary submodule N of a module M is called Y-extraordinary if A and B are secondary socle submodule of M such that $N \subseteq A + B$, then $N \subseteq A$ or $N \subseteq B$.
We conjecture that Y-extraordinary and extraordinary are independent concepts but have no examples to show this. However, we have the following

Remark (3.8): If $V^y(A) \bigcup V^y(B) = V^y(A + B)$ for any tow submodules A and B of a module M, then M is a top^y-module.

Proof. Directly by putting $C = A + B$ in Definition 3.1.
The following theorem shows that the converse of Remark 3.8 is hold in some circumstances.
Theorem (3.9): The following assertions are equivalent

(1) M is a top^y-module.
(2) Every secondary submodule of M is Y-extraordinary.
(3) $V^y(A) \bigcup V^y(B) = V^y(A + B)$ for any secondary socle submodules A and B of M.

Proof. (1) $\Rightarrow$ (2) Let N be secondary of M and let A and B are secondary socle submodule of M such that $N \subseteq A + B$. By (1), there exists a submodule C of M such that $V^y(A) \bigcup V^y(B) = V^y(C)$. Since A is a secondary socle submodule of M thus $A = \sum_{i\in\wedge} A_i$, for some collection of secondary submodules $\{A_i\}_{i\in\wedge}$. It is clear $A_i \in V^y(A) \subseteq V^y(C)$ for each $i \in\wedge$ implies $A_i \subseteq C$ and hence $A \subseteq$ C. By similar way, $B \subseteq$C it follows that $A + B \subseteq C$ and hence $V^y(A + B) \subseteq V^y(C) = V^y(A) \bigcup V^y(B)$ as desired.
(2) $\Rightarrow$ (3) We prove $V^y(A) \bigcup V^y(B) = V^y(A + B)$ for any secondary socle submodules A and B of M. Let $N \in V^y(A + B)$ implies $N \subseteq A + B$ but N is Y-extraordinary thus $N \subseteq A$ or $N \subseteq B$ that is, $N \in V^w(A) \bigcup V^w(B)$. The reverse inclusion is true always as desired.
(3) $\Rightarrow$ (1) It is clear.

Definition (3.10): [3] A non-zero submodule N of M is strongly hollow whenever $N \subseteq A + B$, then $N \subseteq A$ or $N \subseteq B$.

Every strongly hollow submodule is Y-extraordinary. However, we have the following result

Corollary (3.11): Consider the following.

(1) M is a top^y-module.
(2) Every secondary submodule of M is strongly hollow.
(3) $V^y(A) \bigcup V^y(B) = V^y(A + B)$ for any submodules A and B of M.
(4)

Proof. (2) $\Leftrightarrow$ (3), (3) $\Rightarrow$ (1) and (2) $\Rightarrow$ (1) it is clear, while (1) $\Rightarrow$ (2) is not hold in general for example, $\mathbb{Q}$ is a top^y $\mathbb{Z}$-module where $\mathbb{Q}$ is secondary but it is not strongly hollow since $\mathbb{Q} = \mathbb{Q}_p \bigoplus \mathbb{Q}^p$ but $\mathbb{Q} \neq \mathbb{Q}_p$ and $\mathbb{Q} \neq \mathbb{Q}^p$. for every prime number p , where $\mathbb{Q}_p$ is the submodule of $\mathbb{Q}$ consisting all rational numbers whose denominators are relatively prime to p and $\mathbb{Q}^p$ is the submodule of $\mathbb{Q}$ consisting all rational numbers whose denominators are powers of the prime p.

Theorem (3.12): Let M be a finitely generated faithful multiplication module. We have the equivalent

(1) M is a top^y-module.
(2) R is a top^y-ring.

Proof. (1) $\Rightarrow$ (2) Let I be a secondary ideal of R, $I \subseteq J + K$ for ideals J, and K of R implies $MI \subseteq M(J + K) = MJ + MK$. By (1), $MI \subseteq MJ$ or $MI \subseteq MK$ and hence $I \subseteq J$ or $I \subseteq K$ thus I is a strongly hollow ideal so by Proposition (3.11), R is a $\text{top}^{\mathcal{Y}}$-module.

(1) $\Rightarrow$ (2) Let N be a secondary submodule of M, $N \subseteq A + B$ so that $N = MI$, $A = MJ$ and $B = MK$ for ideals I, J, and K of R it follows that $MI \subseteq MJ + MK = M(J + K)$ but M is cancellation thus $I \subseteq J + K$. By (2) either $I \subseteq J$ or $I \subseteq K$ implies $MI \subseteq MJ$ or $MI \subseteq MK$ that is $N \subseteq A$ or $N \subseteq B$ means N is strongly hollow so by Proposition (3.11) M is a $\text{top}^{\mathcal{Y}}$-module.

Proposition (3.13): Let M be an R-module and S a subring of R with M is a $\text{top}^{\mathcal{Y}}$ S-module. Then M is a $\text{top}^{\mathcal{Y}}$ R-module.
Proof. Let N be secondary submodule of an R-module M and A, B are secondary socle submodules of M with $N \subseteq A + B$. Let S be a subring of of R, M is a $\text{top}^{\mathcal{Y}}$ S-module and let N be a secondary submodule of S-module M and A, B are secondary socle of S-module M so already hold $N \subseteq A$ or $N \subseteq B$ that is N is Y-extraordinary so by Theorem (3.9), M is a $\text{top}^{\mathcal{Y}}$-module.

Proposition (3.14): Every submodule of a $\text{top}^{\mathcal{Y}}$-module is also $\text{top}^{\mathcal{Y}}$-module.
Proof. Let N be a submodule of a $\text{top}^{\mathcal{Y}}$-module M and A is a secondary submodule of N implies A is secondary of M so by Theorem (3.9), A is Y-extraordinary of M and follows A is Y-extraordinary in N. Thus N is a $\text{top}^{\mathcal{Y}}$-module.

The convers of Proposition (3.14) is not hold in general as follows

Example (3.15): Let $N = <\frac{1}{p} + \mathbb{Z} > \oplus <\frac{1}{q} + \mathbb{Z} >$ be a submodule of $M = \mathbb{Z}_{p^\infty} \oplus \mathbb{Z}_{q^\infty}$ as $\mathbb{Z}$-module where $p \neq q$ are prime numbers. Then $spec^{\mathcal{Y}}(N) = \{<\frac{1}{p} + \mathbb{Z} > \oplus 0, 0 \oplus <\frac{1}{q} + \mathbb{Z} >\}$ then $V^{\mathcal{Y}}(A) \cup V^{\mathcal{Y}}(B) = V^{\mathcal{Y}}(A + B)$ for any secondary socle submodules A and B of N so N is $\text{top}^{\mathcal{Y}}$ but M is not $\text{top}^{\mathcal{Y}}$.

Proposition (3.16): Every $\text{top}^{\mathcal{Y}}$-module is a top^{s}-module.

Proof. Let $N \in V^s(A + B)$ where A and B submodules of $\text{top}^{\mathcal{Y}}$ M such that $A = soc(A)$ and $B = soc(B)$.Then $N \in V^s(A + B) \subseteq V^{\mathcal{Y}}(A + B)$ $A \subseteq soc(A) \subseteq Y.soc(A)$ and $B \subseteq soc(B) \subseteq Y.soc(B)$. But $V^{\mathcal{Y}}(A + B) = V^{\mathcal{Y}}(A) \cup V^{\mathcal{Y}}(B)$ it follows $N \in V^{\mathcal{Y}}(A)$ or $N \in V^{\mathcal{Y}}(B)$ that is $N \subseteq A$ or $N \subseteq B$ but N is second so $N \in V^s(A)$ or $N \in V^s(B)$ and hence $V^s(A + B) \subseteq V^s(A) \cup V^s(B)$ as desired.

Proposition (3.17): Every chained module is a $\text{top}^{\mathcal{Y}}$-module.

Proof. Let A and B be two submodules of a chained module M so either $A \subseteq B$ or $B \subseteq A$. If $A \subseteq B$ then $V^{\mathcal{Y}}(A) \subseteq V^{\mathcal{Y}}(B)$ and so $V^{\mathcal{Y}}(A) \cup V^{\mathcal{Y}}(B) = V^{\mathcal{Y}}(B)$ means M is a $\text{top}^{\mathcal{Y}}$-module.

Corollary (3.18): Let M be a chained module. Then the collections of open (closed) sets of $(spec^{\mathcal{Y}}(M), \zeta^{\mathcal{Y}}(M))$ form a chain.

Corollary (3.19): Let M be a chained module. Then $spec^{\mathcal{Y}}(M) = V^{\mathcal{Y}}(M)$ is an irreducible space.

Proof. Let $spec^{\mathcal{Y}}(M) = V_1 \cup V_2$ for some closed subsets V_1 and V_2 of $(spec^{\mathcal{Y}}(M), \zeta^{\mathcal{Y}}(M))$. Because M is a chained module so by Proposition (3.17), M is a $\text{top}^{\mathcal{Y}}$-module. This implies $V_1 = V^{\mathcal{Y}}(A)$ and $V_2 = V^{w}(B)$ for submodules A and B of M and so $spec^{\mathcal{Y}}(M) = V^{\mathcal{Y}}(A) \cup V^{\mathcal{Y}}(B)$. By Corollary (3.18), the collections of open (closed) sets of

$(spec^{y}(M),\zeta^{y}(M))$ form a chain. Therefore $spec^{y}(M) = V^{y}(A)$ or $spec^{y}(M) = V^{y}(B)$ as desired.

Conclusion

In this work we present overview study of spectrum of secondary submodules. We show the relationship between the algebraic properties of the modules and the topological properties of their spectrum.

A modified ARIMA model for forecasting chemical sales in the USA

A modified ARIMA model for forecasting chemical sales in the USA

Othman Mahdi Salah , Ghadeer Jasim Mohammed Mahdi , and Iman Ahmed Abud Al-Latif

Department of Mathematics, College of Education for Pure Sciences Ibn Al-Haitham, University of Baghdad, Baghdad, Iraq

E-mail: mahdighadeer@gmail.com

Abstract. model is derived, and the methodology is given in detail. The model is constructed depending on some measurement criteria, Akaike and Bayesian information criterion. For the new time series model, a new algorithm has been generated. The forecasting process, one and two steps ahead, is discussed in detail. Some exploratory data analysis is given in the beginning. The best model is selected based on some criteria; it is compared with some naïve models. The modified model is applied to a monthly chemical sales dataset (January 1992 to Dec 2019), where the dataset in this work has been downloaded from the United States of America census (www.census.gov). Ultimately, the forecasted sales for the next three years for chemical sales in the USA is provided.

1. Introduction

The autoregressive moving average (ARMA) and autoregressive integrated moving average (ARIMA) are among various methods used in the forecasting variables. ARMA/ARIMA predicts the trend using information obtained from the variables. Knowing and analyzing the probabilistic or stochastic, properties of the variable are required using ARIMA/ARIMA. These models are commonly known as the Box-Jenkins (1976) methodology [12]. Two assumptions should be assumed before fitting the model. First, the model is stationary. The series is said to be stationary if it exhibits the mean reversions, has a finite variance and has a theoretical correlogram that diminishes as the length increases. Second, invertibility assumption is required. Invertibility is essential such that a finite order can represent the series.

ARMA model is a component of two distinct models explain the behaviour of a series for two different perspectives: the autoregressive (AR) and the moving average (MA) models. MA combines the dependency between the residual error from a moving average model and an observation. The difference between ARMA and ARIMA is the integration component which brings us back to the subject of stationary. ARIMA model is a word of three parts AR, MA, and the integrate (I). It refers to the differencing of raw data points to allow the stationarity to hold. In other words, a data point is going to replace by the differences between two values. In reality, most variables are non-stationary; hence they have to go through a transformation process, which is called differencing or integration before they become stationary [1][6].

The standard notation of the ARIMA model is ARIMA$(p, d, q)(P, D, Q)$ where each component is contained as a parameter. P is the number of differences in lag-1. P is the leg order, and it is the

number of lag observations in the model. The parameter d represents how many times to perform lag-1 differencing. D refers to the seasonal differencing for a cycle with h seasons. We use lag-h differencing to remove stationary. ARIMA model requires the user to specify the parameter $p, d, q, P, D, and\ Q$. Determine the parameters is not a simple choice and required some experience and expertise. The typical method for determining these parameters is using visual inspection of the series to detect seasonality and trend, as well as looking at the autocorrelation and partial autocorrelation charts [3][7].

2. Methodology

The random variables set $\{x_t: t \in N\}$ is called a time series, where $\mathbb{N}$ is the set of the natural number, and it is called a timestamp. The common critical assumption in time series models is stationary, and it can be strong or weak forms. If the statistical distribution of $\{x_t: t \in \mathbb{N}\}$ is remained unchanged after shifting time scale, i.e., for any time, shift, say h, and observation x_i:

$$P\left(X_{t_1} \le x_1, X_{t_2} \le x_2, \dots, X_{t_k} \le x_k\right) = F\left(x_{t_1}, x_{t_2}, \dots, x_{t_k}\right)$$

$$= F\left(x_{h+t_1}, x_{h+t_2}, \dots, x_{h+t_k}\right) = P\left(X_{h+t_1} \le x_1, X_{h+t_2} \le x_2, \dots, X_{h+t_k} \le x_k\right)$$

The marginal distribution of X_t is independent of t. Two-dimensional distributions of $\{X_{t_1}, X_{t_2}\}$ are independent of the absolute location that related to t_1 and t_2 [4]. Thus, the mean function $E(X)$ is constant, and the covariance $\mathrm{Cov}(X_t, X_{t-k})$ is just a function of k. Similarly, a higher-order moment remains unchanged if a continuous-time shift is added [8].

A stochastically independent time series, with constant mean and continuous variance, is called a random time series. A discrete process $\{Z_t\}$ is called a purely random process if the random variables Z_t are from a sequence of identically distributed and mutually independent variables. This process suggests the system has a constant mean and variance; $\gamma(k) = cov(Z_t, Z_{t+k}) = 0$, for all k [14][15].

If $X_t = X_{t-1} + Z_t$, then the process $\{X_t\}$ is said to be a random walk process. Z_t is a purely random process with mean μ and variance σ_Z^2. When the process starts with $t = 0$ and $X_1 = Z_0$, we have:

$X_1 = X_0 + Z_1$, at $t = 1$
$X_2 = X_1 + Z_2 = X_0 + Z_1 + Z_2$, at $t = 2$
$X_3 = X_2 + Z_3 = X_0 + Z_1 + Z_2 + Z_3$, at $t = 3$
$\vdots$
$$X_t = X_0 + \sum_{i=1}^{n} Z_i$$

The first-order moment and the variance for the above process equal to

$$E[X_t] = X_0 + \sum_{i=1}^{n} E[Z_i] = X_0 + t\mu_z = t\mu_z \quad \text{and} \quad Var(X_t) = t\sigma_Z^2$$

A particular kind of filtering is differences that make a time series of data stationery by removing the trend. For seasonal data to attain average stationarity, differentiating data from first order is usually essential. Let's assume that $X_t = \{X_1, X_2, \dots, X_n\}$ is a non-stationary time series, so $\Delta X_t = X_t - X_{t-1}$ is the first-order difference, and $\Delta^2 X_{t+2} = \Delta X_{t+2} - \Delta X_{t+1}$ is the second-order difference [2] [5].

Let $\{Z_t\}$ be a purely random process with mean and variance equal to 0 and σ_Z^2. It is called Moving Average of order q, (MA (q)), if

$$X_t = \beta_0 Z_t - \beta_1 Z_{t-1} - \cdots - \beta_q Z_{t-q},$$

where $\{\beta_1, \beta_2, \ldots, \beta_q\}$ are constants. $\beta_0 = 1$ because of the random variables $Z_t, t \in \mathbb{N}$.

$$X_t = \alpha_1 X_{t-1} + \alpha_2 X_{t-2} + \cdots + \alpha_p X_{t-p} + Z_t$$
$$X_t = \delta + \alpha_1 X_{t-1} + \alpha_2 X_{t-2} + \cdots + \alpha_p X_{t-p} + Z_t$$

If $E[X_t] = E[X_{t-1}] = \cdots = E[X_p] = \mu$, then $E[X_t] = \mu = \delta + \alpha_1\mu + \alpha_2\mu + \cdots + \alpha_p\mu + 0$, hence

$$\mu = \frac{\delta}{1 - \alpha_1 - \alpha_2 - \cdots - \alpha_p}$$

By considering the condition $\alpha_1 + \alpha_2 + \cdots + \alpha_p < 1$, the above formulate is a constant. When $p = 1$, then the first-order autoregressive $AR(1)$is

$$X_t = \alpha X_t - 1 + Z_t \quad (1)$$

Equation 1 is also known as the Markov process. $AR(1)$ can be expressed as an infinite MA process by using the backshift operator $BX_t = X_t - 1$, i.e., $(1 - \alpha B)X_t = Z_t$, so

$$\begin{aligned} X_t &= \frac{Z_t}{1 - \alpha B} \\ &= (1 + \alpha B + \alpha^2 B^2 + \cdots) Z_t \\ &= Z_t + \alpha Z_t - 1 + \alpha^2 Z_t - 2 + \cdots \\ &= Z_t + \beta_1 Z_t - 1 + \beta_2 Z_t - 2 + \cdots \end{aligned}$$

The mean of X_t is zero, and the variance is the series $\sigma^2 Z(1 + \alpha^2 + \alpha^4 \ldots)$ converging with the condition $|\alpha| < 1$. Mixing both AR and MA in the model leads to the autoregressive moving average (ARMA) process, the process ARMA is of order (p, q) when it contains p autoregressive terms and q moving average terms, and it can be written as equation 2, where $\alpha_p(B)$ and $\beta_q(B)$ are polynomials of order p and q, respectively [9].

$$X_t = \alpha_1 X_{t-1} + \alpha_2 X_{t-2} + \cdots + \alpha_p X_{t-p} + Z_t - \beta_1 Z_{t-1} - \beta_2 Z_{t-2} - \cdots - \beta_q Z_{t-q}$$
$$\alpha_p(B) X_t = \beta_q(B) Z_t \quad (2)$$

Choosing the parameters based on visual inspection is based on different rules of thumb, such as a slowly decreasing autocorrelation chart combined a sharp decline in the partial autocorrelation chart, calles for q equals 0 and p equals to the largest partial autocorrelation. In most cases, either p is 0 or q is 0, and p plus q less than or equal to 3. A few general tips are to use differencing to remove the trend and seasonality to keep the model as simple as possible by differencing at most one time by choosing low values of p and q, and setting P and Q to 0 or 1 [10][11].

3. Exploratory Data Analysis

In this section, the chemical sales dataset is analyzed. In figure 1, the selling of chemicals is plotted; it is started from Jan 1992 to Dec 2019. There is a growing trend in almost all variables. Also, there is a dramatic drop in the level of data around 2008. The log scale is used to map the data in figure 2, and the first knowledge difference is shown in figure 3. The dataset is stationary from the first difference, so further differences do not need to be taken. A significant variation can be seen between 2008 and 2010 when anyone looks at the differential map. For the dataset, the diagnosis plot is shown in figure 4. It is evident that the information is seasonal and has a growing pattern. We should think about the best model from the plot that we can use to estimate revenue for the next three years.

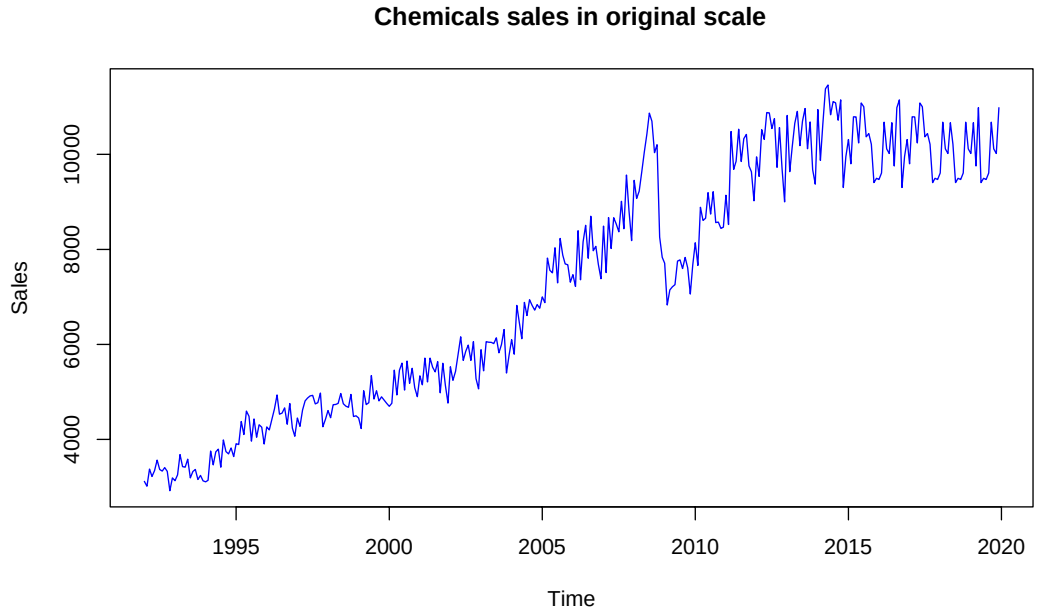

Figure 1. Chemicals sales on the original scale.

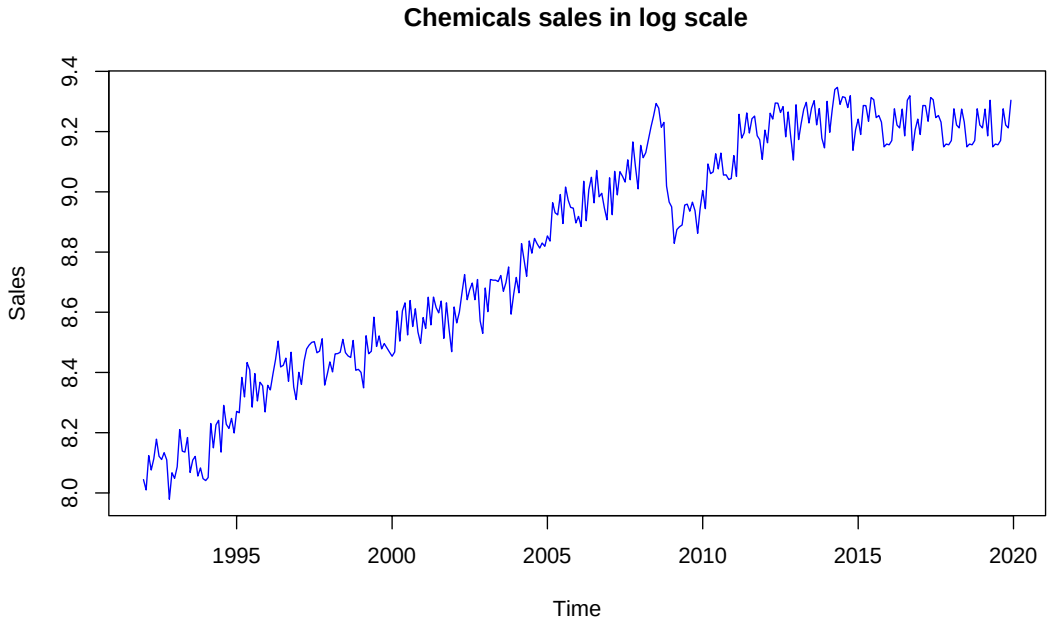

Figure 2. Chemical sales on the log scale.

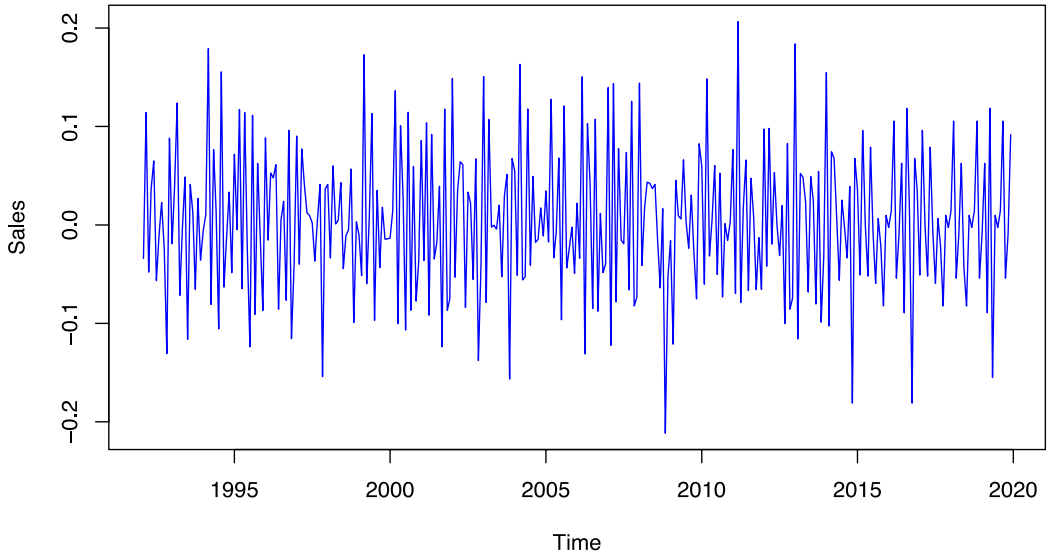

Figure 3. First difference in chemical sales.

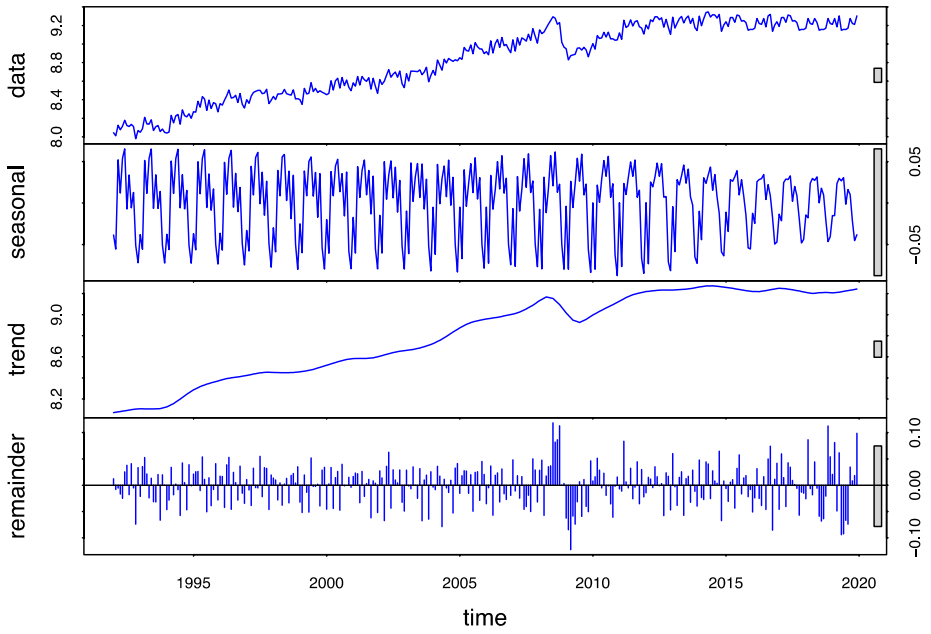

Figure 4. diagnosis plot for chemical sales.

4. Integrated Autoregressive Moving Average Models (ARIMA)

In general, there are two models for ARIMA depend on whether the data set is stationary or non-stationary. A non-seasonal ARIMA model can be written as [9]

$$\left(1-\phi_1 B-\cdots-\phi_p B^p\right)(1-B)^d y_t = c+\left(1+\theta_1 B+\ldots+\theta_q B^q\right)\epsilon_t$$

where $c=\mu\left(1-\phi_1-\cdots-\phi_p\right)$ and μ is the mean of $(1-B)^d y_t$.

The above equation can be written as follows:

$$\Phi(B)(1-B)^d y_t = c+\theta(B)\epsilon_t$$

where $\Phi(B)=\left(1-\phi_1 B-\cdots-\phi_p B^p\right)$ is a p^{th} order polynomial in B, and $\theta(B)=\left(1+\theta_1 B+\theta_q B^q\right)$ is a q^{th} order polynomial in B. A non-seasonal ARIMA model can be written as ARIMA(p,d,q). For the seasonal dataset, a seasonal ARIMA model can be formed by including additional seasonal terms in the ARIMA model, and it can be written as follows: $ARIMA(p,d,q)(P,D,Q)_m$ where $m=$ number of observations per year. For example, for quarterly data when $(p=1,d=1,q=1,P=1,D=1,Q=1)$ the seasonal ARIMA model can be written as follows [13]:

$$(1-\phi_1 B)(1-\Phi_1 B^{12})(1-B)(1-B^{12})y_t = (1+\theta_1 B)(1+\Theta_1 B^{12})\epsilon_t$$

The above equation is denoted by $ARIMA(1,1,1)(1,1,1)_{12}$. The multiplicative seasonal ARIMA model is given by

$\Phi_P(B^s)\phi(B)\nabla_s^D\nabla^d y_t = \delta+\Theta_Q(B^s)\theta(B)\epsilon_t$, where

$\Phi_P(B^s)$: seasonal autoregressive of order P

$\phi(B)$: ordinary autoregressive of order p

$\Theta_Q(B^s)$: moving average components of order Q

$\theta(B)$: moving average components of order q

$\nabla_s^D=(1-\mathrm{B})^{\mathrm{SD}}$: seasonal difference component

$\nabla^d=(1-\mathrm{B})^{\mathrm{d}}$: ordinary difference component

ϵ_t: is the usual Gaussian white noise process.

ARIMA model with the seasonal part is going to be used for forecasting the sales. If anyone wants to stabilize the time series, the Log transform and differences were used as the preferred approaches. The seasonal and nonseasonal differences were used to stabilize the periodicity and the term trend.

5. Forecasting Sales for the Modified ARIMA model

One explanation for developing the model is forecasting or predicting future values that are still unnoticed. For predictive analysis, the ARIMA model is a good time-series data that is used to test or forecast future patterns. ARIMA model is a form of regression analysis that measures the intensity of one independent variable to the other. The model aims to forecast the future by checking the differences between values in the series The ARIMA model that was discussed in the previous section is based on minimizing the mean square forecasting error. Forecasting is an extrapolation of the trend when the model adds zero-mean white noise to the simply deterministic trend. On the other hand, if the model contains autocorrelation, the predictions take advantage of the correlation to produce the best predictions. ARIMA(1,1) with a constant term is: $y_t = y_{t-1}+\theta_0+e_t-\theta e_{t-1}$, so

$$\hat{y}_t(l) = \hat{y}_t(l-1)+\theta_0-\theta e_t = y_t+l\theta_0-\theta e_t$$

$$e_t(l) = e_{t+l,} + (1-\theta)e_{t+l-1} + (1-\theta)e_{t+l-2} + \cdots + (1-\theta)e_{t+1}, \quad \text{for all} \quad l \geq 1.$$

$Var\big(e_t(l)\big) = \sigma_l^2[1 + (l-1)(1-\theta)^2]$.

Similarly, for ARIMA(2,2)

$$y_t = 2y_{t-1} - y_{t-2} + \theta_0 + e_t - \theta_1 e_{t-1} + \theta_2 e_{t-2}$$

$$\hat{y}_t(1) = 2y_t - y_{t-1} + \theta_0 - \theta_1 e_t - \theta_2 e_{t-1}$$

$$\hat{y}_t(2) = 2y_t(1) - y_t + \theta_0 + \theta_2 e_t$$

$$\hat{y}_t(l) = 2\hat{y}_t(l-1) - \hat{y}_t(l-2) + \theta_0, \text{for all } l \geq 3.$$

The algorithm that is going to be used is summarized below. The modified ARIMA model can be summarized in the following algorithm,

Modified ARIMA Algorithm

Step 1: Understand patterns by plotting the data and identifying unusual observations.
Step 2: Use a Box-Cox transformation to stabilize the variance (if necessary).
Step 3: Difference the data it appears stationary (if necessary)
Step 4: Plot the ACF of the differenced data and try to determine possible candidate models.
Step 5: Try some models and use the AIC to search for a better model.
Step 6: Check the residuals from the model by plotting the ACF of the residuals and doing a portmanteau test of the residuals.
Step 7: Do the residuals look like white noise? If YES (calculate forecasts), NO (go to step 4).

6. Seasonal ARIMA model application to chemicals sales in the USA

Based on the given dataset, the aim is to find an appropriate ARIMA model. In this section, a modified ARIMA model that was presented in the previous section is used to forecast chemical sales for the next three years in the USA. Figure 5 shows a comparison between seasonal and non-seasonal models. The white noise assumption was checked in the Cumulative Periodogram plot. There is noise because the curve does not cross the lines. The Kolmogorov-Smirnov test is used to check the normality. Since the p-value equals 0.273, which is high enough, the data is normally distributed.

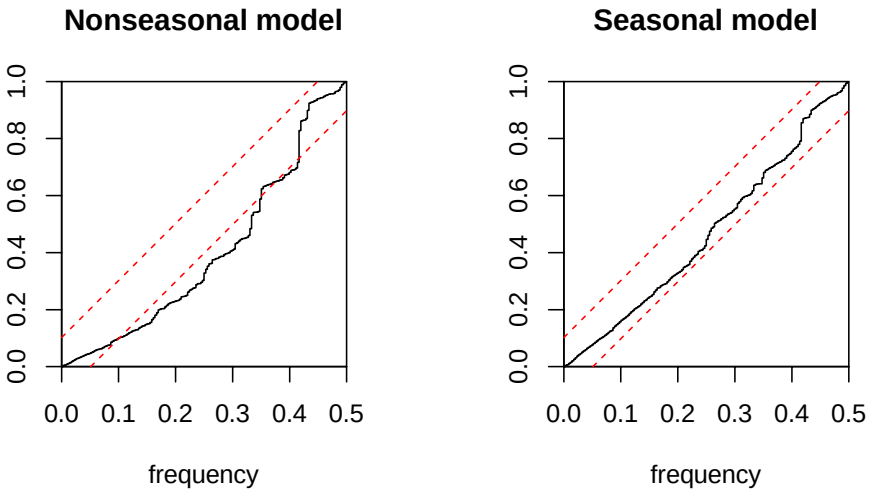

Figure 5. Diagnosis plot for the model.

In Table (1), several seasonal and order possibilities were tested. AIC and BIC values are checked for all the cases. The best model is selected based on the lowest AIC and BIC criteria. According to the AIC and BIC values, the 4^{th} model is chosen as the best model, where the order is c(1, 1, 1), and the seasonal is c(0, 1, 1). This means the series is differenced one at leg-1, and once at leg-12.

Table 1. Different order and seasonal values for the model.

Model	Order	Seasonal	AIC	BIC
1	c(0, 1, 1)	c(1, 1, 1)	185.115	179.272
2	c(0, 1, 2)	c(1, 1, 1)	187.245	170.863
3	c(1, 1, 3)	c(0, 1, 1)	170.215	176.855
4	**c(1, 1, 1)**	**c(0, 1, 1)**	**160.126**	**153.855**
5	c(0, 1, 1)	c(2, 1, 0)	184.215	174.812

For the selected ARIMA model, the Autocorrelation Function (ACF) was checked and used to estimate the parameters of the model. Box and Jenkins popularized the ARIMA approach, and ARIMA models are often referred to as Box-Jenkins models. Box and Tiao addressed the general transfer function model used for the ARIMA procedure. Box-Jenkins is used to estimate the parameters of the fitted model and examine the residual to see if the fitted model is adequate or not.

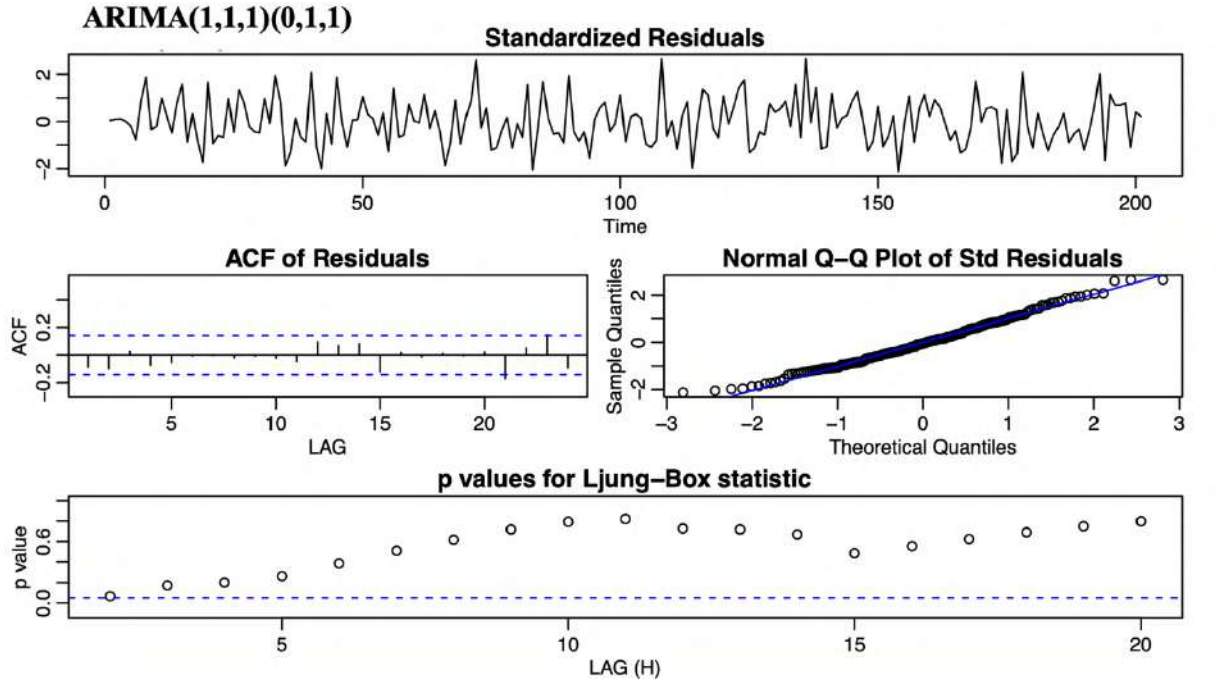

Figure 6. Diagnosis plot for the model.

The selected ARIMA model is compared to the ARMA and NAÏVE ARIMA models by RMSE and MASE calculations. The RMSE and MASE values for the modified ARIMA model are lowest values

in Table (2). This indicates that the selected model has performed better than the ARMA and NAÏVE ATIMA models.

Table 2. A comparison between ARMA, NAÏVE ARIMA, and modified ARIMA models.

	ARMA	**NAÏVE ARIMA**	**Modified ARIMA**
RMSE	0.937	0.722	0.535
MASE	0.847	0.804	0.478

The best model is used in the forecast for the next three years. In Table (3), the forecasted values for the next three years with their associated standard deviations are estimated. Three confidence intervals (50%, 75%, and 90%) are calculated and the upper and lower limits for each interval are evaluated.

Table 3. Forecasting chemical sales for the next three years in Millon dollars.

Figure 7 shows that the expected chemical curve matches the observed curve with small deviations. The time series for the estimated model is from Jan 2010 to Dec 2019. Predicted chemical sales are shown, and three prediction intervals (50%, 75% and 90%) are estimated. The prediction intervals get wider by increasing accuracy.

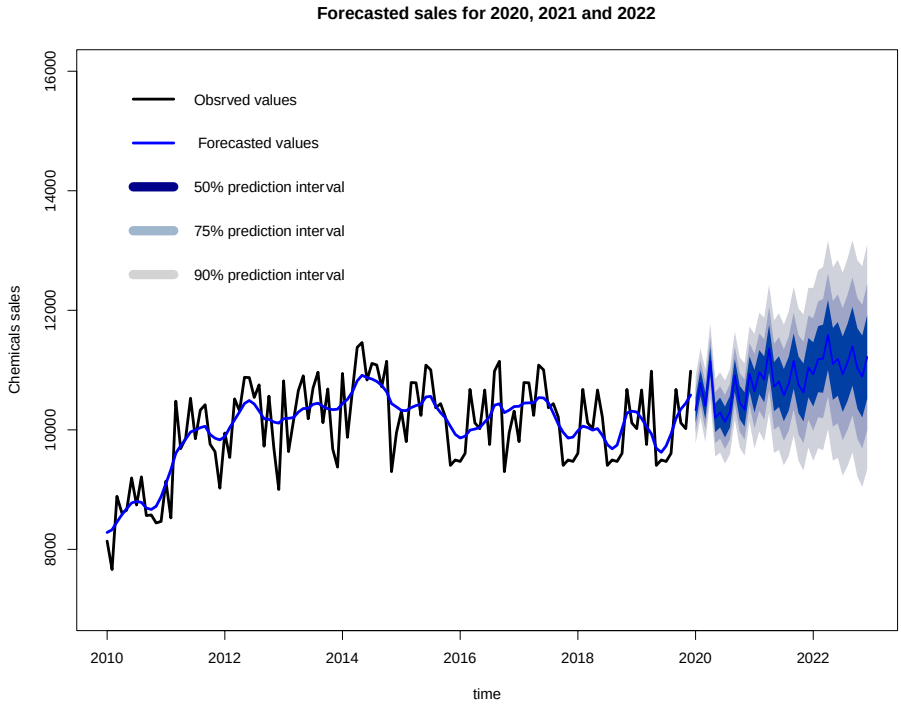

Figure 7. Forecasting chemical sales for the next three years in Millions of dollars.

7. Conclusion

In this work, a modified ARIMA model is introduced, and it has been applied to the monthly chemical sales dataset in the United States. In general, ARIMA models flexible family of models that capture autocorrelation in all kinds of forms. It has a strong statistical foundation, and therefore it's easy to get automated prediction intervals. It does assume and require a stationary series. This means no trend no seasonality and it assumes that this autocorrelation remains fixed throughout the period. The revised ARIMA model is compared to the ARMA and NAÏVE ARIMA models. The updated ARIMA model is more accurate than the ARMA and NAÏVE ARIMA models. An algorithm for the developed ARIMA model is given to be used for modelling and forecasting different data sets. The modified ARIMA model is used to forecast chemical sales in the USA over the next three years (2020, 2021, and 2022).

Abstract. The purpose of this work is to introduce a new fuzzy domination parameter in fuzzy graphs $G_f = (\eta, \rho)$ it is called a ($N-$ fuzzy domination number) denoted by $\gamma_N(G_f)$. Some properties and boundaries of this definition are introduced. The $N-$ fuzzy domination number of fuzzy certain graphs as fuzzy complete, path, star, cycle, complete bipartite, and star are determined. Additionally the relation between the N-degrees of the vertices and the number of edges and N-edges of a fuzzy graph is discussedgraph discussed, with some suitable graphs and examples are given.

1. Introduction

Firstly, in 1965, L. Zadeh [1] published his paper "fuzzy set "in which clarified the uncertainty. In (1975) Rosenfeld [2] introduced the concept of fuzzy graph. In (1975) Kauffmann [3] introduced the fundamental idea of a fuzzy graph. The domination number played an important role via theoretical study in various fields as a fuzzy graph [4-5], topological graph [6-7], labeled graph [8-9], general graph [10-13]and others. Also, several applications in problems life were solved by these branches. So, the study of domination in fuzzy graphs worth to care. The concept of Domination in fuzzy graphs I, introduced by Somasundaram A.and Somasundaram S. [14-15] and them using effective edges. The concept of Domination in fuzzy graph so introduced by Nagoorgani A. and Chandrasekaran V. T. [16] but by using strong edges. There is more than one definition of domination in a fuzzy graph, in this work we will know the fuzzy domination number (γ_f) in fuzzy graph by Xavior et al.[17].

2. Preliminaries

Definition 2.1[18]: Consider $G = (V, E)$ be an undirected, finite, and simple graph. A mapping $\eta: V \to [0,1]$ where V is a non-empty set of vertices called a fuzzy subset and $G_f = (\eta, \rho)$ where $\rho: V \times V \longrightarrow [0,1]$ is called a fuzzy graph if $\rho(x,y) \leq \eta(x) \wedge \eta(y)$, where $\wedge$ is refer to a minimum fuzzy value.

Definition 2.2 [18]: $G^* = (\eta^*, \rho^*)$ is known as underlying crisp graph of $G_f = (\eta, \rho)$.

Definition 2.3 [18]:An edge (x,y) is called effective if $\rho(x,y) = \eta(x) \wedge \eta(y)$ and $G_f = (\eta, \rho)$is called strong fuzzy graph if every edge in G_f is effective.

Definition 2.4 [18]: A triangle free fuzzy graph is a fuzzy graph in which no three vertices form a triangle of edges.

Definition 2.5: The order of a fuzzy graph $G_f = (\eta, \rho)$ is denote by n and define as the cardinality of V, i.e. $|V| = n$, and the fuzzy cardinality of an order fuzzy graph is called fuzzy order of a fuzzy graph $G_f = (\eta, \rho)$ and define by summation membership fuzzy value for n which it denoted by P, i.e. $P = |\mathrm{n}| = \sum_{x \in \mathrm{V}} \eta(x)$.

Definition 2.6[19]: The open and closed neighborhood are define as $N(x) = \{y: (x, y)\text{effective}\}$ and $N[x] = N(x) \cup \{x\}$ respectively.

Definition 2.7[17]: A subset $D$of $V(G_f)$ is called fuzzy dominating set if every vertex $y \in V - D$ is adjacent at least one vertex $x \in D$such that $\rho(x, y) = \eta(x) \wedge \eta(y)$. The fuzzy domination number (γ_f) is summation membership fuzzy value for all minimum fuzzy dominating set.

3. $N-$ fuzzy dominating (NFD) set

Definition3.1: Let $G_f = (\eta, \rho)$ be a fuzzy graph. A subset D_N of $V(G_f)$ is called $N-$ fuzzy dominating (NFD) set if for every vertex $y \in V - D_N$ there exists a vertex $x \in D_N$ such that

1) (x, y) is effective edge.
2) $N(x) \cap N(y) \neq \emptyset$.

Definition3.2**:** The $N-$ fuzzy dominating (NFD) set D_N in a fuzzy graph $G_f = (\eta, \rho)$ is called minimum $N-$ fuzzy dominating $(MNFD)$ set if the number of vertices of all (NFD) sets greater than or equal the number of vertices in D_N

Definition3.3: The (NFD) set of a fuzzy graph $G_f = (\eta, \rho)$ is said to be minimal (NFD) set if no proper subset of D_N is (NFD) set of G_f.

Definition3.4: The minimum fuzzy cardinality of all $(MNFD)$ sets is called $N-$fuzzy domination number and denoted by $\gamma_N(G_f)$ or simply γ_N, i.e.

$\gamma_N(G_f) = min|D_{Ni}| = min\{\sum_{x \in D_{Ni}} \eta(x), D_{Ni}\ are\ \ (MNFD)sets$

Definition 3.5: Let $G_f = (\eta, \rho)$ be a fuzzy graph and $x \in V(G_f)$, then x is called $N-$isolated vertex if $N(x) \cap N(y) = \emptyset$ for all $y \in N(x)$ and x belong to every (NFD)set

Example1.1**:** Consider a strong fuzzy graph $G_f = (\eta, \rho)$, which is given in figuer1:

The minimal (NFD)set are : $D_{N1} = \{f, c, d\}, D_{N2} = \{b, c, d, g\}$, $D_{N3} = \{b, c, d, e\}$, $D_{N4} = \{a, c, d, g\}$, $D_{N5} = \{a, c, d, e\}$

The minimum (NFD) set is $D_{N1} = \{f, c, d\}$.

The $\gamma_N(G_f) = |D_{N1}| = 0.1 + 0.2 + 0.2 = 0.5$.

The minimum fuzzy dominating set $D = \{b, g\}$,

$then\ \gamma_f(G_f) = |D| = 1.3$

The vertices c and d are $N-$isolated vertices

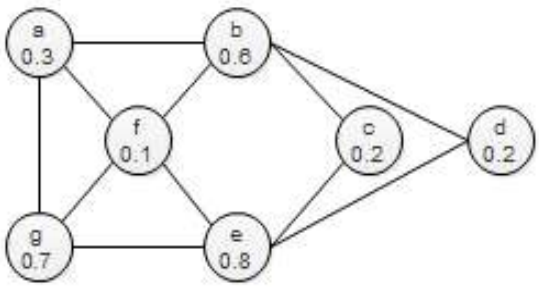

Figure 1 N-fuzzy dominating set.

4. Some properties of (NFD) set.

Observation3.2.1:

1) We will denote to all $N-$ isolated vertices of G_f by i_{sN}. And all isolated vertices of G_f by i_s.
2) $i_s \subseteq i_{sN} \subseteq D_N$, where D_N is the minimum (NFD) set of G_f.
3) Every end vertex is $N-$ isolated vertex.
4) If x and y are any two adjacent vertices in $V(G_f)$ such that $N(x) \cap N(y) \neq \emptyset$, then we say x is $N-$ adjacent to y or y is $N-$fuzzy dominate x.

Preposition 3.2.2: From the definition of $N-$ fuzzy domination number we can obtain:
1) $\gamma_N(K_n) = min(\sigma(x_i)), x_i \in V(K_\sigma)$.

Proof: Since every edge in K_n is effective and each vertex is dominates to all other vertices, then $N(x) \cap N(y) \neq \emptyset$ for all $x, y \in V(K_n)$. then, a minimum $N-$fuzzy dominating set of K_n is singleton. Hence, the result is obtained.
2) For any strong fuzzy path P_n , $\gamma_N(P_n) = P$

Proof: From the definition of $N-$ fuzzy dominating set of P_n , then there is only one minimal $N-$fuzzy dominating set of P_n which contains all vertices. Hence, $\gamma_N(P_n) = P$.
3) For any strong cycle fuzzy graph C_n $then$ $\gamma_N(C_n) = P$.

Proof: Same proof (2).
1) For any complete bipartite fuzzy graph $K_{\sigma 1,\sigma 2}$ then $\gamma_N(K_{\sigma 1,\sigma 2}) = \sum_{i=1}^{n} \eta(x_i) + \sum_{j=1}^{m} \eta(y_j)$ $x_i \in V_1$ and $y_j \in V_2$

Proof: Let $V(K_{\sigma 1,\sigma 2}) = V_1 \cup V_2$ such that $V_1 = \{x_1, x_2, \dots, x_n\}$ and $V_2 = \{y_1, y_2, \dots, y_m\}$.
Since each edge in $K_{\sigma 1,\sigma 2}$ is effective and every vertex in V_1 dominates to all other vertices in V_2 and vice versa also $N(x) \cap N(y) = \emptyset$ for all $x \in V_1$ and $y \in V_2$.then a minimum N- fuzzy dominating set of $(K_{\sigma 1,\sigma 2})$ must be has all vertices ($V_1$and V_1). Hence, the result is obtained.
4) For any strong fuzzy wheel graph with n vertices $\gamma_N(W_n) = \sigma(x), x\ is\ center\ vertex$.

Proof: Let (W_n) be strong fuzzy wheel and x be center vertex in W_n, since x is adjacent to all other vertices in W_n (adjacent to all vertices C_n) then $N(x) \cap N(y) \neq \emptyset$ for all $y \in W_n$. Hence, $\gamma_N(W_n) = \sigma(x), x\ is\ center\ vertex$.

Remark 3.2.3: If $G_f = (\eta, \rho)$ be a fuzzy graph has (NFD) set, we note that the $N-$ fuzzy domination number of a fuzzy graph G_f may be greater than, smaller than or equal to the fuzzy domination number of G_f.

Theorem 3.2.4 : Let D_N be a (NFD) set then D_N is minimal if and only if for every vertex $x \in D_N$ one of the following holds
i) Either $N(x) \cap D_N = \emptyset$ or $N(x) \cap N(y) = \emptyset$ $for\ all\ y \in N(x) \cap D_N$.
ii) There exists a vertex $y \in V - D_N$ such that $N(y) \cap D_N = \{x\}$ and $N(x) \cap N(y) \neq \emptyset$.

Proof: Suppose for every $x \in D_N$ one of the two conditions is hold , i.e. (i) or (ii) hold. Suppose D_N is not minimal. Then, there exist $x \in D_N$ such that $D_N - \{x\}$ is (NFD) set. Hence, there exist $y \in D_N - \{x\}$ such that (y, x) is effective edge, this is implies $y \in N(x)$ and $N(x) \cap N(y) \neq \emptyset$. Therefore, the

condition (i) does not hold. Then, x must be satisfying (ii), so there exist $y \in V$ - D_N such that $N(y) \cap D_N = \{x\}$ and $N(x) \cap N(y) \neq \emptyset$. Since $D_N - \{x\}$ is (NFD) set, then there exist $z \in D_N - \{x\}$ such that z is adjacent to y and $N(z) \cap N(x) \neq \emptyset$. Therefore, $z \in N(y) \cap D_N$, $N(z) \cap N(y) \neq \emptyset$ and $z \neq x$, contradiction to $N(y) \cap D_N = \{x\}$. Therefore, D_N is minimal (NFD)set. Now assume that D_N is minimal (NFD) set and the two conditions not hold, i.e. there is a vertex $x \in D_N$ such that $N(x) \cap D_N \neq \emptyset$ and $N(x) \cap N(y) \neq \emptyset$ for some $y \in N(x) \cap D_N$, and for each vertex $y \in V - D_N$ either $N(y) \cap D_N \neq \{x\}$ or $N(x) \cap N(y) = \emptyset$. Therefore, $D_N - \{x\}$ is (NFD) set. This contradicts the assumption. Hence, (i) or (ii) holds.

Theorem 3.2.5: A fuzzy graph $G_f = (\eta, \rho)$ has a unique minimal (NFD) set if and only if the set of all $N-$ isolated vertices forms a (NFD) set.

Proof: Let $G_f = (\eta, \rho)$ be a fuzzy graph has a unique minimal (NFD) set D_N, and suppose $i_{sN} = \{x \in V : x \text{ is } N - \text{isolated vertex}\}$. Then, $i_{sN} \subseteq D_N$, now suppose $D_N - i_{sN} \neq \emptyset$ and let $z \in D_N - i_{sN}$, since z is not $N-$ isolated vertex, $V - \{z\}$ is (NFD) set. Hence, there exists a minimal (NFD) set $D_{N1} \subseteq V - \{z\}$ and $D_{N1} \neq D_N$. This is a contradiction to our assumption. Now, if the set of all $N-$ isolated vertices forms a (NFD) set, then it is clear that G_f has a unique minimal (NFD) set.

Theorem3.3.6: Let $G_f = (\eta, \rho)$ be a fuzzy graph without $N-$ isolated vertices. If D_N is minimal (NFD) set, then $V - D_N$ is (NFD) set.

Proof: Let D_N be a minimal (NFD) set of G_f. Suppose $V - D_N$ is not (NFD) set. Then, there exists a vertex x in D_N such that x is not $N-$ fuzzy dominated by any vertex in $V - D_N$. Then, x is $N-$fuzzy dominated by at least one vertex y in $D_N - \{x\}$ and $N(x) \cap N(y) \neq \emptyset$. Thus, $D_N - \{x\}$ is a (NFD) set of G_f, which contradiction . Thus, every vertex x in D_N is $N-$ adjacent to at least one vertex y in $V - D_N$. Hence, $V - D_N$ is (NFD) set.

Corollary3.2.7: For any fuzzy graph $G_f = (\eta, \rho)$ without $N-$ isolated vertices has (NFD) set D_N then $\gamma_N(G_f) \leq P/2$.

