E-Mails: [1]ahmedj.aljanaby@uokufa.edu.iq,

IHICPAS Conference Proceeding volume contain the novel contributions that were reviewed and presented through the Ibn Al-Haitham International Conference for Pure and Applied Sciences (IHICPAS) will be held in College of Education for Pure Science (Ibn al-Haitham), University of Baghdad on 20 and 21 December, 2020., where the conference covers 6 tracks which includes (Track1 Chemistry, Track 2: Mathematics, Track3: Computer Science, Track 4: Biology Sciences, Track 5: Physics, and Track 6: Remote Sensing and GIS). IHICPAS aims to gathering together all the new trends, projects, technologies, and recent research works in many fields in pure and Applied Sciences. The received papers which passed the double-blind reviews which successfully passed the reviewers comments and editorial board decisions comes from various authors around the world, where the authors are either working in academics centers, universities, research institutes, corporations, industries, and other agencies or postgraduate students where the presented works refers to their novelty in their research works.

IHICPAS Conference got very significant interesting from authors that comes from several countries like: UK, India, French, Morocco, Turkey, Nepal, Philippines, Indonesia, Australia, Egypt, Lebanon, Algeria, Iran, Pakistan, Malaysia, and Many other Countries where the authors are successfully presented their works and attend the sessions who managed by our scientific and organizing committee Members, and answered all the questions and dotes that directed by session chairs and attendances. We successfully held this conference within 2 days (20 and 21 December 2020), where in the first day we successfully listen to the keynote speakers' presentations then the session started from 10:00 AM based on Iraq Standard Time till 10:00PM. We would like to express our thanks and appreciation to all our session chairs for their hard work and attend our (12) sessions through two days and more than 10 hours per day to deliver the presented works in successful manner.

IHICPAS conference hosted 6 plenary sessions per day, where in the first day (20th December 2020) the Inauguration program started from (9:00 AM) till (10:00 AM). Then Sessions Started directly by dividing the authors into their certain session who managed by 4 Chairs (2 From Scientific Committee board, 1 from Organizing committee board and 1 from Conference Editors chairs board). The manuscripts which have presented and published in the IOP Conference Series: Journal of Physics under the peer-reviewed process. We love to express our gratitude for all of the participants, keynote speakers, organizing committee members, Scientific Committee members, and other Guest Chairs and Patrons for their supports and achievement, and we extend our thankful to all our reviewers (230+) reviewers, for their times and valuable notes. We extend our thanks to our international committee members for gaudiness of their participators and promote this conference in their regions, and successfully present very attractive presents. Also, we thank our authors for their effective contribution in our conference and participating with us in this conference proceeding. We also, acknowledge SICC Center at University of Kufa, Dijla Co. Pvt. Ltd., for their hospitality and sponsoring the conference. Furthermore, would like to thank SICC Center for supporting us to held this conference in successful manner.

Venue of the Conference

The conference has been organized Physically and virtually in College of Education for Pure Science (Ibn al-Haitham), University of Baghdad, in 20-21 December 2020. IHICPAS organizers aims through their scientific departments, and preparing a generation of students armed with knowledge and looking forward to building their country according to the new scientific developments. The university endeavors towards making use of them in an appropriate cultural means as well as building good and new scientific establishments for the sake of developing the present through scientific research.

The Reason(s) why IHICPAS Conference Held virtually:

Due Covid-19 Pandemic Situation in many countries around the world and the incredible increases cases through this Pandemic is very dangerous, and per day the number of cases in our peoples that infected by Covid-19 in the world and in Iraq, and due to the World Health Organization and Ministry of Health Recommendations, the conference organizers decided to conduct and held this