Proof: Let $G_f = (\eta, \rho)$ be a fuzzy graph without $N-$ isolated vertices and D_N be a $\gamma_N - set$ of G_f,By theorem (2.3) $V - D_N$ is (NFD) set of G_f, then $|D_N| \leq |V - D_N|$, tak fuzzy cardinality to both sides we have $\gamma_N \leq P - \gamma_N$. Hence, $\gamma_N \leq P/2$

Proposition 3.2.8**:** Let $G_f = (\eta, \rho)$ be a strong fuzzy graph, then $\gamma_N(G_f) = P$ if and only if G_f is a triangle free fuzzy graph.

Proof**:** Let $G_f = (\eta, \rho)$ be a strong fuzzy graph with (NFD) set D_N and $\gamma_N(G_f) = P$. Suppose that G_f is a triangle. Let$\{x, y, z\}$ be the three vertices form a triangle. Clearly D_N except two vertices is (NFD) set of G_f. Thus, $\gamma_N(G_f) \leq p - \sum_{i=1}^{2} \eta(x_i)$. Hence, $\gamma_N(G_f) < P$, a contradiction, thus G_f is strong triangle free fuzzy graph. Conversely, Suppose that G_f is strong triangle free fuzzy graph. Let D_N be a (NFD) set of G_f with $\gamma_N(G_f) \neq P$, and $y \in V - D_N$, since D_N is (NFD) set of G_f. Then, there exists at least one vertex $z \in D_N$ such that y is $N-$ dominated by z. That is (z, y) is effective edge and $N(z) \cap N(y) \neq \emptyset$. Suppose $r \in N(z) \cap N(y) \neq \emptyset$. Then,$\{z, y, r\}$ form a triangle, a contradiction. Hence, $\gamma_N(G_f) = P$.

Preposition 3.2.9: For any fuzzy graph $G_f = (\eta, \rho)$ has a $(MNFD)$ set then, $\gamma_N(G_f) + \gamma_N(\overline{G_f}) \leq 2P$. Furthermore, the equality holds if and only if $0 < \rho(x, y) < \eta(x) \wedge \eta(y)$, $\forall (x, y) \in \mathrm{E}(G_f)$.

Proof: The inequality is trivial. Suppose that $0 < \rho(x,y) < \eta(x) \wedge \eta(y)$, $\forall (x,y) \in E(G_f)$ .Then $0 < \eta(x) \wedge \eta(y) - \rho(x,y) < \eta(x) \wedge \eta(y)$. This means that $0 < \overline{\rho(x,y)} < \eta(x) \wedge \eta\,(y)$ for all $\rho(x,y) \in E(\overline{G_f})$. thus $\gamma_N(\overline{G_f})$). Hence, $\gamma_N(G_f) + \gamma_N(\overline{G_f}) = 2P$.The converse it is direct.

Theorem 3.2.10 : Let $G_f^* = (\eta^*, \rho^*)$ be a Crips graph of a fuzzy graph $G_f = (\eta, \rho)$ without N −isolate vertices. Then, $\gamma_N(G_f^*) \leq {}^{n}/_{3}$. Further, the equality holds if $G_f = mK_3$ for some positive integer *m*.

Proof: Let D be a $(MNFD)$ set of $G_f^* = (\eta^*, \rho^*)$ such that $|D| = \gamma_N(G_f^*)$. Since G_f has no N-isolated vertices then by Theorem (2.3), $V - D$ is (NFD) set of G_f^*. Thus, each vertex in D is N −adjacent to at least two distinct vertices in $V - D$. Therefore, $|V - D| \geq 2|D|$ and we have $|D| + |V - D| = n$. Therefore, $|D| + 2|D| \leq |D| + |V - D| = n$. Hence, we have $\gamma_N(G_f^*) \leq {}^{n}/_{3}$

Definition 3.2.11**:** Let $x \in V(G_f)$. The $N-$ neighbourhood of *x* denoted by $N_N(x)$ is defined as $N_N(x) = \{y \in N(x): N(x) \cap N(y) \neq \emptyset\}$. The cardinality of $N_N(x)$ is called $N-$ degree of *x* and denoted by $deg_N(x)$ in G_f , and $N_N[x] = N_N(x) \cup \{x\}$. The maximum and minimum $N-$ degree of a vertex in G_f are denoted respectively by $\Delta_N(G_f)$ and $\delta_N(G_f)$, that is $\Delta_N(G_f) = max\{deg_N(x)\}$ and $\delta_N(G_f) = min\,\{deg_N(x)\}$.

Definition 3.2.12**:** An edge $e = (x,y) \in E(G_f)$ is called $N-$ edge if e is effective and N(x) ∩ N(y) ≠ ∅.

Definition3.2.12: The number of $N-edge$of a fuzzy graph $G_f = (\eta, \rho)$ is called ($N-$ size) and denoted by M_N.

Observation 3.2.13:

1) For any fuzzy graph $G_f = (\eta, \rho)$ has (NFD) set then $\gamma_N(G_f) = min\,\sigma(x)$ if and only if $deg_N(x) = n - 1$.
2) For any fuzzy graph $G_f = (\eta, \rho)$ without N −isolated vertices, $deg_N(x) \geq 2$ for each vertex *x* $\in V(G_f)$.

Theorem 3.2.14**:** For any fuzzy graph $G_f = (\eta, \rho)$ with *n* vertices $x_1, x_2, \ldots, x_n$, and q edges $\sum_{i=1}^{n} deg_N(x_i) \leq 2q$. Further, the equality holds if and only if every edge in G_f is $N-edge$

Proof: Let $G_f = (\eta, \rho)$ be a fuzzy graph with n vertices ,then for any vertex x_i $i = 1,2, \ldots, n$ we have $N_N(x_i) \subseteq N(x_i)$ thus clearly $|N_N(x_i)| \leq |N(x_i)|$ and we have $\sum_{i=1}^{n} deg\,(x_i) = \sum_{i=1}^{n} |N(x_i)| = 2q$ and similarly $\sum_{i=1}^{n} deg_N(x_i) = \sum_{i=1}^{n} |N_N(x_i)| \leq \sum_{i=1}^{n} |N(x_i)| = 2q$. Hence,

3) $\sum_{i=1}^{n} deg_N(x_i) \leq 2q$.

Now if every edge in G_f is $N-edge$. Then, $N_N(x_i) = N(x_i)$ for each vertex $x_i \in G_f$. This $\sum_{i=1}^{n} deg_N(x_i) = 2q$. Conversely, assume that $\sum_{i=1}^{n} deg_N(x_i) = 2q$. That means every edge in G_f is $N-edge$.

Theorem 3.2.15: For any fuzzy graph $G_f = (\eta, \rho)$ with n vertices, $\sum_{i=1}^{n} deg_N(x_i) = 2M_N$. Further, $|\sum_{i=1}^{n} deg_N(x_i)| = 2\sum_{y \neq x_i} \rho(x,y)$.

Proof: Let $G_f = (\eta, \rho)$ be a fuzzy graph has n vertices. Then, an $N-edge$ contributes to the N −degrees of two various vertices. Thus, when the N −degrees of the vertices are added, every edge is counted exactly two times. Thus, the sum of the N −degrees is twice the $N-size$ of the fuzzy graph

that is, $\sum_{i=1}^{n} deg_N(x_i) = 2M_N$. Take fuzzy cardinality to both sides thus,we have $|\sum_{i=1}^{n} deg_N(x_i)| = 2\sum_{y \neq x_i} \rho(x,y)$.

Theorem3.2.16: For any fuzzy graph $G_f = (\eta, \rho)$ without $N-$isolated vertex and of order n , $\gamma_N(G_f) \leq P - \sum \sigma(y_i)$, $y_i \in N_N(x)$.

Proof: Let *x* be a vertex such that $deg_N(x) = \Delta_N(G_f)$. Then, *x* dominates $|N_N(x)|$ vertices. Hence, $V - N_N(x)$ is (NFD) set of G_f. Therefore, $\gamma_N(G_f) \leq ||V - N_N(x)|| = |n| - |\Delta_N(G_f)|$. Hence, $\gamma_N(G_f) \leq P - \sum \sigma(y_i)$, $y_i \in N_N(x)$.

Conclusion

According to the results found, Some properties and boundaries of this definition are determined. The N- fuzzy domination number for some fuzzy graphs as fuzzy complete, path, cycle, complete bipartite, and star are calculated. Also, we define the $N-$ neighbourhood of x $N_N(x)$ and some relationships between $N-$ degree , $N-$edge and $N-$size were discussed.

The Direct and Converse Theorems for Best Approximation of Algebraic Polynomial in $L_{p,\alpha}(X)$

The Direct and Converse Theorems for Best Approximation of Algebraic Polynomial in $L_{p,\alpha}(X)$

Abstract. The direct and inverse algebraic polynomials approximation theorems in weighted spaces of unbounded functions are proved by using modulus of smoothness. Also, we obtain sharp Jackson (direct) inequality of algebraic approximation of unbounded functions in terms modulus of smoothness . In addition, constructive characterization of modulus of smoothness are considered.

1. Introduction

Approximation problems concerning algebraic polynomials was recently studied in various spaces of algebraic polynomials for example , in the papers [6] , [9] , [12] , [14] , [15] and [17] .

Approximation problems for functions of one variable were also studied by many mathematicians. Some of these results can be found in [10] , [11] , [16] and [18] . For more general doubling weighted direct and converse algebraic approximation problems was investigated in [2] ,[8] and [13]. For a general discussion of weighted polynomial approximation was can refer to the [1] and [7].

Some direct and converse approximation by relational algebraic polynomials of some weighted bounded functions spaces defined on sufficiently modulus of smooth are investigates in [3] and [4] . In the present work we consider the improved direct and inverse approximation theorems by algebraic polynomials by using modulus of smoothness in the weighted space $L_{p,\alpha}(X)$, $1 \le p < \infty$.

For formulation of the problem we need some further notations properties.

Let $X = [0,1]$ and $L_p(x)$, $1 \le p < \infty$ be the space of all bounded functions with norm equipped :

$$\|f\|_p = \left(\int_X |f(x)|^p dx \right)^{\frac{1}{p}} < \infty \qquad (1.1)$$

Let α be a weight function defined by :

$\alpha : X \to \mathbb{R}^+$, and $L_{p,\alpha}(x)$ the space of all unbounded functions with norm equipped :

$$\|f\|_{p,\alpha} = \left(\int_X |f(x).\alpha(x)|^p dx \right)^{\frac{1}{p}} < \infty \qquad (1.2)$$

For k = 1 , 2 , ….. the modulus of smoothness of the function

$f \in L_{p,\alpha}(X)$ is defined by :

$$\omega_k(f,\delta)_{p,\alpha} = \sup_{|h|\le\delta}\left\{\left\|\Delta_h^k f(x)\right\|_{p,\alpha} \ , \ \delta>0\right\} \quad (1.3)$$

where

$$\Delta_h^k f(x) = \sum_{i=0}^{k}(-1)^{k-i}\binom{k}{i} f(x+ih) \quad (1.4)$$

Let $P_n(n=0,1,\dots.)$ be the set of algebraic polynomial of degree at most less than or equal n and let $E_n(f)_{p,\alpha}$ be the degree of best approximation of $f\in L_{p,\alpha}(X)$ by the polynomial p_n in P_n given by :

$$E_n(f)_{p,\alpha} = \inf_{p_n\in P_n}\|f-p_n\|_{p,\alpha} \quad (1.5)$$

There are many results on approximation of functions belong to $L_{p,\alpha}(X)$ spaces , $1\le p<\infty$. Especially , the classical Jackson theorem (direct theorem) .

$$E_n(f)_{p,\alpha} \le c\omega_r\left(f,\frac{1}{n}\right)_{p,\alpha} , \qquad n=1,2,\dots.... \quad (1.6)$$

and its weak converse

$$\omega_r\left(f,\frac{1}{n}\right)_{p,\alpha} \le \frac{c}{n^{2r}}\sum_{k=0}^{n}(k+1)^{2r-1}E_k(f)_{p,\alpha} \quad (1.7)$$

Where n = 1 , 2, …….

2. Auxiliary results

In this section, we will mention some of the lemmas that we will need to proving the theorems of the main results, As well as we will prove some properties of the modulus of smoothness .

Lemma 2.1 : [5]
Let $\{y_i\}$ be a sequence of the real numbers be satisfy
$|y_i|\le\mathcal{K}$, $\sum_{i=2^{k-1}}^{2^k-1}|y_i-y_{i+1}|\le\mathcal{K}$ $for\ all\ i,k\in\mathbb{N},\mathcal{K}>0$
If $1<p<\infty$, $\beta\in\mathcal{K}_p$ $and\ f\in L_{p,\beta}(X)$, then there is a function $\mathcal{F}\in L_{p,\beta}(X)$ such that $\|\mathcal{F}\|_{p,\beta}\le c\,\mathcal{K}\|\mathcal{F}\|_{p,\beta}$

Lemma 2.2 : [5]
Let $n\in\mathbb{N}, 1\le p<\infty$ and $f\in L_{p,\alpha}(X)$, then :

$$c\left\|\left(\sum_{u=1}^{\infty}|\Delta_u|^2\right)^{\frac{1}{2}}\right\|_{p,\alpha} \le \left\|\sum_{u=1}^{\infty}C_u p_n^{iux}\right\|_{p,\alpha} \le c\left\|\left(\sum_{u=1}^{\infty}|\Delta_u|^2\right)^{\frac{1}{2}}\right\|_{p,\alpha}$$

Lemma 2.3 : Let $f\in L_{p,\alpha}(X), 1\le p<\infty, k\in\mathbb{N}, \delta>0$, Then

$$\omega_k(f,\delta)_{p,\alpha}\ge 0$$

Proof **:** we have

$$\omega_k(f,\delta)_{p,\alpha} = \sup_{|h|\le\delta}\left\{\left\|\Delta_h^k f(.)\right\|_{p,\alpha}\right\}$$

$$= \sup_{|h|\le\delta}\left\{\left\|\sum_{i=0}^{k}(-1)^{k-i}\binom{k}{i}f(.+ih)\right\|_{p,\alpha}\right\}$$

since $\left\|\sum_{i=0}^{k}(-1)^{k-i}\binom{k}{i}f(.+ih)\right\|_{p,\alpha}\ge 0$

implies $\left\|\Delta_h^k f(.)\right\|_{p,\alpha}\ge 0$

Hence $\sup_{|h|\le\delta}\left\{\left\|\Delta_h^k f(.)\right\|_{p,\alpha}\right\}\ge 0$

$$\omega_k(f,\delta)_{p,\alpha} \geq 0 \quad .$$

Lemma 2.4 : Let $f \in L_{p,\alpha}(X), 1 \leq p < \infty, k \in \mathbb{N}, \delta > 0$, Then

$$\omega_k(f,\delta)_{p,\alpha} \to 0 \quad as \quad \delta \to 0$$

Proof :

let $\delta = \frac{1}{n}$

$$\omega_k(f,\delta)_{p,\alpha} = \omega_k\left(f,\frac{1}{n}\right)_{p,\alpha} = \sup_{|h|\leq\frac{1}{n}} \left\{ \left\| \Delta_h^k f(.) \right\|_{p,\alpha} \right\}$$

$$= \sup_{|h|\leq\frac{1}{n}} \left\{ \left\| \Delta_h^{k-1} \Delta_h^1 f(.) \right\|_{p,\alpha} \right\}$$

$$= \sup_{|h|\leq\frac{1}{n}} \left\{ \left\| \Delta_h^{k-1} \left[f(.) - f(.+\frac{1}{n}) \right] \right\|_{p,\alpha} \right\}$$

If $n \to \infty$ then $\frac{1}{n} \to 0$

$$= \sup_{|h|\leq\frac{1}{n}} \left\{ \left\| \Delta_h^{k-1} [f(.) - f(.)] \right\|_{p,\alpha} \right\} = \sup_{|h|\leq\frac{1}{n}} \left\{ \left\| \Delta_h^{k-1} . [0] \right\|_{p,\alpha} \right\}$$

$$= \sup_{|h|\leq\frac{1}{n}} \|0\|_{p,\alpha} = 0.$$

Lemma 2.5 **:** Let $f, g \in L_{p,\alpha}(X), 1 \leq p < \infty, k \in \mathbb{N}, \delta > 0$, Then $\omega_k(f+g,\delta)_{p,\alpha} \leq \omega_k(f,\delta)_{p,\alpha} + \omega_k(g,\delta)_{p,\alpha}$

Proof : $\omega_k(f+g,\delta)_{p,\alpha} = \sup_{|h|\leq\delta} \left\{ \left\| \Delta_h^k (f+g)(.) \right\|_{p,\alpha} \right\}$

$$= \sup_{|h|\leq\delta} \left\{ \left\| \Delta_h^k f(.) + \Delta_h^k g(.) \right\|_{p,\alpha} \right\}$$

$$\leq \sup_{|h|\leq\delta} \left\{ \left\| \Delta_h^k f(.) \right\|_{p,\alpha} + \left\| \Delta_h^k g(.) \right\|_{p,\alpha} \right\}$$

$$= \sup_{|h|\leq\delta} \left\{ \left\| \Delta_h^k f(.) \right\|_{p,\alpha} \right\} + \sup_{|h|\leq\delta} \left\{ \left\| \Delta_h^k g(.) \right\|_{p,\alpha} \right\}$$

$$= \omega_k(f,\delta)_{p,\alpha} + \omega_k(g,\delta)_{p,\alpha}$$

Lemma 2.6 **:** Let $f \in L_{p,\alpha}(X), 1 \leq p < \infty, k \in \mathbb{N}, \delta, c > 0$, Then $\omega_k(f,c\delta)_{p,\alpha} \leq c^k \omega_k(f,\delta)_{p,\alpha}$.

Proof : $\omega_k(f,c\delta)_{p,\alpha} = \sup_{|h|\leq c\delta} \left\{ \left\| \Delta_h^k f(.) \right\|_{p,\alpha} \right\}$

$$\leq \sup_{|h|\leq c\delta} \left\{ \left\| \Delta_{c\delta}^k f(.) \right\|_{p,\alpha} \right\}$$

$$= \sup_{|h|\leq c\delta} \left\{ \left\| (c\delta)^k D^k f(.) \right\|_{p,\alpha} \right\}$$

$$= c^k \sup_{|h|\leq c\delta} \left\{ \left\| \delta^k D^k f(.) \right\|_{p,\alpha} \right\}$$

$$= c^k \sup_{|h|\le c\delta} \left\{ \left\| \Delta_\delta^k f(.) \right\|_{p,\alpha} \right\}$$

$$= c^k \, \omega_k(f, \delta)_{p,\alpha}$$

Lemma 2.7 : Let $f \in L_{p,\alpha}(X), 1 \le p < \infty, k \in \mathbb{N}$, Then $\omega_k(f, \delta_1)_{p,\alpha} \le \omega_k(f, \delta_2)_{p,\alpha}$ for every $\delta_1 \le \delta_2, \delta_1, \delta_2 > 0$

Proof :

$$\omega_k(f, \delta_1)_{p,\alpha} = \sup_{|h|\le\delta_1} \left\{ \left\| \Delta_h^k f(.) \right\|_{p,\alpha} \right\}$$

$$\le \sup_{|h|\le\delta_2} \left\{ \left\| \Delta_h^k f(.) \right\|_{p,\alpha} \right\} since\ \delta_1 \le \delta_2$$

$$= \omega_k(f, \delta_2)_{p,\alpha} .$$

Lemma 2.8 : Let $f, \acute{f} \in L_{p,\alpha}(X), 1 \le p < \infty, k \in \mathbb{N}, \delta > 0$, Then $\omega_k(f, \delta)_{p,\alpha} \le \frac{\delta}{2} \omega_{k-1}(\acute{f}, \delta)_{p,\alpha}$ where $\acute{f}$ is the first derivative of a function f

Proof : We have the difference $\Delta_h^k f(x) = \Delta_h^{k-1}(\Delta_h^1 f(x))$

$$= \Delta_h^{k-1} [f(x+H) - f(x-H)]$$

$$\left\| \Delta_h^k f(.) \right\|_{p,\alpha} = \left\| \Delta_h^{k-1} [f(.+H) - f(.-H)] \right\|_{p,\alpha}$$

$$= \left\| \Delta_h^{k-1} [f(.+H) - f(.) + f(.) - f(.-H)] \right\|_{p,\alpha}$$

$$= \left\| \Delta_h^{k-1} [f(.+H) - f(.)] - \Delta_h^{k-1} [f(.-H) - f(.)] \right\|_{p,\alpha}$$

$$= \left\| \Delta_h^{k-1} \int_0^h \acute{f}(.+L) dL - \Delta_h^{k-1} \int_0^h \acute{f}(.-L) dL \right\|_{p,\alpha}$$

$$\le \int_0^h \left\| \Delta_h^{k-1} [\acute{f}(.+L) - \acute{f}(.-L)] \right\|_{p,\alpha} dL$$

$$\le \int_0^h \omega_{k-1}(\acute{f}, \delta)_{p,\alpha} dL \le \frac{\delta}{2} \omega_{k-1}(\acute{f}, \delta)_{p,\alpha}$$

3. Main results

Let X denote the one-dimensional [0 , 1] we denote by $L_{p,\alpha}(X), 1 \le p < \infty$ the space of all unbounded functions f of one variable on [0 , 1] in each variable and satisfy $\|f\|_{p,\alpha} < \infty$ where :

$$\|f\|_{p,\alpha} = \begin{cases} \left(\int_x |f(x).\alpha(x)|^p dx \right)^{\frac{1}{p}} , & 1 \le p < \infty \\ ess\ sup|f(x)| , & p = \infty \end{cases}$$

In the following give direct and converse approximation theorems for functions of one variable, which are our main results .

Theorem 3.1 : let $f \in L_{p,\alpha}(T)$, $1 \le p < \infty$ *and* $0 < \alpha < 1$ then the Jackson type inequality :

$$E_{n,k}(f)_{p,\alpha} \le c\,\omega_k\left(f,\frac{1}{n}\right)_{p,\alpha} , \qquad n = 1,2,\dots\dots$$

Theorem 3.2 **:** let $f \in L_{p,\alpha}(X)$, $1 \le p < \infty$, $n \in \mathbb{N}$, $r \in \mathbb{R}^+$ and $\lambda = max\{2,p\}$. then there exist positive constant c dependent on r and p such that

$\frac{c}{n^{2r}} \left(\sum_{u=1}^{n} u^{2\lambda r-1} E_u^{\lambda}(f)_{p,\alpha}\right)^{\frac{1}{\lambda}} \le \omega_r\left(f,\frac{1}{n}\right)$

Theorem 3.3 **:** let $f \in L_{p,\alpha}(T)$, $1 \le p < \infty$ and $0 < \alpha < 1$,
then :

$\omega_k\left(f,\frac{1}{n}\right)_{p,\alpha} \le \frac{c(k)}{n^k} \sum_{i=0}^{n}(i+1)^{k-1} E_i(f)_{p,\alpha}$.

4. Proofs of main results

4.1 Proof of theorem 3.1 :

Let $\delta = \frac{1}{n}$ and Let $f \in L_{p,\alpha}(X)$, $1 \le p < \infty$ and the operator of algebraic polynomial defined by :

$$V_n(f,x) = \frac{1}{n+1}\sum_{k=n}^{2n} S_k(f)(x) \quad , \quad n \in \mathbb{N}$$

We see that $V_n \in \mathrm{J}_{2n}$ for $n \in \mathbb{N}$

$$\|f - V_n(f)\|_{p,\alpha} \le cE_n(f)_{p,\alpha}$$

because $E_n(f)_{p,\alpha} = inf\left\{\|f - p_n\|_{p,\alpha} , p_n \in \mathcal{P}_n\right\}$

and we have $\|V_n(f)\|_{p,\alpha} \le c\,\|f\|_{p,\alpha}$

$$E_{n,k}(f)_{p,\alpha} = inf\left\{\|f - V_n(f)\|_{p,\alpha}\right\}$$

$$\le \|f - V_n(f)\|_{p,\alpha} = \left(\int_X |[f(x) - V_n(f)(x)].\alpha(x)|^p dx\right)^{\frac{1}{p}}$$

$$\le sup\left(\int_X |[f(x) - V_n(f)(x)].\alpha(x)|^p dx\right)^{\frac{1}{p}}$$

$$\le \mathrm{c}\sup_{|h|\le\delta}\left\{\left\|\Delta_h^k f(.)\right\|_{p,\alpha}\right\} = c\,\omega_k(f,\delta)_{p,\alpha} = c\,\omega_k\left(f,\frac{1}{n}\right)_{p,\alpha}$$

4.2 Proof of theorem 3.2 :

Since $r \in \mathbb{R}^+$, $1 < \lambda < \infty$, $n \in \mathbb{N}$ we assume that $k \in \mathbb{N}$ such that

$$2^k \le n \le 2^{k+1}$$

By lemma 2.2 , we have

$$\left(\sum_{u=1}^{n} \frac{\mu^{2\lambda r-1}}{n^{2\lambda r}} E_u^{\lambda}(f)_{p,\alpha}\right)^{\frac{1}{\lambda}} \le \left(\sum_{u=1}^{k+1}\sum_{\eta=2^{i-1}}^{2^i-1} \frac{\eta^{2\lambda r-1}}{n^{2\lambda r}} E_\eta^{\lambda}(f)_{p,\alpha}\right)^{\frac{1}{\lambda}}$$

$$\leq \left(\sum_{u=1}^{k+1} \frac{2^{2u\lambda r}}{n^{2\lambda r}} \, E^{\lambda}_{2^{u-1}-1}(f)_{p,\alpha} \right)^{\frac{1}{\lambda}} \leq \left(\sum_{u=1}^{k+1} \frac{2^{2u\lambda r}}{n^{2\lambda r}} \left\| \sum_{|\eta|=2^{u-1}}^{2^u-1} C_\eta p_n^{i\eta x} \right\|^{\lambda}_{p,\alpha} \right)^{\frac{1}{\lambda}}$$

$$\leq c \left(\sum_{u=1}^{k+1} \frac{2^{2u\lambda r}}{n^{2\lambda r}} \left\| \left(\sum_{\eta=u}^{\infty} |\Delta_u|^2 \right)^{\frac{1}{2}} \right\|^{\lambda}_{p,\alpha} \right)^{\frac{1}{\lambda}}$$

Putting $1 < p \leq 2$, $\lambda = 2$
By using Minkowski's inequality , we have

$$\left(\sum_{u=1}^{n} \frac{u^{2\lambda r-1}}{n^{2\lambda r}} \, E^{\lambda}_{u}(f)_{p,\alpha} \right)^{\frac{1}{\lambda}} \leq c \left(\sum_{u=1}^{k+1} \frac{2^{u\lambda r}}{n^{ur}} \left\| \left(\sum_{\eta=v}^{\infty} |\Delta_u|^2 \right)^{\frac{p}{2}} \right\|^{\frac{2}{p}}_{p,\alpha} \right)$$

$$\leq c \left(\sum_{u=1}^{k+1} \frac{2^{uvr}}{n^{ur}} \left\| \sum_{\eta=u}^{\infty} |\Delta_u|^2 \right\|^{\frac{p}{2}}_{p,\alpha} \right)$$

$$\leq c \left(\left\| \left(\sum_{u=1}^{k} \frac{2^{uvr}}{n^{ur}} \, |\Delta_u|^2 + \frac{2^{uvr(k+1)}}{n^{ur}} \sum_{\eta=k+1}^{\infty} |\Delta_\eta|^2 \right)^{\frac{p}{2}} \right\|_{p,\alpha} \right)$$

$$\leq c_0 \left\| \left(\sum_{u=1}^{k} \frac{2^{uvr}}{n^{ur}} \, |\Delta_u|^2 \right)^{\frac{p}{2}} \right\|_{p,\alpha} + c_1 \left\| \left(\sum_{\eta=k+1}^{\infty} |\Delta_\eta|^2 \right)^{\frac{p}{2}} \right\|_{p,\alpha}$$

Using lemma 2.2 we can estimate G_1

$$G_1 = \left\| \left(\sum_{\eta=k+1}^{\infty} |\Delta_\eta|^2 \right)^{\frac{1}{2}} \right\|_{p,\alpha} \leq c \left\| \sum_{\eta=2^k}^{\infty} c_\eta p_n^{inx} \right\|_{p,\alpha}$$

$$\leq c \, E_{2^{k-1}}(f)_{p,\alpha} \leq c \, \omega_r\left(f, \frac{1}{n}\right)_{p,\alpha}$$

On the other hand

$$G_2 = \left\| \left(\sum_{u=1}^{k} \frac{2^{2ur}}{n^{ur}} \, |\Delta_u|^2 \right)^{\frac{p}{2}} \right\|_{p,\alpha} \leq \left\| \sum_{u=1}^{k} \frac{2^{2ur}}{n^{2r}} \, |\Delta_u| \right\|_{p,\alpha}$$

$$\leq \left\| \sum_{u=1}^{k} \sum_{|\eta|=2^{u-1}}^{2^u-1} \frac{2^{2ur}}{n^{2r}} \, |c_\eta p_n| \right\|_{p,\alpha}$$

Now using lemma 2.2 twice , we get

$$G_2 \le \frac{c\,2^{2r}}{n^{2r}} \left\| \sum_{|\eta|=1}^{\infty} p_n \left| c_\eta\, p_n^{i\eta x} \right| \right\|_{p,\alpha} \le \frac{c\,2^{2r}}{n^{2r}} \left\| \left(I - \sigma_{\frac{1}{n}} \right)^r f \right\|_{p,\alpha}$$

$$= \frac{c\,2^{2r}}{n^{2r}} \left\| \left(I - \sigma_{\frac{1}{n}} \right)^{\{r\}} . (I-\sigma)^{r-\{r\}} f \right\|_{p,\alpha} \le c\,\omega_r\left(f, \frac{1}{n} \right)_{p,\alpha}$$

Therefore, the theorem followed
If $p > 2$, $\lambda = p$, then

right hand $\le c \left(\sum_{u=1}^{k+1} \frac{2^{upr}}{n^{2upr}} \left\| \left(\sum_{\eta=u}^{\infty} |\Delta_u|^2 \right)^{\frac{1}{2}} \right\|_{p,\alpha}^{p} \right)^{\frac{1}{p}}$

$$\le c \left(\left\| \sum_{u=1}^{k+1} \frac{2^{upr}}{n^{2upr}} \left(\sum_{\eta=u}^{\infty} |\Delta_u|^2 \right)^{\frac{p}{2}} \right\|_{p,\alpha}^{\frac{1}{p}} \right)$$

$$\le c \left(\left\| \sum_{u=1}^{k+1} \frac{2^{upr}}{n^{ur}} \left(\sum_{\eta=u}^{\infty} |\Delta_u|^2 \right)^{\frac{p}{2}} \right\| \right)^{\frac{1}{p}} \le c\,\omega_r\left(f, \frac{1}{n} \right)_{p,\alpha}$$

4.3 : Proof of theorem 3.3 :
Let $f \in L_{p,\alpha}(X)$ for every natural number k there exist a constant c(k) depending on k such that :

$$\omega_k\left(f, \frac{1}{n} \right)_{p,\alpha} \le \frac{c(k)}{n^k} \sum_{i=0}^{n} (i+1)^{k-1} E_i(f)_{p,\alpha}$$

Let $p_k^* \in \mathcal{P}_n$ be a best algebraic approximation of unbounded function f and b , $b + kh \in X$

We have $0 \le \Delta_h^k f(b)\, \alpha(b)$ then :

$$0 \le \left\| \Delta_h^k f(b) \right\|_{p,\alpha} = \left\| \sum_{i=0}^{k} (i+1)^{k+j} f(b+ih) \right\|_{p,\alpha}$$

$$\le \left\| \sum_{i=0}^{k} \binom{k}{i} | f(b+ih) - p_k^*(b+ih) | + \sum_{i=0}^{k} \binom{k}{i} | p_k^*(b+ih) | \right\|_{p,\alpha}$$

$$\le sup \left\| \Delta_h^k\, p_k^*(b+ih) \right\|_{p,\alpha} + \left\| \sum_{i=0}^{k} \binom{k}{i} | f(b+ih) - p_k^*(b+ih) | \right\|_{p,\alpha}$$

$$\le \omega_k(p_k^*, b, \delta) + \sum_{i=0}^{k} \binom{k}{i} \| f - p_k^* \|_{p,\alpha}$$

$$\leq \frac{c(k)}{n^k} \sum_{i=0}^{k} \binom{k}{i} E_i(f)_{p,\alpha}$$

5. Conclusion

We can be approximated of unbounded functions by using algebraic polynomial in weighted space, also obtain sharp Jackson (direct) inequality of algebraic approximation of unbounded functions in terms modulus of smoothness.

Sequential unconstrained approach for solving index one constrained differential-algebraic optimal control problems

Sequential unconstrained approach for solving index one constrained differential-algebraic optimal control problems

Abstract. A constrained index-one differential algebraic optimal control problem is presented. The algebraic constraint is assumed to have an index one property. With the help of implicit function theorem, the reduced constrained optimal control problem in the state-space is then obtained. The main goal of this work is to solve the present problem by using an unconstrained sequential minimization approach. The necessary mathematical requirements, conditions and proofs are developed. Based on the obtained results, computational algorithm to solve this problem approximately is developed. Numerical illustrations of constrained differential algebraic optimal control problems are implemented. Due to the numerical results and their comparisons, an efficient approximate method is obtained.

1. Introduction

Differential-algebraic systems have been extensively studied later on due to their natural formulation of many real life applications and its importance to the field of control and optimal control system [1], [2],[3],[4],[6],[7],[19],[20]. There is an important field of differential- algebraic equations arising from constrained optimal control problems, where the inequality constraint are active or in the present of equality constraints explicitly. For unconstrained optimal control problem, the necessary conditions of optimality may also lead to semi-explicit differential-algebraic system [5], [8].

In this work, semi-explicit differential algebraic optimal control problem with equality and inequality constraints have been considered assuming that the index one problem can be smoothly reduced into a state space constrained optimal control problems. In solving the reduced problem and hence the original one, sequential minimization penalty function approach is developed where some penalties functions terms are added to the objective performance criterion for any violation of the constraints. We have shown that there is a sequence of admissible solutions whose limit is the optimal solution of the present problem. Based on the esteemed work of [9] and [11] the theoretical proofs have been generalized and modified.

2. Problem formulation (original problem)

Consider a system described by the semi-explicit differential- algebraic form (DAE)

$$x_1 = F_1(x_1, x_2, u, t), \text{a. e. on } [0, T] \quad \ldots.(1)$$
$$F_2(x_1, x_2, u) = 0, \quad \ldots.(2)$$
$$F_3(x_1, t) \geq 0, \quad \ldots .(3)$$
$$F_4(u, t) \geq 0, \text{a. e. on } [0, T] \quad \ldots.(4)$$

$F_1(x_1, x_2, u, t): \mathcal{D} \times \mathcal{R}^{n_2} \times \mathcal{R}^p \times \mathcal{R}^+ \to \mathcal{R}^{n_1}$ is assumed to be measurable in t for fixed (x_1, x_2) and u, continuous in (x_1, x_2) for fixed t, u and continuous in u for fixed t, (x_1, x_2) and there exists an integrable function s(t) on $[0, T]$ such that $\|F_1(x_1, x_2, u, t)\| \le s(t)$ for $0 \le t \le T$ for all admissible functions $x_1(.), x_2(.)$ and $u(.)$, with $\int_0^t s(t)dt < \infty$, and $\int_0^t s^2(t)dt < \infty$

$$F_2(x_1, x_2, u) \in C^1(\mathcal{D} \times \mathcal{R}^{n_2} \times \mathcal{R}^p, \mathcal{R}^{n_2})$$
$$F_3(x_1, t) \in C(\mathcal{D} \times \mathcal{R}^+, \mathcal{R}^{n_3})$$
$$F_4(u, t) \in C(\mathcal{R}^p \times \mathcal{R}^+, \mathcal{R}^{n_4}), \text{ where}$$
$$x_1 = \left(x_1^1, \dots, x_1^{n_1}\right)^T : [0, T] \to \mathcal{R}^{n_1}$$
$$x_2 = \left(x_2^1, \dots, x_2^{n_2}\right)^T : [0, T] \to \mathcal{R}^{n_2}$$
$$u = \left(u_1, \dots, u_p\right)^T : [0, T] \to \mathcal{R}^p$$
$$\xi_1(T) = \left(\xi_1^1(T), \dots, \xi_1^{n_1}(T)\right)^T \text{ (Target of state } x_1) \; (\xi_1(t) \in C(\mathcal{R}^+, \mathcal{R}^{n_1}))$$
$$\xi_2(T) = \left(\xi_2^1(T), \dots, \xi_2^{n_2}(T)\right)^T \text{ (Target of state } x_2) \; (\xi_2(t) \in C^1(\mathcal{R}^+, \mathcal{R}^{n_2}))$$

The aim is to find an admissible functions $x_1(.), x_2(.)$ and $u(.)$ such that

$$J_0(u(.)) = \|x_1(T) - \xi_1(T)\|^2 + \|x_2(T) - \xi_2(T)\|^2 + \int_0^T F_0(x_1(t), x_2(t), u(t))\, dt, \quad \dots.(5)$$

Is minimized, where a.e. is standing for almost everywhere, where $F_0(x_1, x_2, u, t)$ is assumed to be integrable for each fixed x_1, x_2 and u .

$$\mathfrak{F}(0) = \{x_1(0) \in \mathcal{D} \subseteq \mathcal{R}^{n_1}, x_2(0) \in \mathcal{R}^{n_2}, u(0) \in \mathcal{R}^p | F_i(x_1(0), x_2(0), u(0)), i = 0,1,2,3,4$$
Satisfying the constraint (1)-(4) along with the function $F_0(x_1, x_2, u, t)$ }

$\mathcal{D}$ is assumed to be open set of $\mathcal{R}^{n_1}, T > 0$ is fixed real number with $(x_1(0), x_2(0)) = (x_{10}, x_{20}) \in \mathfrak{F}(0)$. Under some reasonable conditions, we are assuming there is an optimal solution to this problem. To reduce the order of this problem into state- space optimal control problem with equality and inequality constraints on the states and control with a suitable consistent initial conditions, one can assume that:

Assumptions 1: $(F_2)_{index-1}$

There exists an open set $\tilde{\upsilon}_{x_1} \subset \mathcal{D}$ such that for all

$(\tilde{x}_1, \tilde{u}) \in \tilde{\upsilon}_{x_1,u} \triangleq \{x_1 \in \tilde{\upsilon}_{x_1}, u \in \mathcal{R}^p |$ it is possible to solve $F_2(\tilde{x}_1, \tilde{x}_2, \tilde{u}) = 0$ for $\tilde{x}_2\}$

The corresponding solution manifold may be defined as

$$\tilde{\upsilon} = \{x_1 \in \tilde{\upsilon}_{x_1}, x_2 \in \mathcal{R}^{n_2}, u \in \mathcal{R}^p | F_2(x_1, x_2, u) = 0\}$$

Which is not necessary be open set of $\tilde{\upsilon}_{x_1} \times \mathcal{R}^{n_2} \times \mathcal{R}^p$.

Assumption 2:

From theorem A.1, [8] and assumption 1 , we have assumed that for every point $(\tilde{x}_1, \tilde{u}) \in \tilde{\upsilon}_{x_1,u}$ There exist a neighborhood $\mathcal{N}_{\tilde{x}_1,\tilde{u}}$ of $(\tilde{x}_1, \tilde{u})$ and corresponding $\mathcal{N}_{\tilde{x}_2}$ of $\tilde{x}_2$ such that, for each point $(x_1, u) \in \mathcal{N}_{\tilde{x}_1,\tilde{u}}$ a unique solution $x_2 \in \mathcal{N}_{\tilde{x}_2}$ exists and the solution is given as $x_2 = \varphi_{\tilde{x}_1}(x_1, u)$ locally. One can also assume that one of the sets $\mathcal{N}_{\tilde{x}_1,u}$ is global in u [8] in the sense that it can be expressed as

$$\mathcal{N}_{\tilde{x}_1,\tilde{u}} = \{x_1 \in \mathcal{N}_{x_1}, u \in \mathcal{R}^p\}$$

Where $\mathcal{N}_{x_1}$ is a neighborhood of $x_1 = 0$. One can define

$$\upsilon \triangleq \{x_1 \in \mathcal{N}_{x_1}, x_2(t) \in \mathcal{R}^{n_2}, u \in \mathcal{R}^p | F_2(x_1, x_2, u) = 0\}.$$

Remarks 1

1. To satisfy the assumption I, we have assumed that the rank of $\left(\frac{\partial F_2}{\partial x_2}\right)$ is constant and full on $\tilde{\upsilon}$.
2. One can using implicit function theorem [21],[22],[23] on υ to find
$$x_2 = \varphi(x_1, u), \forall x_1 \in \mathcal{N}_{x_1}, u \in \mathcal{R}^p.$$
3. Based on the assumptions (I-II), a reduced state – space constrained optimal control problem

may obtained explicitly.

Problem formulation (reduced problem)

Consider the following reduced state –space constrained optimal control problem. Set

$\rho_x \triangleq \{x_1(.)|x_1(.)$ is absolutely continuous function with $\dot{x}_1(.) \in L_2[0,T]$ and $F_3^i(x_1(t),t) \geq 0$, where

$x_1 \in \mathcal{N}_{x_1}$, $i = 1,2,\dots,n_3\}$.

$\rho_u \triangleq \{u(.)|$ u is bounded, measurable (Lebesgue) function such that $F_4^i(u(t),t) \geq 0$, (a. e) $i = 1,\dots,n_4\}$. Where ρ_u is assumed nonempty set, i.e. $\rho_u \neq \emptyset$.

$\mathfrak{F}_0^1 = \{x_1(0) \in \mathcal{R}^{n_1} | F_3(x_1(0),0) \geq 0, F_4(u(0),0) \geq 0$, Which ensure the integrability of $F_0\left(x_1(0), \varphi\big(x_1(0),u(0)\big),u(0)\right)\}$, for a given $u(0) \in \rho_u \subset \mathcal{R}^p\}$.

It assumed that the set $\mathfrak{F}_0^1$ is compact subset of $\mathcal{R}^{n_1}$. Then the problem is to find $x_1(.) \in \rho_x$ and $u(.) \in \rho_u$ so the following equivalent reduced problem minimized

$$\min_{\rho_u} J\big(u(.)\big) = \sum_{i=1}^{n_1} \left|x_1^i(T) - \xi_1^i(T)\right|^2 + \sum_{i=1}^{n_2} \left|\varphi(x_1(T),u(T)) - \xi_2^i(T)\right|^2 + \int_0^T F_0\big(x_1(s),\varphi\big(x_1(s),u(s)\big),u(s),s\big)\,ds \quad \dots(6)$$

$$\frac{dx_1}{dt} = F_1\big(x_1(t),\varphi\big(x_1(t),u(t)\big),u(t),t\big) \text{ a. e. on } [0,T] \quad \dots(7)$$

$$F_3(x_1(t),t) \geq 0, t \in [0,T] \quad \dots(8)$$

$$F_4(u(t),t) \geq 0, \text{a. e. on } [0,T] \quad \dots(9)$$

$$x_1(0) \in \mathfrak{F}_0^1 \quad \dots(10)$$

Over classes of admissible functions.

Remark 2:

If $x_2 = \varphi(x_1(t),u(t))$ and $x_2 = \varphi(x_1(T),u(T)) = \xi_2(T)$ are explicitly satisfied as a result of implicit function theorem on the class of continuously differentiable functions almost all, then the constraint

$\sum_{i=1}^{n_2} |\varphi(x_1(\tau),u(\tau)) - \xi_2(T)|^2$ is neglected from (6).

To define the sequential optimization problem, using a penalty function approach, one can assume the following sets:

Assumption 3:

For each $t \in [0,T]$, $\forall x_{10} \in \mathfrak{F}_0^1$

$$\mathcal{Q}_{x_1}(t) = \{x_1(t)\big|F_3^i(x_1(t),t) \geq 0, i = 1,2,\dots,n_1\} \subseteq \mathcal{R}^{n_1}$$

$$\mathcal{Q}_{x_1}^0(t) = \{x_1(t)\big|F_3^i(x_1(t),t) > 0, i = 1,2,\dots,n_1\}$$

$$\mathcal{Q}_u(t) = \{u(t)|F_4^j(u(t),t) \geq 0, \text{a. e.}, j = 1,2,\dots,n_2\} \subset \mathcal{R}^p$$

$$\mathcal{Q}_{u_0}(t) = \{u(t)|F_4^j(u(t),t) > 0, \text{a. e. } j = 1,2,\dots,n_2\}$$

$$X_1 = \{x_1(.)|x_1(t) \in \mathcal{Q}_{x_1}(t), \forall t \in [0,T]\}$$

$$X_1^0 = \{x_1(.)|x_1(t) \in \mathcal{Q}_{x_1}^0(t), \text{a. e. on} [0,T] \text{ and } \int_0^T \frac{dt}{F_3^i(x_1(t),t)} < +\infty, i = 1,2,\dots,n_3\}$$

$$U = \{u(.)|u(t) \in \mathcal{Q}_u, \text{a. e. on } [0,T]\}$$

$$U^0 = \{u(t)|u(t) \in \mathcal{Q}_{u_0}, \text{a. e. on } [0,T] \text{ and } \int_0^T \frac{dt}{F_4^i(u(t),t)} < +\infty\ i = 1,2,\dots,n_4\}$$

$$\rho_{x_1,u} = \{\big(x_1(.),u(.)\big)\big|x_1(t) - x_{10} - \int_0^T F_0\big(x_1(s),\varphi\big(x_1(s),u(s)\big),u(s),s\big)ds = 0 \text{ For all } t \in [0,T],$$
$$x_2(t) = \varphi(x_1(t),u(t),t), x_1^0 \in \mathfrak{F}_0^1\}.$$

For solvability point of view, one has to assume that $X_1^0 \neq \emptyset$, $U^0 \neq \emptyset$ and $\rho_{x_1,u} \neq \emptyset$.

3.sequential minimization penalty function approach for reduced problem

Consider (6)-(10) under the assumption 3 is satisfied, a decreasing null sequence of positive real numbers $\{\beta_k\}$ for each $\beta_k > 0, \forall x_1(0) \in \mathfrak{F}_0^1$, is defined as:

$$P\left(\beta_k, x_1(.), \varphi\big(x_1(.), u(.)\big), u(.)\right) \triangleq J_1\big(u(.)\big) + \frac{1}{\beta_k}\int_0^T \left\|\frac{dx_1}{dt} - F_1\big(x_1(t), \varphi\big(x_1(t), u(t)\big), u(t), t\big)\right\|^2 dt + \frac{1}{\beta_k}\left[\sum_{i=1}^{n_1}\left|x_1^i(0) - x_{10}^i\right|^2 + \sum_{j=1}^{n_2}\left|\varphi^j\big(x_1(0), u(0)\big) - x_{20}^j\right|^2\right] + \beta_k\left\{\int_0^T\left[\sum_{i=1}^{n_3}\frac{1}{F_3^i(x_1(t),t)} + \sum_{i=1}^{n_4}\frac{1}{F_4^i(u(t),t)}\right]dt\right\} \quad \ldots(11)$$

The aim is to minimize (11), for each fixed k, $\beta_k > 0$ over $X_1^0 \times \mathcal{N}_{\tilde{x}_2} \times U^0$ and show that : the solution of (11) is equivalent to the solution of (6)- (10) which is also equivalent to the solution of original problem (1)- (5).

Remark 3:

1. To steer $x_1(0) \in \mathfrak{F}_0^1$ to its target $x_1(T) = \xi_1(T)$ over a class of admissible control and state functions, when (there exists at least one successful control) over the compact interval [0,T] the corresponding successful response must satisfy some a priori bound. Since $F_1 \in C^1(\mathcal{N}_{\tilde{x}_1} \times \mathcal{N}_{\tilde{x}_2} \times \mathcal{R}^p \times \mathcal{R}^{n_1})$

$$|F_1(x_1, \varphi(x_1, u), u)| \triangleq \sum_{i=1}^{n_1}\left|F_1^i(x_1, \varphi(x_1, u), u)\right|$$
$$|F_1(x_1, \varphi(x_1, u), u)| \le s_1|x_1| + s_2|\varphi(x_1, u)| + s_3|u|; \quad \ldots(12)$$
$$\varphi(x_1, u) \in C^1\big(\mathcal{N}_{\tilde{x}_1, \tilde{u}}\big).$$

One can also obtain that

$$|\varphi(x_1, u)| \le L_1|x_1| + L_2|u|, L_1, L_2 > 0 \quad \ldots.(13)$$

2. Define $\mathcal{Q}_{x_1} \triangleq \bigcup_{t\in[0,T]} \mathcal{Q}_{x_1}$ to be a non-empty bounded subset of the set $\mathcal{R}^{n_1}$.
$\mathcal{Q}_u \triangleq \bigcup_{t\in[0,T]} \mathcal{Q}_u$ to be nonempty convex compact subset of $\mathcal{R}^p$ for optimality

requirement, for simplicity the control will bounded in some sense. Hence from (12), (13) and (1) over these classes, one gets

$$|x_1(t)| \le \left|x_{10} + \int_0^t F_1\big(x_1(s), \varphi\big(x_1(s), u(s)\big), u(s), s\big)ds\right|$$
$$\le |x_{10}| + \int_0^t (\bar{s}_1 + \bar{s}_2 L_1)|x_1(s)|ds + (\bar{s}_2 L_2 + \bar{s}_3)b.T$$
$$\le (|x_{10}| + (\bar{s}_2 L_2 + \bar{s}_3)b.T)e^{(\bar{s}_1 + \bar{s}_2 L_1)T} \text{ (Grownwall inequality[24])}$$

Hence $|x_1(t)| \le \alpha_1$, where α_1 is constant depend only on the T, where $\mathfrak{F}_0^1$ is bounded subset of $\mathcal{N}_{x_1}$ over

$$[-\alpha, \alpha] \times \mathcal{N}_{\tilde{x}_1, \tilde{u}} \times \mathcal{Q}_u \times [0, T].$$

Lemma1.

$\inf J_1(u) = \alpha > -\infty$, $\forall \beta_k > 0$, then $P\left(\beta_k, x_{1,k}(.), \varphi\left(x_{1,k}(.), u_k(.)\right), u_k(.)\right)$ is bounded below on $X_1^0 \times \mathcal{N}_{\tilde{x}_2} \times U^0$.

Proof:

By definition of $P(\beta_k, x_1(.), \varphi(x_1(.), u(.)), u(.))$, we have on $X_1^0 \times \mathcal{N}_{\tilde{x}_2} \times U^0$, that

$$P\left(\beta_k, x_1(.), \varphi(x_1(.), u(.)), u(.)\right) \geq \inf_{X_1^0 \times \mathcal{N}_{\tilde{x}_2} \times U^0} J_1(u(.)) + \frac{1}{\beta_k}\int_0^T \left\| \frac{dx_1}{dt} - F_1(x_1(t), \varphi(x_1(t), u(t)), u(t), t)\right\|^2 dt + \frac{1}{\beta_k}\left[\sum_{i=1}^{n_1}\left|x_1^i(0) - x_{10}^i\right|^2 + \sum_{j=1}^{n_2}\left|\varphi^j(x_1(0), u(0)) - x_{20}^j\right|^2\right] + \beta_k\left\{\int_0^T\left[\sum_{i=1}^{n_3}\frac{1}{F_3^i(x_1(t))} + \sum_{i=1}^{n_4}\frac{1}{F_4^i(u(t))}\right]dt\right\}$$

$$\geq \inf_{x_1^0 \times \mathcal{N}_{\tilde{x}_2} \times U^0} J(u(.))$$

$$\geq \inf J(u(.)) = \alpha > -\infty \text{ since } X_1^0 \times \mathcal{N}_{\tilde{x}_2} \times U^0 \subset X_1 \times \mathcal{N}_{\tilde{x}_2} \times U$$

The generalization spaces functions, the problem formulation and its performance index of [9], [10] and [11] lead to the following theorem.

Theorem 1.

Let assumption 4 and lemma 3 are satisfied, then:

1) $\forall \beta_k > 0, P\left(\beta_k, x_1(.), \varphi(x_1(.), u(.)), u(.)\right)$ is minimized in $X_1^0 \times \mathcal{N}_{\tilde{x}_2} \times U^0$ at the point $\left(x_{10}^k(.), \varphi\left(x_{10}^k(.), u_0^k(.)\right), u_0^k(.)\right)$.

2) $\lim_{k\to\infty} P\left(\beta_k, x_{10}^k(.), \varphi\left(x_{10}^k(.), u_0^k(.)\right), u_0^k(.)\right) = \min_{(X_1 \times \mathcal{N}_{\tilde{x}_2} \times U) \cap \rho_{x_1,u}} \int_0^t F_0(x_1(t), \varphi(x_1(t), u(t)), u(t), t)dt$.

3) The limit point of $(x_{10}^k(.), \varphi\left(x_{10}^k(.), u_0^k(.)\right), u_0^k(.))$ solves the reduced optimal control problem (11).

4) The solution to the original problem is given by $\lim_{k\to\infty}\left(x_{10}^k(.), \varphi\left(x_{10}^k(.), u_0^k(.)\right), u_0^k(.)\right)$ where

$x_{20}^k(.) = \varphi\left(x_{10}^k(.), u_0^k(.)\right)$ starting from $(x_1^0, x_2^0, u^0) \in \mathfrak{F}(0)$.

Proof:

For the proof of (1):

Let $\beta_k > 0$ be fixed, since by lemma1, $P\left(\beta_k, x_1(t), \varphi(x_1(t), u(t)), u(t)\right)$ is bounded below on

$X_1^0 \times \mathcal{N}_{\tilde{x}_2} \times U^0$, let C_k be infimum over $X_1^0 \times \mathcal{N}_{\tilde{x}_2} \times U^0$ of $P\left(\beta_k, x_1(t), \varphi\big(x_1(t), u(t)\big), u(t)\right)$, which is finite by lemma 1, let $\{x_{1,n}^k(.), u_n^k(.)\} \in X_1^0 \times U^0$ such that

$$C_k = \lim_{n\to\infty} P\left(x_{1,n}^k(.), \varphi\left(x_{1,n}^k(.), u_n^k(.)\right), u_n^k(.)\right) \text{ over } X_1^0 \times \mathcal{N}_{\tilde{x}_2} \times U^0$$

Since $\{x_n^k(.)\}$ has bounded range, from Q_{x_1} is bounded subset of $\mathcal{N}_{x_1} \subset \mathcal{D} \subset \mathcal{R}^{n1} \Longrightarrow x_{1,n}^k(.)$ is uniformly bounded subset of $\mathcal{N}_{x_1}$. (assumption 4)

From the definition of $\varphi\left(x_{1,n}^k(.), u_n^k(.)\right)$ which is defined on $\mathcal{N}_{\tilde{x}_1,\tilde{u}}, \forall x_1(.) \in \mathcal{N}_{x_1},\ u \in \mathcal{R}^p$ which is bounded over the class of continuously differentiable functions , $\forall x_{1,n}^k(.) \in \mathcal{N}_{x_1},\ u_n^k \in U^0$

Since $x_1^k(t) \in Q_{x_1}$, $u_n^k(t) \in Q_u$ which are bounded and (convex and compact) subsets, respectively, and

$\left\|\varphi\left(x_{1,n}^k(t), u_n^k(t)\right)\right\| \le L_1\left\|x_{1,n}^k(t)\right\| + L_2\left\|u_n^k(t)\right\| \le L_1\left\|x_{1,n}^k(t)\right\| + L_2.b,\ \ L_1, L_2, b \ge 0$, where

$$\|x_1\| = \sup_{t\in[0,T]} \|x_1(t)\| = \sup_{t\in[0,T]} \sum_{i=1}^{n_1} \left|x_1^i(t)\right|$$

It should be noticed that.

$\int_0^T \left\|\dot{x}_{1,n}^k(t) - F_1\left(x_{1,n}^k(t), \varphi\left(x_{1,n}^k(t), u_n^k(t)\right), u_n^k(t), t\right)\right\|^2 dt = \mathcal{A}$, where $\mathcal{A} < +\infty$ and hence

$$0 \le \int_0^T \left\|\dot{x}_{1,n}^k(t) - F_1\left(x_{1,n}^k(t), \varphi\left(x_{1,n}^k(t), u_n^k(t)\right), u_n^k(t), t\right)\right\|^2 dt$$
$$\le \int_0^T \left\|\dot{x}_{1,n}^k(t)\right\|^2 dt + \int_0^T \left\|F_1\left(x_{1,n}^k(t), \varphi\left(x_{1,n}^k(t), u_n^k(t)\right), u_n^k(t), t\right)\right\|^2 dt$$

$$-2\int_0^T \langle x_{1,n}^k(t), F_1(x_{1,n}^k(t), \varphi\left(x_{1,n}^k(t), u_n^k(t)\right), u_n^k(t), t)\rangle\, dt = \mathcal{A} \qquad \ldots(14)$$

Where $\langle .,. \rangle$ is the inner product in subspace of $\mathcal{N}_{x_1} \subseteq \mathcal{D} \subseteq \mathcal{R}^{n_1}$. As a result of our assumptions, we have that

$$0 \le \int_0^T \left\|\dot{x}_{1,n}^k(t)\right\|^2 dt \le 2\int_0^T \left\|\dot{x}_{1,n}^k(t)\right\| \|s(t)\|\, dt + \int_0^T s^2(t)dt + I \qquad \ldots(15)$$

$$\int_0^T \left\|\dot{x}_{1,n}^k(t)\right\| \|s(t)\|\, dt \le \left(\int_0^T \left\|\dot{x}_{1,n}^k(t)\right\|^2 dt\right)^{\frac{1}{2}} . \left(\int_0^T s^2(t)dt\right)^{\frac{1}{2}} \Longrightarrow \qquad \ldots(16)$$

$$\left[\left(\int_0^T \left\|\dot{x}_{1,n}^k(t)\right\|^2 dt\right)^{\frac{1}{2}} - \left(\int_0^T s^2(t)dt\right)^{\frac{1}{2}}\right]^{1/2} \le \mathcal{A} + 2\int_0^T s^2(t)dt$$

$$\Longrightarrow \int_0^T \left\|\dot{x}_{1,n}^k(t)\right\|^2 dt \le \left[\mathcal{A} + 2\left[\int_0^T s^2(t)dt\right]^{1/2} + [s^2(t)dt]^{1/2}\right]^2$$

$$\le \left[(\mathcal{A} + 2k_1)^{\frac{1}{2}} + (k_1)^{\frac{1}{2}}\right]^2, k_1 > 0$$

Set $m = \left[(\mathcal{A} + 2k_1)^{\frac{1}{2}} + (k_1)^{\frac{1}{2}}\right]^2 \Rightarrow \int_0^T \left\|\dot{x}_{1,n}^k(t)\right\|^2 dt \leq m\,, m > 0.$ …(17)

Which lead to the uniformly bounded and depending only on T. Since

$$\left\|x_{1,n}^k(t_1) - x_{1,n}^k(t_2)\right\|^2 = \left\|\int_{t_1}^{t_2} \frac{d}{dt} x_{1,n}^k(t)dt\right\|^2 = \left\|\int_{t_1}^{t_2} \dot{x}_{1,n}^k(t)dt\right\|^2 \leq$$

$$\left(\left(\int_{t_1}^{t_2} dt\right)^2\right)^{1/2} . \int_0^T \left\|\dot{x}_{1,n}^k(t)\right\|^2 dt$$

$\leq |t_2 - t_1|. \left\|\int_{t_1}^{t_2} \dot{x}_{1,n}^k(t)dt\right\|^2 \leq m\,|t_2 - t_1|, m > 0$ for $|t_2 - t_1| < \delta \Longrightarrow \left\|x_{1,n}^k(t_2) - x_{1,n}^k(t_1)\right\| < \varepsilon,$ $\forall\, n > n_0 \in \mathbb{N}$ and fixed $k, \varepsilon \geq m.\,\delta$.

By using Arzelas theorem [24], there is a sequence, again denoted by

$$\{x_{1,n}^k(.)\} \xrightarrow[n\to\infty]{\substack{uniformly\ convergent \\ on[0,T]}} x_{1,0}^k(.) \text{ on the ranges over } \mathcal{Q}_{x_1} \text{ and } \mathcal{Q}_u, \quad \ldots(18)$$

for $x_1 \in \mathcal{N}_{x_1} \subset \mathcal{D} \subset \mathcal{R}^{n1}$ in $L_2[0,T]$, where $x_{1,0}^k(.)$ is continuous function. From (17) , one can define a further subsequence from $\{x_{1,n}^k(.)\}$ such that

$$\{\dot{x}_{1,n}^k(.)\} \xrightarrow[in\ L_2[0,T]]{weak\ sequential\ convernce} y_1(.) \in L_2[0,T] \quad \ldots(19)$$

Since $y_1(.) \in L_2[0,T]$ and from (18) and (19), we have that $x_{1,0}^k(t) - x_{1,0}^k(0) = \int_0^t \dot{x}_{1,0}^k(t)dt = \int_0^t \lim_{n\to\infty} \dot{x}_{1,n}^k(t)\,dt = \int_0^t y_1(t)dt \Longrightarrow \dot{x}_{1,0}^k(.) = y_1(.)\ \forall\ t \in \in [0,T]$. Since $y_1(.) \in L_2[0,T]$ hence

$$\dot{x}_0^k(.) \in L_2[0,T]$$

.

Since $\mathcal{Q}_u$ is compact and convex in $\mathcal{R}^p$, and $[0,T]$ is compact subset of $\mathcal{R}^1$. There exist a sequence relabeled as $\{u_n^k(.)\}$, for fixed $k > 0$ which has a weak sequential limit function $u_0^k(.)$ and which is bounded measurable [18].

$\{x_{1,n}^k(.),\ u_n^k(.)\}$ is minimizing sequence for $P\left(\beta_k, x_1(.), \varphi\big(x_1(.), u(.)\big), u(.)\right)$ on $X_1^0 \times \mathcal{N}_{\tilde{x}_2} \times U^0$.

we have a consequence that the sequence (in n) , and Since

$$\lim_{n\to\infty} \varphi\left(x_{1,n}^k(t), u_n^k(t)\right) = \varphi\left(\lim_{n\to\infty} x_{1,n}^k(t)\,, \lim_{n\to\infty} u_n^k(t)\right);$$

$$\varphi \in C^1[\mathcal{N}_{\tilde{x}_1,\tilde{u}}, \mathcal{R}^{n_2}]$$

for $i = 1, \ldots, n_3$, and $j = 1, \ldots, n_4$, $\int_0^T \frac{1}{F_3^i(x_{1,n}^k(t),t)}$ bounded on $\mathcal{Q}_{x_1}$ and $\int_0^T \frac{1}{F_4^j(u_n^k(t),t)}$ is bounded on $\mathcal{Q}_u$

$\forall\ x_{10} \in \mathfrak{F}^1(0)$ we have that:

$$\frac{1}{F_3^i(x_{1,n}^k(t),t)} \xrightarrow{n\to\infty} \frac{1}{F_3^i(x_{1,0}^k(t),t)}$$

$$\frac{1}{F_4^j(u_n^k(t),t)} \xrightarrow{n\to\infty} \frac{1}{F_4^j(u_0^k(t),t)} \quad \text{a.e on } [0,T]\,.$$

On using Fatous lemma [17], one gets

$$\int_0^T \frac{1}{F_4^j(u_0^k(t),t)} dt \leq \lim_n inf \int_0^T \frac{1}{F_4^j(u_n^k(t),t)} dt, i = 1, \ldots . n_4$$

$$\int_0^T \frac{1}{F_3^i(x_{1,0}^k(t),t)} dt \leq \lim_n inf \int_0^T \frac{1}{F_3^i\left(x_{1,n}^k(t),t\right)}\, dt, i = 1, \ldots, n_3$$

from (18), we have

$$\lim_{n\to\infty}\left\|x_{1,n}^k(0)-x_{10}\right\|^2=\left\|x_{1,0}^k(0)-x_{10}\right\|^2$$
$$\lim_{n\to\infty}\left\|x_{1,n}^k(T)-\xi_1(T)\right\|^2=\left\|x_{1,0}^k(0)-\xi_1(T)\right\|^2$$
$$\lim_{n\to\infty}\left\|\varphi(x_{1,n}^k(T),u_n^k(T))-\xi_2(T)\right\|^2=\left\|\lim_{n\to\infty}\varphi(x_{1,n}^k(T),u_n^k(T))-\xi_2(T)\right\|^2$$
$$=\left\|\varphi(\lim_{n\to\infty}x_{1,n}^k(T),\lim_{n\to\infty}u_n^k(T)-\xi_2(T)\right\|^2=\left\|\varphi(x_{1,0}^k(T),u_0^k(T))-\xi_2(T)\right\|^2$$

Over $\mathcal{Q}_x$ and $\mathcal{Q}_u$ on the compact subset [0,T] of $\mathcal{R}^1$. Since $\varphi\in C^1(\mathcal{N}_{\tilde{x}_1,\tilde{u}};\mathcal{R}^{n_2})$ and as a consequence of the above, we have got that

$$\left(x_{1,0}^k(.),\varphi\left(x_{1,0}^k(.),u_n^k(.)\right),u_0^k(.)\right)\in X_1^0\times\mathcal{N}_{\tilde{x}_2}\times\mathcal{R}^p$$
$$P\left(\beta_k,x_{1,0}^k(.),\varphi\left(x_{1,0}^k(.),u_0^k(.)\right),u_0^k(.)\right)=B_1^k \text{ on } X_1^0\times\mathcal{N}_{\tilde{x}_2}\times U^0 \quad \ldots(20)$$

Hence (1) of theorem 1 is proved, to complete the prove of (2-3) of theorem 1 we have that, since

$$\int_0^T F_0\left(x_{1,0}^k(t),\varphi\left(x_{1,0}^k(t),u_0^k(t)\right),u_0^k(t),t\right)dt\le P\left(\beta_k,x_{1,0}^k(t),\varphi\left(x_{1,0}^k(t),u_n^k(t)\right),u_0^k(t),t\right)$$
$$\le P\big(\beta_k,x_1(.),\varphi\big(x_1(.),u(.)\big),u(.)t\big)$$

…(21)

for $\left(x_1(.),\varphi\big(x_1(.),u(.)\big),u(.)\right)$ in $(X_1^0\times\mathcal{N}_{\tilde{x}_2}\times U^0)\cap\rho_{x_1,u}$, the following is obtained

$$\int_0^T F_0\left(x_{1,0}^k(t),\varphi\left(x_{1,0}^k(t),u_0^k(t)\right),u_0^k(t),t\right)dt\le P\big(\beta_k,x_1(.),\varphi\big(x_1(.),u(.)\big),u(.),t\big)$$

Where $\left(x_1(.),\varphi\big(x_1(.),u(.)\big),u(.)\right)\in(X_1^0\times\mathcal{N}_{\tilde{x}_2}\times U^0)\cap\rho_{x_1,u}$

Using the following generalization results of interior approximation ability assumption, which is necessary for penalty function approach to control problem of [9] as follows:

$\forall\varepsilon>0,\exists\left(x_{1,0}^\varepsilon(.),u^\varepsilon(.)\right)\in(X_1^0\times\mathcal{N}_{\tilde{x}_2}\times U^0)\cap\rho_{x_1,u}$ Such that

$$\int_0^T F_0\big(x_1^\varepsilon(t),\varphi\big(x_1^\varepsilon(t),u^\varepsilon(t)\big),u^\varepsilon(t),t\big)dt$$
$$\le\inf_{(X_1\times\mathcal{N}_{\tilde{x}_2}\times U)\cap\rho_{x_1,u}}\int_0^T F\big(x_1^\varepsilon(t),\varphi\big(x_1^\varepsilon(t),u^\varepsilon(t)\big),u^\varepsilon(t),t\big)dt+\varepsilon\ \ldots(22)$$

For every $\varepsilon>0,(\hat{x}_1(.),\varphi(\hat{x}_1(.),\hat{u}(.)),\hat{u}(.))$ in $(X_1^0\times\mathcal{N}_{\tilde{x}_2}\times U^0)\cap\rho_{x_1,u}$ such that from (20)

$$P\left(\beta_k,x_{1,0}^k(.),\varphi\left(x_{1,0}^k(.),u_0^k(.)\right),u_0^k(.),t\right)\le P\big(\beta_k,\hat{x}_1(.),\varphi\big(\hat{x}_1(.),\hat{u}(.)\big),\hat{u}(.),t\big)\ \ldots(23)$$

Hence

$$P(\beta_k,\hat{x}_1(.),\varphi(\hat{x}_1(.),\hat{u}(.)),\hat{u}(.))\le\inf_{(X_1\times\mathcal{N}_{\tilde{x}_2}\times U)\cap\rho_{x_1,u}}\int_0^T F_0(x_1(t),\varphi\big(x_1(t),u(t)\big),u(t),t)dt+\frac{\varepsilon}{2}$$
$$+\beta_k\int_0^T\left[\sum_{i=1}^{n_3}\frac{1}{F_3^i(x_1(t),t)}+\sum_{j=1}^{n_4}\frac{1}{F_4^j(u(t),t)}\right]dt\ \ldots(24)$$

Choose k such that $\beta_k\to 0$ enough and assume that

$$\beta_k\int_0^T\left[\sum_{i=1}^{n_3}\frac{1}{F_3^i(\hat{x}_1(t),t)}+\sum_{j=1}^{n_4}\frac{1}{F_4^j(\hat{u}(t),t)}\right]dt<\frac{\varepsilon}{2}\quad\ldots(25)$$

From (22),(23),(24) and (25)

$$\int_0^T F_0\left(x_{1,0}^k(t),\varphi\left(x_{1,0}^k(t),u_0^k(t)\right),u_0^k(t),t\right)dt$$
$$\le inf_{(X_1\times\mathcal{N}_{\tilde{x}_2}\times U)\cap\rho_{x_1,u}}\int_0^T F_0(x_1(t),\varphi\big(x_1(t),u(t)\big),u(t))dt+\frac{\varepsilon}{2}\qquad(26)$$

Therefore,

$$\int_0^T F_0\left(x_{1,0}^k(t), \varphi\left(x_{1,0}^k(t), u_0^k(t)\right), u_0^k(t), t\right) dt$$

$$\leq inf_{(X_1\times\mathcal{N}_{\tilde{x}_2}\times U)\cap\rho_{x_1,u}} \int_0^T F_0(x_1(t), \varphi(x_1(t), u(t)), u(t), t)dt + \varepsilon \quad (27)$$

Which makes $\int_0^T F_0\left(x_{1,0}^k(t), \varphi\left(x_{1,0}^k(t), u_0^k(t)\right), u_0^k(t), t\right) dt$ bounded above and below.

As a consequence of the previous results, one gets

$$\left\|x_{1,0}^k(0) - x_{1,0}(0)\right\|^2 \underset{k\to\infty}{\underset{\beta_k\to 0}{\longrightarrow}} 0 \quad \ldots(28)$$

$$\left\|\varphi\left(x_{1,0}^k(0), u_0^k(0)\right) - x_{2,0}(0)\right\|^2 \underset{k\to\infty}{\underset{\beta_k\to 0}{\longrightarrow}} 0 \quad \ldots(29)$$

$$\left\|x_{1,0}^k(T) - \xi_1(T)\right\|^2 \underset{k\to\infty}{\underset{\beta_k\to 0}{\longrightarrow}} 0 \quad \ldots(30)$$

$$\left\|\varphi\left(x_{1,0}^k(T), u_0^k(T)\right) - \xi_2(T)\right\|^2 \underset{k\to\infty}{\underset{\beta_k\to 0}{\longrightarrow}} 0 \quad \ldots(31)$$

For $x_1(0) = x_{10} \in \mathfrak{F}_0^1$, $\xi_1(T)$, $\xi_2(T)$, are given continuous functions

$$\int_0^T \left\|\dot{x}_{1,0}^k(t) - F_1\left(x_{1,0}^k(t), \varphi\left(x_{1,0}^k(t), u_0^k(t)\right), u_0^k(t), t\right)\right\|^2 dt \underset{k\to\infty}{\underset{\beta_k\to 0}{\longrightarrow}} 0 \quad ..(32)$$

Foe each $k > 0,\ \beta_k > 0,\ u_0^k(.) \in U^0\ and\ x_{1,0}^k(.) \in X_1^0, \varphi\left(x_1^0(.), u^0(.)\right) \in \mathcal{N}_{\tilde{x}_2} \subseteq \mathcal{R}^{n_2}$.

By using the same procedure of the proof of lemma 1

$$u_0^k(.) \xrightarrow[k\to\infty]{weakly} u^*(.) \in U, x_{1,0}^k(.) \xrightarrow[k\to\infty]{weakly} x_1^*(.) \in X_1, \dot{x}_{1,0}^k(.) \to \dot{x}_1^*(.) \in L_2[0,T] \quad ...(33)$$

To prove that, $(x_1^*(.), \varphi(x_1^*(.),\ u^*(.)),\ u^*(.)) \in \rho_{X_1,u}$, once

$$\int_0^T \left\|\dot{x}_1^*(t) - F_1(x_1^*(t), \varphi(x_1^*(t),\ u^*(t)),\ u^*(t))\right\|^2 dt$$

$$\leq \lim_k inf \int_0^T \left\|\dot{x}_1^k(t) - F_1\left(x_1^k(t), \varphi\left(x_1^k(t),\ u^k(t)\right),\ u^k(t)\right)\right\|^2 dt$$

$$\Longrightarrow \int_0^T \left\|x_1^*(t) - F_1\left(x_1^*(t), \varphi(x_1^*(t), u^*(t)), u^*(t)\right)\right\|^2 dt$$

By (20). $x_1^*(t) = F_1\left(x_1^*(t), \varphi(x_1^*(t), u^*(t)), u^*(t)\right)$ a.e. on $[0,T]$ and

$$\|x_1^*(0) - x_{10}\| \leq \left\|x_1^*(0) - x_{1,0}^k(0)\right\| + \left\|x_{1,0}^k(0) - x_{10}\right\| \quad \ldots.(34)$$

$$\left\|\varphi(x_1^*(0), u^*(0)) - x_{2,0}(0)\right\|$$

$$\leq \left\|\varphi(x_1^*(0), u^*(0)) - \varphi\left(x_{1,0}^k(0), u_0^k(0)\right)\right\| + \left\|\varphi\left(x_{1,0}^k(0), u_0^k(0)\right) - x_{20}\right\| \quad \ldots.(35)$$

$$\|x_1^*(T) - \xi_1(T)\| \leq \left\|x_1^*(T) - x_{1,0}^k(T)\right\| - \left\|x_{1,0}^k(T) - \xi_1(T)\right\| \quad \ldots.(36)$$

$$\left\|\varphi(x_1^*(T), u^*(T)) - \xi_2(T)\right\|$$

$$\leq \left\|\varphi(x_1^*(T), u^*(T)) - \varphi\left(x_{1,0}^k(T), u_0^k(T)\right)\right\| + \left\|\varphi\left(x_{1,0}^k(T), u_0^k(T)\right) - \xi_2(T)\right\| \quad \ldots.(37)$$

From (35) and (37), the following is used

$$\left\|\varphi(x_1^*(0), u^*(0)) - \varphi\left(x_{1,0}^k(0), u_0^k(0)\right)\right\| \leq \underset{0}{Lip}\, x_1 \left\|x_1^*(0) - x_{1,0}^k(0)\right\| + \underset{0}{Lip}\, u \left\|u^*(0) - u_0^k(0)\right\| \ldots(38)$$

$$\left\|\varphi(x_1^*(T), u^*(T)) - \varphi\left(x_{1,0}^k(T), u_0^k(T)\right)\right\| \leq \underset{T}{Lip}\, x_1 \left\|x_1^*(T) - x_{1,0}^k(T)\right\| + \underset{T}{Lip}\, u \left\|u^*(T) -$$

$u_0^k(T)\|$..(39)

As $k \to \infty$, $\beta_k \to 0$, $x_1^*(0) = x_{10} \in \mathfrak{F}_0^1$, $x_1^*(T) = \xi_1(T)$, from (38)-(39), we have

$$\left\|\varphi\left(x_{1,0}^k(0), u_0^k(0)\right) - x_{20}\right\| = \left\|\varphi\left(x_{1,0}^k(0), u_0^k(0)\right) - \varphi(x_{10}, u(0))\right\|$$
$$\leq \underset{1}{Lip}\, x_1 \left\|x_{1,0}^k(0) - x_{10}\right\| + \underset{1}{Lip}\, u \left\|u_0^k(0) - u(0)\right\|$$

And from (29)

$$\left\|x_{1,0}^k(0) - x_{10}\right\| = 0 \text{ and } \left\|u_0^k(0) - u(0)\right\| = 0 \text{ , for } u(0) \in \mathcal{F}_0^1 \qquad \ldots(40)$$

And $\varphi\big(x_1^*(0), u^*(0)\big) = x_{20}$, $\varphi\big(x_1^*(T), u^*(T)\big) = \xi_2(T)$. Therefor

$$\lim_{k\to\infty} P\left(\beta_k, x_{1,0}^k(.), \varphi\left(x_{1,0}^k(.), u_0^k(.)\right), u_0^k(.)\right) = \int_0^T F_0\ \left(x_1^*(t), \varphi\big(x_1^*(t), u^*(t)\big), u^*(t), t\big)dt$$
$$= \inf_{(X_1\times\mathcal{N}_{\tilde{x}_2}\times U)\cap\rho_{x_1,u}} \int_0^T F_0(\, x_1(t), \varphi\big(x_1(t), u(t)\big), u(t), t)dt \qquad \ldots(41)$$

Hence from (21), (22), we have that

$$\int_0^T F_0\left(x_{1,0}(t), \varphi\left(x_{1,0}(t), u_0(t)\right), u_0(t), t\right) dt \leq \lim_n inf \int_0^T F_0\left(x_{1,n}(t), \varphi\left(x_{1,n}(t), u_n(t)\right), u_n(t), t\right) dt$$

$$\int_0^T F_0\left(x_{1,0}^*(t), \varphi\left(x_{1,0}^*(t), u_0^*(t)\right), u_0^*(t), t\right) dt \leq \lim_k inf \int_0^T F_0\left(x_{1,0}^k(t), \varphi\left(x_{1,0}^k(t), u_0^k(t)\right), u_0^k(t), t\right) dt$$

$$\int_0^T F_0(\, x_1^*(t), \varphi\big(x_1^*(t), u^*(t)\big), u^*(t), t)dt$$
$$\leq \inf_{(X_1\times\mathcal{N}_{\tilde{x}_2}\times U)\cap\rho_{x_1,u}} \int_0^T F_0(\, x_1(t), \varphi\big(x_1(t), u(t)\big), u(t), t)dt + \varepsilon$$

Which leads to

$$\int_0^T F_0(\, x_1^*(t), \varphi\big(x_1^*(t), u^*(t)\big), u^*(t), t)dt \leq \inf_{(X_1\times\mathcal{N}_{\tilde{x}_2}\times U)\cap\rho_{x_1,u}} \int_0^T F_0(\, x_1(t), \varphi\big(x_1(t), u(t)\big), u(t), t)dt$$

Which complete the proofs of (2), (3), as a consequences of (1)-(3), the remains proof (4) is of the direct obtained.

computational algorithm

On the class of admissible functions $X^0 \times \mathcal{N}_{\tilde{x}_2} \times U^0$ (normed space) of reduced order constrained optimal control problem, one can assume that, the $\sum_{i=1}^{n_1} k_1^i + \sum_{j=1}^{p} k_2^j$ dimensional linear space of $X^0 \times \mathcal{N}_{\tilde{x}_2} \times U^0$ is spanned by the linearly independent bases functions $\psi_1^i, \psi_2^i, \ldots, \psi_{k1}^i$, $i = 1,2,\ldots,n_1$ (for the $n_1 -$ states), $\varphi_1^j, \varphi_1^j, \ldots, \varphi_{k2}^j$, j $= 1,2,\ldots,$ p (for the p - control), hence one can set

$$x_1^i(t) = \sum_{m=1}^{k_1{}^i} a_m^i\, \psi_m^i(t), \qquad a_m^i \in \mathcal{R}, i = 1,2,\ldots,n_1$$

$$u_j(t) = \sum_{m=1}^{k_2{}^j} b_m^j\, \varphi_m^j(t), \qquad b_m^j \in \mathcal{R}, j = 1,2,\ldots,p$$

Then on each subspace and fixed $\beta^k > 0$, the following functional is then obtained as:

$$P\left(\beta^k, \sum_{m=1}^{k_1^i} a_m^i\, \psi_m^i(t), \varphi\left(\sum_{m=1}^{k_1^i} a_m^i\, \psi_m^i(t), \sum_{m=1}^{k_2^j} b_m^j\, \varphi_m^j(t)\right), \sum_{m=1}^{k_2^j} b_m^j\, \varphi_m^j(t)\right) \triangleq P\big(\beta^k, \vec{a}, \vec{b}\big)$$

$\vec{a} \triangleq [a_1^1, a_2^1, \dots, a_{k_1}^1, \dots, a_1^{n_1}, a_2^{n_1}, \dots a_{k_1^{n_1}}^{n_1}]$, $\vec{b} \triangleq [b_1^1, b_2^1, \dots, b_{k_2}^1, \dots, b_1^p, b_2^p, \dots b_{k_2^p}^p]$.

Therefore, we have to choose the arbitrary real numbers $\vec{a}$ and $\vec{b}$, using suitable unconstrained inimization approach such that

$$P(\beta^k, \vec{a}, \vec{b}) \xrightarrow[\beta_k \to 0]{k \to \infty} \inf_{(X_1 \times \mathcal{N}_{\tilde{x}_2} \times U) \cap \rho_{x_1,u}} J(u) = \inf_{(X_1 \times \mathcal{N}_{\tilde{x}_2} \times U) \cap \rho_{x_1,u}} J(\vec{b})$$

Computational Algorithm 1.

Step 0: Find the consistency initial condition set $\mathfrak{F}(0)$ and then select: $(x_1^0, x_2^0, u^0) \in \mathfrak{F}_0$.

Step 1: Solve $F_2(x_1, x_2, u) = 0$ for $x_2(t)$, i.e. $x_2 = \varphi(x_1(t), u(t))$, with $x_2(0) = \varphi(x_1(0), u(0))$.

Step 2: Reduced the original DAE with constraints (1) - (5), into an equivalent problem (6) - (10) using Implicit function theorem as discussed earlier.

Step 3: Set

$$x_1^i(t) = \sum_{m=1}^{k_1{}^i} a_m^i \, \psi_m^i(t), \qquad a_m^i \in \mathcal{R}, i = 1,2, \dots, n_1$$

$$u_j(t) = \sum_{m=1}^{k_2{}^j} b_m^j \, \varphi_m^j(t), \qquad b_m^j \in \mathcal{R}, j = 1,2, \dots, p$$

Where $\psi_m^i(t), \varphi_m^j(t)$ are given linearly independent bases functions (suitable chosen)

Step 4: Set $\varepsilon_1 > 0, k = 1$, β_1 (small positive real number).

Step 4.1: Solve the unconstrained optimization problem for $(\vec{a}, \vec{b})$ over the class of $X_1^0 \times \mathcal{N}_{\tilde{x}_1, \tilde{u}} \times U^0$ by using any suitable optimization technique where the following requirements are assumed to be satisfied properly

$$\int_0^T \sum_{i=1}^{n_3} \frac{1}{F_3^i(\sum_{m=1}^{k_1{}^i} a_m^i \, \psi_m^i(t), t)} dt < +\infty$$

$$\int_0^T \sum_{i=1}^{n_4} \frac{1}{F_4^i(u_j(t) = \sum_{m=1}^{k_2{}^j} b_m^j \, \varphi_m^j(t), t)} dt < +\infty$$

And find the solution of

$$Min\, P\left(\beta^k, \sum_{m=1}^{k_1^i} a_m^i \, \psi_m^i(t), \varphi\left(\sum_{m=1}^{k_1^i} a_m^i \, \psi_m^i(t), \sum_{m=1}^{k_2^j} b_m^j \, \varphi_m^j(t)\right), \sum_{m=1}^{k_2^j} b_m^j \, \varphi_m^j(t)\right) \triangleq P(\beta^k, \vec{a}, \vec{b})$$

Step 4.2: Set

$$\text{Error1} = \frac{1}{\beta_k} \int_0^T \left\| \frac{dx_1}{dt} - F_1\left(x_1(t), \varphi\big(x_1(t), u(t)\big), u(t)\right) \right\|^2 dt$$

$$\text{Error2} = \frac{1}{\beta_k} \left\| x_1(0) - x_1^0 \right\|^2$$

$$\text{Error3} = \frac{1}{\beta_k} \sum_{i=1}^{n_1} \left| x_1^i(T) - \xi_1^i(T) \right|^2$$

$$\text{Error4} = \frac{1}{\beta_k} \| \varphi(x_1(0), u(0)) - x_{10} \|^2$$

$$\text{Error5} = \frac{1}{\beta_k} \| \varphi(x_1(T), u(T)) - \xi_2(T) \|^2$$

If the Total Error $\triangleq |(\text{Error1} + \text{Error2} + \text{Error3} + \text{Error4} + \text{Error5})| < \varepsilon_1;\ \varepsilon_1 \geq 0$. Then

stop and go to ***step 5***, otherwise set $k = 2$, β_k is reduced as $\beta_k,\ i.e.\ (\beta_k = \frac{1}{2}\beta_k)$ and go

to ***step 4.1***.

Step 5: Compute $\vec{a}, \vec{b}$ and back substitute then into the solution form of step 3 and then set $x_2 = \varphi(x_1(t), u(t))$ of step 1 with $u(t)$ of step 3, where $J(u^*(t))$ is obtained as a result steps 4.1, 4.2 , with tolerance error ε_1.

Remark 3.

1 . The choice of the type of basis approximation function $\psi_m^i(t), \varphi_m^i(t)$ and the numbers $k_1^i,\ k_2^j$ are depending on the decision maker and the type of the problem, for simplicity, one can choose a suitable polynomial up to some degree , because the class of polynomial is dense in the class of solvability of this problem $L_2[0,T]$ and especially (for continuous problem) with supremum norm.

2 .The violations in the constraints up to some accuracy say ($\varepsilon_1 > 0$) may be happened due to the selection of bases functions and their numbers as well as to the round - off- errors resulting from the integral forms of the constraints in the dual functional $P(\beta^k, \vec{a}, \vec{b})$ in addition to the same other reasons. one can use this the implicit function theorem to find $\varphi(x_1(t), u(t))$ explicitly globally or even locally as a subset of $\mathcal{R}^{n2}$.

Example 1. (without inequality constraint)

Consider $$Min\, J(u) = \int_0^T \left[\left(x_1(t)\right)^2 + \left(x_2(t)\right)^2\right] dt$$

$$\frac{dx_1}{dt} = x_2(t)$$

$$x_2(t) - u(t) = 0,$$

$$x_1(0) = 1,\ x_2(0) = u(0)\ ,\ T = 1$$

Where the consistency initial condition set

$$\mathfrak{F}(0) = \{x_1(0), x_2(0)) | x_2(0) = u(0)\ for\ a\ given\ x_1(0)\}$$

Since the algebraic equation is of easier kind $F_2(x_2, u) = x_2(t) - u(t) \triangleq x_2(t) - u(t) = 0$

Hence the implicit function theorems is applied globally and directly to have $\varphi(x_1(t), u(t)) = u(t)$

The closed form solution of this problem is given by [14] as:

$$x_1(t) = \left(\frac{2e}{1+e^2}\right)\cosh(1-t)\,, \qquad t \in [0,T]$$

$$x_2(t) = u(t) = \left[\frac{-2e}{1+e^2}\right]\sinh(1-t)$$

$$J^*(x_2) = J^*(u) = \int_0^1 (x_1^2 + u^2)dt = 0.76159.$$

On using the proposed approach and algorithm, the following assumptions are made to the reduced problem (simple basis functions are used)

$x_1(t) = \sum_{i=0}^{5} a_i t^i, \quad \dot{x}_1(t) = \sum_{i=0}^{5} i a_i t^{i-1}, \quad x_2(t) = u(t) = \sum_{j=0}^{5} b_j t^j$, $x_2(t) = \varphi(x_1(t), u(t)) = u(t)$

$$Min\ P(\beta^k, \vec{a}, \vec{b}) = \underset{X^0 \times \mathcal{R}^{n1} \times U^0}{\text{Min}} \frac{1}{\beta_k}|1 - a_0|^2 + \frac{1}{\beta_k}\int_0^1 \left|\sum_{i=0}^{5} i a_i t^{i-1} - \sum_{j=0}^{5} b_j t^j\right|^2 dt + \int_0^1 \left(\left(\sum_{i=0}^{5} a_i t^i\right)^2 + \left(\sum_{j=0}^{5} b_j t^j\right)^2\right) dt \quad \ldots.(42)$$

The unconstrained optimization technique (Quasi-Newton method) is used to find in the approximate solution to the original problem where β_k is selected smaller until the total error is acceptable (by decision maker) and repeat the optimization technique for different values of β_k until the desired result is obtained. The following result is obtained even for a reasonable value of β_k

Table (1)

The parameter β_k	0.001					
The dual objective function $P^*(\beta_k, \vec{a}, \vec{b})$	0.7614					
The objective function $J^*(u)$	0.7614					
The exact objective function $J^*(u)$	0.76159					
The unknown parameter $\vec{a}$ for $k_1 = 5$	a_0	a_1	a_2	a_3	a_4	a_5
	1.0	-0.7244	0.3147	0.1164	-0.0113	-0.0475
The unknown parameter $\vec{b}$ for $k_2 = 5$	b_1	b_2	b_3	b_4	b_5	
	-0.6331	0.331	0.3292	-0.0146	-0.2524	
The total error $\|E\| < \varepsilon_1$	$\varepsilon_1 < 10^{-4}$					
$x_2 = \varphi(x_1, u)$	$x_2 = u$					
The basis function $\varphi^i(t)$	$t^i, i = 1,2,3,4,5$					

The numerical simulations and comparisons between the proposed approach and the exact solution are shown in the following figures (1-2).

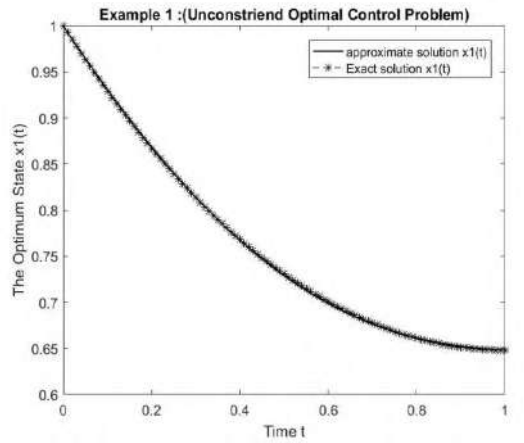

Figure.1

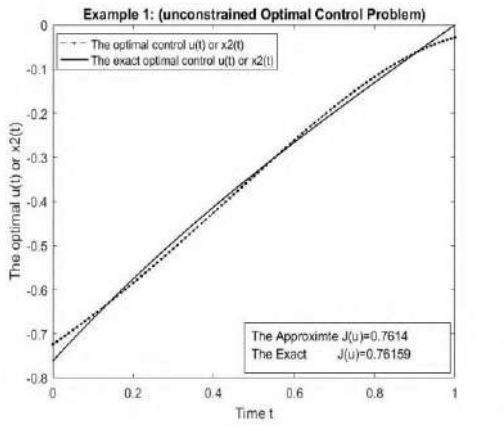

Figure.2

Example 2. (with constant inequality constraint)

Consider $$Min\, J(u) = \int_0^T \left[\left(x_1(t)\right)^2 + \left(u(t)\right)^2\right] dt$$

$$\frac{dx_1}{dt} = x_2(t), \qquad x_1(0) = x_{10}$$

$x_2(t) = u(t)$ (for simplicity used)

With linear constraints $x_1(t) \geq 0.75$ (inequality constaint)

$$\Im(0) = \{x_1(0), x_2(0), u(0)) | x_1(0) = x_{10}\ and\ x_1(t) \geq 0.75, x_2(0) = u(0)\ be\ given\}$$

We have assumed that $T = 1,\ x_1(0) = x_{10} = 1\ and\ n_1 = 5$ (for x_1) , $n_2 = 4$ (for u), and $\varphi^i(t) = t^i$

$x_1(t) = 1 + \sum_{i=0}^{n_1} a_i t^i,$ is substituted into the optimization criterion. The minimization objective function is defined as given by (42) where

$$\left[\beta_k * \int_0^T \frac{1}{g(x_1(t), t)}\, dt\right], g(x_1(t), t) \triangleq x_1(t) - 0.7,$$

is added to the objective function. The following numerical results are obtained, even with very small number of basis and its polynomial type and shown the very efficient technique, as one can see from the figures and its objective function value in **Table.2**.

Table.2

The parameter β_k	10^{-8}				
objective function $P^*(\beta_k, \vec{a}, \vec{b})$	0.8373				
The objective function $J^*(u)$	0.7500				
objective function [14] $J^*(u)$	0.77730				
The unknown parameter $\vec{a}$ for $k_1 = 5$	a_1	a_2	a_3	a_4	a_5
	-0.2380	-0.0488	-0.0010	0.0017	0.0059
The unknown parameter $\vec{b}$ for $k_2 = 5$	b_1	b_2	b_3	b_4	b_5
	-0.2380	-0.0977	-0.0301	0.0069	0.0296
The total error $\|E\| < \varepsilon$	$\varepsilon < 10^{-4}$				
$x_2 = \varphi(x_1, u)$	$x_2 = u$				
The basis function $\varphi^i(t)$	$t^i, i = 1,2,3,4,5$				

As one can see the present results of the proposed approach are better than the results presented in [14] even for simple type of basis functions.one can see the figures figure.3 and figure.4 and table 2 for comparisons point of view.

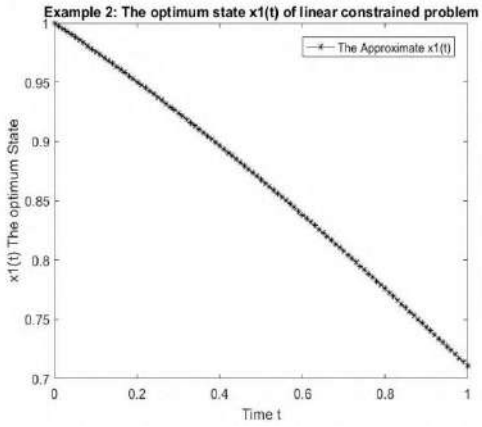

Figure.3

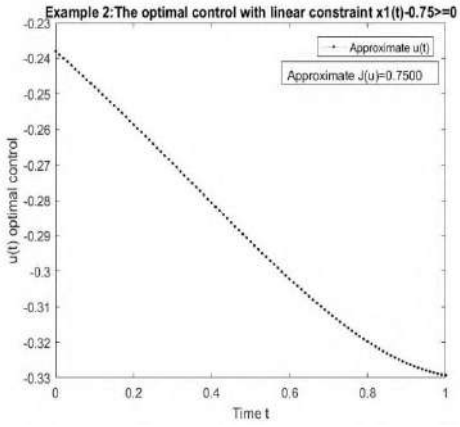

Figure.4

Example 3. (with nonlinear inequality constraint)

Consider $$Min\, J(u) = \int_0^T \left[\left(x_1(t)\right)^2 + \left(u(t)\right)^2\right] dt$$

With $$\dot{x}_1 = x_2(t),\ x_2 = u$$
$$x_1^2(t) \geq t \Leftrightarrow x_1^2(t) - t \geq 0,\ t \in [0,T]$$
$$\Im(0) = \left\{x_1(0), x_2(0), u(0)\right\} \left| x_1^2(0) \geq 0\ , x_2(0) = u(0)\right\}$$

Let $x_1(0) = 1,\ x_1(t) = \sum_{i=0}^{n_1} a_i t^i,\ u(t) = \sum_{i=1}^{n_2} b_i t^i,$ where $n_1 = 7, n_2 = 8$ the objective functions is same as that of example 2 by replacing the nonlinear inequalities constraint $g(x_1(t), t) = x_1(t) - 0.7$, by $g(x_1(t), t) = x_1(t) - t \geq 0$ see table.3 and figure.5 and figure.6

Table.3

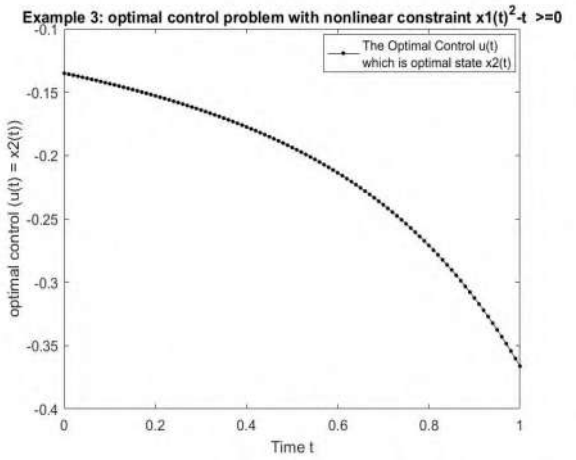

Figure.6

Example 4. (time varying inequality constraint of system of eqautions)

Consider $$Min\, J(u) = \int_0^1 [(x_1(t))^2 + (x_2(t))^2 + 0.005(u(t))^2]dt$$

Subject to $$\frac{dx_1}{dt} = x_2(t),\ x_1(0) = 0\ ,$$

$$\frac{dx_2}{dt} = x_2(t) + x_3(t),\ x_2(0) = -1$$

$$x_3(t) - u(t) = 0,\ \forall t \in [0,1]$$

$$8(t-0.5)^2 - x_2(t) - 0.5 \geq 0, \forall t \in [0,1]$$

$$\Im(0) = \{x_1(0), x_2(0), x_3(0)) | x_3(0) = u(0)\ , x_1(0) = 0, x_2(0) = -1\}$$

The approximate solution using the proposed algorithm is shown in the following table .4

Table.4

The parameter β_k	0.01				
The dual objective function $P^*(\beta_k, \vec{a}, \vec{b})$	0.1631

The unknown parameter $\vec{c}$ for $k_3 = 5$	c_1	c_2	c_3	c_4	c_5
	-12.6440	0.2108	6.3370	3.5905	-2.3879
The total error $\|E\| < \varepsilon$	$\varepsilon < 10^{-4}$				
$x_2 = \varphi(x_1, u)$	$x_2 = u$				
The basis function $G_i(t)\ , H_i(t), M_i(t)$	$t^i, i = 1,2,3,4,5$				

$$x_1(t) = \sum_{i=1}^{n_1} a_i G_i(t)\,, \quad x_2(t) = \sum_{i=0}^{n_2} a_i H_i(t) \quad u(t) = \sum_{i=0}^{n_3} a_i M_i(t),$$

The numerical accuracy of proposed approach can be seen from the following figures: figure.7, figure.8 and figure.9

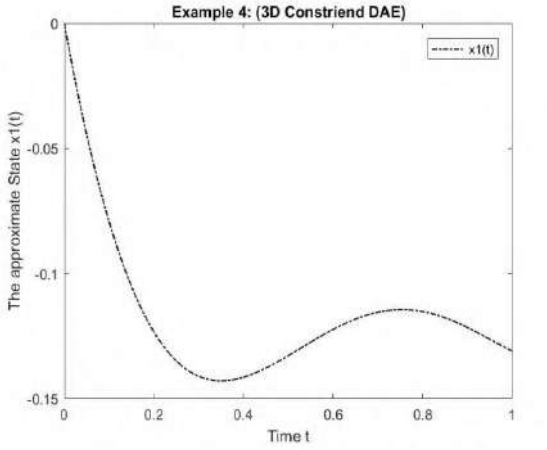

Figure.7

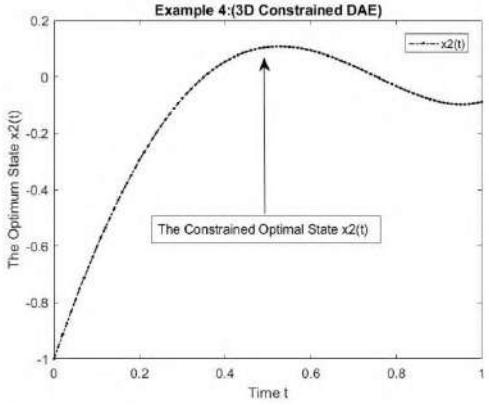

Figure.8

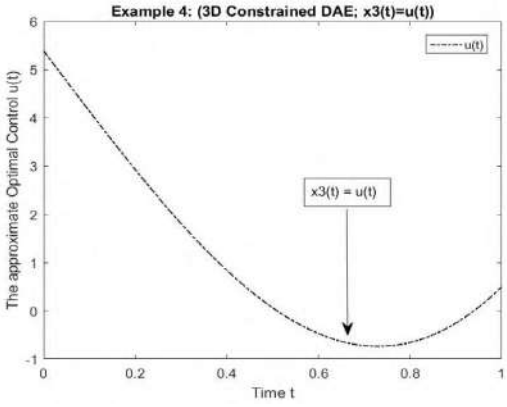

Figure.9

Conclusions

The proof and algorithm of unconstrained sequential penalty function optimization approach for constraint optimal control problem of DAE are proposed, in which a penalty terms are added to the objective function for any violations of equality and inequality constraints. An efficient numerical technique is developing. The accuracy of the method is very good even for a very small number of basis function and its types to solve some classes of the proposed problem are selected. The numerical examples, illustrate the simplicity of implementation and efficiency of the comparisons with exact solution (if any) and the results of others.

Abstract. Let R be a commutative ring. The Von.-Neuman regular (Shortly Vn. Neum. reg.) graph of R is a graph which its vertices are all items of R s. t. thither is an edge between vertices a, b if a+b is a Vn.- Neum. reg. item of R. Here a new definition of the Vn. Neum. reg. graph of R called pseudo –Vn. –Neum. reg. graph of R denoted by P-VG(R) is a graph with all items of R represents a vertex, and two different vertices $a, b \in R$ are adjacent iff $a = a^2b$ or $b = b^2a$. In this work , the main features of P-VG(R) are studied and some outstanding results. Also, we prove if P-VG(R), R= Z_n and $n \geq 3$, n is a prime then it is graph has $\frac{n-3}{2}$ of cycle C_3. Finally, we show that If R=Z_p, where p is a prime number then the PG(R)⊂ P-VG(R).

1. Introduction

There is a bridge between the algebraic concept of rings and the graph theory. The study of algebraic graph has become an exciting research topic through last twenty years. There are many researches in the graphs related with rings were introduced with their features established see[1 - 4]. Taloukolaei and Sahebi defined the Vn.- Neum. reg. graph of R, denoted in $GV_{nr+}(R)$, is a graph consist vertices set R, two different vertices a, b of R are adjacent iff $a + b \in Vnr(R)$ the set of Vn. Neum. reg. items of R [9]. Bhavanari et.al. studied prime graph of a ring with some properties of its graph [7]. And he studied cartesian product of prime graph with Devanaboina [5].

The main goal of this paper creates a new definition named Pseudo-Von. Neum. regular graph of R if V(G) = R and E(G)={ $\overline{ab}$/ $a = a^2b$ or $b = b^2a$ and $a \neq b$, $a, b \in R$ } denoted by P-VG(R) with investigate of some properties as shown in next sections.

2. Preliminary

Definition 2.1:[11] A nonempty set R, with binary operations + and · is said to be a ring if below are satisfied

i- (R,+) is an abelian group
ii- (R,·) is a semi.group
iii- h ·(k+c) = h ·k + h ·c and (h+k) ·c = h ·c+k·c for any h, k, c ∈R

Definition 2.2:[8] suppose R is a ring with a∈R , can say that a is reg. item if there exist b∈R such that a=aba , if any element in R is regular then R is regular ring , if R is commutative then $a = a^2b$ and can say that R is Vn- Neum. reg. ring.

Definition 2.3:[12] Defined the graph G as an ordered pair (V, E), where V is a non-empty set whose items are named vertices and the set E (may be empty) of un-ordered pairs of distinct vertices of V. The item of E is named edges of the graph G . An edge between two end vertices h and k is denote by $\overline{hk}$.

Definition 2.4:[12] Defined the loop as an edge their end vertices are the same .

Definition 2.5:[12] If there are more than one edges related with a given pair of vertices , then these edges are named multiple edges.

Definition 2.6:[12] A graph has not self-loops or multiple. edges is named a simple graph.

Definition 2.7:[6] A graph K is said to be a subgraph of a graph G if all the edges and all the vertices of K are in G , and each edge of K has the same end vertices in K as in G.

Definition 2.8:[6] Suppose that G is a graph , V(G) is the vertex set of G, $D \subseteq V(G)$, the set D is said to be a dominating set if it satisfies the following condition ; $v \in V(G)$ implies either $v \in D$ or there exists $u \in D$ s.t. u and v are adjacent .

Definition 2.9:[12] A graph G include a list$v_1, v_2, \dots, v_n$ of vertics of G s.t. for $1 \leq i \leq p-1$, there is an edge (v_i, v_{i+1}) in G and these are just edge in G is called a path.

Definition 2.10:[6] Let h and k be two vertices in a graph G , then the distance d(h,k) from h to k is the shortest path from h to k.

Definition 2.11:[12] A cycle graph is got when connecting the two end vertices of a path graph . Thus, the degree of any vertex of a cycle graph is equal to two, a cycle graph with n vertices denoted by C_n.

Definition 2.12:[7] Let R be a ring , the graph G named prime graph of R if V=R and E(G)={ $\overline{ab}$/ a R b $= 0$or b R a $= 0$ and $a \neq b$ }and denoted by PG(R).

3. Psedo-Von Neumann Regular Graph

Definition 3.1: suppose R be a commutative ring. A graph G(V , E) is said to be (pseudo- Von. – Neum. regular graph) of R if V(G) =R and E(G)={ $\overline{ab}$/ $a = a^2b$ or $b = b^2a$ and $a \neq b$ } denoted by P-VG(R).

Examples: Consider Z_5={0,1,2,3,4} and Z_6={0,1,2,3,4,5} as follows figures

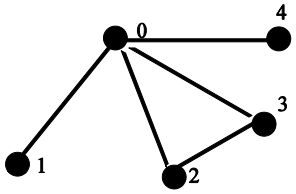

Figure .3.1 P-VG(Z_5)

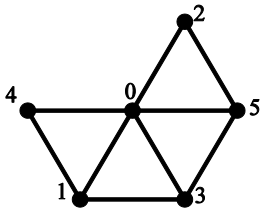

Figure .3.2 P-VG(Z_6)

Also consider Z_7={0,1,2,3,4,5,6} and Z_8={0,1,2,3,4,5,6,7} as follows figures

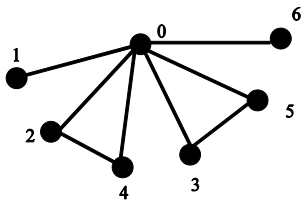

Figure .3.3 P-VG(Z_7)

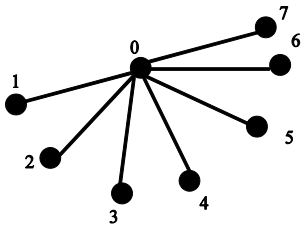

Figure .3.4 P-VG(Z_8)

Observation 3.2: Suppose R be a commutative ring and P-VG(R) then:

1- There are no self-loops
2- Since $0 = 0^2a \; \forall \; 0 \neq a \in R$ there is an edge between 0 and a $\forall$ a $\in V(G) = R$ so degree of the vertex $0 = |R| - 1$
   For any two elements $a,b \neq 0$ in R there is an edge one between 0 and a and another edge between 0 and b this shows that the graph P-VG(R) is always connected graph.
   $d(0,a) = 1$ and $d(a,b) \leq 2$ for any two elements $a,b \neq 0 \in R$
   If there are two non-zero elements a,b in R such that $a = a^2b$ or $b = b^2a$, then the sub graph generated by {0,a,b} is a cycle graph for example is graph P-VG(R) where R= Z_5 as in fig 4,The sub graph generated by {0,2,3} is a cycle.
3- The set {0} is a dominating set for P-VG(R). Hence the domination number of P-VG(R) is equal to 1.

4. Main Results

Remark 4.1:

1- $a = a^2b$ or $b = b^2a$ if and only if d(a,b)=1

Proof: Suppose that $a = a^2b$ or $b = b^2a$ and $a \neq 0 \neq b$ then ab$\in$ E (P-VG(R)) and so by definition 3.1 of P-VG(R) implies d(a,b) =1. If a or b equal to 0, also by definition 3.1 implies d (a,b) =1.
Conversely, suppose d (a,b) =1, if a=0 or b=0, by definition 3.1then $a = a^2b$ or $b = b^2a$
If d (a,b) =1 and $a \neq 0 \neq b$ then ab$\in$ E(P-VG(R)) which implies $a = a^2b$ or $b = b^2a$.

2- $a \neq a^2b$ and $b \neq b^2a$ if and only if d(a,b)=2

Proof: Suppose that $a \neq a^2b$ and $b \neq b^2a$ then there is no edge between a and b, so d (a,b) > 1 . since $0 = 0^2a$, $0 = 0^2b$, $\overline{a0}$, $\overline{b0}$ $\in$ E(P-VG(R)) , hence d (a,b)=2.
Conversely, suppose that d (a,b)=2 since $d(a,b) \neq 1$, there is no edge from a to b so $a \neq a^2b$ and $b \neq b^2a$

Lemma 4.2: If R= Z_n, and $n \geq 3$ (n is prime number), then there is no edge between the vertex 1 and n-1 in P-VG(R) .

Proof: We must show that either
$(1)^2(n-1) \neq 1$ or $(n-1)^2(1) \neq (n-1)$
In case $(1)^2(n-1)$equal 1 is impossible since $n \geq 3$, that is $(1)^2(n-1) \neq 1$
Now let $(n-1)^2(1) = (n-1)$, this leads to
$n^2 - 3.n + 2 = 0$, thus
$(n-2).(n-1) = 0$, Now
Either $n = 2$ or $n = 1$ which is a contradiction since $n \geq 3$
$\therefore \; (n-1)^2(1) \neq (n-1)$.

Lemma 4.3: If R= Z_n and n ≥ 3 (n is a prime number) , then there is no edge between any nonzero vertex with 1 and n-1 in P-VG(R).

Proof: It is clear that the vertex 1 is an identity element in R= Z_n so there is no edge between any vertex with vertex 1 now we check .
the vertex n -1 if we have
$(n-1)^2(a) = (n-1)$
$(n^2 - 2.n + 1)(a) = (n-1)$
$an^2 - 2an + a - n + 1 = 0$
$an^2 - (2a+1)n + (a+1) = 0$
$\big(an - (a+1)\big)(n-1) = 0$, Thus
Either $n - 1 = 0$ impels that $n = 1$ this is a contradiction since $n \geq 3$
or $an - (a+1) = 0$ impels that $n = \frac{a+1}{a}$ this is a contradiction since n is a prime number .

Remark 4.4: If R is a ring with $R^2 = 0$ then P-VG(R) is a tree.

proof: Suppose that R is a ring with $R^2 = 0$, then for any a,b $\in$ R we have ab=0
Now let a,b $\in$ R and $a = a^2b$ or $b = b^2a$ implies that
Either a=a(ab) or b=b(ba), implies that
a=a(0) or b=b(0) , Thus
a=0 or b=0
Hence there is no edge in P-VG(R) except 0a , $\forall$ a $\in$ R
Then P-VG(R) is star graph , then P-VG(R) is a tree since (every star graph is a tree) .

Theorem 4.5: If R= Z_n and n ≥ 3 is prime, then P-VG(R) graph has $\frac{n-3}{2}$ of cycle C_3 .

Proof: By lemma 4.2 and 4.3, the vertices 1 and n-1 have no edge between them and no edge with other vertices only with the vertex 0. Now since n is prime number then Z_n is a field so Z_n is Vn. Neum. reg. ring (every field is Vn. Neum. reg. ring] [10]. For any a$\neq$ 0 $\in Z_n$ $\exists$ b = a^{-1} such that $a = a^2b$ impels that there is an edge between a and b, since the unit element is a unique then has not any edge between a with another element, and so a0, b0 $\in$ E (P-VG(R)). Now we have $\frac{n-1}{2}$ of the cycle C_3 in P-VG(R), So by lemma 4.2 and 4.3 the number of the cycle C_3 in P-VG(R) graph is $\frac{n-1}{2} - 1 = \frac{n-3}{2}$.

Example: P-VG (Z_{13}) has 5 of the cycle C_3 and P-VG (Z_{19}) has 8 of the cycle C_3 as shown in the following figures.

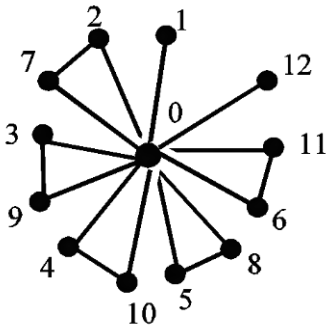

Figure .4.1 P-VG(Z_{13})

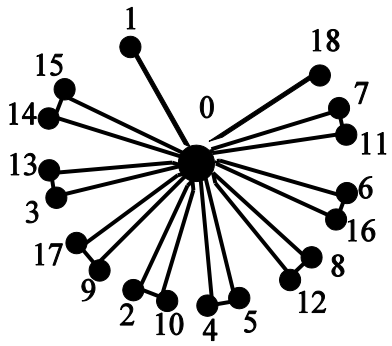

Figure .4.2 P-VG(Z_{19})

Theorem 4.6: If R=Z_p, when p represents a prime number then PG(R)⊂ P-VG(R).

Proof: Let $\overline{ab} \in$ E (PG(R)) then arb = 0
Since Z_p is a filed tnen Z_p is integral domain (has no non-zero divisor)
Implies that either a= 0 or b= 0
If a= 0 then $\overline{0b} \in E(P-VG(R))$,
and if b= 0 then $\overline{a0} \in E(P-VG(R))$
And it is clear that the vertices in graph PG(R) are same in graph P-VG(R)
Hence PG(R)⊂ P-VG(R).

5. Conclusions

The graph properties have become an exciting research topic and very important. In this work , new concept of Vn.- Neum. reg. graph of R called pseudo –Vn.- Neum. reg. graph of R named in P-VG(R) was created . The basic features of P-VG(R) presented are investigated and some results are described. Also, we proved that if P-VG(R), R= Z_n and $n \geq 3$, n is a prime then it is graph has $\frac{n-3}{2}$ of cycle C_3 and we show that if R=Z_p, when p represents a prime number then the PG(R)⊂ P-VG(R).

Abstract. In this paper we studied, the problem of scheduling jobs on a single machine to minimize the multiple objective function and family setup time. This objective function is (total discount completion time and maximum tardiness respectively) which formulated as $1/s_f/\sum_{j=1}^{n}\sum_{f=1}^{F}(1-e^{-rc_{jf}})+T_{max}$. for solving this problem, we derived a lower bound to be used in a branch and bound algorithm. We also proposed heuristic method in order to get an upper bound (near optimal solution). the proposed is number of dominance rules are considered to reduce the number of branches in the search tree. The genetic algorithm (GA) is used to obtain one of the upper bounds is used. The computational results are calculated by coding (programing) the algorithms using (MATLAP) and the final results up to (17) product (jobs) in a reasonable time are introduced by tables and added at the end of the research.

1. Introduction

Scheduling problems are encountered in all kinds of systems, since it is necessary to organize or distribute the work between many entities. There are many definitions for the scheduling problems and among these definitions, it can be quoted the following; (Holger. H. Hoos 2005) [9] defined the scheduling problems accordingly next:

"Given the group from j tasks which has at exist processed by the group from M resources, while the object is for locate a schedule which is a chart from jobs to machines and processing times subject to optimization objectives criteria".

In many industries, the decision to manufacture multiple products on common resources results in the need for changeover and setup activities, symbolize costly disruptions to production processes. Therefore, setup reduction is an important feature of the persistent improvement program of any manufacturing, and even service, organization. It is even more critical if an organization expects to respond to changes like shortened lead times, smaller lot sizes, and big quality standards. Every scheduler should understand the basics of setup reduction and be able to recognize the tolerable improvements [14].

Many practical scheduling problems involve sequencing number of jobs divided into several families, by a machine setup time. Most of these problems are NP-hard ((non-deterministic polynomial-time hardness) is the defining property of a class of problems that are informally "at least as hard as the hardest

problems in NP") even without set up times and thus are difficult to solve to optimality. several scheduling problems in makings and advocacy organizations can be formulated as single aperient problems at task classes (families), for example, Bruno and Downey[3], Monma and Potts [17] and Chen [4] described a computer system application , a collection of jobs need to be executed on a computer in which every task has a diversion time, a due date, and a request for a compiler to be resident in the memory of the computer. When the appropriate compiler is resident in the computer, then the job will start its processing immediately; otherwise the setup time incurred for bringing the relative compiler into the computer's memory. So, the setup time reckon only on the time of loading the compiler for the current job but not on the previous job.
In conventional scheduling problems, it is logical and necessary to consider scheduling problems with setup times. In many concrete situations, the setup times are treating either sequence independent or sequence dependent. In the one case, the setup times are ordinarily added to the job processing times however in the two case, the setup time into the job actually being scheduled depends on the beforehand one or ones already scheduled [25].

Group scheduling problems, where each jobs of the self-family must be scheduled jointly, have attracted abundant researchers due to their frequent real-life occurrence. Many manufacturers have implemented the concept of Group Technology (GT) in order to lessen setup costs, lead times, work-in-process inventory costs, and tools handling costs. Group Technology consists of dividing the sum group of jobs into several subsets, called families, where a family is a subset of jobs that have similar requirements in terms of tooling and setups [11].

Setup operations ensure acquisition material, positioning work in process tools, resumption tooling, cleanup, setting the desired jigs and supply, adjusting tools, and test material [22]. In the problem down study we do not treat the Group Technology (GT) supposition; that is, a family of jobs is not necessarily processed as a single batch [13]. Therefore; a family of jobs could be split into multiple nonconsecutive batches in an optimal sequence and all of the batches endure a setup time.

They explained that regard in scheduling problems that patronize setup times (costs) as split up start in the mid-1960s. Scheduling problems together sequence-dependent setup times are oftentimes across in many production regulation and factory applications.

1.1. Literature Reviews:

The objective function is to minimize discounted total completion time. Following the three-field symbols plot offered by Graham et.al [8]. We declare this problem as: $1/s_f/\sum_{f=1}^{F}\sum_{j=1}^{n_f}(1-e^{-rc_{jf}})$ where r ∈ (0,1) is a discount rate by SPT rule. According to the importance of the scheduling problems, there were a plethora of the specialists whose produced a fine number of the work papers. In the year (1984), Rothkopf and smith [19] work on the sum discounted weighted completion time which is represented accordingly $1//\sum w_j(1-e^{-rcj})$ they generalized the study to cost function and they showed that this problem can exist dissolve optimally as P-kind in polynomial time by the weighted discounted shorter processing time (WDSPT) rule (i.e. scheduling the jobs in order of non- decreasing ratio $w_j e^{-rpj}/1\text{-}e^{-rpj}$ The problem $F_m//\sum w_j$ $(1\text{-}e^{-rc_j})$ is considered as an NP-hard problem by Wang et. Al (2006). In (2012), Lin Li et al. (2013) [15] have studied the problem of the sum weighted discounted total completion time and they showed that the heuristics according to the conformable problems wanting education ware. In (2016), studied the problem $1//\sum w_j(1-e^{-rcj})+L_{max}^{h}$. the maximum tardiness $1//T_{max}$ problem is minimized by Earliest Due Date (EDD) rule [10]. The earliest of these woks was done by Sidney [12].

The interesting in the scheduling problems which deal with the separating setup times (costs) began in the middle of the 60s. As Luh et.al (1998), where they declare that "understanding the sequence-dependent setups is yet confirm to be away of being complete, mostly the scheduling to the congress due dates". So, considering the tardiness is an important matter while the due dates are met. Many authors have worked on

problems in which involving the due dates and sequence subsidiary setup times in order that minimize maximum of tardiness. Baker and Scudder (1990) [2] represented a treatise of penalties (earliness and tardiness) problems while in (2000). Fry et. al. (1987) [6], Garey et. al. (1988) [7], Davis and Kanet (1993) [5]and Yano & Kim (1991) [24] advanced timetabling procedures for finding the optimal beginning times of tasks with inserted idle times. Davis and Kanet (1993) and Kim and Yano (1994) offer a new procedure using branch & bound (B&B) for the problem. Later, Sourd (2005) and Schaller (2007) improved it. In production systems, there occur great accounts of tardiness for several jobs which rise some hardness. As a genuine enforcement, every job in an institution line should be convey at a proven due date. If a task has great tardiness, then the else tasks will not be masterful, resulting in an imponderable in the institution line. So, the term the tardiness ought for approximate to zero. One of the criteria that can satisfy this aim is minimizing the maximum tardiness which is presented as (T_{max}). The aim function value would be equal to zero in the optimal state. If whatever tardiness exist, then the value of the objective function will be larger than zero. That aim function was one worked on by Amin-Nayeri and Moslehi (2000) [1] as a problem of single-machine scheduling case. An algorithm was proposed by Tavakkoli-Moghaddam et al (2005) for obtaining the better potential amount of an idle insert in a sequence, in (2009), Mahnam & Moslehi have worked on single machine problem with morphologic release times for the same objective. As mentioned before, a great number of studies have been accomplished on the scheduling problems which established on the guesstimate of sequence subordinate (independent) setup times, only no study has been convey yet with the same objective.

The remainder of the paper is organized as follows. In Section 2, problem formulation for the problem under study. In Section 3, we explain the heuristic methods used. In Section 4, review the dominance rule. In Section 5, we show the design of instances and report the computational results.

2. Problem Formulation: _

Considering a group N of n jobs ($1 \leq n \leq N$) that are divided into F different families, in our paper we consider F=2,4,6 and 8. Each family f ($1 \leq f \leq F$) consists of n_f jobs (where $\sum_{f=1}^{F} n_f = n$) and it is appropriate to label the jobs as (1,f), (2,f),….(n_f,F) which are available to be processed on the machine at time zero [16]. The jobs of the self-family may have different processing times p_{jf} which is the processing time of job j from the family f, and they can be processed one after one without request any setup times between them. If the machine moves from one family to the other; we would say from the family f to the family g then the setup time is required. Every job will have a due date d_{jf} which is the due date of job j from the family f. The setup time is sequence – independent (i.e. rely only on the family that is about to start), so that it is denoted by sf. If the first job to be processed in the sequence belongs to family f, then the setup at time zero is s_{0f} [20]. The objective is to minimize the by the notation of Graham et al. [8] as $1/s_f/\sum(1\text{-}e^{-rc_{jf}})+T_{max}$).

Suppose the processing order $\sigma = (\sigma(1), \dots, \sigma(n))$, a vector ($S_{\sigma(1)}$,….,$S_{\sigma(n)}$) of corresponding setup time is easily constructed. The setup time request immediately before the processing of job $\sigma(i) = (i = 1, \dots, n)$ is given by: -

$S_{\sigma(1)}$: is the setup time of the first job (positive integer constant).

$$S_{\sigma(i)}=\begin{cases} \sigma_{fg} & if\ \ i>1, \sigma(i-1)\in f\ and\ \ \sigma(i)\ \in g, f\neq g\ ; f,g\ \in F. \\ 0 \quad o.w & \end{cases}$$

Where σ_{fg} is positive integer constant:

Min Z=min $\sum_{j=1}^{F}\sum_{j=1}^{n_f}(1-e^{-rc_{jf}})+T_{max}$

$$\left.\begin{array}{c} subject\ to: \\ c_{jf} = p_{jf} + s_f \quad j = 1; f = 1, \dots., F \\ c_{jf} = c_{j-1,f} + p_j \quad j = 2, \dots., n\ ; f = 1, \dots., F \\ 0 < r < 1 \\ T_{max} = \max\{0, c_{jf} - d_{jf}\} \quad j = 1, \dots., n\ ; f = 1, \dots., F \\ d_{jf} \geq 1, p_{jf} \geq 1 \end{array}\right\} \dots\dots\dots(P)$$

3. Heuristic Method

It is well famous that the calculation can be miniature by using a heuristic to law as an upper bound on the optimal solution previous to the enforcement of branch and bound method. Since as problem max $1/s_f/\sum_{f=1}^{F}\sum_{j=1}^{n_f}(1-e^{-rc_{jf}})+T_{max}$ is NP-hard and subsequently the presence of a polynomial time algorithm for returns an optimal solution is away. Therefore, improve quick heuristic algorithms submission near optimal solution is of great attention. For our problem we proposed heuristic method, the minimum value is used to provide an Upper Bound (UB) [16].

3.1 The Branch and Bound method:

As an exact method, the (BAB) method is used for searching at the optimality or the area that near of it by setting a number of upper bounds as initial solutions to start from then we put the one with the minimum value, and a lower bound to reduce the searching space. the heuristic method is obtained by applying the following: -

3.1.1. (U_1): - This upper bound is acquired b stratify the shortest processing time (SPT) rule (i.e. separation the jobs within each family in order of ($p_1 \leq p_2 \leq \cdots \leq p_n$)).

3.1.2. (U_2): _This upper bound is obtained by applying the earliest due date (EDD) rule (i.e. separation he jobs within each family in order of ($d_1 \leq d_2 \leq \cdots \leq d_n$)).

3.1.3 (U_3): _Obtain by Genetic Algorithm (GA):

Genetic algorithms (GA) are a type of search algorithms and an optimization, for returns optimal solutions to computationally intricate problems. The basic ideas for this method were developed by (Holland (1975), Goldberg and Holland (1988)) during their investigations on how to build computing machines that are capable of learning [21].

The genetic algorithm (GA) is founded on principle "survival of the fittest" for Darwin's (1859), in another meaning it's founded on the basics of genetics and natural selection. So, it is normal the concepts of Genetic Algorithm are directly derived from biological science.

Genetic algorithm: _

Step 1: Formation a primary population of (50) chromosomes, we take any solutions arranged by SPT rule and the second is according EDD rule, the three is according bees' algorithm, the four-weed algorithm while the remain of them are randomly the rest of the solutions are random order.

Step 2: Evaluate the objective (fitness) function for each chromosome and select the better five chromosomes (i.e. the five chromosomes with the minimum values) to generate the new population

Step 3: Generate the new population by mating (i.e. applying crossover and mutation) each chromosome from step 2 with the whole four initial chromosomes, and every parent chromosome will produce 8 children chromosomes and add 5 chosen solutions, selected from the population so the resulting new population will consist of 50 new chromosomes.

Step 4: If the termination criterions are met, then go to step 5, else go to step 2.

Step 5: End.

In this subsection, we will introduce the main upper bound (UB) of the problem P which it is obtained by:

UB=min $\{U_1, U_2, U_3\}$.

3.2 The Lower Bound (LB):

The lower bound for the problem (p) is instituted decomposing (P) of two sub-problems to obtain the a Lower Bound LB for problem (p), where

$$\left.\begin{array}{c} Min\ F_1 = min_{\sigma(j)}\{(1 - e^{-rC_{\sigma(j),f}})\} \\ subject\ to: \\ C_{jf} \geq P_{jf} \quad j = 1, \dots, n_f; f = 1, \dots, F \\ 0 < r < 1 \\ d_{jf} > 0\ , P_{jf} > 0 \quad j = 1, \dots, n_f; f = 1, \dots, F \end{array}\right\} \dots\dots (p_1)$$

$$\left.\begin{array}{c} Min\ F_2 = min_{\sigma(j)}\{T_{max}(\sigma)\} \\ subject\ to: \\ C_{jf} \geq P_{jf} \quad j = 1, \dots, n_f; f = 1, \dots . F \\ T_{max} = \max\{0, C_{jf} - d_{jf}\} \quad j = 1, \dots, n_f; f = 1, \dots, F \\ d_{jf} > 0\ , P_{jf} > 0 \quad j = 1, \dots, n_f; f = 1, \dots, F \end{array}\right\} \dots\dots (p_2)$$

Algorithm (LB): _

Step 1: In un-scheduling arrange the jobs by using (SPT) rule and adding setup time for the first job from jobs un-sequence if the not least family job of sequence.

Step 2: Computation the amount of cost function of F_1 for the problem p_1.

Step 3: Re-arrange the jobs by using (EDD) rule and adding setup time for the first job from jobs un-sequence if the not least family job of sequence.

Step 4: Computation the amount of cost F_2 for the problem p_2.

Step 5: Sum cost the functions (i.e. total cost the problem P_1 and the problem P_2).

Step 6: We repeat the solutions 5 times to get the solutions and compare with the old solutions.

Step 7: Go back to step 2.

Theorem (3.1) [17]: If F_1, F_2 and F are the minimum rate of P_1,P_2 and p problems respectively, then we have that F_1+F_2 ≤ F.

4. Dominance Rule

Dominance rules generally describe if a node can be discarded before its lower bound is counted. obviously, dominance rules are especially beneficial when a node can be terminating which has a lower bound that is least than the optimum solution. Some of dominance rules are useful for minimization of the total of discounted completion time and maximum tardiness.

Theorem (3.1): consider two jobs (J_{jf} and J_{kf}) from the same family, the job J_{jf} must precede the job J_{kf} at least in one optimal sequence if $P_{jf} \leq P_{kf}$, $d_{jf} \leq d_{kf}$ and cost (w') ≥ cost (w)

Where the symbols in which used in this theorem mean as follows:

S

B	s_f	P_{jf}	P_{kf}	W	A

S'

B	s_f	P_{kf}	P_{jf}	W'	A

t

B: The set of jobs in which are scheduled before job j and job k and the jobs before jobs j and k are from different family.
A: The set of the jobs in which are scheduled after job j and k and different from another family.
COST (B): The total cost of $w_j(1-e^{-rc_j})$+T_{max} for jobs in set B.
COST (A): The total cost of w_j(1-e^{-rc_j})+T_{max} for jobs in set A.
W: The group of the jobs in which are scheduled between job j and job k.
COST (W): The total cost of (1-e^{-rc_h})+T_{max} for the jobs of set in sequence S.
COST (w'): The total cost of (1-e^{-rc_h})+T_{max} for the jobs of set w' in sequence S'.
t: The completion time of the last job in set B.
c: The starting time of the one job in the set A.
proof: Let s_1=$\sigma_1$ijσ_2 and s_2=$\sigma_1$jiσ_2 where $\sigma_1$and σ_2 are disassemble subsequence and supposed to be the completion time of σ_1, we examine variation on the in Δ_{ij}(t), where Δ_{ij}(t)=$f_{ij}(t) - f_{ji}(t)$ with following:
for $S_1 = \sigma_1 ij\sigma_2$
(1-e^{-rc_i}) + $(1-e^{-rc_j}) = \left(1-e^{-r(T+P_i)}\right) + (1-e^{-r(T+P_i+P_j)})$……. (1)
For s2
(1-e^{-rc_j})+ (1-e^{-rc_i})= (1-$e^{-r(T+P_j)}$)+(1-$e^{-r(T+P_j+P_i)}$) ……. (2)
For (1) and (2) we get
(1-$e^{-r(T+P_i)}$) + (1-$e^{-r(T+P_i+P_j)}$) − $(1-e^{-r(T+P_j)})$- (1-$e^{-r(T+P_j+P_i)}$)
= - $e^{-r(T+P_i)}$ - $e^{-r(T+P_i+P_j)}$ +$e^{-r(T+P_j)}$+$e^{-r(T+P_i+P_j)}$
= $e^{-rT}(e^{-P_i}$ - $e^{-(p_i+P_j)} + e^{-P_j} + e^{-(P_i+P_j)}$
= $e^{-rT}(e^{-(P_i+P_j)}$ - $e^{-(P_i+P_j)}$ +e^{-P_j} -e^{-P_i})
= $e^{-rT}(e^{-P_j}$-$e^{-P_i}) < 0$ …… (3)
And for S_1
T_{max}=max{T,T_i,T_j}
where T_i=max {0, c_i-d_i}=max {0, T+P_i-d_i}
T_j=max {0,c_j-d_j}=max {0, T+P_i +P_j-d_j}
For schedule s'
T'_{max}=max {T',T'_j,T'_i}
T'_j=max {0,c_j-d_j}=max {0, T+P_j-d_j}
T'_i=max {0,c_i-d_i}=max {0, T+P_j+P_i-d_i}
$\because c'_j \geq c'_i$, $d_i \leq d_j$and T=T' then $T'_i \geq T'_j$, $T'_i \geq T_i$ and $T'_i \geq T_j$
So $T'_{max} \geq T_{max}$ ……. (4)
From (3) and (4) we get
$i < j$ in optimal solution for problem (P).

5. Experimental Results: In this part, the results are advertising in the table. Table include the comparison results of the (BAB), ILB and UB for the problem.

1- The Problems Instances: The problems were created randomly, and for all job (j), where j ∈ {1, n}, with family f= {2,4,6,8} he processing times and setup times are randomly created integer from uniform divide m in [1,10]. While the due date d_j is uniformly generated in the period [(1-TF-RDD /2), (1 − TF + RDD/2)], where TP is the total processing times of jobs. TF is the tardiness factor, and RDD is the range prorated of the due dates. TF has values {0.1, 0.2,0.3,0.4} and RDD has values {0.8,1.0, 1.2}.
2- Computational results: The calculation results are presented in tables and his table award the results (i.e. optimal values by (BAB), the upper bound of the problem, the initial lower bound and the pursuance time).

For each n, 5 problems and family (2,4,6,8) are examined, and a stopping condition is 1800 seconds as the most the pursuance time. The code which used in the table is:
n → The number of jobs.
F → the number of setup times families.
Ex → The number of examples.-
BAB → The branch and bound method.
UB → Indicates that upper bound.
ILB → Indicates that initial lower bound.
N → The number of the nodes.
Time → The pursuance time.

4-3 The Table of Results: In Table. the results of applying (BAB, UB, ILB, the number of the nodes and the execution time) are showed for n= [5, 17] Jobs with the family f= {2,4,6,8}. For each n and there are 5 different examples are tested. These results showed for n= {5,6,7,8,9} of using (BAB and UB) are equal, and the stopping condition is 1800 seconds as the maximum execution time. the symbol (/) in some examples denotes on time exceeded the specified time.

A comparison results between (BAB), (UB) and (ILB).

6. Conclusions: -

1-By using branch and bound method done problem solution.
2-Get three the upper and one lower bound.
3-The upper bound using the genetic hybridization algorithm its results were equal to the optimal solution in part of the results. except in case of job (n=14,15,16,17) where there are some examples failed because they take a long executing time (i.e. more than 1800 seconds)

Regression shrinkage and selection variables via an adaptive elastic net model

Regression shrinkage and selection variables via an adaptive elastic net model

Abstract. In this paper, a new method of selection variables is presented to select some essential variables from large datasets. The new model is a modified version of the Elastic Net model. The modified Elastic Net variable selection model has been summarized in an algorithm. It is applied for Leukemia dataset that has 3051 variables (genes) and 72 samples. In reality, working with this kind of dataset is not accessible due to its large size. The modified model is compared to some standard variable selection methods. Perfect classification is achieved by applying the modified Elastic Net model because it has the best performance. All the calculations that have been done for this paper are in R program by using some existing packages.

1. Introduction

In the various fields of statistical analysis, the most commonly used model is the Multivariate Linear Regression (MLR) model. Ordinary least squares (OLS) is the most widely used estimating technique for MLR. Consider $\{x_1, x_2, \dots, x_p\}$ is a set of variables and y is a response, the multiple linear regression model for $y_i, i = 1, \dots, n$, can be written as follows:

$$y_i = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + \cdots + \beta_p x_{ip} + \epsilon$$

x_{ij} represents the i^{th} level of the j^{th} predictor. In matrix notation, for n samples, the MLR can be expressed in the following equations:

$$y_{n\times 1} = X_{n\times(k+1)}\beta_{(k+1)\times 1} + \epsilon_{n\times 1} \text{ , where}$$

$$y = \begin{bmatrix} y_1 \\ y_2 \\ . \\ . \\ . \\ y_n \end{bmatrix}, \quad X = \begin{bmatrix} 1 & x_{11} & x_{12} & \dots & x_{1k} \\ 1 & x_{21} & x_{22} & \dots & x_{2k} \\ & & . & & \\ & & . & & \\ & & . & & \\ 1 & x_{n1} & x_{n2} & \dots & x_{nk} \end{bmatrix}, \beta = \begin{bmatrix} \beta_0 \\ \beta_1 \\ . \\ . \\ . \\ \beta_k \end{bmatrix}, \text{ and } \epsilon = \begin{bmatrix} \epsilon_1 \\ \epsilon_2 \\ . \\ . \\ \epsilon_n \end{bmatrix}$$

The matrix X refers to the design matrix. It contains information about the predictor variable levels at which the observations are obtained. All the regression coefficients are in the vector β, and it can be estimated using the OLS estimates; i.e., $\hat{\beta}$ can be calculated by solving the following

$$\min_{\beta}\{(y - X\beta)^T(y - X\beta)\}$$

$$\min_{\beta}\{y^T y - 2\beta X^T y + \beta^T X^T y + \beta^T X^T X\beta\} = \min_{\beta}\{SRR\}$$

solving,

$$\frac{\partial SRR(\beta)}{\partial \beta} = -2X^T y + sX^T X\beta = 0$$

for β gives,

$$\hat{\beta} = (X^{\mathrm{T}}X)^{-1} X^T y \quad (1)$$

The multicollinearity or collinearity exists in a linear relationship among the variables if the number of variables exceeds the number of samples [10]. The problem of multicollinearity is well explained by several studies applying different methods. Some previous methods are explained in this work, and then the modified method is compared with them.

This paper is structured as follows: In section 2, an overview for Ridge, Lasso, and Elastic Net models are given. In section 3, a modified Elastic Net model is discussed. Real data analysis is introduced in Section 4. In section 5, results and discussion are presented. Finally, the conclusion is given in section 6.

2. Ridge and Lasso and Elastic Net Models

Researchers face some challenges such as poor results and time-consuming with large datasets. One way to solve this problem is by using variable selection techniques. As a result, large datasets can be reduced to reasonable datasets. This section lists three typical variable selection (shrinkage) models which are Ridge [2], Lasso [4], and Elastic Net [11]. Shrinkage techniques can be used under certain constraints depending on the size of the datasets. The regression model can be fitted with all the p variables, and the shrinkage techniques enhance the accuracy and efficiency of the model by reducing the number of variables in the model.

2.1 Ridge Model

Ridge model treats the associated variables in the same way by shrinking their coefficient similarly. Ridge estimates the coefficients of some variables to be 0 or close to 0, so these variables should be excluded from the model, $\hat{\beta} = (\hat{\beta}_0, \hat{\beta}_1, \ldots, \hat{\beta}_p)$. Similar to equation (1), Ridge seeks the vector $\hat{\beta}^{ridge}$ that minimizes the penalized RSS; i.e., $RSS + \lambda \sum_{j=1}^{p} \beta_j^2$; hence,

$$\hat{\beta}^{ridge} = minimize\left(\sum_{i=1}^{n}\left(y_i - \beta_0 - \sum_{j=1}^{n}\beta_j x_{ij}\right)^2 + \lambda\sum_{j=1}^{p}\beta_j^2\right), \quad \text{subject to } \sum_{j=1}^{p}\beta_j^2 \le \mathrm{K} \quad (2)$$

where the value of K is the upper bound for the sum of the coefficients. The complexity parameter, λ, is greater than or equals to 0. If $\lambda = 0$, then $\hat{\beta}^{ridge} = \hat{\beta}$, and as $\lambda \to \infty$, $\hat{\beta}^{ridge} \to 0_p$. For $0 < \lambda < \infty$, the fitting a linear regression model and shrinkage the coefficients are balanced. The shrinkage penalty is small when $\beta_1, \beta_2, \ldots,$ and β_p are close to zero [3]. Unlike OLS, Ridge solutions are not unique; as a result, before the estimation, the inputs customary can be standardized. β_0 should be estimated separately as $\bar{y} = \sum_{i=1}^{n}\frac{y_i}{n}$, and the remaining parameters can be estimated by using the data matrix X as follows, $\hat{\beta}^{ridge} = (X^T X + \lambda I)^{-1} X^T y$, where I is the $p \times p$ identity matrix.

2.2 Lasso Model

Another kind of penalty (LASSO) can be considered to constrain the size of OLS estimates. Lasso collapses some of the correlated parameters to 0. L_1 norm is used as penalty encompasses, so

$$\hat{\beta}^{lasso} = minimize\left(\sum_{i=1}^{n}\left(y_i - \beta_0 - \sum_{j=1}^{n}\beta_j x_{ij}\right)^2 + \lambda\sum_{j=1}^{p}|\beta_j|\right), \qquad \lambda \geq 0 \tag{3}$$

The LASSO property allows the exclusion of variables by setting their coefficients to be 0. When some variables are excluded, the model will be more efficient, especially if the number of variables is much larger than the number of samples, $p \gg n$ [5].

2.3 Elastic Net

Some weakness appears using Lasso. For example, with highly correlated variables, Lasso sometimes does not perform well because it can select at most n variables before it saturates when $p \gg n$. If there is a very high pairwise correlation in a group of variables, Lasso takes care of only one variable from the group [12]. Moreover, Lasso often performs worse than Ridge in prediction. Therefore, a penalty that combines the L_1 (Lasso) and L_2 (Ridge) constraints have been developed to overcome these limitations [2]. Elastic Net model is a variable selection procedure that uses the penalty

$$\lambda\left[\frac{1}{2}(1-\alpha)\sum_{j=1}^{p}\beta_j^2 + \alpha\sum_{j=1}^{p}|\beta_j|\right] \tag{4}$$

where $\alpha \in [0,1]$ is called the mixing parameter. Lasso and Ridge are special cases for the Elastic Net model when $\alpha = 1$ and $\alpha = 0$ as shown in equation (2) and (3). Lasso penalty gains more weight than the Ridge penalty when α approaches one, and the opposite happens when α approaches zero. Elastic Net enables us to select more than n variables, improve the predictive, and tends to jointly select groups of highly correlated variables.

3. Modified Elastic Net Model

In general, the shrinkage penalty expression can be conveniently extended to $\lambda\sum_{j=1}^{p}|\beta_j|^q$, where $q > 0$. Figure 1 shows the restriction regions, $\sum_{j=1}^{p}|\beta_j|^q \leq 1$, for different values of q. For $q \geq 1$, the constraints are convex; and when q equals 1 and 2, the lasso and Ridge penalties exist, respectively.

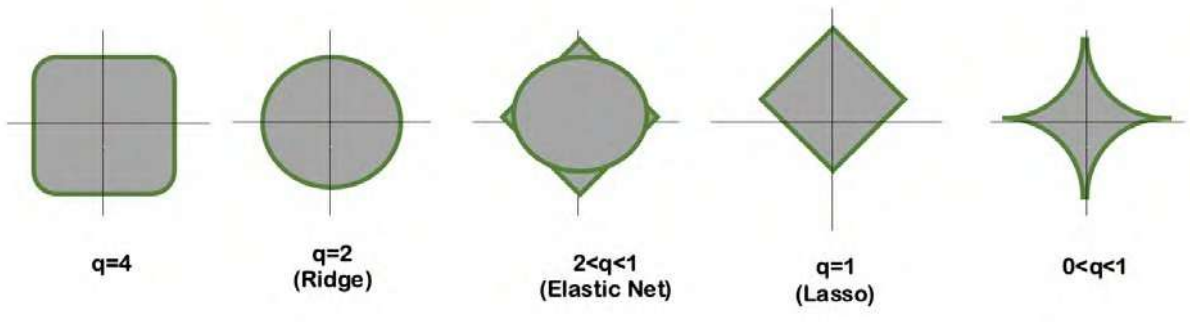

Figure 1. The Contours of constant value of $\sum_j|\beta_j|^q$ for different values of q.

To estimate the mean square error of a model, cross-validation (CV) can be used. CV is a re-sampling technique where the chosen method is applied to predict the held-out outcome. The two typical CV are, i) leave-one-out CV: it takes out one observation, then on the remaining $(n-1)$ observations the model is fitted; ii) k-flod CV: it splits the data randomly into k equal size subsets (folds), then eliminates one, and fit the model on the remaining $(k-1)$ folds. In both leave-one-out CV and k-flod CV, the process is repeated $(n-1)$ and $(k-1)$ times; respectively, then we take the average. Leave-one-out CV has low bias and high variance; in contrast, k-flod CV has adequate bias and low variance. To minimize the estimated MSE, k-flod CV is used to choose the value of λ. Typically, the value of k between 5 and 10 is indicated as good for computational.

The weight of the parameters is the key part of the modified Elastic Net model. It could be estimated by $\widehat{\lambda_k} = \left(\left|\widehat{\beta_k}^{inp}\right|^{-\gamma}\right)$, where γ is a positive constant and inp is $\widehat{\beta_k}^{inp}$ is a set of the initial parameters that could be selected using a naïve Elastic Net model. Therefore, the modified Elastic Net model penalty can be written as:

$$\lambda\left[\frac{1}{2}(1-\alpha)\sum_{k=1}^{p}\beta_k^2+\alpha\sum_{k=1}^{p}|\beta_k|\right]+\alpha^*\sum_{k=1}^{p}\widehat{\lambda_k}\,|\beta_k| \tag{5}$$

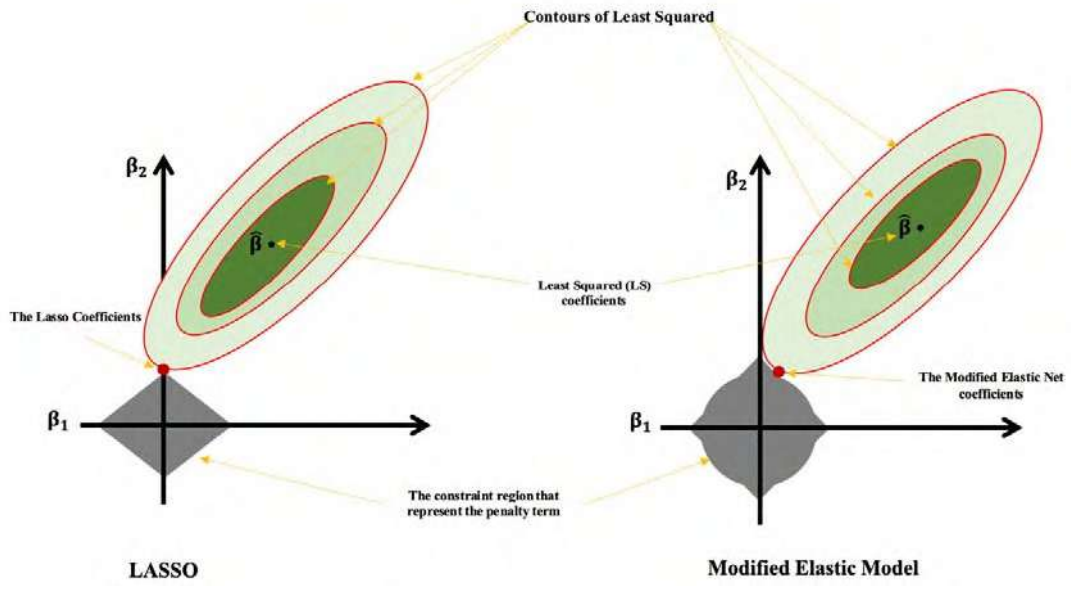
The adaptive weight $\hat{\lambda}_k^{(s)} = \frac{1}{|\hat{\beta}^{(s-1)}(\alpha^{*(s-1)})_j|}, j = 1,2,\dots,p$. For $s = 1$, the adaptive weights are equaled to the naïve Elastic Net weights. When $s = 2,\dots,p$, $\hat{\lambda}_k^{(s)}$ corresponds to the adaptive weights for the previous step. Figure 2 provides a simple geometrical view of Lasso and modified Elastic Net models. The solid gray areas are the regions for both Lasso and modified Elastic Net models. The red ellipses correspond to the contours of the residual sum of squares functions. $\hat{\beta}$ depicts the normal (unconstrained) least-squares estimate. The curve contours encourage strongly correlated variables to share coefficients. The plot indicates that the modified Elastic Net yields less *0*-valued estimates than lasso estimation [8]. It is an attractive feature, especially when $p \gg n$. The following algorithm summarizes the modified Elastic Net model approach.

Algorithm: Modified Elastic Net Model

The choice of $\boldsymbol{\alpha}$ and $\boldsymbol{\lambda}$ in the Elastic Net model.

In practice, a grid of α, $\{\alpha_1, \alpha_2, \dots, \alpha_M\}$, can be constructed and for each $m = 1, 2, \dots, M$:

- For given $\alpha = \alpha_m$, k-fold CV λ.
- For $m = 1, \dots, M$, save the Mean Squared Error.
- Compare the M Mean Squared Error.
- Choose α that is associated with the preferred value.
- Use the best λ within the selected profile for modeling



a. Lasso: the constraint regions is $|\beta_1| + |\beta_2| \leq t$

b. Modified Elastic Net: the constraint regions are $\beta_1^2 + \beta_2^2 \leq t^2$ and $|\beta_1| + |\beta_2| \leq t$

4. Real data Analysis

Diagnosis and classification of cancer are complicated due to the broad datasets that deal with this type of research. One of the universal forms of cancer is the Leukemia dataset. Dataset was published by Golub in 1999 [7]. The complete Golub-Merge dataset is available in the golub Esets packages in ***R*** program. Working with this dataset confront many difficulties such as time-consuming and inefficient performance, as the number of predictors exceeds the number of responses. Leukemia dataset contains 3051 variables (genes) and 72 samples (patients). It is used in this section for experimental evaluation. It shows how the gene expression monitoring (via the DNA microarray) can identify the new cancer cases, providing a standard method for assigning tumors to known classes [9]. Patients can be categorized into two types, which are: Acute Myeloid Leukemia (AML) and Acute Lymphoblastic Leukemia (ALL) [6].

4.1 Analyzing Golub Datasets

Significant genes for the type of cancer must be selected to obtain a reduced dataset. This means that only specific genes that are expressed differently across classes should be advised. As the differential genes are defined between two groups, the t-test appears to be a common choice [1] [13]. However, the t-test requires a normality assumption, which may not be a logical assumption. A histogram of 3051×2 cannot be plotted to have an idea about the justification for normality. Mann Whitney U test looks more suitable and is almost as efficient as the t-test. After running the t-test, the p-values are modified according to the Benjamin-Hochberg method. Most genes do not appear to have different mean values across classes. The same result for the median has been achieved. The mean and median differences between types are shown in figure 3. Most of the genes are clustered around zero. A few numbers of genes seem interesting, and they can be easily indicated.

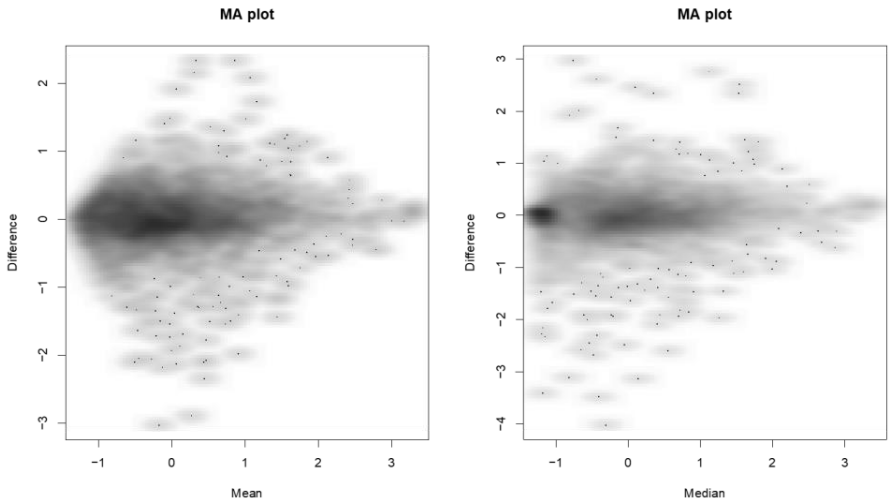

Figure 3. Plot for the differences in Mean and Median.[13]

5. Result and Discussion for the Real Data

The results of OLS, Ridge, Lasso, Elastic Net, and modified Elastic Net results are shown in Table (1). The accuracy rate of classification, the number of selected genes, and the approximate time-consumption are determined for all methods. The best accuracy occurs with the modified Elastic Net model with only 63 selected genes and approximately 9 seconds of consuming time. The paths and the misclassification errors for both Elastic Net and modified Elastic Net models are displayed in figure 6. Figure 6.a shows that the Elastic Net model has selected 329 genes as significant variables. Figure 6.b shows that the modified Elastic Net model has selected only 63 genes out of the total of 3051genes. In both models, the dotted vertical lines indicate the optimal value of λ. It is "3.36" and "-4.47" in both in Elastic Net and modified Elastic Net models, respectively. The factor map is plotted with two dimensions in figure 7. The percentage of variation for both first and second dimensions are 50.34 and 7.98, respectively. The selected genes in the modified Elastic Net model are used to construct the model. The training dataset was classified by type of cancer samples. The model was applied to the testing dataset as well. Figure 7.b shows the *ALL* in black and *AML* in red colors. Only one sample (ID=66) is misclassified, has an *AML* class, but it is classified as *ALL*.

Table 1. Comparison between OLS, Ridge, Lasso, Elastic Net, and modified Elastic Net for classification Leukemia dataset.

Methods	**Accuracy rate (%)**	**Number of selected genes**	**Approximately consuming time**
OLS	56.93	3051	≈ 30 seconds
Ridge	83.00	3051	≈ 24 seconds
Lasso	85.33	23	≈ 12 seconds
Elastic Net	88.93	329	≈ 18 seconds
Modified Elastic Net	**95.80**	**63**	≈ 9 seconds

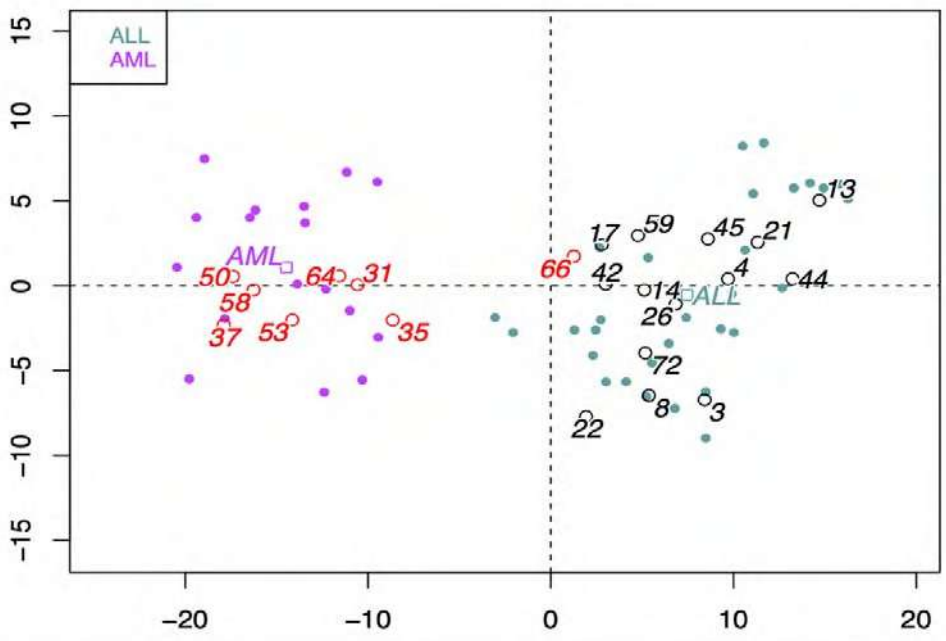

Figure 5 b. Classification plot for patients according to *AML* and *ALL* classes.
Figure 5. Factor map and classification plot for Leukemia dataset.

6. Conclusions

In this paper, an enhanced Elastic Net model was developed and applied to the leukemia dataset. It is derived by combining Lasso and Ridge models with the addition of a penalty term. The modified Elastic Net is compared with some standard classification methods. The updated Elastic Net is the best variable selection model in both training and testing datasets because it has high accuracy results and less time-consuming. The classification accuracy using the modified Elastic Net model is 95.80%, while the other is below 89%. Among 3051 genes, 63 genes have been selected by the updated Elastic Net model. Approximately 9 seconds was required to complete the classification process. The proposed model can be used for large datasets in the future because it is accurate and efficient.

Reliability of one Strength-four Stresses for Lomax Distribution

Reliability of one Strength-four Stresses for Lomax Distribution

Ahmed H. Khaleel

Department of Statistics, College of Administration & Economics, University of Sumer, Iraq

E-mail: ahmedharoon885@gmail.com

Abstract. In this paper, we find the reliability R of a component when it is exposed to four independent stresses and it having one strength for Lomax distribution. the reliability R was estimated by using four different estimations (MLE, RgE, LSE, and WLSE) methods. A comparison was made between the results of estimating the reliability function by MSE and MAPE criteria, that will get from a Monte Carlo simulation study. We found that the performance of ML is the best to.

1. Introduction

In the reliability literature, stress-strength is an important model. In the statistical approach to the stress-strength model, considerations are based on the supposition that component strengths are independently and identically distributed (iid) and are subjected to common stress. Here the system reliability, when X and Y are independent and identical. Let X is a strength random variable subjected to a common stress Y then the reliability of the system contained one component is: $R = P(X > Y)$ [1, 2]. The reliability of a component (or a system) can be represented in various forms depending on the structure of the system, where the component (or the system) would fail if the stress exceeds its strength [3, 4]. The Lomax (1954), or Pareto II, distribution has been quite widely applied in a variety of contexts [5]. The Lomax distribution has been used for reliability modeling and life testing and applied to income and wealth distribution data. It has also found application in the biological sciences. Some authors have suggested the use of this distribution as an alternative to the exponential distribution when the data are heavy-tailed [6].

The present study considering stress – strength Lomax reliability of model for one component having one strength it is exposed to four independent stresses when the stress and strength are followed Lomax two-parameter random variables. Estimation of the parameters and the reliability model is made by MLE, RgE, LSE, and WLSE estimation methods. Finally, the Monte Carlo simulation study for comparing between them by MSE and MAPE are explained.

2. The Mathematical Formula of one Strength-Four Stress Component Reliability

The reliability of the stress-strength model defines the life of a component that has strength X and exposed to stress Y. So that if stress overtake the strength $(Y > X)$ the component fails [7]:

$$R = P(Y < X) = \int_0^\infty f(x)F_y(x)dx$$

In this article, the stress-strength reliability of one component subjected to four stress is examined. Let the strength r.v. of the component represented by X as a Lomax r.v. (α, μ), and the component subjected stress r.v. are represented by $Y_i; i = 1,2,3,4$ following Lomax distribution (α_i, μ) ; i=1,2,3,4 with unknown shape parameters $\alpha, \alpha_1, \alpha_2, \alpha_3, \alpha_4$ and known common scale parameter μ.The pdf and CDF of the r.v. for $X \sim L\ (\alpha, \mu)$ are given as:

$$f(x) = \frac{\alpha}{\mu}\left(1+\frac{x}{\mu}\right)^{-(\alpha+1)} \qquad x \geq 0; \alpha, \mu > 0 \qquad \ldots(1)$$

$$F(x) = 1-\left(1+\frac{x}{\mu}\right)^{-\alpha} \quad y \geq 0; \alpha, \mu > 0 \qquad \ldots(2)$$

Also the CDF of $Y_i \sim L\ (\alpha_i, \mu)$:

$$F_1(y_1) = 1-\left(1+\frac{y_1}{\mu}\right)^{-\alpha_1} \quad y_1 \geq 0, \alpha_1, \mu > 0 \qquad \ldots(3)$$

$$F_2(y_2) = 1-\left(1+\frac{y_2}{\mu}\right)^{-\alpha_2} \quad y_2 \geq 0, \alpha_2, \mu > 0 \qquad \ldots(4)$$

$$F_3(y_3) = 1-\left(1+\frac{y_3}{\mu}\right)^{-\alpha_3} \quad y_3 \geq 0, \alpha_3, \mu > 0 \qquad \ldots(5)$$

$$F_4(y_4) = 1-\left(1+\frac{y_4}{\mu}\right)^{-\alpha_4} \quad y_4 \geq 0, \alpha_4, \mu > 0 \qquad \ldots(6)$$

Now, we can obtain to find the reliability model as follows:

$$R = P[Max(Y_1, Y_2, Y_3, Y_4) < X]$$
$$= \int_0^{\infty} \int_0^{y_1} \int_0^{y_2} \int_0^{y_3} \int_0^{y_4} f(y_1, y_2, y_3, y_4, x)\, dy_4 dy_3 dy_2 dy_1 dx \qquad \ldots(7)$$

since r.v are independent and identical distributed; then :

$$R = \int_0^{\infty} \int_0^{y_2} \int_0^{y_3} \int_0^{y_4} f(y_1) f(y_2) f(y_3) f(y_4)\, f(x) dy_4 dy_3 dy_2 dy_1 dx$$
$$R = \int_{x=0}^{\infty} F_{1y_1}(x) F_{2y_2} F_{3y_3}(x) F_{4y_4}(x) f(x) dx \qquad \ldots(8)$$

The reliability model of Lomax distribution will get it by substitution equations (1),(2), (3),(4),(5) and (6) in equation (8), as:

$$R = \int_{x=0}^{\infty} [1-\left(1+\frac{x}{\mu}\right)^{-\alpha_1}][1-\left(1+\frac{x}{\mu}\right)^{-\alpha_2}][1-\left(1+\frac{x}{\mu}\right)^{-\alpha_3}][1-\left(1+\frac{x}{\mu}\right)^{-\alpha_4}]$$
$$\cdot \frac{\alpha}{\mu}\left(1+\frac{x}{\mu}\right)^{-(\alpha+1)} dx$$

$$R = \int_0^{\infty} \left[1-\left(1+\frac{x}{\mu}\right)^{-\alpha_1} - \left(1+\frac{x}{\mu}\right)^{-\alpha_2} - \left(1+\frac{x}{\mu}\right)^{-\alpha_3} - \left(1+\frac{x}{\mu}\right)^{-\alpha_4} + \left(1+\frac{x}{\mu}\right)^{-(\alpha_1+\alpha_2)}\right.$$
$$+\left(1+\frac{x}{\mu}\right)^{-(\alpha_1+\alpha_3)} + \left(1+\frac{x}{\mu}\right)^{-(\alpha_1+\alpha_3)} + \left(1+\frac{x}{\mu}\right)^{-(\alpha_1+\alpha_4)} + \left(1+\frac{x}{\mu}\right)^{-(\alpha_2+\alpha_3)}$$
$$+\left(1+\frac{x}{\mu}\right)^{-(\alpha_2+\alpha_4)} + \left(1+\frac{x}{\mu}\right)^{-(\alpha_3+\alpha_4)} - \left(1+\frac{x}{\mu}\right)^{-(\alpha_1+\alpha_2+\alpha_3)} - \left(1+\frac{x}{\mu}\right)^{-(\alpha_1+\alpha_2+\alpha_4)}$$
$$\left.-\left(1+\frac{x}{\mu}\right)^{-(\alpha_2+\alpha_3+\alpha_4)} + \left(1+\frac{x}{\mu}\right)^{-(\alpha_1+\alpha_2+\alpha_3+\alpha_4)}\right] \frac{\alpha}{\mu}\left(1+\frac{x}{\mu}\right)^{-(\alpha+1)} dx$$

$$R = \int_0^{\infty} \frac{\alpha}{\mu}\left(1+\frac{x}{\mu}\right)^{-(\alpha+1)} dx - \int_0^{\infty} \frac{\alpha}{\mu}\left(1+\frac{x}{\mu}\right)^{-(\alpha+\alpha_1+1)} dx - \int_0^{\infty} \frac{\alpha}{\mu}\left(1+\frac{x}{\mu}\right)^{-(\alpha+\alpha_2+1)} dx$$

$$-\int_0^{\infty}\frac{\alpha}{\mu}\left(1+\frac{x}{\mu}\right)^{-(\alpha+\alpha_3+1)}dx-\int_0^{\infty}\frac{\alpha}{\mu}\left(1+\frac{x}{\mu}\right)^{-(\alpha+\alpha_4+1)}dx$$

$$+\int_0^{\infty}\frac{\alpha}{\mu}\left(1+\frac{x}{\mu}\right)^{-(\alpha+\alpha_1+\alpha_2+1)}dx+\int_0^{\infty}\frac{\alpha}{\mu}\left(1+\frac{x}{\mu}\right)^{-(\alpha+\alpha_1+\alpha_3+1)}dx$$

$$+\int_0^{\infty}\frac{\alpha}{\mu}\left(1+\frac{x}{\mu}\right)^{-(\alpha+\alpha_1+\alpha_4+1)}dx+\int_0^{\infty}\frac{\alpha}{\mu}\left(1+\frac{x}{\mu}\right)^{-(\alpha+\alpha_2+\alpha_3+1)}dx$$

$$+\int_0^{\infty}\frac{\alpha}{\mu}\left(1+\frac{x}{\mu}\right)^{-(\alpha+\alpha_2+\alpha_4+1)}dx+\int_0^{\infty}\frac{\alpha}{\mu}\left(1+\frac{x}{\mu}\right)^{-(\alpha+\alpha_3+\alpha_4+1)}dx$$

$$-\int_0^{\infty}\frac{\alpha}{\mu}\left(1+\frac{x}{\mu}\right)^{-(\alpha+\alpha_1+\alpha_2+\alpha_3+1)}dx-\int_0^{\infty}\frac{\alpha}{\mu}\left(1+\frac{x}{\mu}\right)^{-(\alpha+\alpha_1+\alpha_2+\alpha_4+1)}dx$$

$$-\int_0^{\infty}\frac{\alpha}{\mu}\left(1+\frac{x}{\mu}\right)^{-(\alpha+\alpha_2+\alpha_3+\alpha_4+1)}dx+\int_0^{\infty}\frac{\alpha}{\mu}\left(1+\frac{x}{\mu}\right)^{-(\alpha+\alpha_1+\alpha_2+\alpha_3+\alpha_4+1)}dx$$

The reliability of a component has strength exposed to four stresses of Lomax distribution can be expressed as:

$$R=1-\left[\frac{\alpha}{(\alpha+\alpha_1)}\right]-\left[\frac{\alpha}{(\alpha+\alpha_2)}\right]-\left[\frac{\alpha}{(\alpha+\alpha_3)}\right]-\left[\frac{\alpha}{(\alpha+\alpha_4)}\right]+\left[\frac{\alpha}{(\alpha+\alpha_1+\alpha_2)}\right]+\left[\frac{\alpha}{(\alpha+\alpha_1+\alpha_3)}\right]+\left[\frac{\alpha}{(\alpha+\alpha_1+\alpha_4)}\right]$$
$$+\left[\frac{\alpha}{(\alpha+\alpha_2+\alpha_3)}\right]+\left[\frac{\alpha}{(\alpha+\alpha_2+\alpha_4)}\right]+\left[\frac{\alpha}{(\alpha+\alpha_3+\alpha_4)}\right]-\left[\frac{\alpha}{(\alpha+\alpha_1+\alpha_2+\alpha_3)}\right]-\left[\frac{\alpha}{(\alpha+\alpha_1+\alpha_2+\alpha_4)}\right]$$
$$-\left[\frac{\alpha}{(\alpha+\alpha_1+\alpha_3+\alpha_4)}\right]-\left[\frac{\alpha}{(\alpha+\alpha_2+\alpha_3+\alpha_4)}\right]+\left[\frac{\alpha}{(\alpha+\alpha_1+\alpha_2+\alpha_3+\alpha_4)}\right] \quad \ldots(9)$$

3. Maximum likelihood Estimator (MLE)

The maximum likelihood estimation method can use to estimate the parameter of Lomax distribution [8]. let $x_1, x_2 \ldots, x_n$ be random samples from LD (α, μ) of n sample size then the Likelihood function will be:

$$L(x,\alpha,\mu)=\frac{\alpha^n}{\mu^n}\prod_{i=1}^{n}\left(1+\frac{x_i}{\mu}\right)^{-(\alpha+1)} \quad \ldots(10)$$

By taking the Log-likelihood function and derivative this function with respect to , then we get the ML estimator for α:

$$\hat{\alpha}_{\mathrm{ML}}=\frac{n}{\sum_{i=1}^{n}Ln\left(1+\frac{x_i}{\mu}\right)} \quad \ldots(11)$$

In the same way; let $y_{11}, y_{12} \ldots, y_{1n}$; $y_{21}, y_{22} \ldots, y_{2n}$; $y_{31}, y_{32} \ldots, y_{3n}$ and $y_{41}, y_{42} \ldots, y_{4n}$ be the random samples from LD of $n_1, n_2, n_3\ and\ n_4$ sample sizes. Then the ML estimators of $\alpha_1, \alpha_2, \alpha_3\ and\ \alpha_4$ are given as:

$$\hat{\alpha}_{1\mathrm{ML}}=\frac{n_1}{\sum_{j_1=1}^{n_1}Ln\left(1+\frac{y_{1j_1}}{\mu}\right)} \quad \ldots(12)$$

$$\hat{\alpha}_{2\mathrm{ML}}=\frac{n_2}{\sum_{j_2=1}^{n_2}Ln\left(1+\frac{y_{2j_2}}{\mu}\right)} \quad \ldots(13)$$

$$\hat{\alpha}_{3\mathrm{ML}}=\frac{n_3}{\sum_{j_3=1}^{n_3}Ln\left(1+\frac{y_{3j_3}}{\mu}\right)} \quad \ldots(14)$$

$$\hat{\alpha}_{4\mathrm{ML}}=\frac{n_4}{\sum_{j_4=1}^{n_4}Ln\left(1+\frac{y_{4j_4}}{\mu}\right)} \quad \ldots(15)$$

The ML estimator of R is given by substitute (11), (12), (13), (14), and (15) in equation (9) we get:

$$\hat{R}_{\mathrm{ML}}=1-\left[\frac{\hat{\alpha}_{\mathrm{ML}}}{(\hat{\alpha}_{\mathrm{ML}}+\hat{\alpha}_{1\mathrm{ML}})}\right]-\left[\frac{\hat{\alpha}_{\mathrm{ML}}}{(\hat{\alpha}_{\mathrm{ML}}+\hat{\alpha}_{2\mathrm{ML}})}\right]-\left[\frac{\hat{\alpha}_{\mathrm{ML}}}{(\hat{\alpha}_{\mathrm{ML}}+\hat{\alpha}_{3\mathrm{ML}})}\right]-\left[\frac{\hat{\alpha}_{\mathrm{ML}}}{(\hat{\alpha}_{\mathrm{ML}}+\hat{\alpha}_{4\mathrm{ML}})}\right]+\left[\frac{\hat{\alpha}_{\mathrm{ML}}}{(\hat{\alpha}_{\mathrm{ML}}+\hat{\alpha}_{1\mathrm{ML}}+\hat{\alpha}_{2\mathrm{ML}})}\right]$$

$$+\left[\frac{\hat{\alpha}_{\mathrm{ML}}}{(\hat{\alpha}_{\mathrm{ML}}+\hat{\alpha}_{1\mathrm{ML}}+\hat{\alpha}_{3\mathrm{ML}})}\right]+\left[\frac{\hat{\alpha}_{\mathrm{ML}}}{(\hat{\alpha}_{\mathrm{ML}}+\hat{\alpha}_{1\mathrm{ML}}+\hat{\alpha}_{4\mathrm{ML}})}\right]+\left[\frac{\hat{\alpha}_{\mathrm{ML}}}{(\hat{\alpha}_{\mathrm{ML}}+\hat{\alpha}_{2\mathrm{ML}}+\hat{\alpha}_{3\mathrm{ML}})}\right]+\left[\frac{\hat{\alpha}_{\mathrm{ML}}}{(\hat{\alpha}_{\mathrm{ML}}+\hat{\alpha}_{2\mathrm{ML}}+\hat{\alpha}_{4\mathrm{ML}})}\right]$$
$$+\left[\frac{\hat{\alpha}_{\mathrm{ML}}}{(\hat{\alpha}_{\mathrm{ML}}+\hat{\alpha}_{3\mathrm{ML}}+\hat{\alpha}_{4\mathrm{ML}})}\right]-\left[\frac{\hat{\alpha}_{\mathrm{ML}}}{(\hat{\alpha}_{\mathrm{ML}}+\hat{\alpha}_{1\mathrm{ML}}+\hat{\alpha}_{2\mathrm{ML}}+\hat{\alpha}_{3\mathrm{ML}})}\right]-\left[\frac{\hat{\alpha}_{\mathrm{ML}}}{(\hat{\alpha}_{\mathrm{ML}}+\hat{\alpha}_{1\mathrm{ML}}+\hat{\alpha}_{2\mathrm{ML}}+\hat{\alpha}_{4\mathrm{ML}})}\right]$$
$$-\left[\frac{\hat{\alpha}_{\mathrm{ML}}}{(\hat{\alpha}_{\mathrm{ML}}+\hat{\alpha}_{1\mathrm{ML}}+\hat{\alpha}_{3\mathrm{ML}}+\hat{\alpha}_{4\mathrm{ML}})}\right]-\left[\frac{\hat{\alpha}_{\mathrm{ML}}}{(\hat{\alpha}_{\mathrm{ML}}+\hat{\alpha}_{2\mathrm{ML}}+\hat{\alpha}_{3\mathrm{ML}}+\hat{\alpha}_{4\mathrm{ML}})}\right]+\left[\frac{\hat{\alpha}_{\mathrm{ML}}}{(\hat{\alpha}_{\mathrm{ML}}+\hat{\alpha}_{1\mathrm{ML}}+\hat{\alpha}_{2\mathrm{ML}}+\hat{\alpha}_{3\mathrm{ML}}+\hat{\alpha}_{4\mathrm{ML}})}\right] \quad \ldots(16)$$

4. Regression Estimator (RgE):

The regression estimation is an important method that uses the regression equation to estimate the parameter [9]:

$$z_i = a + bu_i + e_i \quad \ldots(17)$$

By taking the Log to equation (2):

$$\ln\left(1 - F\left(x_{(i)}\right)\right) = -\alpha \ln\left(1 + \frac{x_{(i)}}{\mu}\right)$$

Use plotting position (P_i) instead of $\mathrm{F}(\mathrm{x}_{(\mathrm{i})})$ where $P_i = \frac{i}{n+1}$, then:

$$\ln(1 - P_i) = -\alpha \ln\left(1 + \frac{x_{(i)}}{\mu}\right) \quad \ldots(18)$$

Substitute an equation (18) into the equation (17):

$$z_i = \ln(1 - P_i)\,, a = 0, b = \alpha, u_i = -\ln\left(1 + \frac{x_{(i)}}{\mu}\right) \quad \ldots(19)$$

Then the estimator b is :

$$\hat{\mathrm{b}} = \frac{\mathrm{n}\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{z_i u_i} - \sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{z_i} \sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{u_i}}{\mathrm{n}\sum_{\mathrm{i}=1}^{\mathrm{n}} [\mathrm{u_i}]^2 - \left[\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{u_i}\right]^2} \quad \ldots(20)$$

Now, since $b = \alpha$, the estimator $\hat{\alpha}_{Rg}$ is:

$$\hat{\alpha}_{\mathrm{Rg}} = \frac{-\mathrm{n}\sum_{\mathrm{i}=1}^{\mathrm{n}} \ln(1-\mathrm{P_i})\, \ln\left(1+\frac{\mathrm{x(i)}}{\mu}\right) + \sum_{\mathrm{i}=1}^{\mathrm{n}} \ln(1-\mathrm{P_i}) \sum_{\mathrm{i}=}^{\mathrm{n}} \ln\left(1+\frac{\mathrm{x(i)}}{\mu}\right)}{\mathrm{n}\sum_{\mathrm{i}=1}^{\mathrm{n}} \left[\ln\left(1+\frac{\mathrm{x(i)}}{\mu}\right)\right]^2 - \left[\sum_{\mathrm{i}=1}^{\mathrm{n}} \ln\left(1+\frac{\mathrm{x(i)}}{\mu}\right)\right]^2} \quad \ldots(21)$$

In the same steps above, we will estimate α_1, α_2, α_3 and α_4 are:

$$\hat{\alpha}_{1Rg} = \frac{-n_1 \sum_{j_1=1}^{n_1} \ln(1-P_{j_1})\, \ln\left(1+\frac{y_{1(j_1)}}{\mu}\right) + \sum_{j_1=1}^{n_1} \ln(1-P_{j_1}) \sum_{j_1=1}^{n_1} \ln\left(1+\frac{y_{1(j_1)}}{\mu}\right)}{n_1 \sum_{j_1=1}^{n_1} \left[\ln\left(1+\frac{y_{1(j_1)}}{\mu}\right)\right]^2 - \left[\sum_{j_1=1}^{n_1} \ln\left(1+\frac{y_{1(j_1)}}{\mu}\right)\right]^2} \quad \ldots(22)$$

$$\hat{\alpha}_{2Rg} = \frac{-n_2 \sum_{j_2=1}^{n_2} \ln(1-P_{j_2})\, \ln\left(1+\frac{y_{2(j_2)}}{\mu}\right) + \sum_{j_2=1}^{n_2} \ln(1-P_{j_2}) \sum_{j_2=1}^{n_2} \ln\left(1+\frac{y_{2(j_2)}}{\mu}\right)}{n_2 \sum_{j_2=1}^{n_2} \left[\ln\left(1+\frac{y_{2(j_2)}}{\mu}\right)\right]^2 - \left[\sum_{j_2=1}^{n_2} \ln\left(1+\frac{y_{2(j_2)}}{\mu}\right)\right]^2} \quad \ldots(23)$$

$$\hat{\alpha}_{3Rg} = \frac{-n_3 \sum_{j_3=1}^{n_3} \ln(1-P_{j_3})\, \ln\left(1+\frac{y_{3(j_3)}}{\mu}\right) + \sum_{j_3=1}^{n_3} \ln(1-P_{j_3}) \sum_{j_3=1}^{n_3} \ln\left(1+\frac{y_{3(j_3)}}{\mu}\right)}{n_3 \sum_{j_3=1}^{n_3} \left[\ln\left(1+\frac{y_{3(j_3)}}{\mu}\right)\right]^2 - \left[\sum_{j_3=1}^{n_3} \ln\left(1+\frac{y_{3(j_3)}}{\mu}\right)\right]^2} \quad \ldots(24)$$

$$\hat{\alpha}_{4Rg} = \frac{-n_4 \sum_{j_4=1}^{n_4} \ln(1-P_{j_4})\, \ln\left(1+\frac{y_{4(j_4)}}{\mu}\right) + \sum_{j_4=1}^{n_4} \ln(1-P_{j_4}) \sum_{j_4=1}^{n_4} \ln\left(1+\frac{y_{4(j_4)}}{\mu}\right)}{n_3 \sum_{j_4=1}^{n_4} \left[\ln\left(1+\frac{y_{4(j_4)}}{\mu}\right)\right]^2 - \left[\sum_{j_4=1}^{n_4} \ln\left(1+\frac{y_{4(j_4)}}{\mu}\right)\right]^2} \quad \ldots(25)$$

The Rg estimator of R is given by substitute (21), (22), (23), (24), and (25) in equation (9) we get:

$$\hat{R}_{Rg} = 1 - \left[\frac{\hat{\alpha}_{Rg}}{(\hat{\alpha}_{Rg}+\hat{\alpha}_{1Rg})}\right] - \left[\frac{\hat{\alpha}_{Rg}}{(\hat{\alpha}_{Rg}+\hat{\alpha}_{2Rg})}\right] - \left[\frac{\hat{\alpha}_{Rg}}{(\hat{\alpha}_{Rg}+\hat{\alpha}_{3Rg})}\right] - \left[\frac{\hat{\alpha}_{Rg}}{(\hat{\alpha}_{Rg}+\hat{\alpha}_{4Rg})}\right] + \left[\frac{\hat{\alpha}_{Rg}}{(\hat{\alpha}_{Rg}+\hat{\alpha}_{1Rg}+\hat{\alpha}_{2Rg})}\right]$$
$$+ \left[\frac{\hat{\alpha}_{Rg}}{(\hat{\alpha}_{Rg}+\hat{\alpha}_{1Rg}+\hat{\alpha}_{3Rg})}\right] + \left[\frac{\hat{\alpha}_{Rg}}{(\hat{\alpha}_{Rg}+\hat{\alpha}_{1Rg}+\hat{\alpha}_{4Rg})}\right] + \left[\frac{\hat{\alpha}_{Rg}}{(\hat{\alpha}_{Rg}+\hat{\alpha}_{2Rg}+\hat{\alpha}_{3Rg})}\right] + \left[\frac{\hat{\alpha}_{Rg}}{(\hat{\alpha}_{Rg}+\hat{\alpha}_{2Rg}+\hat{\alpha}_{4Rg})}\right]$$
$$+ \left[\frac{\hat{\alpha}_{Rg}}{(\hat{\alpha}_{Rg}+\hat{\alpha}_{3Rg}+\hat{\alpha}_{4Rg})}\right] - \left[\frac{\hat{\alpha}_{Rg}}{(\hat{\alpha}_{Rg}+\hat{\alpha}_{1Rg}+\hat{\alpha}_{2Rg}+\hat{\alpha}_{3Rg})}\right] - \left[\frac{\hat{\alpha}_{Rg}}{(\hat{\alpha}_{Rg}+\hat{\alpha}_{1Rg}+\hat{\alpha}_{2Rg}+\hat{\alpha}_{4Rg})}\right]$$
$$- \left[\frac{\hat{\alpha}_{Rg}}{(\hat{\alpha}_{Rg}+\hat{\alpha}_{1Rg}+\hat{\alpha}_{3Rg}+\hat{\alpha}_{4Rg})}\right] - \left[\frac{\hat{\alpha}_{Rg}}{(\hat{\alpha}_{Rg}+\hat{\alpha}_{2Rg}+\hat{\alpha}_{3Rg}+\hat{\alpha}_{4Rg})}\right] + \left[\frac{\hat{\alpha}_{Rg}}{(\hat{\alpha}_{Rg}+\hat{\alpha}_{1Rg}+\hat{\alpha}_{2Rg}+\hat{\alpha}_{3Rg}+\hat{\alpha}_{4Rg})}\right] \quad ...(26)$$

5. Least Square Estimator (LSE):

This estimation method is very popular for model fitting, especially in linear and non-linear regression [10]. Suppose that the random sample $x_1, x_2 \ldots, x_n$ of size n from LD. The LS estimator can be obtain by minimizing:

$$\sum_{i=1}^{n}\left[\ln(1-P_i)^{-1} - \alpha \ln\left(1+\frac{x_{(i)}}{\mu}\right)\right]^2 .$$

By driving with respect to α we get LS estimator of α is

$$\hat{\alpha}_{LS} = \frac{\sum_{i=1}^{n}\ln(1-P_i)^{-1}\ln\left(1+\frac{x_{(i)}}{\mu}\right)}{\sum_{i=1}^{n}\left(\ln\left(1+\frac{x_{(i)}}{\mu}\right)\right)^2} \quad ...(27)$$

Also the LS estimators of α_1, α_2, α_3 and α_4 are:

$$\hat{\alpha}_{1LS} = \frac{\sum_{j_1=1}^{n_1}\ln\left(1-P_{j_1}\right)^{-1}\ln\left(1+\frac{y_{1(j_1)}}{\mu}\right)}{\sum_{i=1}^{n_1}\left(\ln\left(1+\frac{y_{1(j_1)}}{\mu}\right)\right)^2} \quad ...(28)$$

$$\hat{\alpha}_{2LS} = \frac{\sum_{j_2=1}^{n_2}\ln\left(1-P_{j_2}\right)^{-1}\ln\left(1+\frac{y_{2(j_2)}}{\mu}\right)}{\sum_{j_2=1}^{n_2}\left(\ln\left(1+\frac{y_{2(j_2)}}{\mu}\right)\right)^2} \quad ...(29)$$

$$\hat{\alpha}_{3LS} = \frac{\sum_{j_3=1}^{n_3}\ln\left(1-P_{j_3}\right)^{-1}\ln\left(1+\frac{y_{3(j_3)}}{\mu}\right)}{\sum_{j_3=1}^{n_3}\left(\ln\left(1+\frac{y_{3(j_3)}}{\mu}\right)\right)^2} \quad ...(30)$$

$$\hat{\alpha}_{4LS} = \frac{\sum_{j_4=1}^{n_4}\ln\left(1-P_{j_4}\right)^{-1}\ln\left(1+\frac{y_{4(j_4)}}{\mu}\right)}{\sum_{j_4=1}^{n_4}\left(\ln\left(1+\frac{y_{4(j_4)}}{\mu}\right)\right)^2} \quad \ldots(31)$$

The LS estimator of R is given by substitute (27), (28), (29), (30), and (31) in equation (9) we get:

$$\hat{R}_{LS} = 1 - \left[\frac{\hat{\alpha}_{LS}}{(\hat{\alpha}_{LS}+\hat{\alpha}_{1LS})}\right] - \left[\frac{\hat{\alpha}_{LS}}{(\hat{\alpha}_{LS}+\hat{\alpha}_{2LS})}\right] - \left[\frac{\hat{\alpha}_{LS}}{(\hat{\alpha}_{LS}+\hat{\alpha}_{3LS})}\right] - \left[\frac{\hat{\alpha}_{LS}}{(\hat{\alpha}_{LS}+\hat{\alpha}_{4LS})}\right] + \left[\frac{\hat{\alpha}_{LS}}{(\hat{\alpha}_{LS}+\hat{\alpha}_{1LS}+\hat{\alpha}_{2LS})}\right]$$
$$+ \left[\frac{\hat{\alpha}_{LS}}{(\hat{\alpha}_{LS}+\hat{\alpha}_{1LS}+\hat{\alpha}_{3LS})}\right] + \left[\frac{\hat{\alpha}_{LS}}{(\hat{\alpha}_{LS}+\hat{\alpha}_{1LS}+\hat{\alpha}_{4LS})}\right] + \left[\frac{\hat{\alpha}_{LS}}{(\hat{\alpha}_{LS}+\hat{\alpha}_{2LS}+\hat{\alpha}_{3LS})}\right] + \left[\frac{\hat{\alpha}_{LS}}{(\hat{\alpha}_{LS}+\hat{\alpha}_{2LS}+\hat{\alpha}_{4LS})}\right]$$
$$+ \left[\frac{\hat{\alpha}_{LS}}{(\hat{\alpha}_{LS}+\hat{\alpha}_{3LS}+\hat{\alpha}_{4LS})}\right] - \left[\frac{\hat{\alpha}_{LS}}{(\hat{\alpha}_{LS}+\hat{\alpha}_{1LS}+\hat{\alpha}_{2LS}+\hat{\alpha}_{3LS})}\right] - \left[\frac{\hat{\alpha}_{LS}}{(\hat{\alpha}_{LS}+\hat{\alpha}_{1LS}+\hat{\alpha}_{2LS}+\hat{\alpha}_{4LS})}\right]$$
$$- \left[\frac{\hat{\alpha}_{LS}}{(\hat{\alpha}_{LS}+\hat{\alpha}_{1LS}+\hat{\alpha}_{3LS}+\hat{\alpha}_{4LS})}\right] - \left[\frac{\hat{\alpha}_{LS}}{(\hat{\alpha}_{LS}+\hat{\alpha}_{2LS}+\hat{\alpha}_{3LS}+\hat{\alpha}_{4LS})}\right] + \left[\frac{\hat{\alpha}_{LS}}{(\hat{\alpha}_{LS}+\hat{\alpha}_{1LS}+\hat{\alpha}_{2LS}+\hat{\alpha}_{3LS}+\hat{\alpha}_{4LS})}\right] \quad ...(32)$$

6. Weighted Least Square Estimator (WLSE) :

It can be obtained by the same sample assumptions of LS estimation using the weight w_i, which given as:

$$w_i = \frac{1}{Var[F(x_{(i)})]} = \frac{(n+1)^2(n+2)}{i(n-i+1)}, i = 1,2,\dots,n$$

The minimizing with respect to the unknown parameter α:

$$\sum_{i=0}^{n} w_i \left[\ln(1-P_i)^{-1} - \alpha \ln\left(1+\frac{x_{(i)}}{\mu}\right)\right] = 0 \quad \text{...(33)}$$

The WLS estimator for α, is finally given as:

$$\hat{\alpha}_{WLS} = \frac{\sum_{i=1}^{n} w_i \ln(1-P_i)^{-1} \ln\left(1+\frac{x_{(i)}}{\mu}\right)}{\sum_{i=1}^{n} w_i \left(\ln\left(1+\frac{x_{(i)}}{\mu}\right)\right)^2} \quad \text{...(34)}$$

The WLS estimators of α_1, α_2, α_3 and α_4 are:

$$\hat{\alpha}_{1WLS} = \frac{\sum_{j_1=1}^{n_1} w_{j_1} \ln(1-P_{j_1})^{-1} \ln\left(1+\frac{y_{1(j_1)}}{\mu}\right)}{\sum_{i=1}^{n_1} w_{j_1} \left(\ln\left(1+\frac{y_{1(j_1)}}{\mu}\right)\right)^2} \quad \text{...(35)}$$

$$\hat{\alpha}_{2WLS} = \frac{\sum_{j_2=1}^{n_2} w_{j_2} \ln(1-P_{j_2})^{-1} \ln\left(1+\frac{y_{2(j_2)}}{\mu}\right)}{\sum_{j_2=1}^{n_2} w_{j_2} \left(\ln\left(1+\frac{y_{2(j_2)}}{\mu}\right)\right)^2} \quad \text{...(36)}$$

$$\hat{\alpha}_{3WLS} = \frac{\sum_{j_3=1}^{n_3} w_{j_3} \ln(1-P_{j_3})^{-1} \ln\left(1+\frac{y_{3(j_3)}}{\mu}\right)}{\sum_{j_3=1}^{n_3} w_{j_3} \left(\ln\left(1+\frac{y_{3(j_3)}}{\mu}\right)\right)^2} \quad \text{...(37)}$$

$$\hat{\alpha}_{4WLS} = \frac{\sum_{j_4=1}^{n_4} w_{j_4} \ln(1-P_{j_4})^{-1} \ln\left(1+\frac{y_{4(j_4)}}{\mu}\right)}{\sum_{j_4=1}^{n_4} w_{j_4} \left(\ln\left(1+\frac{y_{4(j_4)}}{\mu}\right)\right)^2} \quad \text{...(38)}$$

The WLS estimator of R is given by substitute (34), (35), (36), (37), and (38) in equation (9) we get:

$$\begin{aligned}\hat{R}_{WLS} = 1 &- \left[\frac{\hat{\alpha}_{WLS}}{(\hat{\alpha}_{WLS}+\hat{\alpha}_{1WLS})}\right] - \left[\frac{\hat{\alpha}_{WLS}}{(\hat{\alpha}_{WLS}+\hat{\alpha}_{2WLS})}\right] - \left[\frac{\hat{\alpha}_{WLS}}{(\hat{\alpha}_{WLS}+\hat{\alpha}_{3WLS})}\right] - \left[\frac{\hat{\alpha}_{WLS}}{(\hat{\alpha}_{WLS}+\hat{\alpha}_{4WLS})}\right] \\ &+ \left[\frac{\hat{\alpha}_{WLS}}{(\hat{\alpha}_{WLS}+\hat{\alpha}_{1WLS}+\hat{\alpha}_{2WLS})}\right] + \left[\frac{\hat{\alpha}_{WLS}}{(\hat{\alpha}_{WLS}+\hat{\alpha}_{1WLS}+\hat{\alpha}_{3WLS})}\right] + \left[\frac{\hat{\alpha}_{WLS}}{(\hat{\alpha}_{WLS}+\hat{\alpha}_{1WLS}+\hat{\alpha}_{4WLS})}\right] \\ &+ \left[\frac{\hat{\alpha}_{WLS}}{(\hat{\alpha}_{WLS}+\hat{\alpha}_{2WLS}+\hat{\alpha}_{3WLS})}\right] + \left[\frac{\hat{\alpha}_{WLS}}{(\hat{\alpha}_{WLS}+\hat{\alpha}_{2WLS}+\hat{\alpha}_{4WLS})}\right] + \left[\frac{\hat{\alpha}_{WLS}}{(\hat{\alpha}_{WLS}+\hat{\alpha}_{3WLS}+\hat{\alpha}_{4WLS})}\right] \\ &- \left[\frac{\hat{\alpha}_{WLS}}{(\hat{\alpha}_{WLS}+\hat{\alpha}_{1WLS}+\hat{\alpha}_{2WLS}+\hat{\alpha}_{3WLS})}\right] - \left[\frac{\hat{\alpha}_{WLS}}{(\hat{\alpha}_{WLS}+\hat{\alpha}_{1WLS}+\hat{\alpha}_{2WLS}+\hat{\alpha}_{4WLS})}\right] \\ &- \left[\frac{\hat{\alpha}_{WLS}}{(\hat{\alpha}_{WLS}+\hat{\alpha}_{2WLS}+\hat{\alpha}_{3WLS}+\hat{\alpha}_{4WLS})}\right] + \left[\frac{\hat{\alpha}_{WLS}}{(\hat{\alpha}_{WLS}+\hat{\alpha}_{1WLS}+\hat{\alpha}_{2WLS}+\hat{\alpha}_{3WLS}+\hat{\alpha}_{4WLS})}\right] \quad \text{...(39)}\end{aligned}$$

7. Simulation study

The Monte Carlo Simulation is conducted to compare the performances of the Maximum likelihood, Regression, Least Square, and Weighted Least Square estimators of R (repeat 10000 times).

It is performed by assuming eight states of R, say:$(\alpha, \alpha_1, \alpha_2, \alpha_3, \alpha_4, \mu) = (1.9,0,5,0.4,0.5, 1.5,1.3)$ $(1.9,0,5,0.4,0.5, 1.5,1.8)$, $(0.7,1.2,1.5,1.8, 1.6,1.3)$, $(0.7,1.2,1.5,1.8, 1.6,1.8)$, $(2.6,1.3,2.4,1.6,1.4,1.3)$, $(2.6,1.3,2.4,1.6, 1.4,1.8)$, $(2.2,1.3,1.8,1.6, 1.5,1.3)$ and $(2.2,1.3,1.8,1.6, 1.5,1.8)$ for different sample sizes $(n, n_1, n_2, n_3, n_4) = (10,10,15,15,15)$, $(25,25,25,25,25)$, $(35,35,20, 20,25)$, $(75,75,75,75,75)$ &$(75,75,50,50,50)$. The real values of R and the (MSE & MAPE) values for these cases are recorded in tables from (1) to (8). The ML estimator gives the best performance in all tables.

Table (1): MSE and MAPE values of $[(\alpha, \alpha_1, \alpha_2, \alpha_3, \alpha_4, \mu) = (1.9,0,5,0.4,0.5, 1.5,1.3)]$ $R = 1.2557$

8. Conclusions

The reliability R of a component being having X Lomax distribution strength and exposed to Y_1, Y_2, Y_3 and Y_4 Lomax stresses the shape parameter and a common scale parameter is obtained. We conducted a comparison between the four different estimation methods using MSE and MAPE and found that MLE is best for estimating R. The performance of LSE and WLSE convergent in all tables.

Abstract. In this paper, the heat conduction equation for composite materials posed and solved. This problem is known as an inverse initial value problem for the heat conduction equation. In order to solve and formulate this inverse problem, the function spaces must be defined and represented. By studying and solving the direct problem for the heat equation in composite materials, it is possible to determine the function spaces and solve the inverse initial value problem. Scientific methods used: the separation of variables method used to solve the direct problem for the heat equation. It found that method separation of variables does not completely lead to the solution of the inverse initial value problem, since this method leads to a divergent series of solutions and rather massive errors. The heat conduction problem can be formulated as Fredholm integral first kind equations. The discretization algorithm applied to reformulated the problem as linear operator problem as matrix and vectors form. Then, Tikhonov's regularization inversion method has been used to find an approximation solution. Finally, as shown in the numerical example the regularized approximate solutions obtained.

1. Introduction

Many applied problems formulated as inverse problems of mathematical physics belong to the class of ill-posed problems. The inverse initial value problem for the heat equation is defined as an ill-posed problem in the sense that a "small" arbitrary change in data can lead to "large" errors in the solution [1]. Many methods can solve the inverse problem under the study of the heat equation. For example, the method of regularization Tikhonov A. N. [2], the method of Lavrentiev M. M. [3, 4], and the method of quasi-solutions Ivanova V. K. [5, 6]. With the development of high-speed personal computers, it has become more convenient to use numerical methods to solve inverse problems. Theoretical concepts and computational implementation associated with the solution of inverse and ill-posed problems were investigated by AN Tikhonov, MM Lavrent'ev, VK Ivanov, and their students and successive ones [7].

Many authors have discussed the theoretical concepts and computational implementation associated with the inverse problem of the heat equation for composite materials, and many methods have been described. In [8] the inverse problem of heat conduction was investigated using the Fourier series in eigenfunctions for an equation with a discontinuous coefficient. The Fourier transform was used, which made it possible to derive an inverse problem for the operator equation. Then the inverse problem of the operator equation was solved by the residual method. In [9], the author solved the problem of a moving boundary according to the Cauchy data in a one-dimensional heat equation with composite materials or a multilayer region. This problem is solved using a numerical regularization method based on the method

of fundamental solutions and the method of discrete Tikhonov regularization. An artificial neural network is used in [10] as an inverse tool for evaluating the thermal conductivity of a composite made of an aluminum core with an aluminum face sheet connected by an adhesive layer. The Picard method proposed to solve the inverse Cauchy problem to heat equation for composite materials [11] the Picard method applied in [12].

The main idea of this work is to reconstruct the source function of the heat equation by using the Tikhonov's regularization method, and it implemented to solve the inverse initial Cauchy problem for the heat equation in composite materials. The method of separation of variables was used to solve the direct problem of the partial differential equation for the heat equation in composite materials.

2. Statement of the problem

The direct problem of finding the temperature in the rod that is created from composite materials is the problem of heat conduction at any moment by using the initial and boundary values of the temperature. The mathematical formulation of this problem is described [11] by a system of differential equations:

$$\frac{\partial u_1(x,t)}{\partial t} = a_1^2 \frac{\partial^2 u_1(x,t)}{\partial x^2}; x \in (0, x_0); t \in (0,T], a_1 > 0, \tag{1}$$

$$\frac{\partial u_2(x,t)}{\partial t} = a_2^2 \frac{\partial^2 u_2(x,t)}{\partial x^2}; x \in (x_0, 1); t \in (0,T], a_2 > 0, \tag{2}$$

$$u_1(x,0) = u_1(x); 0 \le x \le x_0, u_2(x,0) = u_2(x); x_0 \le x \le 1; \tag{3}$$

$$u_1(0) = u_1'(0) = u_2(1) = u_2'(1) = 0, \tag{4}$$

where $u_1(x) \in (C[0, x_0] \cap C^2(0, x_0)); u_2(x) \in (C[x_0, 1] \cap C^2(x_0, 1))$

$$\frac{\partial u_1(0,t)}{\partial x} = 0; t \in [0,T], \tag{5}$$

$$u_2(1,t) = 0; t \in [0,T], \tag{6}$$

$$u_1(x_0,t) = u_2(x_0,t); t \in [0,T], \tag{7}$$

$$a_1 \frac{\partial u_1(x_0,t)}{\partial x} = a_2 \frac{\partial u_2(x_0,t)}{\partial x}; t \in [0,T], \tag{8}$$

in the direct problem (1–8) we need to find the vector $\tilde{u}(x,t)$.

$$\tilde{u}(x,t) = \begin{cases} u_1(x,t); \ x \in [0, x_0]; t \in [0,T] \\ u_2(x,t); \ x \in [x_0, 1], t \in [0,T] \end{cases}, \tag{9}$$

where $\tilde{u}(x,t) \in C([0,1] \times [0,T]) \cap C^{2,1}\left(\left[(0, x_0) \cup (x_0, 1)\right] \times (0,T]\right)$,

$$\tilde{u}(x,t) \to \tilde{u}(x) \ for \ t \to 0, \tag{10}$$

Theorem 1. For any function $\tilde{u}(x)$ satisfying (4), $\exists$ the unique solution of the direct problem satisfying (1–3), (5), (8, 9).

Proof. We will seek a formal solution to system (1–7) in the form of a series in eigenfunctions corresponding to the Sturm-Liouville problem $\{S_n(x)\}_{n=1}^{\infty}$,

$$\tilde{u}(x,t) = \sum_{n=1}^{\infty} u_n e^{-\lambda_n^2 t} S_n(x), \tag{11}$$

where function $S_n(x)$ is defined by $S_n(x)=\begin{cases} S_n^1\left(x/a_1\right);\ x\in(0,x_0), \\ S_n^2\left(x/a_2\right);\ x\in(x_0,1). \end{cases}$

$$S_n(x)=\beta_n\begin{cases}\cos\left(\dfrac{\lambda_n x}{a_1}\right)\sin\left(\dfrac{\lambda_n(1-x_0)}{a_2}\right);\ x\in[0,x_0],\\ \sin\left(\dfrac{\lambda_n(1-x)}{a_2}\right)\cos\left(\dfrac{\lambda_n x_0}{a_1}\right);\ x\in[x_0,1],\end{cases} \tag{12}$$

$$u_n=\frac{\alpha_n}{\lambda_n}\begin{cases}u_n^1=\int_0^{x_0}u_1(x)S_n^1\left(x/a_1\right)d\left(x/a_1\right)\\ u_n^2=\int_{x_0}^{1}u_2(x)S_n^2\left(x/a_2\right)d\left(x/a_2\right)\end{cases}, \tag{13}$$

where $\alpha_n=\beta_n cos\left(\dfrac{\lambda_n x_0}{a_2}\right)$

$$\beta_n^2=\frac{2a_1a_2}{a_2x_0\sin^2\left(\dfrac{\lambda_n(1-x_0)}{a_2}\right)+a_1(1-x_0)\cos^2\left(\dfrac{\lambda_n x_0}{a_1}\right)}, \tag{14}$$

$$\lambda_n=\frac{\pi a_1a_2(2n-1)}{2(a_2x_0+a_1(1-x_0))},n=1,2,3,\ldots. \tag{15}$$

From (9), (11) and (13) we can reduce problem as Fredholm integral first kind equation.

$$\tilde{u}(x,t)=\begin{cases}u_1(x,t)=\int_0^{x_0}\sum_{n=1}^{\infty}e^{-\lambda_n^2t}S_n^1(y)S_n^1(x)u_1(x)d\left(x/a_1\right),y\in[0,x_0];\\ u_2(x,t)=\int_0^{x_0}\sum_{n=1}^{\infty}e^{-\lambda_n^2t}S_n^1(y)S_n^1(x)u_1(x)d\left(x/a_1\right),y\in[0,x_0];\end{cases}, \tag{16}$$

can write (16) as following

$$A\tilde{u}(x)=\begin{cases}A_1u_1(x)=\int_0^{x_0}P_1(y,x,t)u_1(x)d\left(x/a_1\right),y\in[0,x_0];\\ A_2u_2(x)=\int_{x_0}^{1}P_2(y,x,t)u_2(x)d\left(x/a_2\right),y\in[x_0,1]\end{cases}=\tilde{g}(x), \tag{17}$$

where $P_1(y,x,t)=\sum_{n=1}^{\infty}e^{-\lambda_n^2t}S_n^1(y)S_n^1(x)$, $P_2(y,x,t)=\sum_{n=1}^{\infty}e^{-\lambda_n^2t}S_n^2(y)S_n^2(x)$

The function $\tilde{u}(x)$ refers as initial temperature, see (3) and (10) $\tilde{u}(x)=\begin{cases}u_1(x);\ x\in[0,x_0];\\ u_2(x);\ x\in[x_0,1];\end{cases}$,

the kernels $P_1(y,x,t)\in C\left([0,x_0]\times[0,x_0]\right),P_2(y,x,t)\in C\left([x_0,1]\times[x_0,1]\right),\tilde{u}(x)\in H_2^1[0,1]$ and $\tilde{g}(x)\in L_2[0,1]$. The kernels of the integral operator A in (17) is closed.

3. Statement of the inverse problem

In (1–8), consider the inverse initial value problem for the heat equation, that is, the temperature distribution at the time t = T > 0, which is given by the function $\tilde{u}(x,T)$, and it is required to find the initial distribution $\tilde{u}(x)=\begin{cases}u_1(x);\ x\in[0,x_0];\\ u_2(x);\ x\in[x_0,1];\end{cases}$, assuming that $\tilde{u}(x)\in H_2^1[0,1]$. Suppose that we know a function $\tilde{g}(y)\in L_2[0,1]$, which is a solution to the direct problem for t = T,

$$\tilde{u}(x,T)=\begin{cases}A_1u_1(x)=\int_0^{x_0}P_1(y,x,T)u_1(x)d\left(x/a_1\right), y\in[0,x_0];\\ A_2u_2(x)=\int_{x_0}^{1}P_2(y,x,T)u_2(x)d\left(x/a_2\right), y\in[x_0,1]\end{cases}=\tilde{g}(y), \tag{18}$$

the exact value of the function $\tilde{g}(y)=\tilde{g}_0(y)$ in (18) is unknown, and instead of it a pair $\tilde{g}_\delta(y)$ and δ are given, where $\tilde{g}_\delta(y)\in L_2[0,1], \delta>0$,

$$\|\tilde{g}_\delta(y)-\tilde{g}_0(y)\|_{L_2}\le\delta. \tag{19}$$

Required using the initial data of the problem $\tilde{g}_\delta(y)$ and δ to find the approximation solution $u_\delta(x)\in L_2[0,1]$, the $u_\delta(x)$ is converges to $\tilde{u}(x)$ when the $\delta\to 0,$ in $L_2[0,1]$, as well as to obtain an estimate of the error $\|u_\delta(x)-\tilde{u}(x)\|_{L_2}$.

4. Discretization of the integral equation of the first kind

The discretization algorithm described in [13] and implemented in [14]. For simplicity, we used the following steps to reformulate the first integral equation $A_1u_1(x)=\int_0^{x_0}P_1(y,x,T)u_1(x)d\left(x/a_1\right), y\in[0,x_0]$ for problem (17) and we can apply same step on the second integral equation $A_2u_2(x)=\int_{x_0}^{1}P_2(y,x,T)u_2(x)d\left(x/a_2\right), y\in[x_0,1]$. We considered the following integral equation for first kind without T because the is fixed number.

$$Au(x)=\int_a^b P(x,y)u(x)dx=g(y), a\le y\le b, \tag{20}$$

where $u(x)\in L_2[a,b], g(y)\in L_2[a,b],$ the function $P(x,y)$ represent the kernel operator $A,$ where $P(x,y), P_y'(x,y)\in C^{1,1}([a,b]\times[a,b])$. We propose that for $g(x)=g_0(x)$ there exist a true solution $u_0(x)$ for problem (20) in the set M_r

$$M_r=\left\{u(x):u(x),u'(x)\in L_2[a,b], u(a)=u(b)=0, \|u(x)\|_{L_2}^2\le r^2\right\}, \tag{21}$$

The function $g_0(x)$ is unknown instead of we have $g_\delta\in L_2[a,b]$ and $\delta>0$ such that $\|g_\delta(y)-g_0(y)\|_{L_2}^2\le\delta^2$. In order to solve the problem (20) we need find the approximation solution $u_\delta(x)$ by using the given information $g_\delta(y),\delta$ and M_r. Then we estimate the deviation of the approximation solution $u_\delta(x)$ from the true solution $u_0(x)$ in the metric of space $L_2[a,b]$.

We need define an operator $B:L_2[a,b]\to L_2[a,b]$ by the following formula

$$u(x)=Bv(x)=\int_a^s v(\zeta)d\zeta, v(x), Bv(x)\in L_2[a,b], \tag{22}$$

There is an operator named C which can be defined by

$$Cv(x) = ABv(x),\ v(x), \in L_2[a,b],\ Cv(x) \in L_2[a,b], \tag{23}$$

from (23) and (24) we follow that $Cv(x) = \int_a^b K(x,y)v(x)dx$, where $K(x,y) = -\int_a^x P(\varsigma, y)d\varsigma$.

The finite-dimensional operator $C_{n,n}$ has been defined for computing the numerical solution for problem (20), the C replaced with the operator $C_{n,n}$ and these operators satisfied the following relation where the value of the $\eta_{n,n}$ is define by

$$N(y) = \max_{a \le x \le b} |P(x,y)|,\ y \in [a,b], \tag{24}$$

and

$$N_1 = \max\left\{ \left| K'_y(x,y) \right| : a \le x \le b, a \le y \le b \right\}, \tag{25}$$

the $N(y) \in [a,b]$ and N_1 exist because the $P(x,y), P'_y(x,y) \in C([a,b] \times [a,b])$.

By dividing the intervals $[a,b]$ into n equal parts where interval $[a,b]$ is divided by points $x_i = a + \frac{i(b-a)}{n}, i = 0, 1, \ldots, n-1$. Now, we need to define the following functions

$$\bar{K}_i(y) = K(x_i, y), \tag{26}$$

$$K_n(x,y) = \bar{K}_i(y); x_i \le x \le x_{i+1},\ \ y \in [a,b], i = 0,1,\ldots,n-1 \tag{27}$$

$$K_{n,n}(x,y) = \bar{K}_i(y_j); x_i \le x \le x_{i+1}, y_j \le y \le y_{j+1}, i = 0,1,\ldots,n-1,\ j = 0,1,\ldots,n-1, \tag{28}$$

By using the equations (26–28), we define the operators $C_{n,}$ and $C_{n,n}$

$$C_n v(x) = \int_a^b K_n(x,y)v(x)dx, y \in [a,b],\ C_{n,n}v(x) = \int_a^b K_{n,n}(x,y)v(x)dx, y \in [a,b], \tag{29}$$

where $C_{n,}$ and $C_{n,m}$ map $L_2[a,b]$ into $L_2[a,b]$

Next step need to estimate the $\|C_{n,n} - C\|$, by using the inequality relation $\|C_{n,n} - C\| \le \|C_{n,n} - C_n\| + \|C_n - C\|$. Since

$$|K_{n,n}(x,y) - K_n(x,y)| \le |\bar{K}_i(y) - \bar{K}_i(y_j)|, \tag{30}$$

for $x_i \le x \le x_{i+1}$ and $y_j \le y \le y_{j+1},\ i = 0,1,\ldots,n-1,\ j = 0,1,\ldots,n-1,$ from (25) $|\bar{K}_i(y) - \bar{K}_i(y_j)| \le N_1 \frac{b-a}{m}$, finding from (30) that

$$|K_{n,n}(x,y) - K_n(x,y)| \le N_1 \frac{b-a}{m}, \tag{31}$$

By using the equality $\|C_{n,n} - C_n\| = \sup_{\|v\| \le 1} \|C_{n,n}v - C_n v\|$, we get

$$\|C_{n,n} - C_n\|^2 = \sup_{\|v\| \le 1} \int_a^b \left[\int_a^b |K_{n,n}(x,y) - K_n(x,y)| . |v(x)| dx \right]^2 dy. \tag{32}$$

Driving from (31) and (32) the following

$$\|C_{n,n} - C_n\|^2 \le N_1^2 \left(\frac{b-a}{n} \right)^2 \int_a^b \left[\int_a^b |v(x)| dx \right]^2 dy. \tag{33}$$

Since $\int_a^b |v(x)| dx \le \sqrt{b-a}\, \|v(x)\|_{L_2}$, inequality (33) implies that

$$\|C_{n,n}-C_n\|\le\sqrt{(b-a)(b-a)}N_1\frac{b-a}{n}. \tag{34}$$

Now the term $\|C_n-C\|$ can be estimating. Since $C_nv(x)-Cv(x)=\int_a^b(K(x,y)-K_n(x,y))v(x)dx$ and

$$\|C_n-C\|^2=\sup\left\{\int_a^b\left[\int_a^b|K_{n,n}(x,y)-K_n(x,y)|.|v(x)|dx\right]^2dy:\|v(x)\|\le1\right\}$$

Taking into account (24), (26) and (27) and the inequality

$$\int_a^b|K(x,y)-K_n(x,y)|.|v(x)|dx\le\int_a^b|K(x,y)-K(x_i,y)|.|v(x)|dx\le\frac{b-a}{n}N(y)\int_a^b|v(x)|dx,$$

We find the following

$$\|C_{n,n}v(x)-C_nv(x)\|^2\le\left(\frac{b-a}{n}\right)^2\int_a^bN^2(y)\left[\int_a^b|v(x)dx|\right]^2dy. \tag{35}$$

The $\|v(x)\|\le1$ and $\int_a^b|v(x)|dx\le\frac{b-a}{n}\|v(x)\|$ with inequality (35) implies that

$$\|C_n-C\|\le\sqrt{(b-a)}\|N(y)\|_{L_2}\frac{b-a}{n}. \tag{36}$$

Thus from (34) and (36)

$$\eta_{n,n}=\sqrt{(b-a)(b-a)}N_1\frac{b-a}{n}+\sqrt{(b-a)}\|N(y)\|_{L_2}\frac{b-a}{n}. \tag{37}$$

5. Finite-dimensional of the Tikhonov regularization method

This step described in [13]. We define subspace X_n of spaces $L_2(a,b)$. Those subspaces consisting of all functions on intervals $[x_i,x_{i+1}),i=0,1,...,n-1$, and intervals $\left[y_j,y_{j+1}\right),j=0,1,...,n-1$, for space $L_2(a,b)$. We denote by P_n the metric projection operator where $P_n:L_2(a,b)\to X_n$,
The problem (20) reduces to linear operator problem first type.

$$C_{n,n}v(x)=g_\delta^n(y), \tag{38}$$

where $g_\delta^n(y)=P_n|g_\delta(y)|$.

The approximation solution for the problem (20) can be obtained by using the generalized discrepancy method. The method reduces the problem (38) to the conditional extremum variational problem.

$$\inf\left\{\|v(x)\|^2:v(x)\in X_n,\|C_{n,n}v(x)-g_\delta^n(y)\|\le\|v(x)\|\eta_{n,n}+\delta\right\}, \tag{39}$$

under the condition

$$\|g_\delta^n(y)\|=\|u_0'(x)\|\eta_{n.n}+\delta, \tag{40}$$

The variational problem (38) has a unique solution $v_{\delta,\eta_{n,n}}(x)$ such that $\|C_{n,n}v_{\delta,\eta_{n,n}}(x)-g_\delta^n(y)\|=\|v_{\delta,\eta_{n,n}}(x)\|\eta_{n,n}+\delta.$

The conditional problem (38) is reduced to the unconditional problem

$$\inf\left\{\|C_{n,n}v(x)-g_\delta^n(y)\|^2+\alpha\|v(x)\|^2:v(x)\in X_n\right\},\alpha>0, \tag{41}$$

The (41) it is a finite-dimensional version of the Tikhonov regularization method [5].

There is a unique solution $v_\delta^\alpha(x)$ for problem (41) . This solution should satisfy the general discrepancy principle [15].

$$\left\|C_{n,m}v_\delta^\alpha(x)-g_\delta^n(y)\right\|=\left\|v_\delta^\alpha(x)\right\|\eta_{n,n}+\delta. \tag{42}$$

Under condition (40), the equation (42) has a unique solution $v_\delta^\alpha(x)$ with respect of regularization parameter $\alpha(n,n)$. That condition known in [16] and by theorem defined, there is $v_{\delta,\eta_{n,m}}(x)=v_\delta^{\alpha(n,m)}(x)$ where the approximation solution is $u_{\delta,\eta_{n,n}}(x)=Bv_{\delta,\eta_{n,n}}(x)$.

For solving the problem (42), we get the equation

$$C_{n,n}^TC_{n,n}v(x)+\alpha v(x)=C_{n,n}^Tg_\delta^n(y). \tag{43}$$

In space X_n, the orthonormal bases have introduced $\{\varphi_i(x)\}$ by following

$$\varphi_i(x)=\begin{cases}\sqrt{\dfrac{n}{b-a}}; & x_i\le x<x_{i+1,}\\ 0; & x\notin\left[x_i,x_{i+1,}\right),i=0,1,...,n-1,\end{cases}$$

$$\varphi_j(y)=\begin{cases}\sqrt{\dfrac{n}{b-a}}; & y_j\le y<y_{j+1,}\\ 0; & x\notin\left[y_j,y_{j+1,}\right),j=0,1,...,n-1,\end{cases}$$

With these bases, we define the isometric operator J_s where $J_s:R^n\to X_n$ following.

$$\begin{aligned}J_s\left[s(x)\right]&=\sum_{i=0}^{n-1}s_i\varphi_i(x),s=(s_0,s_1,....,s_{n-1}),\\ J_s\left[s(y)\right]&=\sum_{j=0}^{n-1}s_j\varphi_j(y),s=(s_0,s_1,....,s_{n-1})\end{aligned} \tag{44}$$

The problem 42

$$\inf\left\{\left\|J_s^{-1}\left[C_{n,n}v(x)\right]-J_s^{-1}\left[g_\delta^n(y)\right]\right\|^2+\alpha\left\|J_s^{-1}\left[v(x)\right]\right\|^2:J_s^{-1}\left[v(x)\right]\in X_n\right\},\alpha>0,$$

where

$$J_s^{-1}\left[g_\delta^n(y)\right]=\sqrt{\frac{n}{b-a}}\int_{y_j}^{y_{j+1}}f(y)dy$$

$$J_s^{-1}\left[v(x)\right]=\sqrt{\frac{n}{b-a}}\int_{x_i}^{x_{i+1}}v(x)dx$$

We can rewrite the equation (44) in matrix and vector form as following

$$(\bar{C}_{j,i})^T\bar{C}_{j,i}\bar{v}_i+\alpha\bar{v}_i=(\bar{C}_{j,i})^T\bar{g}_j,i=0,1,...n-1,\ j=0,1,...,n-1,$$

Where

$$\bar{v}_i = J_s^{-1}\left[v(x)\right] = \sqrt{\frac{n}{b-a}}\begin{bmatrix} \bar{v}_0 = \int_{x_0}^{x_1} v(x)dx \\ \bar{v}_1 = \int_{x_1}^{x_2} v(x)dx \\ \vdots \\ \bar{v}_{n-1} = \int_{x_{n-1}}^{x_n} v(x)dx \end{bmatrix}$$

$$\bar{g}_j = J_s^{-1}\left[g_\delta^n(y)\right] = \sqrt{\frac{n}{b-a}}\begin{bmatrix} g_0 = \int_{y_0}^{y_1} g(y)dy \\ g_1 = \int_{y_1}^{y_2} g(y)dy \\ \vdots \\ g_{n-1} = \int_{y_{n-1}}^{y_n} g(y)dy \end{bmatrix}$$

$$\bar{C}_{j,i} = \frac{b-a}{n}\sqrt{\frac{b-a}{n}}\begin{bmatrix} \bar{K}_{i=0}(y_{j=0}) & \bar{K}_{i=1}(y_{j=0}) & \dots & \bar{K}_{i=n-1}(y_{j=0}) \\ \bar{K}_{i=0}(y_{j=1}) & \bar{K}_{i=1}(y_{j=1}) & \dots & \bar{K}_{i=n-1}(x_{j=1}) \\ \vdots & \vdots & \ddots & \vdots \\ \bar{K}_{i=0}(y_{j=n-1}) & \bar{K}_{i=1}(y_{j=n-1}) & \cdots & \bar{K}_{i=n-1}(y_{j=n-1}) \end{bmatrix}$$

$$(\bar{C}_{j,i})^T = \frac{b-a}{n}\sqrt{\frac{b-a}{n}}\begin{bmatrix} \bar{K}_{i=0}(y_{j=0}) & \bar{K}_{i=0}(y_{j=1}) & \dots & \bar{K}_{i=0}(y_{j=n-1}) \\ \bar{K}_{i=1}(y_{j=0}) & \bar{K}_{i=1}(x_{j=1}) & \dots & \bar{K}_{i=1}(y_{j=n-1}) \\ \vdots & \vdots & \ddots & \vdots \\ \bar{K}_{i=n-1}(y_{j=0}) & \bar{K}_{i=n-1}(y_{j=1}) & \cdots & \bar{K}_{i=n-1}(y_{j=n-1}) \end{bmatrix}$$

6. Numerical example

Considering the inverse initial value problem (1–8) for the heat equation in composed materials, we need to find the $u_\delta^\alpha(x)$ by using Tikhonov regularization method. The exact solution $\tilde{u}(x) = \cos(\pi x/2)$ will be shown in 'figure 1', and the input function for inverse problem $u(x,T) = g_0(x)$ where the $x_0 \in (0,1)$, $x_0 = 0.5$. We will add some noise to $g_0(x)$ to become $g_\delta(x)$.

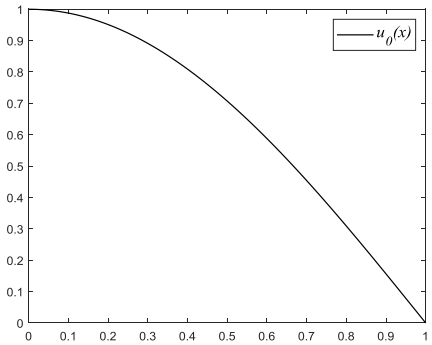

Figure 1. The exact solution for inverse problem $u_0(x)$.

We divided the intervals [0,1] into $m = 100$. and the $T = 0.1$. We have applied our method with different regularization parameter value α,

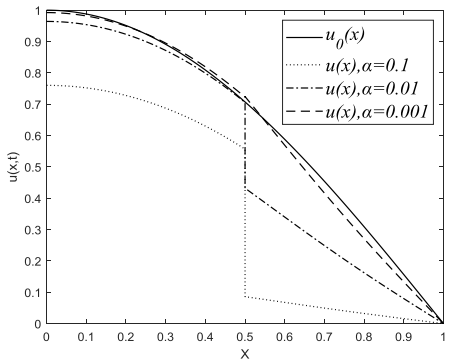

Figure 2. $u_\delta^\alpha(x)$. where $\delta = 0.02$.

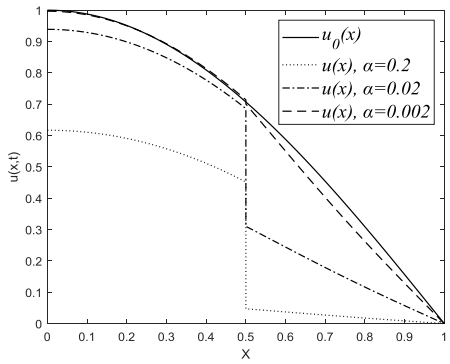

Figure 3. $u_\delta^\alpha(x)$. where $\delta = 0.04$.

From above figure 2 and figure 3, we obtain a good estimated solution compared with exact initial value $u_0(x)$.

7. Conclusion

This work deals with the algorithm for solving the initial value problem for the heat equation in composed materials. This problem is an ill-posed problem, and a special method needs to reformulate the problem to liner operator problem. The separation of variables method used to represent the partial differential equation as an integral equation of the first kind. By using the discretization method, the integral equation converted to a system of linear equations or linear operator equation first kind. Tikhonov's regularization method is a suitable method to obtain the approximation solution.

Abstract. Recent statistical research has witnessed activity on the study of skew normal distribution (SND) due to the fact that the data set does not fit well with the normal distribution due to Skewnessand excessive Kurtosis**.** For the purpose of estimating the parameters of the model (SND),the maximum likelihood method (ML) was used, but the probability equations of this method do not have clear solutions in the distribution (SND), and the problem was solved using the genetic algorithm (GA) and Other repetitive techniques are Newton Raphson, Nelder Mead and Iteratively Reweighting Algorithm, using the simulation method with different sample sizes and comparing the preference of results methods used based on criteria (Mean, Mse and Def). It has been concluded that (ML) capabilities using the (GA) of parameters (SND) are best in the case of a small or medium sample size and the best (IR) algorithm at a large sample size.

1. Introduction

The symmetric normal distribution is considered the most prevalent theoretically due to its important Properties, but in practice and analysing the data we find in many cases that the data is not distributed in a normal distribution The reason is due to the presence of outliers that cause skewness in the data. Since the skew is responsible for the asymmetry in the shape of the distribution, and previous studies confirm that most of the phenomena of life contain a proportion of the skew. Symmetric Here lies the importance of studying a skew normal distribution (SND).

The (SND) distribution shares common features and characteristics of the normal distribution, adding the mechanism of the skewness parameter (ω) that is responsible for regulating the skewnessand is considered the turning point from the normal to the skew normal distribution and gives the distribution (SND) greater flexibility and more appropriate to the data under study .

In our research we studied experimental data with different sample sizes and different skewness levels using the Monte Carlo simulation method. The values of the simulation results express the accuracy and best methods and methods used in the research for the studied model and obtaining the best results from the use of statistical methods and methods of improvement appropriate to the model and relying on them according to scientific rules that result in taking the correct and scientific decision appropriate to the studied problem.

The main problem of the research is to overcome the problems of probability equations in the (ML) when estimating the parameters of the (SND), which are considered the most prominent statistical methods for estimating probability distributions and because of the emergence of nonlinear functions

when the possibility function is derived and thus the results of (ML) have no solutions Evident in estimating the model parameters of a skew normal distribution modelpp.3.

The aim of our research is to study the (SND) of the characteristics and features, study the effect of the skewness parameter (ω), and address the problem of nonlinear functions in the (ML) equations of the (SND) . For the purpose of estimating the parameters of the skew normal distribution model, the genetic algorithm (GA) was used in addition to iterative algorithms (NR, NM and IR), then comparison between the preference of these methods based on criteria (Mean, Mse and Def)

2. Skew Normal Distribution (SND)

The univariate skew normal distribution was introduced by the researcher Azzalini in 1985, the mathematical formula for the probability density function (PDF) for the variable y distributed (SND) for the location parameter (ϵ) , the scale parameter (τ) and the shape parameter (ω) are written as follows[3] :-

$$f(y,\epsilon,\tau,\omega) = \frac{2}{\tau}\,\emptyset\left(\frac{y-\epsilon}{\tau}\right)\,\psi\left(\omega\,\frac{y-\epsilon}{\tau}\right) \qquad y \in R \quad \ldots \ (1)$$

Where $\emptyset$ and ψ are the (pdf) and (cdf) functions of the normal distribution, respectively. The skew normal distribution converts to the normal distribution when the shape parameter value is (ω =0) , and when the location and scale parameters values is (ϵ= 0 and τ = 1) respectively , the (SND) becomes a standard skew normal distribution (SSND) With the parameter of skewness (ω)[2], it is expressed mathematically as follows :

$$f(y,\omega) = 2\,\emptyset(y)\;\varphi(\omega\,y) \qquad y \in R \ \ldots (2)$$

The skewness increases (asymmetry of the distribution) with the increase of the skewness parameter (ω) [8] .

3. Method Maximum Likelihood (ML)

The ML method is considered one of the most prominent methods used to estimate the parameters of the probability model to characterize the estimated of maximum likelihood with high efficiency. The (ML) estimators of the parameters consider as points that lead to increase the logarithm of the likelihood function to its maximum limit [5]. The logarithm function of the (SND) is written as follows:

$$lnL = nln(2) - nln(\tau) - \frac{n}{2}ln(2\pi) - \frac{1}{2}\sum_{i=1}^{n}\left(\frac{y_i-\epsilon}{\tau}\right)^2 + \sum_{i=1}^{n} ln\,\psi\left(\omega\,\frac{y_i-\epsilon}{\tau}\right). \ldots (3)$$

Deriving the logarithm function of the skew normal distribution (SND) for the parameters (ϵ, τ, ω), we obtain nonlinear equations as follows :

$$\frac{\partial lnL}{\partial \epsilon} = \sum_{i=1}^{n}\left(\frac{y_i-\epsilon}{\tau}\right) - \ \omega\sum_{i=1}^{n}\frac{\emptyset\left(\omega\frac{y_i-\epsilon}{\tau}\right)}{\psi\left(\omega\frac{y_i-\epsilon}{\tau}\right)} \ = 0 \qquad \ldots \ (4)$$

$$\frac{\partial lnL}{\partial \tau} = \ -n + \sum_{i=1}^{n}\left(\frac{y_i-\epsilon}{\tau}\right)^2 - \ \omega\sum_{i=1}^{n}\frac{\emptyset\left(\omega\frac{y_i-\epsilon}{\tau}\right)}{\psi\left(\omega\frac{y_i-\epsilon}{\tau}\right)}\left(\frac{y_i-\epsilon}{\tau}\right) \qquad \ldots (5)$$

$$\frac{\partial lnL}{\partial \omega} = \ \sum_{i=1}^{n}\frac{\emptyset\left(\omega\frac{y_i-\epsilon}{\tau}\right)}{\psi\left(\omega\frac{y_i-\epsilon}{\tau}\right)}\left(\frac{y_i-\epsilon}{\tau}\right) \ = 0 \ldots (6)$$

Where $w(y_i) = \frac{\emptyset\left(\omega\frac{y_i-\epsilon}{\tau}\right)}{\psi\left(\omega\frac{y_i-\epsilon}{\tau}\right)}$ are nonlinear equations, and because of these equations are nonlinear, the calculation of parameters by the (ML) method is considered not has clear solutions in estimating a skew normal distribution [5].

4. Newton Raphson Algorithm (NR)

This method was introduced by Newton and Raphson in 1960, which is used to find a solution for nonlinear functions or equations that are difficult to solve using the traditional method. In our study, we aim to solve nonlinear greatest possibility equations (4-6) and get the best estimate of the distribution parameters based on elementary estimates. An iterative method is used to find the solution (NR) algorithm [8]. The mathematical form of the (NR) algorithm is written in the following rule

$$\hat{\theta}^{(p+1)} = \hat{\theta}^{(p)} - \left(W^{(p)}\right)^{-1} * \ T^{(P)} \ , \ \theta = \left(\epsilon\ , \tau\ , \omega\right) \qquad \ldots (7)$$

p The number of iterations (p = 1,2,3,...)
$\hat{\theta}^{(p)}$and $\hat{\theta}^{(p+1)}$ represent the estimation of the parameters of the maximum likelihood of iteration (p) and the subsequent iteration (p + 1), respectively.
$T^{(P)}$represents the vector of the first derivative of the logarithm of the likelihood

$$T = \frac{\partial LnL}{\partial \theta} = \left(\frac{\partial LnL}{\partial \epsilon} \quad \frac{\partial LnL}{\partial \tau} \quad \frac{\partial LnL}{\partial \omega}\right) \ \ldots (8)$$

$W^{(p)}$represents the second matrix of the logarithm of the likelihood

$$W = \frac{\partial\left(\frac{\partial LnL}{\partial \theta}\right)}{\partial \theta} = \frac{\partial^2 LnL}{\partial \theta \partial \theta} = \begin{bmatrix} \frac{\partial^2 LnL}{\partial \epsilon^2} & \frac{\partial^2 LnL}{\partial \epsilon \partial \tau} & \frac{\partial^2 LnL}{\partial \epsilon \partial \omega} \\ \frac{\partial^2 LnL}{\partial \epsilon \partial \tau} & \frac{\partial^2 LnL}{\partial \tau^2} & \frac{\partial^2 LnL}{\partial \tau \partial \omega} \\ \frac{\partial^2 LnL}{\partial \epsilon \partial \omega} & \frac{\partial^2 LnL}{\partial \tau \partial \omega} & \frac{\partial^2 LnL}{\partial \omega^2} \end{bmatrix} \quad \ldots (9)$$

5. Nelder Mead Algorithm (NM)

It is a numerical algorithm in which geometric relations are used to reach the best minimum of the objective function, and it was formulated by researchers Nelder and Mead in 1965. In previous years, it was used in many practical applications and research for its effectiveness in finding results, its simplicity, as well as its use without needing to derive the function and in many mathematical problems similar to its ability to find solutions when faced nonlinear functions [4].

The basis of the work of the (NM) algorithm is the initial Simplex configuration, since its working mechanism depends on the order of Simplex points ($\lambda_1 \ , \ \lambda_2 , \ . \ . \ . \ , \ \lambda_{n+1}$) in ascending order, and substituting the points in the objective function.The objective function is written as follows [7]:

$$R(\lambda) = -ln\, L(\lambda) \qquad , \ \lambda = (\epsilon\ , \tau\ , \omega) \ldots (10)$$
$$R(\lambda_1) < R(\lambda_2) < \ . \ . \ . \ < R(\lambda_{n+1}) \qquad \ldots (11)$$

Where λ_1 and $R(\lambda_1)$ refer to the best point and the best value of a objective function while λ_{n+1} and $R(\lambda_{n+1})$ refer to the worst point and worst value of the objective function. These points go through a set of processes iteratively (reflection, expansion, contraction and shrink) [7], and in these operations the worst point is replaced by a new point that is better than the previous one, and the process repeated to obtain the best minimum of the objective function that represents the best solution .

6. Iterative Re-Weighting Algorithm (IR)

It is one of the types of function maximization algorithms, and it is used in many previous studies in calculating the capabilities of the maximum potential parameters of the (SND). At the beginning of the work of the algorithm, initial values of the parameters are selected and the nonlinear weight function is updated$W_i^{(p)} = \frac{\emptyset(\omega t_i^{(p)})}{\psi(\omega t_i^{(p)})}$,Where $t_i = \frac{y_i - \epsilon^{(p)}}{\tau^{(p)}}$[5].

Parameter estimates of the SND algorithm are calculated by the following laws [8]:

$$\epsilon^{(P+1)} = \bar{y} - \omega^{(p)}\overline{W}^{(p)}\tau^{(p)} \quad \ldots (12)$$

$$\tau^{(p+1)} = \frac{-\omega^{(p)}(\sum_{i=1}^{n} W_i^{(p)} y_i - n\overline{W}^{(p)}\bar{y}) + \sqrt{(\omega^{(p)}(\sum_{i=1}^{n} W_i^{(p)} y_i - n\overline{W}^{(p)}\bar{y})^2 + 4n\sum_{i=1}^{n}(y_i - \bar{y})^2}}{2n} \quad \ldots (13)$$

$$\omega^{(P+1)} = \frac{\bar{y} - \epsilon^{(P)}}{\tau^{(p)}\overline{W}^{(p)}} \quad \ldots (14)$$

where $\overline{W}$and $\bar{y}$are the mean values of theW and y , respectively.

7. Genetic Algorithm (GA)

It is a randomized research technique based on the mechanism of natural selection and genetics to find the best solution to the problem under study. It was invented and developed by John Holland in 1975. The GA algorithm begins with a randomly selected population of possible solutions and ends with the optimal solution. When applying the algorithm to a problem [1], an appropriate coding method for chromosomes must be determined and the fitness function must be determined.

The genetic algorithm goes through several stages and steps to reach the optimal solution, which will be mentioned as follows [6]:

1- Initialization: It is the process of generating many primary solutions (chromosomes) in a random manner.
2- Fitness function: evaluating the population under study by calculating the value of each chromosome with the evaluation function and the resulting value expresses the efficiency of the chromosome.
3- Selection: choosing the best chromosomes for the formation of the fathers in future generations, based on the evaluation function.
4- Crossover: the mating process that occurs between each parental chromosome that was selected in the selection process to produce offspring.
5- Mutation: random changes in the genes of a chromosome through a change in one or more genes in the son chromosome.
6- Stopping and Termination Criterion: (GA) continues to find the generations sequentially to find the best solution, and (GA) tests whether or not the stopping condition exists according to the nature of the problem studied.

8. Simulation

It is one of the important methods to study many of the approved problems that are difficult for the applied field in the absence of data or difficulty in obtaining [7]. The Monte Carlo simulation method was used to generate random data distributed in (SSND). The genetic algorithm (GA) and iterative algorithms (NR, NM and IR) were used in calculating the capabilities of (ML) parameters and discussing the preference of methods in estimating the model and comparing them.

To observe the effect of the skewness parameter (ω), different values of the parameter (ω = 0, 0.5, 1.5, 2, 3, 4) were taken with different sample sizes (n = 20, 50, 100, 200, 500), noting that when the parameter value is The warp is equal to zero, the shape of the distribution is symmetrical, and when it increases, the warp increases.

The results were compared by extracting the statistical parameters, the mean, the mean square of error (Mse), and the sum of the mean squares of error for the parameters (Def). The smaller the value of (Mse and Def) is better. We note from the simulation results:

1- In Table (1), when ($\epsilon = 0, \tau = 1, \omega = 0$), we find that the mean squares of error (Mse) for the parameter (ϵ) that using the sample size (n = 20, 100, 200), the genomic algorithm (GA) gives less (MSE) then followed by the algorithm (NM) for volumes (n = 50, 500). As for the parameter (τ), (GA) products appear to be the best in small and medium samples and the (IR) algorithm is best in large samples. The superiority of (IR) was observed by estimating the skewness parameter (ω) in all of the samples used.

The results of (Def) for the skew normal distribution model for small and medium samples (n = 20, 50, 100) show that (GA) is better because it has the lowest value for the (Def) criterion. Whereas in large samples (n = 200, 500) the (IR) algorithm was the best because it was the lowest (Def) value.

3- In Table (3), when (ϵ= 0, τ = 1, ω = 1.5), results of (Mse) appear for the parameter (ϵ) when using the sample sizes (n = 20, 100, 200) given (GA) The lowest value and the better (NM) algorithm for samples (n = 50, 500). In parameter (τ), the (GA) algorithm outperformed all other methods. While the (IR) algorithm got the least (Mse) in large sample size, and the (NR) algorithm in large samples in the calculation of parameter estimation (ω).

As can be seen, (GA) is superior in small and medium samples of the sum of the mean square error (Def) of the distribution parameters, and the (IR) algorithm is the best when using large samples.

5- In Table (5), when (ϵ = 0, τ = 1, ω = 5) the results of (Mse) appear for the parameter (ϵ) that the algorithm (GA) and (NM) are the best, and it was noticed that in the parameter (τ) the (GA) was the best in medium sample and the (IR) algorithm was best in large samples for the parameter (τ), also in calculating the shape parameter estimator (ω) in small and medium samples, and the (NR) algorithm was the best in large samples.

As usual, (GA) was the best at sample size (n = 20,50,100) to estimate all model parameters because it gave less (Def) and (IR) was the best in large samples.

9. Conclusions

The ML results of the (SND) parameters were improved by employing the genetic algorithm (GA) and iterative methods (NR, NM and IR) by extracting the results from the simulation experiment and then analysing the results so, the following conclusions were reached:

1- The results of the genetic algorithm (GA) in estimating the model is superior to the skew normal distribution (SND) at the sample sizes (n = 20, 50, 100) because it has the lowest (Def) value among the methods used regardless of the skewness value.
2- The results of the iterative re-weighting algorithm (IR) of the model were superior to the sample sizes (n = 200, 500) for having the lowest value of the (Def) criterion among the methods used.
3- We note that the (GA) genetic algorithm was the best in most cases when calculating the estimation of the location parameter (ϵ) at the sample size (n = 20, 100, 200) and the (NR) algorithm was better when the sample size (n = 20, 100, 200) and The (IR) algorithm has a clear advantage when the torsion size is very slight.
4- We found that when calculating the estimator of the measurement parameter (τ), it exceeds (GA) at sample sizes (n = 20, 50, 100), and the higher the sample size, the better the (IR) algorithm because it has less (Mse).
5- When calculating the estimator of the shape parameter (ω), we concluded that at small and medium sample sizes (n = 20, 50, 100) the (IR) algorithm was the best, but for large sample sizes the (NR) algorithm was better in calculating the capabilities of the parameter (ω).

E-mail: tahini.qader@gmail.com

Abstract. This paper is approving the simultaneous approximation order by a modification family of the classical sequence of Szãsz operators. This modification depends on a real parameter $s > -1/2$. First, we show that this family (or its derivatives) converges to the function (or the corresponding derivatives) being approximated. Next, a Voronovski-type asymptotic formula for this family is given. The order of this approximation is improved from the order $O(n^{-1})$ (the order of the classical sequence) to the order $O\left(n^{-(2s+1)}\right)$ whenever $s > 0$. Finally, the study supports by some numerical examples and discusses the results obtained.

1. Introduction

In [2] Bernstein defined a sequence of positive linear operators as:

$$B_n(f;x) = \sum_{k=0}^{n} \binom{n}{k} x^k (1-x)^{n-k} f\left(\frac{k}{n}\right), \qquad x \in [0,\infty) \tag{1.1}$$

where $f \in C[0,1]$.

In [9] Szãsz generalized the Bernstein sequence to the unbounded interval $[0,\infty)$ as

$$S_n(f(t);x) = \sum_{k=0}^{\infty} q_{n,k}(x)\, f\left(\frac{k}{n}\right), \tag{1.2}$$

where $q_{n,k}(x) = \frac{(nx)^k}{k!e^{nx}}$, $x \in [0,\infty)$ and $f \in C_\alpha[0,\infty) = \{f \in C[0,\infty): |f(t)| \le Ae^{\alpha t} \text{ for some } A, \alpha > 0\}$.

The sequence $S_n(f(t);x)$ is said to be the classical Szãsz sequence.

Several modifications of the Szãsz sequence were constructed and studied. All of them have the same order $O(n^{-1})$, here we refer to [1], [7], [10] and [11].

Some techniques got a better approximation order by the sequences of positive linear operators introduced and studied [6] and [3].

In [8], Pallini modified the Bernstein sequence by using the parameter s, where $s > -1/2$, as follows

$$B_{n,s}(f;x)=\sum_{k=0}^{n}\binom{n}{k}x^k(1-x)^{n-k}f\left(x+\frac{1}{n^s}\left(\frac{k}{n}-x\right)\right),x\in[0,\infty). \tag{1.3}$$

Clearly, $B_{n,0}(f;x)=B_n(f;x)$. Pallini showed that the order of this approximation is $O\left(n^{-(2s+1)}\right)$ and this order is better than the classical order $O(n^{-1})$ whenever $s>0$.
This paper using the same structure as Pallini and introduce a modification family of the classical Szãsz sequence as follows:
Suppose that $f\in C_\alpha[0,\infty)$, the definition of the modification is given as

$$M_{n,s}(f(t);x)=\sum_{k=0}^{\infty}q_{n,k}(x)\,f\left(x+\frac{1}{n^s}\left(\frac{k}{n}-x\right)\right). \tag{1.4}$$

Clearly, $M_{n,0}(f;x)=S_n(f;x)$.

The convergence theorem of the sequence $M_{n,s}(f(t);x)$ in the simultaneous approximation is studied and the Voronovski-type asymptotic formula for $M_{n,s}(f(t);x)$ is introduced. It turns out that the sequence $M_{n,s}(f;x)$ has a better order $(O\left(n^{-(2s+1)}\right))$ than the order $O(n^{-1})$ of the classical sequence $S_n(f;x)$ whenever $s>0$. This study supported with a numerical example to show the better approximation by this sequence to a chosen test function $f(x)=\sin(7x)$, $x\in[0,5]$ and discuss the results obtained.■

2. Auxiliary Results

Here, some help preliminaries results are introduced to reach the goal of this paper.
This section will introduce some necessary lemmas, where we will need to prove our main results.

Lemma 2.1 [10]
For $x\in[0,\infty),m\in\mathbb{N}$, we have:
(1) $\sum_{k=0}^{\infty}q_{n,k}(x)=1;$
(2) $\sum_{k=0}^{\infty}kq_{n,k}(x)=nx;$
(3) $\sum_{k=0}^{\infty}k^2q_{n,k}(x)=n^2x^2+nx;$
(4) $xq'_{n,k}(x)=(k-nx)q_{n,k}(x);$
(5) Suppose that $\Phi_{n,m}(x)=\sum_{k=0}^{\infty}k^mq_{n,k}(x)$ then $\Phi_{n,m+1}(x)=x\Phi'_{n,m}(x)+nx\Phi_{n,m}(x)$ and

$$\Phi_{n,m}(x)=(nx)^m+\frac{m(m-1)}{2}(nx)^{m-1}+\text{terms in lower powers of }x.$$

Lemma 2.2
For $x\in[0,\infty)$, the following conditions hold:
(1) $M_{n,s}(1;x)=1;$
(2) $M_{n,s}(t;x)=x;$
(3) $M_{n,s}(t^2;x)=x^2+\frac{x}{n^{2s+1}}.$

Proof
By using Lemma 2.1 and the direct computation, the proof easily follows.
Note that by Korovkin's theorem, one has $M_{n,s}(f;x)\to f(x)$ as $n\to\infty$. (see [5])

For $m \in \mathbb{N}$, the m-th order moment $\mu_{n,m}(x)$ of the classical Szãsz sequence $S_n(.;x)$ is defined as:

$$\mu_{n,m}(x) = S_n((t-x)^m;x) = \sum_{k=0}^{\infty} q_{n,k}(x)\left(\frac{k}{n}-x\right)^m.$$

Lemma 2.3 [9]
The moment $\mu_{n,m}(x)$ has the following
$\mu_{n,0}(x) = 1, \mu_{n,1}(x) = 0, \mu_{n,2}(x) = \frac{x}{n}$ and $n\mu_{n,m+1}(x) = x\mu'_{n,m}(x) + mx\mu_{n,m-1}(x), m \geq 1.$
Further,

(1) $\mu_{n,m}(x)$ is a polynomial in x of degree $\leq m$.
(2) For every $x \in [0,\infty), \mu_{n,m}(x) = O\left(n^{-\left[\frac{m+1}{2}\right]}\right)$.

For $m \in \mathbb{N}$, the m-th order moment $T_{n,m}(x)$ of $M_{n,s}(.;x)$ is defined as:

$$T_{n,m}(x) = M_{n,s}((t-x)^m;x) = \frac{1}{n^{sm}}\sum_{k=0}^{\infty} q_{n,k}(x)\left(\frac{k}{n}-x\right)^m.$$

Lemma 2.4
The moment $T_{n,m}(x)$ has
$T_{n,0}(x) = 1, T_{n,1}(x) = 0, T_{n,2}(x) = \frac{x}{n^{2s+1}}$ and $n^{s+1}T_{n,m+1}(x) = xT'_{n,m}(x) + \frac{mx}{n^s}T_{n,m-1}(x)$, $m \geq 1$

Proof
From Lemma 2.1, we have

$$T'_{n,m}(x) = \frac{1}{n^{sm}}\sum_{k=0}^{\infty} q'_{n,m}(x)\left(\frac{k}{n}-x\right)^m - \frac{m}{n^s}T_{n,m-1}(x)$$

then,

$$x\left[T'_{n,m}(x) + \frac{m}{n^s}T_{n,m-1}(x)\right] = \frac{1}{n^{sm}}\sum_{k=0}^{\infty}(k-nx)q_{n,k}(x)\left(\frac{k}{n}-x\right)^m$$

hence,
$n^{s+1}T_{n,m+1}(x) = xT'_{n,m}(x) + \frac{mx}{n^s}T_{n,m-1}(x), m \geq 1.$

Lemma 2.5
For $m \geq 1$, we have:

$$M_{n,s}(t^m;x) = x^m + \frac{x^{m-1}}{n^{sm}}\left\{\sum_{i=2}^{m}\binom{m}{i}(n^s-1)^{m-i}\frac{i(i-1)}{2n}\right\}.$$

Proof
By using Lemma 2.1(5), we have

$$M_{n,s}(t^m;x) = \sum_{k=0}^{\infty} q_{n,k}(x)\left(x + \frac{\frac{k}{n}-x}{n^s}\right)^m$$
$$= \frac{1}{n^{sm}}\sum_{k=0}^{\infty} q_{n,k}(x)\left((n^s-1)x + \frac{k}{n}\right)^m$$

$$= \frac{1}{n^{sm}} \sum_{k=0}^{\infty} q_{n,k}(x) \left\{ (n^s-1)^m x^m + \binom{m}{1} (n^s-1)^{m-1} x^{m-1} \frac{k}{n} + \binom{m}{2} (n^s-1)^{m-2} x^{m-2} \frac{k^2}{n^2} + \cdots + \binom{m}{m-1} (n^s-1) x \frac{k^{m-1}}{n^{m-1}} + \frac{k^m}{n^m} \right\}$$

$$= \frac{1}{n^{sm}} \left\{ (n^s-1)^m x^m + \binom{m}{1} (n^s-1)^{m-1} x^{m-1} \frac{nx}{n} + \binom{m}{2} (n^s-1)^{m-2} x^{m-2} \frac{(nx)^2+nx}{n^2} + \cdots + \binom{m}{m-1} (n^s-1) x \left(\frac{(nx)^{m-1}}{n^{m-1}} + \frac{(m-1)(m-2)}{2n^{m-1}} (nx)^{m-2} \right) + \left(\frac{(nx)^m}{n^m} + \frac{m(m-1)}{2n^m} (nx)^{m-1} \right) \right\}$$

$$= \frac{x^m}{n^{sm}} \left\{ (n^s-1)^m + \binom{m}{1} (n^s-1)^{m-1} + \binom{m}{2} (n^s-1)^{m-2} + \cdots + \binom{m}{m-1} (n^s-1) + 1 \right\} + \frac{x^{m-1}}{n^{sm}} \left\{ \binom{m}{2} (n^s-1)^{m-2} \frac{1}{n} + \cdots + \binom{m}{m-1} (n^s-1) \frac{(m-1)(m-2)}{2n} + \frac{m(m-1)}{2n} \right\}$$

$$= x^m + \frac{x^{m-1}}{n^{sm}} \left\{ \sum_{i=2}^{m} \binom{m}{i} (n^s-1)^{m-i} \frac{i(i-1)}{2n} \right\}.$$

Lemma 2.6 [4]
There exist the polynomials $Q_{i,j,r}(x)$ independent of n and k such that

$$x^r q_{n,k}^{(r)} = \sum_{\substack{2i+j \le r \\ i,j \ge 0}} n^i (k-nx)^j Q_{i,j,r}(x) q_{n,k}(x)$$

3. Main results

This section introduces two theorems. The first theorem proves that the derivatives of $M_{n,s}(f;x)$ is an approximation for the corresponding derivative of f. The second theorem gives a Voronovski-type asymptotic formula for the sequence $M_{n,s}^{(r)}(f;x)$, $r = 0,1,2, \ldots$.

Theorem 3.1
Suppose that $r \in N, f \in C_\alpha[0,\infty)$for some $\alpha > 0$ and $f^{(r)}(x)$ exists a point $x \in (0,\infty)$, then
$\lim_{n\to\infty} M_{n,s}^{(r)}(f(t);x) = f^{(r)}(x)$

Proof
Using Taylor's expansion of f at x, we have

$$f(t) = \sum_{i=0}^{r} \frac{f^{(i)}(x)}{i!} (t-x)^i + \varepsilon(t,x)(t-x)^r$$

where $\varepsilon(t,x) \to 0$ as $t \to x$.
Then,

$$M_{n,s}^{(r)}(f(t);x) = \sum_{i=0}^{r} \frac{f^{(i)}(x)}{i!} M_{n,s}^{(r)}\left((t-x)^i;x\right) + M_{n,s}^{(r)}(\varepsilon(t,x)(t-x)^r;x) := E_1 + E_2.$$

From Lemmas 2.4 and 2.5

$$E_1 = \frac{f^{(r)}(x)}{r!}\sum_{j=0}^{r}\binom{r}{j}(-x)^{r-j}M_{n,s}^{(r)}(t^j;x)$$

$$= \frac{f^{(i)}(x)}{r!}\frac{d^r}{dx^r}\left[x^r + \frac{x^{m-1}}{n^{sm}}\left\{\sum_{i=2}^{m}\binom{m}{i}(n^s-1)^{m-i}\frac{i(i-1)}{2n}\right\}\right] = f^{(r)}(x).$$

Now, using Lemma 2.6, the estimate of E_2 is going as follows:

$$E_2 = M_{n,s}^{(r)}(\varepsilon(t,x)(t-x)^r;x)$$

$$= \sum_{k=0}^{\infty} q_{n,k}^{(r)}(x)\varepsilon\left(x + \frac{\left(\frac{k}{n}-x\right)}{n^s}, x\right)\left(\frac{\left(\frac{k}{n}-x\right)}{n^s}\right)^r$$

$$= \sum_{\substack{2i+j\le r\\ i,j\ge 0}} n^i \frac{Q_{i,j,r}(x)}{x^r}\sum_{k=0}^{\infty} q_{n,k}(x)(k-nx)^j \varepsilon\left(x + \frac{\left(\frac{k}{n}-x\right)}{n^s}, x\right)\frac{\left(\frac{k}{n}-x\right)^r}{n^{rs}}$$

$$|E_2| \le \sum_{\substack{2i+j\le r\\ i,j\ge 0}} \frac{n^{i+j}}{n^{rs}}\frac{|Q_{i,j,r}(x)|}{x^r}\sum_{k=0}^{\infty} q_{n,k}(x)\left|\frac{k}{n}-x\right|^{j+r}\left|\varepsilon\left(x + \frac{\left(\frac{k}{n}-x\right)}{n^s};x\right)\right|.$$

Let $\sup_{\substack{2i+j\le r\\ i,j\ge 0}} \frac{|Q_{i,j,r}(x)|}{x^r} = M(x) = M,$

$$|E_2| \le \frac{\varepsilon M}{n^{rs}}\sum_{\substack{2i+j\le r\\ i,j\ge 0}} n^{i+j}\sum_{k=0}^{\infty} q_{n,k}(x)\left|\frac{k}{n}-x\right|^{j+r}$$

Since $\varepsilon\left(x + \frac{\left(\frac{k}{n}-x\right)}{n^s};x\right) \to \varepsilon$ as $\frac{k}{n} \to x$. Now, using Schwarz inequality for summation and from Lemma 2.3, we get

$$|E_2| \le \frac{\varepsilon M}{n^{rs}}\sum_{\substack{2i+j\le r\\ i,j\ge 0}} n^{i+j}\left[\sum_{k=0}^{\infty} q_{n,k}(x)\left(\frac{k}{n}-x\right)^{2(j+r)}\right]^{\frac{1}{2}}\left[\sum_{k=0}^{\infty} q_{n,k}(x)\right]^{\frac{1}{2}}$$

$$|E_2| \le \frac{\varepsilon M}{n^{rs}}\sum_{\substack{2i+j\le r\\ i,j\ge 0}} n^{i+j}\, O\left(n^{\frac{-(j+r)}{2}}\right) = \frac{\varepsilon M}{n^{rs}}O(1) \to 0 \text{ as } n \to \infty.$$

Then

$$\lim_{n\to\infty} M_{n,s}^{(r)}(f(t);x) = f^{(r)}(x)$$

Theorem 3.2

Let $f \in C_\alpha[0,\infty)$ for some $\alpha > 0$. If $f^{(r+2)}$ exists and is continuous at a point $x \in (0,\infty)$, then

$$\lim_{n\to\infty} n^{2s+1}\left(M_{n,s}^{(r)}(f(t);x) - f^{(r)}(x)\right) = \frac{r}{2}f^{(r+1)}(x) + \frac{x}{2}f^{(r+2)}(x).$$

Proof

By Taylor's expansion of f, we have

$$f(t) = \sum_{i=0}^{r+2}\frac{f^{(i)}(x)}{i!}(t-x)^i + \varepsilon(t,x)(t-x)^{r+2},$$

where $\varepsilon(t,x) \to 0$ as $t \to x$.
Then

$$M_{n,s}^{(r)}(f(t);x) = \sum_{i=0}^{r+2} \frac{f^{(i)}(x)}{i!} M_{n,s}^{(r)}\left((t-x)^i;x\right) + M_{n,s}^{(r)}(\varepsilon(t,x)(t-x)^{r+2};x)$$
$$:= I_1 + I_2$$
$$I_1 = \sum_{i=0}^{r+2} \frac{f^{(i)}(x)}{i!} M_{n,s}^{(r)}\left((t-x)^i;x\right)$$
$$= \sum_{i=r}^{r+2} \frac{f^{(i)}(x)}{i!} \sum_{j=0}^{i} \binom{i}{j} (-x)^{i-j} M_{n,s}^{(r)}\left(t^j;x\right)$$
$$= \sum_{i=r}^{r+2} \frac{f^{(i)}(x)}{i!} \sum_{j=r}^{i} \binom{i}{j} (-x)^{i-j} M_{n,s}^{(r)}\left(t^j;x\right)$$
$$= \frac{f^{(r)}(x)}{r!}[r!] + \frac{f^{(r+1)}(x)}{(r+1)!}\Bigg[(r+1)(-x)r! + (r+1)!\,x + \frac{r!}{2n^{s(r+1)+1}} \sum_{i=2}^{r+1} \binom{r+1}{i} (n^s-1)^{r+1-i} i(i-1)\Bigg]$$
$$+ \frac{f^{(r+2)}(x)}{(r+2)!}\Bigg[\frac{(r+2)(r+1)}{2}(-x)^2 r! + (r+2)(-x)\left\{(r+1)!\,x + \frac{r!}{2n^{s(r+1)+1}} \sum_{i=2}^{r+1} \binom{r+1}{i} (n^s-1)^{r+1-i} i(i-1)\right\}$$
$$+ \frac{(r+2)!}{2}x^2 + \frac{(r+1)!\,x}{2n^{s(r+2)+1}} \sum_{i=2}^{r+2} \binom{r+2}{i} (n^s-1)^{r+2-i} i(i-1)\Bigg]$$
$$= f^{(r)}(x) + \frac{f^{(r+1)}(x)}{2n^{s(r+1)+1}} \sum_{i=2}^{r+1} \binom{r+1}{i} (n^s-1)^{r+1-i} i(i-1)$$
$$+ \frac{f^{(r+2)}(x)}{2}\Bigg[\frac{-x}{n^{s(r+1)+1}(r+1)} \sum_{i=2}^{r+1} \binom{r+1}{i} (n^s-1)^{r+1-i} i(i-1) + \frac{x}{n^{s(r+2)+1}(r+2)} \sum_{i=2}^{r+2} \binom{r+2}{i} (n^s-1)^{r+2-i} i(i-1)\Bigg]$$
$$n^{2s+1}\left(M_{n,s}^{(r)}(f(t);x) - f^{(r)}(x)\right)$$
$$= \frac{n^{2s+1} f^{(r+1)}(x)}{2(r+1)n^{s(r+1)+1}}\left[r(r+1)(n^s-1)^{r-1} + \sum_{i=3}^{r+1} \binom{r+1}{i} (n^s-1)^{r+1-i} i(i-1)\right] + \frac{n^{2s+1} f^{(r+2)}(x)}{2}$$

By using the same technique of Theorem 3.1, we get
$I_2 \to 0 \quad as \quad n \to \infty$.
Then

$$\lim_{n\to\infty} n^{2s+1}\left(M_{n,s}^{(r)}(f(t);x) - f^{(r)}(x)\right) = \frac{r}{2}f^{(r+1)}(x) + \frac{x}{2}f^{(r+2)}(x).$$

4. Numerical example

This part shows that, by a numerical example, the approximation by the sequence $M_{n,s}(f;x)$ is better than the approximation by the classical sequence $S_n(f;x)$ whenever $s > 0$. The choice test function here is $f(x) = \sin(7x), x \in [0,5]$.

Example

We apply the sequence $M_{n,s}(f(t);x)$ for $n = 10,20,30,40$ and $s = 0,1,1.5,2$ to approximate the function $f(x) = \sin(7x), x \in [0,5]$. We describe the cases by graphing the test function and its approximations as follows

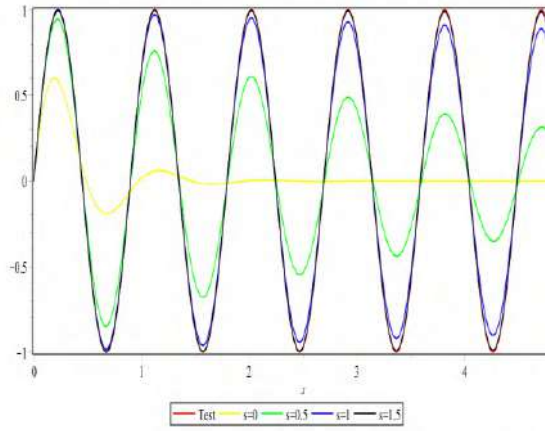

Fig. 4.1 (n=10)

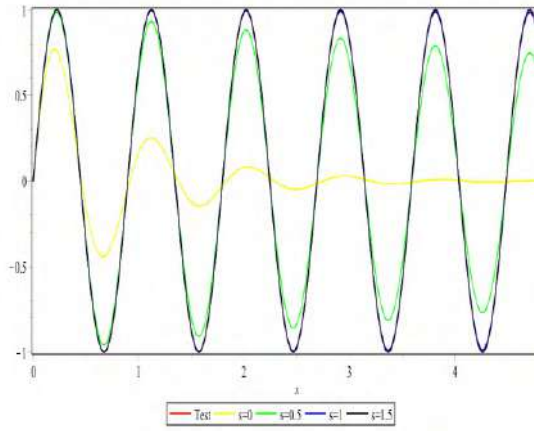

Fig. 4.2 (n=20)

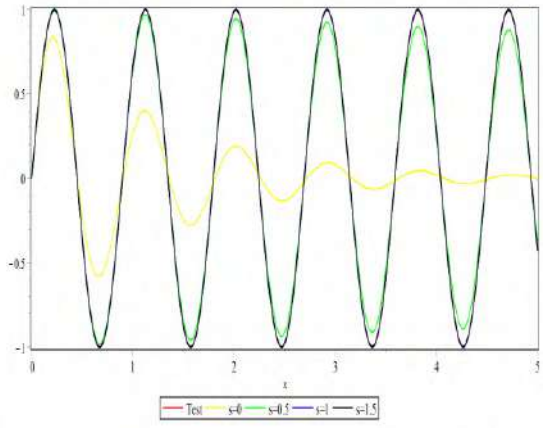

Fig. 4.3 (n=30)

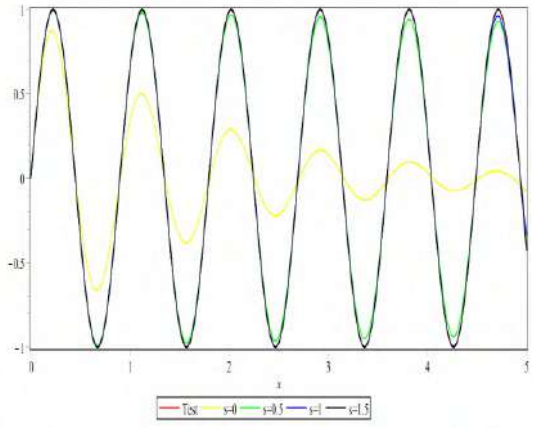

Fig. 4.4 (n=40)

5. Conclusion

From the above numerical example for the sequence $M_{n,s}(f;x)$, one has that, the numerical results are faster and more accurate than the sequence $S_n(f(t);x)$, whenever $s > 0$. Also, these properties are increasing whenever $s > 0$.

On Prime and Semiprime Gamma Rings with Symmetric Gamma n-Centralizers

On Prime and Semiprime Gamma Rings with Symmetric Gamma n-Centralizers

Ikram A. Saed

Department of Applied Sciences, University of Technology, Baghdad, Iraq

Email: ikramsaed1962@gmail.com

Abstract. In this paper, we assume that M is Γ-ring then we will present the definition of symmetric Γ-n-centralizers and the definition of Jordan Γ-n-centralizers of M . After that, we try to find the commutativity of a prime Γ- ring that has a left Γ-n-centralizers of M when it satisfies certain identities. Finally, we find the relationship between Jordan Γ-n-centralizers and symmetric Γ-n-centralizers when M is semiprime Γ- ring.

1. Introduction

Let M be the Γ-ring. Saed found the commutativity of adding prime near-rings in 2018 in [1] that satisfied certain identities and including right (θ, θ)-3-derivations. Saed discovered the commutativity of adding and multiplying prime near-rings in 2018 in [2] that satisfied some identifications with right (θ, θ)-4-derivations. In addition, Saed in 2018 showed that in [3] prime near-ring N that satisfied certain identities usually contains left generalized (θ, θ)-4- derivations and semigroup ideals is commutative ring. In 2019 Saed in [4] introduce the notion of perpendicular generalized 3- derivations in semiprime Γ-near-rings and present several necessary and sufficient conditions for generalized 3-derivations on semiprime Γ-near-rings to be perpendicular. Finally, Saed in 2020 in [5] studied commutativity of prime near-ring N under some conditions on semigroup ideals of N.

There are three sections in this article. We mentioned some known definitions and essential lemmas in section one. In section two, we introduce the definition of symmetric Γ-n-centralizers of M and study the commutativity of prime Γ- ring by using the notion of left Γ-n-centralizers. In section three, we define the notion of Jordan Γ-n- centralizers to prove that every Jordan Γ-n- centralizers of the semiprime Γ- ring M of char (M) ≠2 is symmetric Γ-n-centralizers.

2. Basic Concept

Definition 2.1: [4]

Assume M and Γ be additive abelian groups. If there exists a mapping M x Γ x M → M :(a , α , b) → a α b which satisfies the conditions :

for every a ,b ,c ∈ M , α , β ∈ Γ :

(i) (a +b) α c=a αc + b α c

a(α+ β)b = a αb + aβb

a α (b+c) = a αb + a αc

(ii) (a αb) β c=a α (b βc)

Where M refers to as a Γ-ring.

Example 2.2: [4]
Let R be a ring, the additive abelian groups $M = M_{2x3}(R)$ and $\Gamma = M_{3x2}(R)$ denotes the sets of all 2×3 matrices over R and 3×2 matrices over R respectively. Then M is Γ-ring.

Definition 2.3: [6]
A right (resp. left) ideal of a Γ-ring M is an additive subgroup U of M such that $U\Gamma M \subset U$ (resp. $M \Gamma U \subset U$) . If U is both right and left ideal, then it said that U is an ideal.

Definition 2.4: [6]
Let M be a Γ-ring. The set $Z(M) = \{ x \in M : x\gamma y = y\gamma x$, for all $y \in M$ and $\gamma \in \Gamma\}$ is called the center of the Γ- ring M.

Definition 2.5: [6]
A Γ-ring M is called a prime if $a \Gamma M \Gamma b = \{0\}$ implies that either $a = 0$ or $b = 0$, for $a , b \in M$.

Definition 2.6: [6]
A Γ-ring M is called semiprime if $a \Gamma M \Gamma a = \{0\}$ implies that $a=0$, for $a \in M$.

Definition 2.7: [6]
A Γ-ring M is called 2-torsion-free if $2a=0$ implies $a=0$, for $a \in M$.

Definition 2.8: [6]
A Γ-ring M is called a commutative if $a\gamma b = b\gamma a$, for all $a, b \in M$ and $\gamma \in \Gamma$.

Definition 2.9: [7]
Let M be a Γ-ring. If a positive integer n exists, such that $na = 0$, for all $a \in M$, then the smallest positive integer with this property is called the Γ-ring characteristic and it is denoted by char(M).

Definition 2.10: [6]
Let M be a Γ-ring. Then, for any $x , y \in M$ and $\alpha \in \Gamma$, the symbol $[x,y]_\alpha = x \alpha y – y \alpha x$, will denote the commutator and symbol $(x \circ y)_\alpha = x \alpha y + y \alpha x$ will denote the additive group commutator.

Lemma 2.11: [7]
If M is a Γ-ring , for all $a ,b, c \in M$ and $\alpha, \beta \in \Gamma$ then :

(i) $[a, b]_\alpha+[b, a]_\alpha=0$
(ii) $[a + b, c]_\alpha=[a , c]_\alpha+[b, c]_\alpha$
(iii) $[a , b + c]_\alpha= [a , b]_\alpha+ [a, c]_\alpha$
(iv) $[a , b]_{\alpha+\beta} =[a, b]_\alpha+[a, b]_\beta$
(v) $[a \beta b, c]_\alpha=a \beta[b, c]_\alpha+[a, c]_\alpha \beta b+a \beta c \alpha b- a \alpha c \beta b.$

Remark 2.12: [7]
A Γ-ring M is commutative if and only if $[x , y]_\alpha=0$, for all $x , y \in M$ and $\alpha \in \Gamma$.

3.On Symmetric Left Γ-n-Centralizer and Commutatively of Prime Γ-Ring.
First, in this section, we present the fundamental definition.

Definition 3.1:

Let M be the Γ-ring and n be the positive integer. If the following equations hold for all $y, r_1, r_2 \ldots r_n \in M$ and $\gamma \in \Gamma$, the n-additive mapping $T: MxMx \ldots xM \to M$ shows to be left as a Γ-n-centralizer.

$T_1(r_1\gamma\, y, r_2, \ldots, r_n) = T_1(r_1, r_2, \ldots, r_n)\, \gamma\, y$
$T_2(r_1, r_2\, \gamma\, y, \ldots, r_n) = T_2(r_1, r_2, \ldots, r_n)\, \gamma\, y$
$\vdots$
$T_n(r_1, r_2, \ldots, r_n\, \gamma\, y) = T_n(r_1, r_2, \ldots, r_n)\, \gamma\, y$

T has said to be a symmetric left Γ-n-centralizer if all the above equations are equivalent to all other. That is:

$T(r_1\gamma\, y, r_2, \ldots, r_n) = T(r_1, r_2, \ldots, r_n)\, \gamma\, y$ for all $y, r_1, r_2 \ldots, r_n \in M$ and $\gamma \in \Gamma$.

Theorem3.2:

Let M be a prime Γ-ring, and I be a non-zero ideal of M. Assume that M admits a nonzero left Γ-n-centralizer, such that $T(r, r_2, \ldots, r_n) = r$. If $T([r, y]_\gamma, r_2, \ldots, r_n) - [r, y]_\gamma = 0$, for all $r_2, \ldots, r_n \in M$ and $r, y \in I$, $\gamma \in \Gamma$, then M is a commutative.

Proof:

Since $(T(r, r_2, \ldots, r_n) - r)\gamma y - (T(y, r_2, \ldots, r_n) - y)\, \gamma\, r = 0$ (3.1)

Putting $r = r\beta h$, where $h \in M$, $\beta \in \Gamma$ in (3.1), we get:

$(T(r, r_2, \ldots, r_n) - r)\beta\, h\gamma\, y - (T(y, r_2, \ldots, r_n) - y)\, \gamma\, r\, \beta\, h = 0$ (3.2)

Multiply (3.1) from the right by βh:

$(T(r, r_2, \ldots, r_n) - r)\, \gamma\, y\, \beta\, h - (T(y, r_2, \ldots, r_n) - y)\, \gamma\, r\, \beta\, h = 0$ (3.3)

Comparing (3.2) and (3.3):

$(T(r, r_2 \ldots r_n) - r)\, \beta(h\, \gamma\, y - y\, \gamma h) = (T(r, r_2 \ldots r_n) - r)\beta[h, y]_\gamma = 0$ (3.4)

Replacing h by $h\, \mu\, s$ in (3.4) and using it, where $s \in M$ and $\mu \in \Gamma$.

$(T(r, r_2, \ldots, r_n) - r)\, \beta h\, \mu[s, y]_\gamma = 0$

Therefore, M is a prime Γ-ring, then either:

$(T(r, r_2, \ldots, r_n) - r) = 0$ or $[s, y]_\gamma = 0$

For $r, y \in I$ and $r_2 \ldots r_n, h, s \in M$ and $\gamma \in \Gamma$.

Implies that $[s, y]_\gamma = 0$ and $I \subseteq Z(M)$.

We have, M is a commutative.

Theorem 3.3:

Suppose M be a prime Γ-ring and I be a non-zero ideal of M, assume that T be a nonzero left Γ-n-centralizer like that $T(r, r_2, \ldots, r_n) \neq -r$. If $T([r, y]_\gamma, r_2, \ldots, r_n) + [r, y]_\gamma = 0$, for all $r_2, \ldots, r_n \in M$ and $r, y \in I$, $\gamma \in \Gamma$, then M is a commutative.

Proof:

Since $(T(r, r_2, \ldots, r_n) + r)\, \gamma\, y - (T(y, r_2, \ldots, r_n) + y)\, \gamma\, r = 0$ (3.5)

Putting $r = r\beta h$, where $h \in M$, $\beta \in \Gamma$ in (3.5) we get:

$(T(r, r_2, \ldots, r_n) + r)\, \beta\, h\, \gamma\, y - (T(y, r_2, \ldots, r_n) + y)\, \gamma\, r\, \beta\, h = 0$ (3.6)

Multiply (3.5) from the right by βh:

$(T(r, r_2, \ldots, r_n) + r)\, \gamma\, y\, \beta\, h - (T(y, r_2, \ldots, r_n) + y)\, \gamma\, r\, \beta\, h = 0$ (3.7)

Comparing (3.6) and (3.7):

$(T(r, r_2, \ldots, r_n) + r)\, \beta(h\gamma\, y - y\, \gamma h) = (T(r, r_2, \ldots, r_n) + r)\, \beta[h, y]_\gamma = 0$ (3.8)

Replacing h by $h\, \mu\, s$ in (3.8) and using it, where $s \in M$ and $\mu \in \Gamma$.

$(T(r, r_2, \ldots, r_n) + r)\, \beta h\, \mu[s, y]_\gamma = 0$

Therefore, M is a prime Γ-ring, then either:

$(T(r, r_2, \ldots, r_n) + r) = 0$ or $[s, y]_\gamma = 0$

For $r , y \in I$ and $r_2,\ldots,r_n , h , s \in M$ and $\gamma \in \Gamma$. Implies that $[s , y]_\gamma = 0$ and $I \subseteq Z(M)$. We get is a commutative.

Theorem 3.4:
Suppose M be a main (prime) Γ-ring and I be a non-zero ideal of M , assume that T be a nonzero left Γ-n-centralizer like that $T(r , r_2 , \ldots,r_n) \neq -r$. If $T((r \circ y)_\gamma , r_2 , \ldots,r_n) + (r \circ y)_\gamma = 0$, for all $r_2 ,\ldots, r_n , r , y \in I$ and $\gamma \in \Gamma$, then M is a commutative.

Proof:
$T ((r \circ y)_\gamma , r_2, \ldots,r_n) + (r \circ y)_\gamma = 0$,for all $r_2 ,\ldots, r_n , r , y \in I$ and $\gamma \in \Gamma$ (3.9)
If $T ((r \circ y)_\gamma , r_2 , \ldots,r_n) \neq 0$ we have $(r \circ y)_\gamma = 0$ (3.10)
Substituting $r = r \beta h$ in (3.10) , where $h \in M$, $\beta \in \Gamma$ to get :
$r \beta h \gamma y + y \gamma r \beta h = 0$, $y \gamma r = - r \gamma y$. We get $r\beta[h , y]_\gamma = 0$ (3.11)
Replacing r by $r \mu s$ in (3.11) and using it , where $s \in M$ and $\mu \in \Gamma$. $r\mu s\beta[h , y]_\gamma = 0$, for all y, $r, h \in I$ and $\gamma, \mu, \beta \in \Gamma$.
So M is a main(prime) Γ-ring , then $I\mu M\beta[h , y]_\gamma = \{0\}$. Therefor M is a main (prime) Γ-ring and $I \neq \{0\}$, so that :
$[h , y]_\gamma = 0$, for all h, $y \in M$ and $\gamma \in \Gamma$. Thus, I is commutative and hence M is a commutative.

Theorem 3.5:
Let M be a prime Γ-ring and I be a non-zero ideal of M. Let T be a nonzero left Γ-n-centralizer . If $T(r^2,r_2 ,\ldots,r_n) = - r^2$, for all $r_2 ,\ldots,r_n , r \in I$, then M is a commutative.

Proof:
Since $T (r^2, r_2,\ldots,r_n) = - r^2$, for all $r_2 ,\ldots, r_n , r \in I$, we have :
$T ((r + y)^2, r_2, \ldots,r_n) = -(r + y)^2$, which implies that :
$T((r \circ y)_\gamma , r_2 , \ldots,r_n) = (r \circ y)_\gamma$, by Theorem 3.4 , so M is a commutative.

Theorem 3.6:
Let M be a prime Γ-ring and I be a non-zero ideal of M. Let T be a nonzero left Γ-n-centralizer thus that $T(r , r_2 , \ldots,r_n) \neq r$. If $T(r \gamma y, r_2, \ldots,r_n) - r \gamma y \in Z(M)$, for all $r_2 ,\ldots, r_n \in M$ and $r, y \in I , \gamma \in \Gamma$, then M is a commutative.

Proof:
$(T(r, r_2, \ldots,r_n) - r)\gamma y \in Z(M)$ (3.12)
Substituting $r = r \beta h$ in (3.12) , where $h \in M , \beta \in \Gamma$ to get :
$(T(r,r_2,\ldots,r_n) - r) \beta h \gamma y \in Z(M)$
for all h, $r_2,\ldots, r_n \in M$ and $r, y \in I , \gamma , \beta \in \Gamma$. (3.13)
Multiply (3.12) from the right by βh
$(T(r, r_2, \ldots,r_n) - r) \gamma y \beta h \in Z(M)$
for all h, $r_2 ,\ldots, r_n \in M$ and $r, y \in I , \gamma , \beta \in \Gamma$. (3.14)
Comparing (3.13) and (3.14) to get:
$[T(r , r_2, \ldots , r_n) - r) \gamma y , h]_\beta = 0$
For all h, $r_2,\ldots, r_n \in M$ and $r, y \in I , \gamma , \beta \in \Gamma$. (3.15)
$(T(r , r_2, \ldots , r_n) - r)\gamma[y, h]_\beta + [T(r , r_2, \ldots , r_n) - r) , h]_\beta \gamma y = 0$ (3.16)
Replacing r by $r \mu s$ in (3.16) and using it, where $s \in M$ and $\mu \in \Gamma$.
$(T(r , r_2, \ldots , r_n) - r)\mu s\gamma[y, h]_\beta + [T(r, r_2, \ldots , r_n) - r) \mu s, h]_\beta \gamma y = 0$ (3.17)
Comparing (3.16) and (3.17) to get:
$(T(r, r_2, \ldots , r_n) - r)\mu s\gamma[y, h]_\beta = 0$, for all $h,r_2,\ldots, r_n \in M$ and $r, y \in I, \gamma, \beta, \mu \in \Gamma$.

Primness of T implies that $(T(r, r_2, \dots, r_n) - r)\mu\, T\gamma[y, h]_\beta = \{0\}$. Either $(T(r, r_2, \dots, r_n) - r) = 0$ or $[y, h]_\beta = 0$. Since $I \neq \{0\}$ and $T(r, r_2, \dots, r_n) \neq r$, we discover that I is necessary and therefore M is a commutative.

4. Symmetric Jordan Γ-n-Centralizer of Semiprime Γ-Ring.

First, we offer the basic definition in this section.

Definition 4.1:

Let M be a Γ-ring and n be a fixed positive integer. An n-additive symmetric mapping T: MxMx…xM →M is said to be Jordan left (resp. right) Γ-n-centralizer in case :

$T(r_1^2, r_2, \dots, r_n) = T(r_1, r_2, \dots, r_n)\gamma r_1$ (resp. $T(r_1^2, r_2, \dots, r_n) = r_1\gamma T(r_1, r_2, \dots, r_n)$)

Hold for $r_1, r_2, \dots, r_n \in M$ and $\gamma \in \Gamma$.

T is called Jordan Γ-n-centralizer if T Jordan left and Jordan right Γ-n-centralizer.

Lemma 4.2:

Assume M be a semiprime Γ-ring and $a \in M$. If $T(r, r_2, \dots, r_n) = (a \circ r)_\gamma$ is a Jordan Γ-n-centralizer, for $r, r_2, \dots, r_n \in M$ and $\gamma \in \Gamma$, then $a \in Z(M)$.

Proof:

$T(r, r_2, \dots, r_n) = (a \circ r)_\gamma$, for $r, r_2, \dots, r_n \in M$ and $\gamma \in \Gamma$. (4.1)

Replacing $r = r\beta y + y\beta r$ in (4.1), where $y \in M$ and $\beta \in \Gamma$, to get :

$T(r\beta y + y\beta r, r_2, \dots, r_n) = T(r, r_2, \dots, r_n)\beta y + y\beta\, T(r, r_2, \dots, r_n) = (a \circ r)_\gamma \beta y + y\beta(a \circ r)_\gamma = a\gamma r\beta y + r\gamma a\beta y + y\beta a\gamma r + y\beta r\gamma a$. On other hand,

$(a \circ (r\beta y + y\beta r))_\gamma = a\gamma r\beta y + a\gamma y\beta r + r\beta y\gamma a + y\beta r\gamma a = r\gamma a\beta y + y\beta a\gamma r = a\gamma y\beta r + r\beta y\gamma a$.

That is,

$r\beta[a, y]_\gamma = [a, y]_\gamma \beta r = r\beta[a, y]_\gamma - [a, y]_\gamma \beta r = 0$. To get $[r, [a, y]_\gamma]_\beta = 0$, Implies $[a, y]_\gamma \in Z(M)$, hence $a \in Z(M)$.

Lemma 4.3:

Let M be a semiprime Γ-ring. Then every Jordan Γ-n-centralizer of M maps Z(M) into Z(M).

Proof:

$T(r^2, r_2, \dots, r_n) = T(r, r_2, \dots, r_n)\gamma r$, for $r, r_2, \dots, r_n \in M$ and $\gamma \in \Gamma$ $2T(r\gamma y, r_2, \dots, r_n) = T(r\gamma y + y\gamma r, r_2, \dots, r_n) = T(r\gamma y, r_2, \dots, r_n) + T(y\gamma r, r_2, \dots, r_n) = T(r, r_2, \dots, r_n)\gamma y + y\gamma T(r, r_2, \dots, r_n)$ (4.2)

Let $r \in Z(M)$ and denote $a = T(r, r_2, \dots, r_n)$ from (4.2), for $r, r_2, \dots, r_n \in M$,

$2\,T(r\gamma y, r_2, \dots, r_n) = a\gamma y + y\gamma a$.

Assume $S = a\gamma y + y\gamma a$, we show that S is also a Jordan Γ-n-centralizer of M by Lemma 4.2 implies $T(r, r_2, \dots, r_n) \in Z(M)$.

Suppose $T(r, r_2, \dots, r_n) = a\gamma r + r\gamma a$, for $r, r_2, \dots, r_n \in M$ and $\gamma \in \Gamma$.

Replacing $r = r\beta y + y\beta r$, $y \in M$, $\beta \in \Gamma$.

$T(r\beta y + y\beta r, r_2, \dots, r_n) = T(r, r_2, \dots, r_n)\beta y + y\beta\, T(r, r_2, \dots, r_n) = (a \circ r)_\gamma \beta y + y\beta(a \circ r)_\gamma = a\gamma r\beta y + r\gamma a\beta y + y\beta a\gamma r + y\beta r\gamma a$ (4.3)

On other hand,

$(a \circ (r\beta y + y\beta r))_\gamma = a\gamma r\beta y + a\gamma y\beta r + r\beta y\gamma a + y\beta r\gamma a$ (4.4)

Comparing (4.3) and (4.4), we have:

$= r\beta[a, y]_\gamma - [a, y]_\gamma \beta r = [r, [a, y]_\gamma]_\beta = 0$

Implies $[a, y]_\gamma \in Z(M)$:

$= (a \circ r)_\gamma \beta\, y + y\beta(a \circ r)_\gamma$, then $a \in Z(M)$, also: $T(r,r_2,\ldots,r_n) \in Z(M)$, hence $T(r,r_2,\ldots,r_n) = a$, for $r,r_2,\ldots,r_n \in M$.

Lemma 4.4:
Assume M be a semiprime Γ-ring of char $\neq 2$ and T be an additive that mapping satisfying $T(r^2,r_2,\ldots,r_n) = T(r,r_2,\ldots,r_n)\gamma r$ (resp. $T(r^2,r_2,\ldots,r_n) = r\,\gamma T(r,r_2,\ldots,r_n)$). Hold for $r,r_2,\ldots,r_n \in M$ and $\gamma \in \Gamma$. Then T is a symmetric left Γ-n-centralizer.

Proof: It is clear.

Theorem 4.5:
Assume M be a semiprime Γ-ring of char$\neq 2$. Then every Jordan Γ-n-centralizer of M is a symmetric Γ-n-centralizer.

Proof:
$T(r\,\gamma y+y\,\gamma r,r_2,\ldots,r_n) = T(r,r_2,\ldots,r_n)\gamma y + y\,\gamma T(r,r_2,\ldots,r_n)$ (4.5)
$T(r\gamma y + y\gamma r,r_2,\ldots,r_n) = r\gamma T(y,r_2,\ldots,r_n) + T(y,r_2,\ldots,r_n)\gamma r$ (4.6)
Replacing $y = r\,\beta y + y\,\beta\, r$ in (4.6), where $y \in M$ and $\beta \in \Gamma$.
$T(r\gamma y+y\gamma r,r_2,\ldots,r_n) = r\gamma T(r,r_2,\ldots,r_n)\beta y + r\gamma y\beta T(r,r_2,..,r_n) + T(r,r_2,..,r_n)\beta y\gamma r +$
$y\,\beta\, T(r,r_2,\ldots,r_n)\gamma r$ (4.7)
In addition, replacing $y = r\,\beta y + y\,\beta\, r$ in (4.5), where $y \in M$ and $\beta \in \Gamma$.
$= T(r,r_2,\ldots,r_n)\gamma r\beta y + T(r,r_2,\ldots,r_n)\,\gamma y\beta r + r\beta y\,\gamma T(r,r_2,\ldots,r_n) + y\beta r\gamma T(r,r_2,\ldots,r_n)$ (4.8)
Comparing (4.7) and (4.8), we get:
$r\gamma T(r,r_2,\ldots,r_n)\beta y + y\beta T(r,r_2,\ldots,r_n)\gamma\, r = T(r,r_2,\ldots,r_n)\gamma r\beta y + y\beta r\gamma T(r,r_2,\ldots,r_n)$, for $y,\ r\ ,\ r_2\ ,\ \ldots,r_n \in M$ and $\gamma,\beta \in \Gamma$.
$[T(r, r_2, \ldots, r_n), r]_\gamma \beta y + y\beta[\, r\ , T(r, r_2, \ldots, r_n)]_\gamma = 0$
$[T(r, r_2, \ldots, r_n), r]_\gamma \beta y - y\beta[\, T(r, r_2, \ldots, r_n), r]_\gamma = 0$
$[[T(r, r_2, \ldots, r_n), r]_\gamma, y]_\beta = 0$. So $[\, T(r, r_2, \ldots, r_n), r]_\gamma \in Z(M)$
Let $a \in Z(M)$:
$2T(a\gamma r, r_2, \ldots,r_n) = T(a,r_2,\ldots,r_n)\,\gamma r + r\,\gamma T(a,r_2,\ldots,r_n)$ (4.9)
Also,
$2T(r\gamma a, r_2, \ldots,r_n) = a\gamma T(r,r_2,...,r_n) + T(r,r_2,\ldots,r_n)\gamma a$ (4.10)
We get , $T(a,r_2, \ldots,r_n)\gamma r = T(r, r_2, \ldots,r_n)\gamma a$. By using Lemma 4.3, we have:
$[T(r, r_2, \ldots, r_n), r]_\gamma \beta a = (T(r,r_2,\ldots,r_n)\,\gamma r - r\,\gamma T(r,r_2,\ldots,r_n))\,\beta a =$
$T(r,r_2,\ldots,r_n)\gamma r\beta a - r\,\gamma T(r, r_2,\ldots,r_n)\,\beta a =$ $T(r,r_2,\ldots,r_n)$
$\gamma a\,\beta r - r\gamma\, T(r,r_2,\ldots,r_n)\,\beta r =$ $T(a,r_2,\ldots,r_n)\,\gamma r\,\beta r - r\,\gamma$
$T(r,r_2,\ldots,r_n)\,\beta r$ $2T(r^2,r_2,\ldots,r_n) = T(r,r_2,\ldots,r_n)\gamma r +$
$r\,\gamma T(r,r_2,\ldots,r_n) = 2T(r\ ,\ r_2\ ,\ \ldots,r_n\ )\,\gamma r$
By Lemma 4.4 , hence M is a symmetric Γ-n-centralizer.

Email1: alzaer1972@uomustansiriyah.edu.iq

Abstract. The non-polynomial spline method has been used to solving 2-dimensional variable-order(VO) fractional partial differential equations (FPDE). For VO fractional derivative, described in the sense of the Caputo. The main objective of this study and advantage of the proposed method is to investigate a public approximation for the frequency of the trigonometric functions of the non-polynomial part of the spline function. The powerful algorithm of the proposed method gives high accuracy results.

1. Introduction

The variable-order fractional is the one of most important tool in nowadays, with successful applied in mechanics [1], It can be used in the design of abnormal diffusion because it can depict the time-based diffusion process more efficiently than the partial derivative of the static arrangement means that the order of α.[2-3]. The topic is very active and of great interest due to its many applications, not only in Mathematics, but also in physics and in engineering, and it has proven that it describes complex phenomena in nature better and more broadly. [4-10]. The effect of differences between the use of fixed-order and variable-order fractional derivatives has been discussed and studied in [11].The addition and mathematical formalization of coefficients of variable-order fractions. The Evolutionary control equations for successful application have led to the modelling of complex world problems, from the study of biology and mechanics to transport processes and to many important applications. Partial variable calculus is an unknown branch of calculus that provides wonderful opportunities to simulate interdisciplinary processes. The scientific community has been extensively exploring the applications of fractional variable order in modelling and physical systems engineering. Among the goals of this work, will be starting point for researchers who interested in approaching this wonderful topic. We are interested in developing computational and analytical methods and applying complex physical systems using advanced simulation software. For more details, see [12-18].

This paper proposes non-polynomial spline functions(SF) to approximate the solution of the fractional partial differential equations of variable order (FPDEVO).

2. Definitions and properties:

2.1 Some Definitions:

In this part, some necessary and important definitions and mathematical principles of variable-order fractional derivatives and some properties of fractional derivatives will be mentioned.

Definition 2.1 [19] The Caputo and Riemann fractional derivatives of order α of $f(t)$ defined as:

$$ {}_0^C D_\cdot^\alpha f(t) = \frac{1}{\Gamma(n-\alpha)} \int_0^t \frac{f^{(n)}(s)}{(t-s)^{\alpha-n+1}} ds $$

$$ {}_0 D_t^\alpha f(t) = \frac{1}{\Gamma(n-\alpha)} \frac{d^n}{dt^n} \int_0^t \frac{f(s)}{(t-s)^{\alpha-n+1}} ds, \quad \ldots(1) $$

where $n-1 < \alpha \leq n$, $n \in N$ and $n > 0$.

After folding the definition of fixed-order fractional derivatives, we show the variable-order fractional differentiation factor. Fixed-order fractional derivatives are expanded into the variable-order fractional meaning.

Definition 2.2 [19] The Riemann FPDEO of $\alpha(t)$ is defined as:

$$ {}_0 D_t^{\alpha(t)} f(t) = \frac{1}{\Gamma(n-\alpha(t))} \frac{d^n}{dt^n} \int_0^t (t-s)^{\alpha(t)-n+1} f(s) ds \quad \ldots(2) $$

and

$$ {}_t D_b^{\alpha(t)} f(t) = \frac{1}{\Gamma(n-\alpha(t))} \frac{d^n}{dt^n} \int_t^1 (t-s)^{\alpha(t)-n+1} f(s) ds $$

where $n-1 < \alpha_{min} < \alpha(t) < \alpha_{max} < n$, $n \in \mathbb{N}$ for $t \in [0, \tau]$.

Other definitions of the derivative of variable arrangement have been proposed with respect to Caputo.

Definition 2.3 [19] Let $n-1 < \alpha(t) \leq n$ for all $t \in [0, \tau]$ the operator ${}_0^C D_t^{\alpha(t)}$ defined by

$$ {}_0^C D_t^{\alpha(t)} f(t) = \frac{1}{\Gamma(n-\alpha(t))} \int_0^t \frac{f^{(n)}(s)}{(t-s)^{\alpha(t)-n+1}} ds \quad \ldots(3) $$

and

$$ {}_t^C D_b^{\alpha(t)} f(t) = \frac{1}{\Gamma(n-\alpha(t))} \int_0^t \frac{f^{(n)}(s)}{(t-s)^{\alpha(t)-n+1}} ds $$

is called the Caputo fractional derivative of VO of $\alpha(t)$.

If $\alpha(t)$ is a constant function, then the order of the partial variable is changed to the derivative of the constant order. The two definitions of variable-order derivatives are not generally equivalent, but are related by the following relationship:

$$ {}_0 D_t^{\alpha(t)} f(t) = \sum_{k=0}^{n-1} \frac{f^{(k)}(0) t^{k-\alpha(t)}}{\Gamma(k+1-\alpha(t))} + {}_0^C D_t^{\alpha(t)} f(t). \quad \ldots (4) $$

The formula for the fractional Caputo derivative, $0 < \alpha(t) \leq 1$:

$$ {}_0^C D_t^{\alpha(t)} x^\beta = \begin{cases} 0, & \beta = 0, \\ \frac{\Gamma(\beta+1)}{\Gamma(\beta+1-\alpha(t))} x^{\beta-\alpha(t)}, & \beta = 0,1,2,\dots \end{cases} \quad \dots (5) $$

Definition 2.4 [20] Let $0 < \alpha(x,t) \leq 1$ the operator ${}_0^C D_t^{\alpha(x,t)}$ defined by

$$ {}_0^C D_t^{\alpha(x,t)} u(x,t) = \frac{1}{\Gamma(n-\alpha(x,t))} \int_0^x \frac{1}{(x-s)^{\alpha(x,t)-n+1}} \frac{\partial^n u(x,t)}{\partial s^n} ds \quad \dots(6) $$

is called the Caputo space fractional derivative of variable-order
Next, let us introduce some properties of fractional derivatives [21].
1-Linearity : if the operator ${}_a D_t^\alpha (A\, g_1(t) + B g_2(t)) = A\, D^\alpha g_1(t) + B\, D^\alpha g_2(t)$, then of must be linear.
where $g_1(t)$ and $g_2(t)$ are any two function, $A, B \in \mathbb{R}$, $\mathbb{R}$ be a regain s.t
$\mathcal{R} = \{(x,t): a \leq x \leq b\, , c \leq t \leq d\}$, $\alpha \in \mathcal{R}^+$ for any type of fractional derivatives.

2-Analyticty:-if $f(z)$ is analytic then, ${}_a D_t^\alpha f(z)$ is also analytic function of order α and z

3- Law of exponents :- ${}_a D_t^\alpha \, {}_a D_t^\beta f(t) = {}_a D_t^{\alpha+\beta} f(t)$, and existence the inverse of the operator ${}_a D_t^\alpha \, {}_a D_t^{-\alpha} f(t) = f(t)$.

4- Identity: if ${}_a D_t^\alpha f(t) = f(t)$,then ${}_a D_t^\alpha f(t)$ is identity when α is zero order.

2.2Two-dimensional non-polynomial spline for solving FPDEVO
Consider the partition $\Delta = \{t_0, t_1, t_2, \dots, t_n\}$of $[a,b] \in \mathcal{R}$. Let $S(\Delta)$Indicate the set of piecewise polynomials on interval $I_i = [t_i, t_{i+1}]$ of partition Δ. let $u(x,t)$be the exact solution, this new method provides an approximation. Also, C^∞In the trigonometric portion of the non-polynomial slices it compensates for the loss of smoothness inherited by the polynomial.The non-polynomial spline function, obtained by the segment Pi(t).Each non- polynomial spline of n order Pi (t)has the form*:*
$p_i(t) = a_i \cos k(t-t_i) + b_i\, sink(t-t_i) + \dots + y_i(t-t_i)^{n-1} + z_i \dots(7)$
Where $a_i, b_i, \dots, y_i$and$z_i$are constants and k is repeat the trigonometric functions that will be used to increase the accuracy of the method. of fractional Caputo differential equation of order α, $0 < \alpha \leq 1$.

Definition 3.1 [22] Let$a_i, b_i, c_i$and$d_i$are constants to be determined

$$ p_i(t) = a_i \cos k(t-t_i) + b_i\, sink(t-t_i) + c_i(t-t_i) + d_i \dots(8) $$

is called Linear Non-Polynomial SF
Now, by tensor product we will construct two dimensional non-polynomial spline.
Let $\mathcal{R}$ be a regain s.t$\mathcal{R} = \{(x,t): a \leq x \leq b\, ,\ c \leq t \leq d\}$
the method of finding two dimensional functions $g(x,y)$in a tensor product space $S_1 \otimes S_2$,such that $S_1 = span\{\cos(t), \sin(t), t, 1\}\ and\ S_2 = span\{\cos(x), \sin(x), x, 1\}$
$S_1 \otimes S_2 = z(x,t)$ … (9)
Let the matrix form:
$A\, C = F$ ... (10)
where $A = \Psi \otimes \Phi$ is tensor product of two matrices Ψ and $\Phi$of dimensions$n \times m$

$$ \Psi = \begin{bmatrix} a_{1,1} & \cdots & a_{1,m} \\ \vdots & \ddots & \vdots \\ a_{n,1} & \cdots & a_{n,m} \end{bmatrix}, \quad \Phi = \begin{bmatrix} b_{1,1} & \cdots & b_{1,m} \\ \vdots & \ddots & \vdots \\ b_{n,1} & \cdots & b_{n,m} \end{bmatrix} $$

$$A = \Psi \otimes \Phi = \begin{bmatrix} a_{1,1}\Phi & \cdots & a_{1,m}\Phi \\ \vdots & \ddots & \vdots \\ a_{n,1}\Phi & \cdots & a_{n,m}\Phi \end{bmatrix}$$

and

$$C = [c_{1,1} \ \ldots \ c_{m,1}c_{1,2} \ \ldots \ c_{m,,2} \ \ldots \ c_{m,n}]^T$$
$$F = [f_{1,1} \ \ldots \ f_{m,1}f_{1,2} \ \ldots \ f_{m,,2} \ \ldots \ f_{m,n}]^T$$

Solve (10) to find the unknown vector.
The following theorem present the two dimensional linear non-polynomial spline functions that will be used to evaluate the approximate solution of FPDEVO which is achieved by evaluating Caputo fractional derivative of the spline basis.

Theorem 3.1 The Caputo variable-order fractional derivative of the linear non-polynomial spline approximate the solution of FPDVOE's of the form

$D^{\alpha(x,t)}u(x,t) = f(x,t,u_x,u_t,u_{xx},u_{tt})$, $0 \le x \le 1$,$0 \le \alpha(x,t) \le 1, t > 0$…(11)
with initial condition $u(x,0) = g_1(x)$, $0 \le x \le 1$ …(12)
and boundary condition $u(0,t) = g_2(t)$, $u(1,t) = g_3(t)$, $t > 0$ …(13)
where $g_1(x), g_2(t)$and$g_3(t)$ are arbitrary functions.

proof:
let $z(x,t) = \sum_{i=0}^{m}\sum_{j=0}^{n} C_{i,j}\Psi_j(t)\Phi_i(x)$…(14)
where $\Phi_i(x)$,and $\Psi_j(t) i = 0,1,2,\ldots,m$, $j = 0,1,2,\ldots,n$are the basis of the linear non-polynomial spline function.
From the initial condition given by equation (12), one my get:

$$\sum_{i=0}^{m}\sum_{j=0}^{n} C_{i,j}\Psi_j(0)\Phi_i(x) = g_1(x) \quad \ldots(15)$$

substituting the knot points for the x-axis to get an equation for each knot point ,and form boundary condition given in equation (13), we have

$$\sum_{i=0}^{m}\sum_{j=0}^{n} C_{i,j}\Psi_j(t)\Phi_i(0) = g_2(t) \quad \ldots(16)$$

and $\sum_{i=0}^{m}\sum_{j=0}^{n} C_{i,j}\Psi_j(t)\Phi_i(1) = g_3(t)$ …(17)

similarly, substituting the knot points for the t-axis to get an equation for each knot point at $x = 0$ and $x = 1$
the assumed solution in equation (14) is substituted in equation (11), we have

$$\sum_{i=0}^{m}\sum_{j=0}^{n} C_{i,j}\,{}_0^C D_{\cdot}^{\alpha(x,t)}\Psi_j(t)\Phi_i(x) = f(x,t,\Psi'(t),\Phi'(x),\Psi''(t),\Phi''(x) \quad \ldots \quad (18)$$

substitute the knot points (x_i, t_j),for $i = 0,1,2,\ldots,m$, $j = 0,1,2,\ldots,n$, to get an equation for each pair $(i\ ,j)$, for all $i = 0,1,2,\ldots,m$, ,$j = 0,1,2,\ldots,n$ then from equations (14-18) and a system with unknown coefficients $C_{i,j}$must be determined to compute equation (14).
Now, present the method in the following algorithm FPDEVO:

The Algorithm (3.1) : (FPDEVO)
To find the approximate solution to (14), we choose $n > 0$ and follow these steps::
Step1: Set $h = (a-b)/n$, $x_i = x_o + i\,h, i = 0,1,2,\dots,n$
where $x_o = a, x_n = b$
step2: Set k=(d-c)/m , t_j=t_0+j k, j= 0,1,2,…,m where $t_0 = c, t_m = d$
step3: Evaluate $a_0 b_0, c_0$ and $d_0$in comparison with equation (8)
step4: Calculate the matrix A by using equations 11-14
step5: Evaluate the vector F by using (10)
step6: Calculate A^{-1} by step4
step7: Evaluate the coefficient $C_{i,j}$ by using step5 and step6 such that
$C_{i,j} = A^{-1}\,F$ by using equation (10)
step8: Calculate approximate solution $z(x,t)$using step7 and equation (14)

3. Illustrative Example
There are two illustrative examples of variable order linear fractional partial differential equations to prove the proposed action linear non-polynomial spline method, where MathCad 15 program applied for computation the results.

Example 3.1
${}_0^C D_t^2 u(x,t) + 0.5\cos\left(\frac{\alpha(x,t)\,\pi}{2}\right) {}_0^C D_x^{\alpha(x,t)} u(x,t) - \frac{2}{t^2+1} u(x,t) = f(x,t)$,
for $x \in [0,1]$, t $\in [0,1]$
subject to initial condition(IC): $u(x,0) = x^2(8-x)$
and the boundary conditions(BC): $u(0,t) = 0$, $u(1,t) = 7(t^2+1)$
the exact solution [20]given by:$u(x,t) = x^2(8-x)(t^2+1)$
with$f(x,t) = -(t^2+1)\left(\frac{16\,x^{2-\alpha(x,t)}}{\Gamma(3-\alpha(x,,t))} + \frac{6\,x^{3-\alpha(x,t)}}{\Gamma(4-\alpha(x,t))}\right)$
and $\alpha(x,t) = 1.5 + 0.5e^{-(x\,t)^2-1}$
by algorithm (3.1) the approximate solution is:

$$\begin{aligned} z(x,t) = {} & (-85.484\cos t - 40.66\sin t + 81.904\,t + 70.891)\cos x \\ & + (397.705\cos t - 15.124\sin t - 36.852\,t - 398.745)\sin x \\ & + (-388.014\cos t + 6.369\times 10^{-6}\sin t + 62.695\,t + 389.181)x \\ & + (85.484\cos t + 40.66\sin t - 81.904\,t - 70.891) \end{aligned}$$

Table (3.1) illustrate the exact, approximate solution and absolute error

Table 3.1

X	t	u(x,t)	z(x,t)	$\lvert z(x,t) - u(x,t)\rvert$

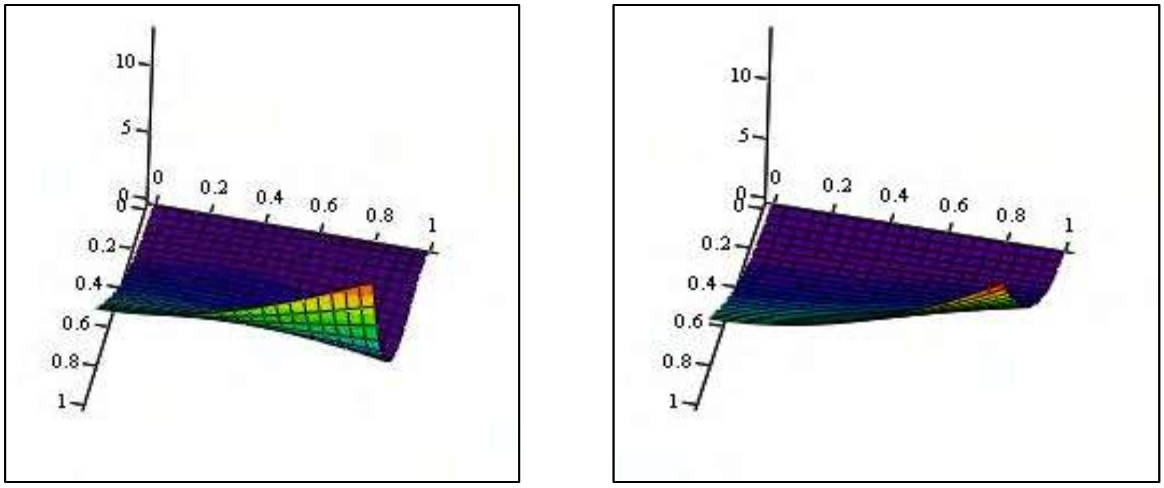
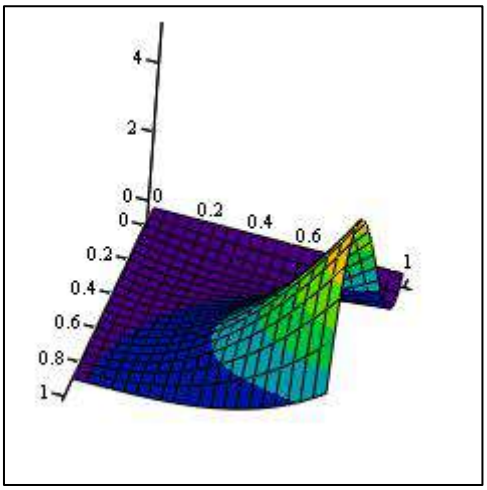
	0.03	7.007	7.006	2.065×10^{-4}

The approximation solution $z(x,t)$and the exact solution$u(x,t)$are illustrated in figure (3.1), and the absolute error$er(x,t)$is given in figure (3.2).



z u

Figure (3.1): the approximate surface $z(x,t)$ and the exact surface $u(x,t)$ for example (3.1)



er

Figure (3.2): the error $er(x,t)$for example (3.1)

Figure (3.1) summarizes the results approximate solution$z(x,t)$in Table(3.1) gives a more realistic approximation at$\alpha(x,t) = 1.5 + 0.5e^{-(x\,t)^2-1}$.

Example (3.2):
${}_0^C D_t^{\alpha(x,t)} u(x,t) - D_x u(x,t) + D_t u(x,t) - D_x^2 u(x,t) = f(x,t)$, for $x \in [0,1]$, t $\in [0,1]$
subject to IC: $u(x,0) = 5x(1-x)$
and BC: $u(0,t) = u(1,t) = 0$
the exact solution [23]given by $u(x,t) = 5x(t+1)(1-x)$
with$f(x,t) = -\frac{5x(x-1)}{\Gamma(3-\alpha(x,t))} t^{1-\alpha(x,t)} - 5(t(2x-3) + x^2 + x - 3)$
and $\alpha(x,t) = 0.8 + 0.005 \sin(x) \cos(tx)$
by algorithm (3.1) the approximate solution is:

$$\begin{aligned} z(x,t) = {} & (-4.857\cos t - 0.626\sin t + 8.906\,t + 13.839)\cos x \\ & + (7.246\cos t - 0.255\sin t + 5.808\,t - 2.339)\sin x \\ & + (-8.33\ \cos t + 7.573\times 10^{-8}\sin t + -0.867t + 8.33)x \\ & + (4.857\cos t + 0.626\ \sin t - 8.906\,t - 13.839) \end{aligned}$$

Table (3.2) illustrate the exact approximate solution and absolute error

Table (3.2)

X	t	$z(x,t)$	$u(x,t)$	$\lvert z(x,t) - u(x,t) \rvert$
0	0.0	0.0	0.0	0.0
	0.01	0.0	0.0	0.0

er

Figure (3.4): the error $er(x,t)$for example (3.2)
Figure (3.3) summarizes the results approximate solution $z(x,t)$in Table(3.2) gives a more realistic approximation at$\alpha(x,t) = 0.8 + 0.005\sin(x)\cos(tx)$.

Conclusion and future work
The linear non-polynomial spline function is presented for solving the FPDEVO. Our proposed method is based on trigonometric and polynomial, and it is completely different from the previously shown methods. The results in Table 3.1, 3.2 and figures 3.1, 3.3 show that the proposed method can be used to solve the problem with high accuracy.

Indeed, implementation of an FPDEVO algorithm may also be on our future lines of research. Also we may use the proposed method to solve system of FPDEVO.

Interval value fuzzy hyper AT-algebras

Interval value fuzzy hyper AT-algebras

Abstract. The aim of this work is to a connection between two concepts which are an interval value fuzzy set and a hyper AT-algebra. Also, some properties of these concepts are found. The notions of IVF hyper AT-subalgebras, IVF hyper ideals and IVF hyper AT-ideals are defined. Then IVF (weak, strong) hyper ideals and IVF (weak, strong) hyper AT-ideals are discussed. After that, some relations among these ideals are presented and some interesting theorems are proved.

1. Introduction

The algebraic structure which is called an AT-algebra was introduced by Hameed[3] after that, Hameed[4,5] introduced the notion of hyper AT-algebra a generalization of an AT-algebra and fuzzy hyper AT-algebra. Jun and Xin [6,7] studied the fuzzification of a (strong, weak, reflexive) hyper BCK-ideal and discussed some properties among them. Fuzzy sets extensions such as intuitionistic fuzzy sets, Bipolar-valued fuzzy sets, interval valued fuzzy sets etc are studied by many mathematicians see [1,2,8,9,10]. In this paper, we applied the notion of IVF hyper AT-ideals of a hyper AT-algebra, and investigated some related properties. Also, we study the notions of IVF hyper (weak, strong) ideals and IVF hyper (weak, strong) AT-ideals and gave relations between these ideals.

2.Preliminaries

We review some basic definitions and theories of a hyper AT-algebra and fuzzy hyper AT-algebra in this section.

Definition2.1[4]. A hyper AT-algebra$(H,\circ,0)$ is a nonempty set H and a hyper operation "$\circ$" on H, with a constant "0" and the following conditions hold,

$$\forall \chi,\gamma,\nu \in H$$

(HAT_1) $\big((\gamma\circ\nu)\circ(\chi\circ\nu)\big) \ll \chi\circ\nu$,
(HAT_2) $0\circ\chi = \{\chi\}$,
(HAT_3) $\chi\circ 0 = \{0\}$
where $\chi \ll \gamma$ is defined as follows $0 \in \gamma\circ\chi$ and $A \ll B$ is defined as $\forall a \in A, \exists b \in B$ such that $a \ll b$, for every $A, B \subseteq H$. In such case, we call "<<" the hyper order in H.

Example 2.2[4]. If $H = \{0,1,2\}$ and $\circ$ is a hyper operation on H defined in the following table

∘	0	1	2
0	$\{0\}$	$\{1\}$	$\{2\}$
1	$\{0\}$	$\{0,1\}$	$\{1,2\}$
2	$\{0\}$	$\{0,1\}$	$\{0,1,2\}$

Then $(H,\circ,0)$ is a hyper AT-algebra.

Proposition 2.3[4].In a hyper AT-algebra$(H,\circ,0)$, $\forall\chi,\gamma,\nu\in H$ and , $B\subseteq H$, where $A\ and\ B$ nonempty subsets, then
(P_1) If A $\subseteq$ B , then A << B,
(P_2) $0\circ 0=\{0\}$;
(P_3) $0\ll\chi$;
(P_4) $\nu\ll\nu$;
(P_5) $\chi\circ\nu\ll\nu$;
(P_6) $A\circ 0=\{0\}$;
(P_7) $0\circ A=A$;
(P_8) $(0\circ 0)\circ\chi=\{\chi\}$;
(P_9) If $\gamma\in(0\circ\chi)\Rightarrow\gamma\ll\chi$.

Proposition2.4[4].In a hyper AT-algebra$(H,\circ,0)$, we have $\nu\circ(\gamma\circ\chi)=\gamma\circ(\nu\circ\chi)$, for all $\chi,\gamma,\nu\in H$.

Definition2.5[4]. A hyper AT-subalgebra is a non-empty subset S of a hyper AT-algebra $(H,\circ,0)$ and $\chi\circ\gamma\ll S,\ \forall\chi,\gamma\in S$.

Definition 2.6[4]. A subset $A\neq\emptyset$ of a hyper AT-algebra $(H,\circ,0)$ is named a hyper ideal if
(^{hI_1}) $0\in A$;
(^{hI_2}) if $\chi\circ\gamma\ll A$ and $\chi\in A$, then $\gamma\in A,\forall\chi,\gamma\in H$.

Definition 2.7[4]. A subset $A\neq\emptyset$ of a hyper AT-algebra $(H,\circ,0)$ is named a hyper AT-ideal if
(^{I_1})$0\in A$;
(^{I_2}) if $\chi\circ(\gamma\circ\nu)\ll A$ and $\gamma\in A$, then $\chi\circ\nu\in A$, $\forall\chi,\gamma,\nu\in H$.

Example 2.8[4]. If $H=\{0,a,b\}$ and $\circ$ is a hyper operation on H defined in the following table

∘	0	*a*	*b*
0	$\{0\}$	$\{a\}$	$\{b\}$
a	$\{0\}$	$\{0,a\}$	$\{b\}$
b	$\{0\}$	$\{b\}$	$\{0,b\}$

By apply definition 2.1, we get $(H,\circ,0)$ is a hyper AT-algebra. The subset A= {0, *b*} is a hyper ideal but it is not a hyper AT-ideal, because $0\circ(b\circ a)$ << A and $b\in$A; but $a\notin$A.

Definition 2.9[4].Let$(H,\circ,0)$be a hyper AT-algebra and K be a nonempty subset of H and $0\in K$, then
(1) K is named a weak hyper ideal, if $\chi\circ\gamma\subseteq K$ and $\chi\in K$, then $\gamma\in K,\forall\chi,\gamma\in H$.
(2) K is named a strong hyper ideal, if $\chi\circ\gamma\cap K\neq\varphi$ and $\chi\in K$, then $\gamma\in K$, $\forall\chi,\gamma\in H$.
Now, we review some concepts of fuzzy hyper AT-algebra and some useful theorems for this paper.

Definition 2.10[5]. Let $(H,\circ,0)$ be a hyper AT-algebra and μ be a fuzzy set of H. Then μ is named a fuzzy hyper AT-subalgebra if $\inf_{\nu\in\chi\circ\gamma}\mu(\nu)\geq\min\{\mu(\chi),\mu(\gamma)\}$,$\forall\,\chi,\gamma,\nu\in H$.

Example 2.11[5]. If $H=\{0,a,b\}$ and $\circ$ is a hyper operation on H defined in the following table

∘	0	A	b
0	$\{0\}$	$\{a\}$	$\{b\}$
a	$\{0\}$	$\{0,a\}$	$\{a,b\}$
b	$\{0\}$	$\{0,a\}$	$\{0,a,b\}$

So, $(H,\circ,0)$ is a hyper AT-algebra. If g: $H\rightarrow[0,1]$ is a fuzzy set and is defined by
g (a)=0.5 ,g(0) = 0.7, and g (b)=0.2 . Then g is a fuzzy hyper AT-subalgebra of H.
Definition 2.12[5].Ifμ :$H\rightarrow[0,1]$ is a fuzzy set in a hyper AT-algebra $(H,\circ,0)$. Then μ is named a fuzzy hyper AT-ideal of H, if $\forall\chi,\gamma,\nu,u\in H$, $\chi\ll\gamma$ implies $\mu(\gamma)\geq\mu(\chi)$ and $\mu(\chi\circ\nu)\geq\min\{\inf_{u\in(\chi\circ(\gamma\circ\nu))}\mu(u),\mu(\gamma)\}$.

Example 2.13[5]. If $H=\{0,a,b\}$ and $\circ$ is a hyper operation on H defined in the following table

∘	0	a	b
0	$\{0\}$	$\{a\}$	$\{b\}$
a	$\{0\}$	$\{0,a\}$	$\{a,b\}$
b	$\{0\}$	$\{0,a\}$	$\{0,a,b\}$

Hence $(H,\circ,0)$ is a hyper AT-algebra. If μ: $H\rightarrow[0,1]$ is defined by
$\mu(0)=\mu(a)=\alpha_1>\alpha_2=\mu(b)$. $\Rightarrow\mu$ is a fuzzy hyper AT-ideal of H.

Definition 2.14[5].Let $(H,\circ,0)$ be a hyper AT-algebra and μ:$H\rightarrow[0,1]$ be a fuzzy set . Then$\forall\chi,\gamma,\nu\in H$. The fuzzy set μ is named

(1) A fuzzy hyper ideal if $\chi\ll\gamma$, then $\mu(\gamma)\geq\mu(\chi)$ and $\mu(\gamma)\geq\min\{\inf_{\nu\in(\chi\circ\gamma)}\mu(\nu),\mu(\chi)\}$.

(2) A fuzzy weak hyper ideal if $\mu(0)\geq\mu(\gamma)\geq\min\{\inf_{\nu\in(\chi\circ\gamma)}\mu(\nu),\mu(\chi)\}$.

(3) A fuzzy strong hyper ideal if $\inf_{a\in(\chi\circ\chi)}\mu(a)\geq\mu(\gamma)\geq\min\{\sup_{\nu\in(\chi\circ\gamma)}\mu(\nu),\mu(\chi)\}$.

Definition2.15[2]. Let $\hat{E}=[e^L,e^U]$ be an interval number, where $0\leq e^L\leq e^U\leq 1$ and D[0, 1] be denotes the family of all closed sub-intervals of [0, 1], in other words
$D[0,1]=\{\hat{E}=[e^L,e^U]: e^L\leq e^U, where\ \ e^L,e^U\in[0,1]\}$.
The operations $\leq$, $\geq$, $=$, $rmin$, $rmax$ for two elements in D [0, 1] are defined as follows: let $\hat{E}=[e^L,e^U]$ and $\hat{B}=[b^L,b^U]$ in $D[0,1]$, then
1- $\hat{E}\leq\hat{B}\ \ iff\ \ e^L\leq b^L, e^U\leq b^U$;
2- $\hat{E}\geq\hat{B}\ \ iff\ \ e^L\geq b^L, e^U\geq b^U$;
3- $\hat{E}=\hat{B}\ \ iff\ \ e^L=b^L, e^U=b^U$ $\tilde{E}=\tilde{b}$ $iff\ e^L=b^L, e^U=b^U$;
4- $rmin\{\hat{E},\hat{B}\}=[min\{e^L,b^L\},min\{e^U,b^U\}]$;
5- $rmax\{\hat{E},\hat{B}\}=[max\{e^L,b^L\},max\{e^U,b^U\}]$.

It is obvious that $(D[0,1], \leq, \wedge, \vee)$ is a lattice with a least element $\hat{0} = [0,0]$ and a greatest element $\hat{1} = [1,1]$.
An interval valued fuzzy set $\tilde{\mu}$ in X is defined as $\tilde{\mu} = \{\chi, [\mu^L(\chi), \mu^U(\chi)]: \chi \in X\}$, where $\tilde{\mu}: X \to D[0,1]$ and $\mu^L(\chi) \leq \mu^U(\chi), \ \forall \chi \in X$. In this paper we use the interval fuzzy set $\Gamma = \{< \chi, \tilde{\mu}_\Gamma(\chi) >: \chi \in H\}$, where $\tilde{\mu}_\Gamma: H \to D[0,1]$ and we use the notations $\mu_\Gamma^L(\chi)$ and $\mu_\Gamma^U(\chi)$ to mean the left end point and the right end point, respectively such that $\tilde{\mu}_\Gamma(\chi) = [\mu_\Gamma^L(\chi), \mu_\Gamma^U(\chi)]$. For the sake of simplicity, we shall use the symbol
$\tilde{\mu}_\Gamma = [\mu_\Gamma^L, \mu_\Gamma^U]$ for the interval valued Γ.

3. An Interval valued fuzzy set of a hyper AT-algebra

Now, we study the notion of interval valued fuzzy set (briefly IVF) on a hyper AT-algebra, and present some characterizations of this idea.

Definition3.1. Let $(H, \circ, 0)$ be a hyper AT-algebra and $\tilde{\mu}_\Gamma: H \to D[0,1]$ be an IVF set of H . Then the level subset of $\tilde{\mu}_\Gamma$ is denoted by $U(\tilde{\mu}_\Gamma, \tilde{t})$ and it is defined by
$U(\tilde{\mu}_\Gamma, \tilde{t}) = \{\chi \in H: \tilde{\mu}_\Gamma(\chi) \geq \tilde{t}\}$, for every $[0,0] \leq \tilde{t} \leq [1,1]$.

Definition3.2. an IVF set $\tilde{\mu}_\Gamma$ of a hyper AT-algebra $(H, \circ, 0)$ is called IVF hyper AT-subalgebra if $\inf_{\nu \in (x \circ y)} \tilde{\mu}_\Gamma(\nu) \geq rmin\{\tilde{\mu}_\Gamma(\chi), \tilde{\mu}_\Gamma(\gamma)\}, \ \forall \chi, \gamma, \nu \in H$.

Example3.3. If $H = \{0, a, b\}$, and $\circ$ is a hyper operation on H defined in the following table

$\circ$	0	a	b
0	$\{0\}$	$\{a\}$	$\{b\}$
a	$\{0\}$	$\{0, a\}$	$\{a, b\}$
b	$\{0\}$	$\{0, a\}$	$\{0, a, b\}$

Then$(H, \circ, 0)$ is a hyper AT-algebra, an IVF set $\tilde{\mu}_\Gamma(\chi)$ is defined
$\tilde{\mu}_\Gamma(\chi) = \begin{cases} [0.2,0.7] & if \quad \chi = \{0, a\} \\ [0.1,0.3] & if \quad \chi = b \end{cases}$
And by apply definition3.2; we can prove that $\tilde{\mu}_\Gamma(\chi)$is an IVF hyper AT-subalgebra of H.

Proposition 3.4. If $\tilde{\mu}_\Gamma$ is an IVF hyper AT-subalgebra of H, then $\tilde{\mu}_\Gamma(0) \geq \tilde{\mu}_\Gamma(\chi), \ \forall x \in H$.

Proof. By Proposition 2.4, we have $0 \in \chi \circ \chi$, $\forall \chi \in H$. Then
$\inf_{0 \in (\chi \circ \chi)} \tilde{\mu}_\Gamma(0) \geq rmi\, n\{\tilde{\mu}_\Gamma(\chi), \tilde{\mu}_\Gamma(\chi)\} = \tilde{\mu}_\Gamma(\chi)$.

Proposition3.5. If $\tilde{\mu}_\Gamma$ is an IVF hyper AT-subalgebra of H, then $\tilde{\mu}_\Gamma(0 \circ \chi) \geq \tilde{\mu}_\Gamma(\chi)$, for all $\chi \in H$.

Proof. Using Proposition 3.4, we have
$\inf_{\chi \in (0 \circ \chi)} \tilde{\mu}_\Gamma(0 \circ \chi) \geq rmi\, n\{\tilde{\mu}_\Gamma(0), \tilde{\mu}_\Gamma(\chi)\} = \tilde{\mu}_\Gamma(\chi)$.

Theorem 3.6. The set $\tilde{\mu}_\Gamma = [\mu_\Gamma^L, \mu_\Gamma^U]$ in H is an IVF hyper AT-subalgebra if and only if μ_Γ^L and μ_Γ^U are IVF hyper AT-subalgebras of H.

Proof. Letμ_Γ^L and μ_Γ^U be IVF hyper AT-subalgebras of H and $\chi, \gamma \in H$. Then
$\inf_{\nu \in (\chi \circ \gamma)} \tilde{\mu}_\Gamma(\nu) = \left[\inf_{\nu \in (\chi \circ \gamma)} \mu_\Gamma^L(\nu), \inf_{\nu \in (\chi \circ \gamma)} \mu_\Gamma^U(\nu)\right] \geq \left[rmin\{\mu_\Gamma^L(\chi), \mu_\Gamma^L(\gamma)\}, rmin\{\mu_\Gamma^U(\chi), \mu_\Gamma^U(\gamma)\}\right] =$

$rmin\{[\mu_\Gamma^L(\chi),\mu_\Gamma^U(\chi)],[\mu_\Gamma^L(\gamma),\mu_\Gamma^U(\gamma)]\}=rmin\{\tilde{\mu}_\Gamma(\chi),\tilde{\mu}_\Gamma(\gamma)\}$, it follows that $\tilde{\mu}_\Gamma$ is an IVF hyper AT-subalgebra.
Conversely, if $\tilde{\mu}_\Gamma$ is an IVF hyper AT-subalgebra . Then for any$\chi,\gamma\in H$, we get
$\left[\inf_{\nu\in(\chi\circ\gamma)}\mu_\Gamma^L(\nu),\inf_{\nu\in(\chi\circ\gamma)}\mu_\Gamma^U(\nu)\right]=\inf_{\nu\in(\chi\circ\gamma)}\tilde{\mu}_\Gamma(\nu)\geq rmin\{\tilde{\mu}_\Gamma(\chi)\cdot,\cdot\tilde{\mu}_\Gamma(\gamma)\}=$
$rmin\{[\mu_\Gamma^L(\chi),\mu_\Gamma^U(\chi)],[\mu_\Gamma^L(\gamma),\mu_\Gamma^U(\gamma)]\}=[rmin\{\mu_\Gamma^L(\chi),\mu_\Gamma^L(\gamma)\},rmin\{\mu_\Gamma^U(\chi),\mu_\Gamma^U(\gamma)\}.$
It follows that
$\inf_{\nu\in(\chi\circ\gamma)}\mu_\Gamma^L(\nu)=rmin\{\mu_\Gamma^L(\chi),\mu_\Gamma^L(\gamma)\}$
And
$\inf_{\nu\in(\chi\circ\gamma)}\mu_\Gamma^U(\nu)=rmin\{\mu_\Gamma^U(\chi),\mu_\Gamma^U(\gamma)\}$
Then μ_Γ^L and μ_Γ^U are IVF hyper AT-subalgebras of H.

Theorem3.7. Let Γ be an IVF hyper set in a hyper AT-algebra H. ThenΓ is an IVF hyper AT-subalgebra if and only if the level set $U(\tilde{\mu}_\Gamma,\tilde{t})\neq\varphi$ of $\tilde{\mu}_\Gamma$ is a fuzzy hyper AT-subalgebra of H.

Proof. Let$U(\tilde{\mu}_\Gamma,\tilde{t})\neq\varphi$ for any $\tilde{t}=[t_1,t_2]\in D[0,1]$. Then there exists
$\chi,\gamma\in U(\tilde{\mu}_\Gamma,\tilde{t})$. and so $\tilde{\mu}_\Gamma(\chi)\geq\tilde{t}$ and $\cdot\tilde{\mu}_\Gamma(\gamma)\geq\tilde{t}$. And since Γ is an IVF hyper AT-subalgebra, then
$\inf_{\nu\in(\chi\circ\gamma)}\tilde{\mu}_\Gamma(\nu)\geq rmi\,n\{\tilde{\mu}_\Gamma(\chi)\cdot,\cdot\tilde{\mu}_\Gamma(\gamma)\}\geq rmi\,n\{\tilde{t}\cdot,\cdot\tilde{t}\}=\tilde{t}$. It follows that
$\nu\in U(\tilde{\mu}_\Gamma,\tilde{t})$, then $\chi\circ\gamma\ll U(\tilde{\mu}_\Gamma,\tilde{t})$
Hence $U(\tilde{\mu}_\Gamma,\tilde{t})$ is fuzzy hyper AT-subalgebra of H.
Conversely, let $U(\tilde{\mu}_\Gamma,\tilde{t})\neq\varphi$ and it is a fuzzy hyper AT-subalgebra for every
$\tilde{t}\in D[0,1]$. Suppose that there exists $\chi,\gamma\in H$ such that
$\inf_{\nu\in(\chi\circ\gamma)}\tilde{\mu}_\Gamma(\nu)<rmi\,n\{\tilde{\mu}_\Gamma(\chi),\tilde{\mu}_\Gamma(\gamma)\}$
By taking $\tilde{t}_0=\frac{1}{2}[\inf_{\nu\in(\chi\circ\gamma)}\tilde{\mu}_\Gamma(\nu)+rmin\{\tilde{\mu}_\Gamma(\chi),\tilde{\mu}_\Gamma(\gamma)\}]$. Then we have

$$\inf_{\nu\in(\chi\circ\gamma)}\tilde{\mu}_\Gamma(\nu)<\tilde{t}_0<rmin\{\tilde{\mu}_\Gamma(\chi),\tilde{\mu}_\Gamma(\gamma)\}$$

Hence $\chi\in U(\tilde{\mu}_\Gamma,\tilde{t})$ and $\gamma\in U(\tilde{\mu}_\Gamma,\tilde{t})$, but $\nu\notin U(\tilde{\mu}_\Gamma,\tilde{t})$ it follows that
$\chi\circ\gamma\gg U(\tilde{\mu}_\Gamma,\tilde{t})$, which means that $U(\tilde{\mu}_\Gamma,\tilde{t})$ is not fuzzy hyper AT-subalgebra of H. This is contradiction. Hence Γ is an IVF hyper AT-subalgebra of H.

Proposition 3.8. Let A be a nonempty subset of a hyper AT-algebra$(H,\circ,0)$ and $\tilde{\mu}_\Gamma$ be an IVF set in H, define by $\tilde{\mu}_\Gamma(\chi)=\begin{cases}[t_1,t_2] & \chi\in A\\ [0,0] & otherwise\end{cases}$, where $t_1>0$, $t_2>0$, and $t_1,t_2\in[0,1]$ with $t_1<t_2$. Then $\tilde{\mu}_\Gamma$ is an IVF hyper AT- subalgebra if and only if A is a hyper AT-subalgebra of H.

Proof . Let $\tilde{\mu}_\Gamma$ be an IVF hyper AT-subalgebra of $(H,\circ,0)$ and $\chi,\gamma\in A$. Then $\inf_{\nu\in(\chi\circ\gamma)}\tilde{\mu}_\Gamma(\nu)\geq rmin\{\tilde{\mu}_\Gamma(\chi),\tilde{\mu}_\Gamma(\gamma)\}=rmin\{[t_1,t_2],[t_1,t_2]\}=[t_1,t_2]$. It follows that $\nu\in A$ and thus $\chi\circ\gamma\ll A$. Hence A is a hyper AT- subalgebra.
Conversely, suppose that A is a hyper AT-subalgebra and $\chi,\gamma,\nu\in H$. If $y\notin A$ and $\chi\circ\gamma\ll A$, then clearly $\inf_{\nu\in(\chi\circ\gamma)}\tilde{\mu}_\Gamma(\nu)\geq rmin\{\tilde{\mu}_\Gamma(\chi),\tilde{\mu}_\Gamma(\gamma)\}$.
Assume that $\gamma\in A$ and $\chi\circ\gamma\gg A$. Then by Definition 2.5, we have $\chi\notin A$. Therefore $\inf_{\nu\in(\chi\circ\gamma)}\tilde{\mu}_\Gamma(\nu)=[0,0]=rmin\{\tilde{\mu}_\Gamma(\chi),\tilde{\mu}_\Gamma(\gamma)\}$
It follows that $\tilde{\mu}_\Gamma$ is an IVF hyper AT-subalgebra of H.

Definition3.9. Let $\tilde{\mu}_\Gamma$ be an IVF set of a hyper AT-algebra$(H,\circ,0)$. Then $\tilde{\mu}_\Gamma$ is named an IVF hyper AT-ideal, if for all $\chi,\gamma,\nu,a\in H$.

(i) $\chi\ll\gamma\ implies\ \tilde{\mu}_\Gamma(\chi)\geq\tilde{\mu}_\Gamma(\gamma)$
(ii) $\tilde{\mu}_\Gamma(\chi\circ\nu)\geq rmin\{\inf_{\nu\in(\chi\circ(\gamma\circ\nu))}\tilde{\mu}_\Gamma(a),\tilde{\mu}_\Gamma(\gamma)\}$

Example3.10. A set $H=\{0,a,b\}$ in Example3.3, we define $\tilde{\mu}_\Gamma$ by follows:
$\tilde{\mu}_\Gamma(0)=\tilde{\mu}_\Gamma(a)=[\alpha_1,\alpha_2]$ and $\tilde{\mu}_\Gamma(b)=[t_1,t_2]$ such that $\alpha_1>t_1$ and $\alpha_2>t_2$, then it is easy to see $\tilde{\mu}_\Gamma$ is an IVF hyper AT-ideal of H.

Definition3.11.Let $(H,\circ,0)$ be a hyper AT-algebra and $\tilde{\mu}_\Gamma: H\to D[0,1]$. Then for all $\chi,\gamma,\nu,a\in H$,

(1) $\tilde{\mu}_\Gamma$ is named an IVFhyper ideal if,

$\chi\ll\gamma\ implies\ \tilde{\mu}_\Gamma(\chi)\geq\tilde{\mu}_\Gamma(\gamma)$ and $\tilde{\mu}_\Gamma(\chi)\geq rmin\{\inf_{a\in(\gamma\circ\chi)}\tilde{\mu}_\Gamma(a),\tilde{\mu}_\Gamma(\gamma)\}$

(2) $\tilde{\mu}_\Gamma$ is named an IVF weak hyper ideal if ,

$$\tilde{\mu}_\Gamma(0)\geq\tilde{\mu}_\Gamma(\chi)\geq rmin\{\inf_{a\in(\gamma\circ\chi)}\tilde{\mu}_\Gamma(a),\tilde{\mu}_\Gamma(\gamma)\}$$

(3) $\tilde{\mu}_\Gamma$ is named an IVFstrong hyper ideal if,

$$\inf_{\nu\in(\chi\circ\chi)}\tilde{\mu}_\Gamma(\nu)\geq\tilde{\mu}_\Gamma(\chi)\geq rmin\{\sup_{a\in(\gamma\circ\chi)}\tilde{\mu}_\Gamma(a),\tilde{\mu}_\Gamma(\gamma)\}.$$

Proposition 3.12.If $\tilde{\mu}_\Gamma$ is an IVF strong hyper ideal of H, then
(1) $\tilde{\mu}_\Gamma(0)\geq\tilde{\mu}_\Gamma(\chi)$, for all $\chi\in H$,
(2) $\chi\ll\gamma\ implies\ \tilde{\mu}_\Gamma(\chi)\geq\tilde{\mu}_\Gamma(\gamma)$,
(3) $\tilde{\mu}_\Gamma(\chi)\geq rmin\{\tilde{\mu}_\Gamma(a),\tilde{\mu}_\Gamma(\gamma)\}$, for all $a\in\gamma\circ\chi$.

Proof. (1) By using Proposition 2.4, we have $0\in\chi\circ\chi$ for all $\chi\in H$. Hence
$\tilde{\mu}_\Gamma(0)\geq\inf_{\nu\in(\chi\circ\chi)}\tilde{\mu}_\Gamma(\nu)\geq\tilde{\mu}_\Gamma(\chi)$.
(2) Suppose that $\chi\ll\gamma$, then $0\in\gamma\circ\chi$. It follows that $\sup_{\nu\in(\gamma\circ\chi)}\tilde{\mu}_\Gamma(\nu)\geq\tilde{\mu}_\Gamma(0)$. By definition3.11and (1) , we have $\tilde{\mu}_\Gamma(\chi)\geq rmin\{\sup_{\nu\in(\gamma\circ\chi)}\tilde{\mu}_\Gamma(\nu),\tilde{\mu}_\Gamma(\gamma)\}\geq rmin\{\tilde{\mu}_\Gamma(0),\tilde{\mu}_\Gamma(\gamma)\}=\tilde{\mu}_\Gamma(\gamma)$.
(3) Let $a\in\gamma\circ\chi$. Since $\tilde{\mu}_\Gamma$ is an IVF strong hyper ideal of H, then
$\tilde{\mu}_\Gamma(\chi)\geq rmin\{\sup_{\nu\in(\gamma\circ\chi)}\tilde{\mu}_\Gamma(\nu),\tilde{\mu}_\Gamma(\gamma)\}\geq rmin\{\tilde{\mu}_\Gamma(a),\tilde{\mu}_\Gamma(\gamma)\}$.

Corollary 3.13. If $\tilde{\mu}_\Gamma$ is an IVF strong hyper ideal of H, then
$\tilde{\mu}_\Gamma(\chi)\geq rmin\{\inf_{\nu\in(\gamma\circ\chi)}\tilde{\mu}_\Gamma(\nu),\tilde{\mu}_\Gamma(\gamma)\}$, for all $\chi,\gamma\in H$.

Theorem3.14.If $(H,\circ,0)$ is a hyper AT-algebra and $\tilde{\mu}_\Gamma: H\to D[0,1]$. Then every IVF strong hyper ideal is an IVF hyper ideal of H.

Proof.If $\chi\ll\gamma$, then by proposition 3.12$\tilde{\mu}_\Gamma(\chi)\geq\tilde{\mu}_\Gamma(\gamma)$ and by Corollary 3.13, We have
$\tilde{\mu}_\Gamma(\chi)\geq rmin\{\inf_{\nu\in(\gamma\circ\chi)}\tilde{\mu}_\Gamma(\nu),\tilde{\mu}_\Gamma(\gamma)\}$.
Thus $\tilde{\mu}_\Gamma$ is an IVF hyper ideal of H.
The following example proves the converse of Theorem3.14 is not true.

Example 3.15. Let $H=\{0,1,2\}$ and $\circ$ be a hyper operation on H defined in the following table

$\circ$	0	1	2
0	{0}	{1}	{2}
1	{0}	{0,2}	{0,2}
2	{0}	{2}	{0,1}

is a hyper AT-algebra. An IVF set $\tilde{\mu}_\Gamma(\chi)$ is defined by

$$\tilde{\mu}_\Gamma(\chi) = \begin{cases} [0,0.9] & if\ \chi = 0 \\ [0.3,0.7] & if\ \chi = 1 \\ [0.1,0.2] & if\ \chi = 2 \end{cases}$$

Then we can simply prove that $\tilde{\mu}_\Gamma(\chi)$is an IVF hyper ideal. But it is not IVF hyper ideal since

$[0.1,0.2] = \tilde{\mu}_\Gamma(2) = \inf_{\nu \in (1\circ 1)} \tilde{\mu}_\Gamma(\nu) < \tilde{\mu}_\Gamma(1) = [0.3,0.7]$.

Theorem3.16. Let $(H,\circ,0)$ be a hyper AT-algebra and $\tilde{\mu}_\Gamma: H \to D[0,1]$. Then $\tilde{\mu}_\Gamma$ is an IVF hyper AT-ideal if and only if it is an IVF hyper ideal of H.

Proof. Let $\tilde{\mu}_\Gamma$ be an IVF hyper AT-ideal of H. Then

, $\chi \ll \gamma implies \tilde{\mu}_\Gamma(\chi) \geq \tilde{\mu}_\Gamma(\gamma)$ and $\tilde{\mu}_\Gamma(\chi \circ \nu) \geq rmin\{\inf_{a \in (\chi\circ(\gamma\circ\nu))} \tilde{\mu}_\Gamma(a), \tilde{\mu}_\Gamma(\gamma)\}$

put $\chi = 0$, we obtain

$\tilde{\mu}_\Gamma(\nu) = \tilde{\mu}_\Gamma(0 \circ \nu) \geq rmin\{\inf_{a \in (0\circ(\gamma\circ\nu))} \tilde{\mu}_\Gamma(a), \tilde{\mu}_\Gamma(\gamma)\} = rmin\{\inf_{a \in (\gamma\circ\nu)} \tilde{\mu}_\Gamma(a), \tilde{\mu}_\Gamma(\gamma)\}$. Hence $\tilde{\mu}_\Gamma$ is an IVF hyper ideal of H.

Conversely, suppose that $\tilde{\mu}_\Gamma$ is an IVF hyper ideal of H. Then

$\chi \ll \gamma\ implies\ \ \tilde{\mu}_\Gamma(\chi) \geq \tilde{\mu}_\Gamma(\gamma)$ and $\tilde{\mu}_\Gamma(\chi \circ \nu) \geq rmin\{\inf_{a \in (\gamma\circ(\chi\circ\nu))} \tilde{\mu}_\Gamma(a), \tilde{\mu}_\Gamma(\gamma)\}$. It follows that using Proposition2.4, we get $\tilde{\mu}_\Gamma(\chi \circ \nu) \geq rmin\{\inf_{a \in (\chi\circ(\gamma\circ\nu))} \tilde{\mu}_\Gamma(a), \tilde{\mu}_\Gamma(\gamma)\}$. Thus $\tilde{\mu}_\Gamma$ is an IVF hyper AT-ideal of H.

Corollary 3.17.Ina hyper AT-algebra$(H,\circ,0)$. Every IVF strong hyper ideal is an IVF hyper AT-ideal.

Proof. Clear

Definition3.18.Let $(H,\circ,0)$ be a hyper AT-algebra and $\tilde{\mu}_\Gamma: H \to D[0,1]$. Then for all $\chi,\gamma,\nu,a,b \in H$

(i) $\tilde{\mu}_\Gamma$ is named an IVFweak hyper AT-ideal if ,

$$\tilde{\mu}_\Gamma(0) \geq \tilde{\mu}_\Gamma(\chi \circ \nu) \geq rmin\{\inf_{a \in (\chi\circ(\gamma\circ\nu))} \tilde{\mu}_\Gamma(a), \tilde{\mu}_\Gamma(\gamma)\}$$

(ii) $\tilde{\mu}_\Gamma$ is named an IVF strong hyper AT-ideal if,

$\inf_{b \in (\chi\circ(\gamma\circ\nu))} \tilde{\mu}_\Gamma(b) \geq \tilde{\mu}_\Gamma(\chi \circ \nu) \geq rmin\{\sup_{a \in (\chi\circ(\gamma\circ\nu))} \tilde{\mu}_\Gamma(a), \tilde{\mu}_\Gamma(y)\}$.

Theorem 3.19. Ina hyper AT-algebra$(H,\circ,0)$. Then $\tilde{\mu}_\Gamma: H \to D[0,1]$ isIVF (weak, strong) hyper AT-ideal iff $\tilde{\mu}_\Gamma$ is an IVF (weak, strong) hyper ideal.

Proof. Similarly to theorem 3.16.

Theorem 3.20.Let $\tilde{\mu}_\Gamma$ be an IVF set of a hyper AT-algebra H.

(i) If $\tilde{\mu}_\Gamma$ is an IVF hyper ideal. Then $U(\tilde{\mu}_\Gamma, \tilde{t})$ is ahyper ideal, for all $[0,0] \leq \tilde{t} \leq [1,1]$ and $U(\tilde{\mu}_\Gamma, \tilde{t}) \neq \varphi$.

(ii) If $\tilde{\mu}_\Gamma$ is an IVF weak hyper ideal. Then $U(\tilde{\mu}_\Gamma, \tilde{t})$ is a weakhyper ideal, for all $[0,0] \leq \tilde{t} \leq [1,1]$ and $U(\tilde{\mu}_\Gamma, \tilde{t}) \neq \varphi$.

(iii) If $\tilde{\mu}_\Gamma$ is an IVF strong hyper ideal. Then $U(\tilde{\mu}_\Gamma, \tilde{t})$ is a stronghyper ideal, for all $[0,0] \leq \tilde{t} \leq [1,1]$ and $U(\tilde{\mu}_\Gamma, \tilde{t}) \neq \varphi$.

Proof.Let $\tilde{\mu}_\Gamma$ be an IVF set of a hyper AT-algebra H and

$[0,0] \leq \tilde{t} \leq [1,1]$ with $U(\tilde{\mu}_\Gamma, \tilde{t}) \neq \varphi$.

(i) Suppose that $\tilde{\mu}_\Gamma$ is an IVF hyper ideal and $\chi,\gamma \in H$ such that

$\gamma \circ \chi \ll U(\tilde{\mu}_\Gamma, \tilde{t})$ and $y \in U(\tilde{\mu}_\Gamma, \tilde{t})$. Then for all $v \in \gamma \circ \chi$, there exists $a \in U(\tilde{\mu}_\Gamma, \tilde{t})$ such that $v \ll a$, that is , $\tilde{\mu}_\Gamma(v) \geq \tilde{\mu}_\Gamma(a) \geq \tilde{t}$. Thus $\inf_{v \in (\gamma \circ \chi)} \tilde{\mu}_\Gamma(v) \geq \tilde{t}$ and by definition 3.11(1), we have $\tilde{\mu}_\Gamma(\chi) \geq rmin\{\inf_{v \in (\gamma \circ \chi)} \tilde{\mu}_\Gamma(v), \tilde{\mu}_\Gamma(\gamma)\} \geq \tilde{t}$. hence $\chi \in U(\tilde{\mu}_\Gamma, \tilde{t})$.Thus $U(\tilde{\mu}_\Gamma, \tilde{t})$ is ahyper ideal.

(ii) Let $\tilde{\mu}_\Gamma$ be an IVF weak hyper ideal and $\chi, \gamma \in H$ such that $\gamma \circ \chi \subseteq U(\tilde{\mu}_\Gamma, \tilde{t})$ and $\gamma \in U(\tilde{\mu}_\Gamma, \tilde{t})$. Then for all $v \in \gamma \circ \chi$, we have $v \in U(\tilde{\mu}_\Gamma, \tilde{t})$, that is , $\tilde{\mu}_\Gamma(v) \geq \tilde{t}$. Thus $\inf_{v \in (\gamma \circ \chi)} \tilde{\mu}_\Gamma(v) \geq \tilde{t}$ and by definition 3.11(2), we have $\tilde{\mu}_\Gamma(0) \geq \tilde{\mu}_\Gamma(\chi) \geq rmin\{\inf_{v \in (\gamma \circ \chi)} \tilde{\mu}_\Gamma(v), \tilde{\mu}_\Gamma(\gamma)\} \geq \tilde{t}$. Hence $\chi \in U(\tilde{\mu}_\Gamma, \tilde{t})$.Thus $U(\tilde{\mu}_\Gamma, \tilde{t})$ is a weakhyper ideal of H.

(iii) Suppose that $\tilde{\mu}_\Gamma$ is an IVF strong hyper ideal of H.

Let $x, y \in H$ such that $(\gamma \circ \chi) \cap U(\tilde{\mu}_\Gamma, \tilde{t}) \neq \varphi$ and $\gamma \in U(\tilde{\mu}_\Gamma, \tilde{t})$. Then there exists $v \in (\gamma \circ \chi) \cap U(\tilde{\mu}_\Gamma, \tilde{t})$, that is $v \in \gamma \circ \chi$ and $v \in U(\tilde{\mu}_\Gamma, \tilde{t})$, that is , $\tilde{\mu}_\Gamma(v) \geq \tilde{t}$. Thus $\sup_{v \in (\gamma \circ \chi)} \tilde{\mu}_\Gamma(v) \geq \tilde{t}$ and by definition 3.11(3), we have $\tilde{\mu}_\Gamma(\chi) \geq rmin\{\sup_{v \in (\gamma \circ \chi)} \tilde{\mu}_\Gamma(v), \tilde{\mu}_\Gamma(\gamma)\} \geq \tilde{t}$. Hence $\chi \in U(\tilde{\mu}_\Gamma, \tilde{t})$.Thus $U(\tilde{\mu}_\Gamma, \tilde{t})$ is a stronghyper ideal of H.

Closed Fuzzy Dominating Set in Fuzzy Graphs

Closed Fuzzy Dominating Set in Fuzzy Graphs

Hayder J. Yousif and [1] and Ahmed A. Omran[2]

Department of Mathematics, College of Education for Pure Science, University of Babylon, Babylon, Iraq

Email: hayderjasim36@gmail.com

Abstract. In this paper, we focus on closed fuzzy domination number of a fuzzy graph $G_F = (\eta, \rho)$by using effective edge and is denoted by $\gamma_{cl}(G_F)$ and we obtain some result on this concept, the relationship between $\gamma\gamma_{cl}(G_F)$ and some other concepts is obtained, finally the concept of closed fuzzy domination number of a join fuzzy graphs is introduced.

1. Introduction

FirstlyA.Zadeh [1] in 1965 suggested the mathematical framework to describe the phenomena of uncertainty in real life situation firstly. Rosenfeld [2] introduced the notion of fuzzy graph and several fuzzy analogs of graph theoretic concepts such as path, cycles and connectedness, The domination number played an important role via theoretical study in various fields as a fuzzy graph [3], topological graph [4], labeled graph [5]and others. Also, several applications in problems life were solved by these branches. So, the study of domination in fuzzy graphs worth to care. The notion of domination in fuzzy graphs was introduced by A.Somasundram, S.Somasundramby using effective edges[6,7] . NagoorGani and chanderskeran [8] discussed domination in fuzzy graph using strong arcs.In this work we introduce the concept of closed fuzzy domination number in fuzzy graph by effective edge.

2.Definitions

Definition2.1[9]: Consider $G = (V, E)$ be an undirected, finite and simple graph. A pair of function $\eta : V \to [0,1]$and $\rho: V \times V \to [0,1]$such that for all $x, y \in V$ we have $\rho(x, y) \leq \eta(x) \wedge \eta(y)$ is called a fuzzy graph and denoted by $G_F = (\eta, \rho)$. Where $\wedge$ is refer to minimum fuzzy value.

Definition2.2[9]: The edge $e = (x, y)$in a fuzzy graph $G_F = (\eta, \rho)$ is called effective edge if $\rho(x, y) \leq \eta(x) \wedge \eta(y)$.

Definition 2.3 [10]: The open neighborhood of a vertex $x \in V(G_F)$ is denoted by $N(x)$ and define as $N(x) = \{y \in V / (x, y)\ is\ effective\ edge\}$and $N[x] = N(x) \cup \{x\}$ is called closed neighbrho-rhoodof a vertex x.

Definition2.4 [10]: Afuzzy graph $G_F = (\eta, \rho)$is called strong if each edge belongs to it iseffecti-ve.

Definition 2.5[11]:The degree of a vertex x is the number of effective edges. And denoted by $\deg(x)$. The minimum degree of $G_F$is $\delta(G_F) = \wedge\{d(x), x \in V\}$ and the maximum degree of $G_F$is $\Delta(G_F) = \vee\{d(x) / x \in V\}$.

Definition2.6[11]: Let S be a subset of $V(G_F)$is a known as the independent fuzzy set if $\rho(x,y) < \eta(x) \wedge \eta(y)$ for all $x, y \in S$.

Definition2.7[7]: Let $A \subseteq V(GAF)$ is known as fuzzy vertex cover of G_F if for each effective Edge e = (u, w), at least on of u, w is in A. The minimum fuzzy cardinality of all minimum fuzzy vertex cover is known as fuzzy vertex covering number of $G_F$and is represented by $\alpha_0(G_{AF})$.

Definition2.8[11]: The fuzzy cardinality of A is defined as$\sum_{x\in A}\eta(x)$.

Definition2.9 [11]:The size m and order n of $G_F = (\eta, \rho)$ are defined to the number of edges and number of vertices respectively, i.e. $n = |V(G_F)|$ and $m = |E|$.

Definition2.10 The fuzzy sizeṢ and fuzzy order$P$ are define as Ṣ =$\sum_{uv\in E}\rho(u,v)$and Ṗ = $\sum_{x\in V}\eta(x)$ respectively.

Definition2.10 [12]: A subset D of a vertex set $V(G_F)$ is called fuzzy dominating set of G_F if for each vertex y in $V - D$ there exist a vertex x in D such that $\rho(x,y) = \eta(x) \wedge \eta(y)$.The minimum fuzzy cardinality for all minimum fuzzy dominating set in G_F is called the fuzzy domin-ation number of G_F and denoted byγ_f.

3.closed fuzzy domination number in fuzzy graph.

Definition 3.1 : Let $G_F = (\eta, \rho)$be any fuzzy graph on a vertex set $V = \{x_1, x_2, \dots, x_n\}$ a vertex sub set $D_k = \{x_1, x_2, \dots, x_k\}$ for some positive integer k, if $N[D_k] = V(G_f)$ then $D_k$is called closed fuzzy dominating (CFD) set of G_f .Where D_k is obtained by:

Choose $x_1 \in V(G_f)$, put $D_1 = \{x_1\}$,if $N[D_1]$= $V(G_f)$ then D_1 is called closed fuzzy dominating set if not, choose$x_2 \in V - D_1$(may $x_1 and\ x_2\ are\ adjacent$) put $D_2 = \{x_1, x_2\}$ if $N[D_2] = V(G_f)$, then D_2 is closed fuzzy dominating set if not, so on choose$x_k \in V - N[D_{k-1}], k \geq 3$, positive integer k such that $N[D_K] = V(G_f)$.

Definition3.2: A closed fuzzy dominating set $D_k$in a fuzzy graph $G_F = (\eta, \rho)$ is called minimum closed fuzzy dominating $(MCFD)$set if the number of vertices of all closed fuzzy dominating set greater than or equal the number of vertices in D_k.

Definition3.3:The minimum fuzzy cardinality of all minimum closed fuzzy dominating sets is called closed fuzzy domination number and denoted by $\gamma_{cl}(G_F)$.
I.e.$\gamma_{cl}(G_F) = min\{\sum_{x\in D_{ki}}\eta(x), D_{ki}\ is\ MCFD\ stes\}$.

Definition3.4:The minimum closed fuzzy dominating set has minimum fuzzy cardinality is called $\gamma_{cl} - set$.

Example3.1: Consider the fuzzy graph $G_F = (\eta, \rho)$, which is given in figure 1.
There are two $(MCFD)$ sets: $D_{k1} = \{y_1, y_2, z, x\} = \{x\} \cup N(y)andD_{k2} = \{x_1, x_2, z, y\} = N(x) \cup \{y\}$such that $N[D_{k1}] = V(G_f)$ and$N[D_{k2}] = V(G_f)$.
The closed fuzzy domination number $\gamma_{cl} = min\{||D_{k1}||, ||D_{k2}||\}$

$$= min\{0.9, 1\} = 1$$

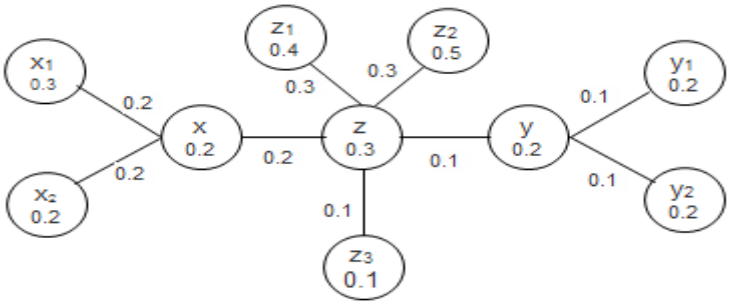

Fig 1

Preposition3.1: Every closed fuzzy dominating set of a fuzzy graph $G_F = (\eta, \rho)$ is a fuzzy dominating set of G_F .

Proof: We know that a vertex subset D_k of $V(G_F)$ in a fuzzy graph G_F is closed fuzzy dominating set if satisfy two conditions:
1) For every vertex x not in D_{k2}, x is dominated by at least one vertex of D_{k2} and also if D_{k2}contains more than two vertices then the third vertex must be not adjacent to the others.
2) $N[D_k] = V(G_f)$,it is clear that every vertex x not in D_k is dominated by a vertex of D_k,thus D_k is fuzzy dominating set of G_F.

Remark 3.1: Let $G_F = (\eta, \rho)$be a fuzzy graph has closed fuzzy dominating set then not necessary $\gamma_F \leq \gamma_{cl}$.

Preposition 3.2: For any fuzzy graph $G_F = (\eta, \rho)\, min\, \eta(x) \leq \gamma_{cl}(G_F) \leq$ P.Further upper bound equality holds if $\rho(\mathrm{x}, \mathrm{y}) < \eta(x) \wedge \eta(y) \forall x, y \in \eta^*$.

Proof: The lower and upper of the inequality are trivial from definition(CFD) set. If $\rho(\mathrm{x}, \mathrm{y}) < \eta(x) \wedge \eta(y) \forall x, y \in \eta^*$, then every vertex is isolated, thus there is only one $(MCFD)$ set which contains all vertices. Hence,$\gamma_{cl}(G_F) = P$.

Theorem 3.1:For every fuzzy dominating set contains at most two vertices of a fuzzy graph itis closed fuzzy dominating set.

Proof: LetD_k be a fuzzy dominating set of G_F contains at most two vertices. Then here are two cases:
Case1: If $D_k = \{x\}$ is trivial
Case2: If $D_k$contains two vertices say $D_k = \{x, y\}$,then $N[D_k] = V(G_f)$, thus no need to any other vertex z to be independent with x, y. Hence,$D_k$is closed fuzzy dominating set of G_F.
Corollary 3.1: Let$G_F = (\eta, \rho)$ be any fuzzy graph then $\gamma_f = \gamma_{cl}$ if G_f is one of the following
i) $G_F \cong K_{n,m}$ complete bipartite fuzzy graph.
ii) $G_F \cong K_n$ complete fuzzy graph.
iii) $G_F$is strong star fuzzy graph.
iv) $G_F$is strong wheel fuzzy graph.

Proof: Let $G_F = (\eta, \rho)$ be a fuzzy graph satisfying above condition, since a fuzzy dominating set of $K_{n,m}$contains two vertices and fuzzy dominating set of (K_n,strong star,strong wheel) has only one vertex. Hence, from theorem (3.1) we have $\gamma_f = \gamma_{cl}$.

Theorem 3.2: Every independent fuzzy dominating set of a fuzzy graph$G_F = (\eta, \rho)$ is closed fuzzy dominating set.

Proof: Let S_K be an independent fuzzy dominating set of G_F then there are two cases:
Case1: IfS_K contains only one vertex, then is trivial S_K is closed fuzzy dominating set .
Case2:If $S_K$contains more than two vertices,since $\rho(x,y) < \eta(x) \wedge \eta\,(y)$ for any two vertices in S_K,therefore every vertex in $V - S_K$ has at least one effective edge inS_K. Thus $N[S_K] = V(G_F)$ and each vertex in $S_K \in V - N[S_K]$. Hence,S_K is closed fuzzy dominating set.

Preposition 3.3: Let$G_F = (\eta, \rho)$be afuzzy graph without isolated vertex then $\gamma_{cl}(G_F) \leq \mathrm{P} - \alpha_0$ where α_0 is the vertex covering number of G_F.

Proof: Let$G_F = (\eta, \rho)$be afuzzy graph without isolated vertex and A is a vertex cover set of G_F then $V - A$ is independent set of G_F. Thus, by theorem (3.2),then $V - A$ is closed fuzzy dominating set of G_F. Hence,$\gamma_{cl}(G_f) \leq ||\,V - A|| = |n| - ||A|| = P - \alpha_0$.

Preposition3.4: Let $G_F = (\eta, \rho) \cong K_n$ then $\gamma_{cl}(K_n) = min\,\eta(x), x \in V(G_F)$.

Proof: Given $G_F \cong K_n$ be a complete fuzzy graph, then all edges in G_F are effective and each vertex dominates to all other vertices. Hence, the closed fuzzy dominating set is singleton sayD_K={x}
such that $N[D_K] = V(G_F)$ and x has minimum fuzzy value. Hence, the result is obtained.

Preposition3.5: Let $G_F = (\eta, \rho)$ be a strong fuzzy star graph then$\gamma_{cl}(G_F) = \eta(x)$, where x is a root vertex.

Proof: Let$G_F = (\eta, \rho)$ be a strong fuzzy star and $V(G_F)$ = $\{x, x_1, x_2, \dots, x_n\}$ where x is a root vertex, since each edge is effective and x is dominates $x_i i = 1,2, \dots, n.$ thus a closed fuzzy dominating set is singleton such that $N[x] = V(G_f)$. Hence, $\gamma_{cl}(G_F) = \eta(x)$.
Preposition 3.6: Let $G_F \cong K_{n,m}$ be a complete bipartite fuzzy graph with n , m vertices then $\gamma_{cl}(K_{n,m}) =$

$$\begin{cases} min\,\{|X|, min\,\eta(x_i) + min\,\eta(y_j)\} \;\; if\; 2 = n < m \;\; , \text{where} x_i \in X, y_j \in Y \\ min\,\{|y|, min\,\eta(x_i) + min\,\eta(y_j)\} \;\; if\; 2 = m < n \;\; , \text{where} x_i \in X, y_j \in Y \\ mi\,n\{|X|, |y|, min\,\eta(x_i) + min\,\eta(y_j)\}\, if n = 2 = m \;\; , \text{where} x_i \in X, y_j \in Y \\ min\,\sigma(x_i) + mi\,n\,\sigma(y_j) \;\; n\,, m \geq 3 \qquad\qquad , \text{where}\, x_i \in X, y_j \in Y. \end{cases}$$

Proof: Given $G_F \cong K_{n,m}$ and $V(K_{n,m})$=$X \cup Y$ where X={$x_1, x_2, \dots, x_n$}and $Y = \{y_1, y_2, \dots, y_m\}$. Since each vertex of X is adjacent to $y_j, j = 1,2, \dots, m$ and similarly each vertex of Y is adjacent to $x_i, i = 1,2, \dots, n$.Then, any minimum closed fuzzy dominating D_K contains two vertices thus there are three cases:

Case1: If *2= n < m* andif there is a vertex $y_j \in Y, j = 1,2, \dots, m$ has a fuzzy value equal to the fuzzy values of one of the vertices of $x_i \in X, i = 1,2$.Then $\gamma_{cl}(K_{n,m}) = mi\,n\{|X|, min\,\eta(x_i) + min\,\eta\,(y_j)\}$, where $x_i \in X, y_j \in Y$,in the same manner if $2 = m < n$
$\gamma_{cl}(K_{n,m}) = mi\,n\{|Y|, min\,\eta(x_i) + min\,\eta\,(y_j)\}$. Where$x_i \in X, y_j \in Y$. if $2 = m < n$
Case2: If $n = 2 = m$ it is clear $\gamma_{cl}(K_{n,m}) = mi\,n\{|X|, |Y|, min\,n\,(x_i) + min\,n\,(y_j)\}, x_i \in X, y_j \in Y$

Case3:If $n, m \geq 3$since each vertex from X dominates to all vertices from Y and vice versa. Then, a $(MCFD)$ set of $K_{n,m}$ contains two vertices. Hence,$\gamma_{cl}(K_{n,m}) = min\,[n(x_i)] + min[n\,(y_j)]$,

where $x_i \in X$, $y_j \in Y$. The prove complete.

Preposition3.7: Let W_{n+1}be a strong fuzzy wheel, then $\gamma_{cl}(W_{n+1}) = \eta(x)$where x is a center vertexW_{n+1}.

Proof: Given W_{n+1}be a strong fuzzy wheel, since each edge is effective then x is dominates to $x_i, i = 1,2, \dots, n$. Then, a closed fuzzy dominating set $D_K = \{x\}$such that$N[D_K] = V(W_{n+1})$. Hence,$\gamma_{cl}(W_{n+1}) = \eta(x)$.

Preposition3.8: For any strong fuzzy graph $G_F = (\eta, \rho)$, $\gamma_{cl} \leq P - \sum_{y \in N(x)} \eta(y)$.

Proof: Let D_K be a$\gamma_{cl} - set$of $G_F$and $x$be a vertexof$G_F$such that $d(x) = \Delta(G_F)$. Then,$V - N(x)$ is(CFD) set, thus$|D_K| \leq |V - N(x)| = |n - \Delta(G_F)|$, take fuzzy cardinality to both sides hence,

4. closed fuzzy dominating set in join and union two fuzzy graphs.

Definition 4.1: Let $G_{F1} = (\eta_1, \rho_1)$ and $G_{F2} = (\eta_2, \rho_2)$be any two fuzzy graphs on V_1andV_1 respectively with $V(G_{F1}) \cap V(G_{F2}) = \emptyset$,the union of $G_{F1}$and G_{F2} is a fuzzy graph G_F defined on $V_1 \cup V_2$ as $G_F = G_{F1} \cup G_{F2} = (\eta_1 \cup \eta_2, \rho_1 \cup \rho_2)$ where:

$$(\eta_1 \cup \eta_2)(x) = \begin{cases} \eta_1(x) & if\ x \in V_1 \\ \eta_2(x) & if\ x \in V_2 \end{cases}$$

$$(\rho_1 \cup \rho_2)(x,y) = \begin{cases} \rho_1(x,y) & if\ (x,y) \in E_1 \\ \rho_2(x,y) & if\ (x,y) \in E_2 \\ 0 & otherwise \end{cases}$$

Theorem 4.1: Let $G_{F1} = (\eta_1, \rho_1)$ and $G_{F2} = (\eta_2, \rho_2)$ be any two strong fuzzy graphs then $\gamma_{cl}(G_{F1} \cup G_{F2}) = \gamma_{cl}(G_{F1}) + \gamma_{cl}(G_{F2})$.

Proof: Let $D_{k1}$and D_{k2} be a $\gamma_{cl} - sets$ of $G_{F1}$and G_{F2} respectively. Since $V_1 \cap V_2$=∅, then$D_{k1} \cap D_{k2} = \emptyset$. Therefore,$D_k = D_{k1} \cup D_{k2}$ is (CFD) set of $G_F = G_{F1} \cup G_{F2}$. Hence,
$\gamma_{cl}(G_F) = \gamma_{cl}(G_{F1} \cup G_{F2}) = ||D_{k1} \cup D_{k2}|| = ||D_{k1} + D_{k2}|| = \gamma_{cl}(G_{F1}) + \gamma_{cl}(G_{F2})$.

Definition4.2: Let$G_{F1} = (\eta_1, \rho_1)$ and $G_{F2} = (\eta_2, \rho_2)$ be any two fuzzy graphs on $V_1$and V_1 respectively with$V_1 \cap V_2 = \emptyset$, the join of G_{F1} and $G_{F2}$is a fuzzy graph $G_F = G_{F1} + G_{F2} = (\eta_1 + \eta_2, \rho_1 + \rho_2)$ where :

$$(\eta_1 + \eta_2)(x) = \begin{cases} \eta_1(x) & if x \in V_1 \\ \eta_2(x) & if\ x \in V_2 \end{cases} \text{ and}$$

$$(\rho_1 + \rho_2)(x,y) = \begin{cases} \rho_1(x,y) & if\ (x,y) \in E_1 \\ \rho_2(x,y) & if\ (x,y) \in E_2 \\ \rho_1(x) \wedge \rho_1(x) & if\ x \in E` \end{cases}$$

where $E`$ is the set of all edges joining vertices of V_1 with vertices of V_2.

Observation4.1: Consider join two strong fuzzy graphs$G_F = G_{F1} + G_{F2}$. For any $x \in V(G_{F1})$and $y \in V(G_{F2})$such that x and y have minimum fuzzy value, the set $\{x, y\}$ is a closed fuzzy dominate-ngset in $G_{F1} + G_{F2}$.Thus, $\gamma_{cl}(G_F) = \gamma_{cl}(G_{F1} + G_{F2}) = min(\eta(x)) + min\ (\eta(y))$.

Theorem 4.2: Let $G_{F1} = (\eta, \rho)$ and $G_{F2} = (\eta, \rho)$ be any two strong fuzzy graphs on $V_1$and V_2 respectively. Then,$\gamma_{cl}(G_F) = \gamma_{cl}(G_{F1} + G_{F2}) \leq min\ \{\gamma_{cl}(G_{F1}), \gamma_{cl}(G_{F2})\}$.

Proof: Let $S_1$and S_2 be a $\gamma_{cl}-$ sets of $G_{F1}$and G_{F2} respectively,by definition the join two fuzzy graphs ,we conclude that $S_1$and S_2 are closed fuzzy dominating sets of G_F. Hence $\gamma_{cl}(G_F) = \gamma_{cl}(G_{F1} + G_{F2}) \leq min\{|S_1|, |S_2|\}$ = min { $\gamma_{cl}(G_{F1}), \gamma_{cl}(G_{F2})$}.

Theorem4.3: Let $G_F = (\eta, \rho)$ be a strong fuzzy graph of *n* vertices , then:

i) $\gamma_{cl}(G_F) = \eta(x_1)$ if and only if $G_F = K_1$ or $G_f = K_1 + \bigcup_{i=1}^{k} H_i$ for Some $k \geq 1$ and connected strong fuzzy graph $H_1, H_2, \dots, H_k$.

ii) $\gamma_{cl}(G_F) = P$ if and only if $G_F = \overline{K_n}$;

iii) $\gamma_{cl}(G_F) = P - \eta(x)$ if and only if $G_F = K_2$or $G_F = K_2 \cup \overline{K_{n-2}}$.

Proof :

i) Suppose that $G_F = K_1 + \bigcup_{i=1}^{k} H_i$ for some $k \geq 1$ and connected strong fuzzy graph $H_1, H_2, \dots, H_k$, choose $x \in V(K_1)$ since $V(G_F) = N[x]$. Thus $\gamma_{cl}(G_F) = \eta(x)$. Conversely, assume that $\gamma_{cl}(G_F) = \eta(x)$ and let $x \in V(G_F)$ such that$\{x\}$ is a (CFD) set of G_F. If $G_F \neq K_1$,then $V(G_F) - \{x\} = N_{Gf}(x)$. Consequently,$G_F = K_1 + \bigcup_{i=1}^{k} H_i$For some $k \geq 1$ and connected strong fuzzy graph $H_1, H_2, \dots, H_k$.Hence, (i) is obtained.

ii) If $G_F = \overline{K_n}$ it clearly that$\gamma_{cl}(G_F) = P$. Suppose that $G_F \neq \overline{K_n}$. If $G_F = K_2$,then $\gamma_{cl}(G_F) = P - \eta(x) \neq P$a contradiction, suppose that $G_F \neq K_2$and let x and y be two adjacent vertices in $G_F$construct a (CFD) set $\{x_1, x_2, \dots, x_k\}$ in G_f such that $x_1 = x$ and $x_2 \neq y$. Then $K \leq n - 1$ vertices, thus $\gamma_{cl}(G_F) < P$, a contradiction. Hence, (ii) is proved.

iii) If n = 2, then a (CFD)set containing exactly one vertex,thus by (i) $\gamma_{cl}(G_F) = \eta(x)$. If and only if $G_F = K_2$. Now if $n \geq 3$. Suppose that $\gamma_{cl}(G_F) = P - \eta(x)$ then $\Delta(G_F) \geq 1$. Suppose that $\Delta(G_F) > 1$and let $x \in V(G_F)$ such that $d(x) = \Delta(G_F)$ construct a (CFD)set $\{x_1, x_2, \dots, x_k\}$ in $G_F$such that $x_1 = x$and $x_2 \in V(G_F) - N[x]$.Then $k \leq n - 2$, then$\gamma_{cl}(G_F) \neq P - \eta(x)$, a contradiction. Thus,$\Delta(G_F) = 1$ therefore$G_F = K_2 \cup \overline{K_{n-2}}$ .The converse is directly.

5. Conclusion

In this research paper a new type of fuzzy domination of fuzzy graph is presented ,which it is called The closed fuzzy domination , and we have studied some basic properties and determined this typeof fuzzy domination for some fuzzy certain graphs . Adding a closed fuzzy domination for some operation in fuzzy graphs discussed

Abstract. In this paper, neural networks (NN) are implemented to manipulate a problem of machine scheduling for a single machine to minimize multicriteria objective function: maximum tardiness, maximum late work and total late work simultaneously ($T_{max}, V_{max}, \sum V_j$). Also the results of applying NN are compared with some exact methods, some heuristic methods and local search methods [7,14]. The used NN is learned by pack propagation algorithm for $n = 3:500$ jobs. NN technique was be found to be effective and used to select the best efficient and optimal schedule which minimizes the objective function.

1. Introduction

When the single Machine Scheduling Problem (MSP) concerns Non Polynomial-hard (NP-hard) problem, the computational time requirements are enormous for large sized problem, to avoid these drawbacks we can appeal to heuristics methods. In recent years, the improvement in heuristic methods has become under the name “local search methods (LSM)”. The local search provides approach high quality solutions to NP- hard problems of a realistic size in reasonable time. The LSM's start with an initial solution and then continually try to add better solution by searching neighborhoods [1].

The concept of Neural Networks (NN) came into being when the first model of neuron was created by two physiologists, Warren S. McCulloch and Walter H. Pitts in 1943 [2]. Willems and Rooda (1994) [3] looked at first formulating a job shop scheduling problem as an integer programming problem, and using a NN to solve the resultant integer programming problem. Foo and Takefuji (1998) [4], employed integer linear programming NNs to minimizing the total starting times of all jobs with a precedence constraint. Hamad et al., (2002) [5], presented a method for machine scheduling with common due date on single machine which depended on artificial NN. The objective of this problem is to minimize the total earliness and the total tardiness cost. The paper of Muralidhar and Alwarsamy (2013) [6] considers the problem of scheduling jobs on parallel machines with the combined objective to minimize the makespan, total tardiness and total earliness using NN technique. Abdul-Razaq and Ali (2014) [2] presented an approach for scheduling problem on single machines with multi objective to decrease the total completion of time and the total tardiness by using NN.

One of the important local search methods is Particle swarm optimization (PSO) which introduced by R. Eberhart and J. Kennedy in 1995. This method is obtained from the experiments with some algorithms that depend on the “flocking behavior” which are seen in some kinds of birds. PSO is an

optimization algorithm that lies under the soft computing umbrella which is covers genetic algorithm (GA) and some evolutionary algorithms [7].

The Bees Algorithm (BA) is an optimization algorithm inspired by the natural foraging behavior of honey bees to find the optimal solution. The pseudo code for the BA in its simplest form is mentioned in [7].

In section 2 we discuss some important terminologies and notations for MSP. The NN is discussed in details in section 3. The MSP formulation of this paper is detailed in section 4, while the experimental results of applying NN, for the problems which will be discussed in this paper, are shown in section 5. In section 6 we discuss the analysis of the results of applying NN to solve MSP. Lastly, the conclusions are shown in section 7.

2. Machine Scheduling Terminologies and Notations

Most single MSPs (SMSP's) assume that the processing times of jobs are known and have fixed values through the process, and SMSP's has good learning effects form a new subfield in many areas like the scheduling [8].

In the classical scheduling models, most researchers consider that the job processing times are all constant numbers [9]. For decades, MSP researches will be more interest on one performance measures. The most real world with applications of scheduling, the researchers will be more interest in the multiobjectives which have received more attention in recent years [10].

Definition (1) [10]: The "optimize" term in a multicriteria decision making problem means that a solution with some objective which we can't improve it without worsening the other objectives.

Definition (2) [10]: Any feasible schedule σ is called Pareto optimal, or nondominated (or efficient) with respect to the objective functions f_1 and f_2 if there is no different feasible schedule π such that each $f_1(\pi) \leq f_1(\sigma)$ and $f_2(\pi) \leq f_2(\sigma)$, take in consider that at least one of the inequalities is strict. The more common notations which used in scheduling are:

n	:	number of jobs.
p_i	:	Processing time of job i.
d_i	:	Due date of job i.
C_i	:	Completion time of job i.
T_i	:	Tardiness of job i.
T_{max}	:	max $\{T_i\}$.
V_i	:	min$\{T_i, p_i\}$.
V_{max}	:	Max $\{V_i\}$.
ΣV_i	:	Sum of V_i.

3. Neural Network

The most important neural networks is the Feedforward neural networks (FNNs) which have been used widly in regressions and classification applications. To approximate any target continuous function we can use a single hidden layer feedforward networks with additive models. Single hidden layer feedforward networks have good role in many applications and have been implemented widly in both sides, the theory and application sides [11].

3.1 Back Propagation Algorithm

Back Propagation (BP) algorithm consists of two important stages, the forward stage and revers propagation. The NN contains hidden layer with output layer and lastly input layer, in which the states of used neurons in every layer can influence the neurons under them. As initial state, starting with the process wihch acts in forward propagation, the signal will be transmitted from the input layer to the hidden layer and calculated at the hidden layer. The results of calculation is recalculated in hidden layer

which are sended to the output layer and will be considered as output. The final results are compared with the some values called the expected valu, then the error which is the absolute differenes will be corrected by the reverse state propagation, which is conisdered as backtrack. In the hidden layer, a function which is used in this process is called the activation function. This process still be repeated. The random weights will be changed depending on the results in output layer through every reverse calculation propagation to reduce the error. When the error reach some spesfied value, stop the calculations [12].

The learning rate (η) determines the portion of weight needed to be adjusted. However, the optimum value of η depends on the problem. The momentum (α) determines the fraction of the previous weight adjustment that is added to current weight adjustment. It accelerates the network convergence process.

During the training process, the learning rate and the momentum are adjusted to bring the network out of its local minima, and to accelerate the convergence of the network [2]. The details of BP Algorithm are described in [2].

3.2 Fitness Criterion of NN

One of the stopping criterions is the fitness value. Since the BP algorithm is chosen to be a supervised learning algorithm, then there are observed values (O_i) and desired output values (G_i). These two values have to be compared, if they are closed to each other, then the fitness is good, else the algorithm must continue its calculations until this condition is satisfied or the specified number of iterations is finished [2].

The Mean Squared Error (MSE) is one of the tests for the comparison process:

$$\text{MSE} = \frac{1}{n}\sum_{i=1}^{n}(O_i - G_i)^2 \quad \ldots(1)$$

where n is the number of the compared categories.

4. Problem Formulation

The problem of scheduling $N = \{1,2,\ldots,n\}$ the set of n jobs, these jobs are processed on a one machine to minimize the multicriteria which may be act as follows. Each job $j \in N$ has is to be processed on an one machine which can process only one job at a time, job j has a processing time p_j with due date d_j. All jobs are ready for processing at a time zero. If a schedule $\sigma = (1,2,\ldots,n)$ is given, then the completion time $C_j = \sum_{k=1}^{j} p_j$ for every job j can be calculated and then the tardiness of job j, $T_j = max\{C_j - d_j, 0\}$ is easy to compute. We aim to find a schedule $\sigma \in S$ (where S is the set of all possible feasible schedules) that minimizes the tricriteria problem. This problem belongs to simultaneous optimization.

4.1 The $1//(T_{max}, V_{max}, \sum V_j)$ Problem

We aim to find the order of the jobs on one machine to minimize the multicriteria $(T_{max}, V_{max}, \sum V_j)$. This problem, which is denoting by (P), can be formulated mathematically as follows:

$Z = min(T_{max}(\sigma), V_{max}(\sigma), \sum V_j(\sigma))$.

Subject to

$$\left.\begin{array}{rl} T_{\sigma(j)} \geq 0 & ,j = 1,\ldots,n \\ T_{\sigma(j)} \geq C_j - d_{\sigma(j)} & ,j = 1,\ldots,n \\ V_{\sigma(j)} \leq T_{\sigma(j)} & ,j = 1,\ldots,n \\ V_{\sigma(j)} \leq p_{\sigma(j)} & ,j = 1,\ldots,n \\ T_{\sigma(j)}, V_{\sigma(j)} \geq 0 & ,j = 1,\ldots,n \end{array}\right\} \quad \ldots(\text{P})$$

where $\sigma_{(j)}$ represents the position of job j in the schedule σ. The discussed P-problem is NP-hard because the problem $1//\sum_{j=1}^{n} V_j$ is NP-hard [13].

4.2 The $1//(T_{max} + V_{max} + \sum V_j)$ Problem

We aim to find the order of the jobs on one machine to minimize the the sum of maximum tardiness, maximum late work and total late work. This problem, which is denoting by (P_1), can be formulated mathematically as follows:

$$Z = min(T_{max}(\sigma) + V_{max}(\sigma) + \sum V_j(\sigma))$$

Subject to

$$\left.\begin{array}{ll} T_{\sigma(j)} \geq 0 & ,j = 1,\dots,n \\ T_{\sigma(j)} \geq C_j - d_{\sigma(j)} & ,j = 1,\dots,n \\ V_{\sigma(j)} \leq T_{\sigma(j)} & ,j = 1,\dots,n \\ V_{\sigma(j)} \leq p_{\sigma(j)} & ,j = 1,\dots,n \\ T_{\sigma(j)}, V_{\sigma(j)} \geq 0 & ,j = 1,\dots,n \end{array}\right\} \quad \dots(P_1)$$

5. Experimental Results of Applying NN for P and P_1-Problems

For the two problems (P) and (P_1), a simulation has been constructed in order to apply the NN. For practical comparison, the Branch and Bound (BAB), Hybrid Method (HM) and Modified BAB (MBAB) details results are obtained from [14], and PSO and BA details results are obtained from [7].

5.1 Constructing of Multi-Layer NN to Solve P and P_1-Problem

The NN which is proposed for the single machine to minmize the multiple criteria functions ($T_{max}, V_{max}, \sum V_j$) for MSP, is arranged into three layers of the processing units. First we have an input layer consists of (10) nodes, then the hidden layer consists of (8) nodes, lastly the output layer which include a single node. The number of units in each, the input and output layers depended on to the representation adopted for the MSP [15]. In the suggested representation of the proposed NN, the input layer contains important information interpreted the MSP in the form of a vector or string of continuous values. In table (1) we show the 10 input nodes which are designed to contain the important information for each job that have to be scheduled [5].

Table 1. 10 units information of input layer units of NN [5].

Input units									
1	**2**	**3**	**4**	**5**	**6**	**7**	**8**	**9**	**10**
$\frac{p_j}{M_p}$	$\frac{d_j}{M_d}$	$\frac{SL_j}{M_{sl}}$	$\frac{\alpha_j}{10}$	$\frac{\beta_j}{10}$	$\frac{\overline{p}}{M_p}$	1	$\frac{\overline{SL}}{M_{sl}}$	$\sqrt{\frac{\sum(p_j - \overline{p})^2}{n \times \overline{p}^2}}$	$\sqrt{\frac{\sum(SL_j - \overline{SL})^2}{n \times \overline{SL}^2}}$

where SL_j slack for job *j*such that $SL_j = d_j - p_j$,

M_p: longest processing time among the n jobs $= max\{p_j\}$.

M_d: longest due date among the n jobs$= max\{d_j\}$.

M_{sl}: largest slack time for the n jobs $= max\{SL_j\}$,

$\alpha_j = \beta_j = 1, j \in N, N = \{1,2,\dots,n\}$.

$\overline{p} = \sum_{j=1}^{n} \frac{p_j}{n}$ and $\overline{SL} = \sum_{j=1}^{n} \frac{SL_j}{n}$ are the mean of processing times and slak time respectivly.

Thus, 10-input vectors represent each job, which includes information related to that job and the relation of this job to the other jobs in the MSP. The output unit includes values that are in the range of [0.10-0.90], the value being an pointer of where this job represented at the input layer should where its position lie in this schedule. Low values should put in the beginig positions in this schedule, while higher values which has less priority and the job position put in the end of tis schedule. The objective value related for each input training pattern is a target value that assigns the position determines the best or optimal schedule. The objective value G_j for the job has the j^{th} position in the best or optimal schedule is calculated as in equation (2) [5];

$$G_j = \left\{0.1 + 0.8 \times \left(\frac{j-1}{n-1}\right)\right\}, j = 1,2,\dots,n \quad \text{...(2)}$$

Equation (2) ensures that the n target values are distributed evenly between $0.1-0.9$. The number of units in the hidden layer is selected by trial and error during the training phase. The suggested final network for single machine with multi objective has 8 units in its hidden layer and 1 unit of output layer, therefore known as $10-8-1$ network.

5.2 Neural Network BP -Training Results

To train the proposeded NN, each vector with their output is presented individually at the input layer and output layer of the NN. Before we disscuss the NN training we will describe the proposed NN-Scheduling algorithm using BP as a learning algorithm.

NN-Scheduling Algorithm for P and P_1-problem

Step(1):READ (n) { n=*number of jobs*}
READ (p_j , d_j) { *processing time and due date*}
Step(2):DEFINE input units { *as input equations in Table* (1) }
Calculate G_j {*actual value as in equation* (2)}
Step(3):INITIALIZATION
W_{jkl} =random$(-1,1)$ {*weight in layer j, node k connected node l*}
Step(4):IMSE = Maxint; Error= 0.0001; Threshold=0.01{*specified by experiance*}
Iter=0; NI=10000; BSC=Mxint; BST=Maxint;
WHILE (Iter ≤ NI) AND (IMSE >Error) DO
Iter = Iter + 1;
Compute MSE { *using equation* (1) }
σ =*SORT*(O_j);
IF$(T(\sigma) < BT)$ *OR* $(V(\sigma) < BV)$*OR* $(SV(\sigma) < BSV)$*THEN*
{IF $(T(\sigma) + V(\sigma) + SV(\sigma) < BT + BV + BSV)$*THENfor P1}*
$\sigma' = \sigma; BT = T(\sigma); BV = V(\sigma); BSV = SV(\sigma)$; *IMSE=MSE*;
END; *{ENDIF}*
END; *{ ENDWHILE }*
Step(5):Best sequence= σ', with minmium BT, BV and BSV;
{with minmum $BT + BV + BSV$ for P1}
Step(6): END;

Training is considered completed after an average10000 cycles or more using a 10-8-1 configuration. A cycle is concluded after the network has been exposed once, in the course of the BP algorithm, to each one of the available training patterns. The trained NN is used to find job schedule for our problem.

Table (2) shows the comparison results of Effecinit Points (EP), consuming time, Average of MAE (AMAE) and MAER with EP of applying NN-BP for P-problem with CEM for $n = 3:10$.

MET : Method={CEM, HM, MBAB}.
NI : Number of iterations.
MSE : Mean square error.
MAER : MAE Relative =abs(best(EP of MET)-best(EP of BP)) / best(EP of MET)
R : 0≤Real value≤1.
F : Objective or target function of Problem (P).
F_1 : Objective or target function of Problem (P_1).
BS : Best Solution.
CT : Complete Time.
BT : Best Time to obtain best value(s) of each experiment.
NI : Number of Iterations.

Table 2. Applying NN-BP for (P) for $n = 3:10$ and compared with CEM.
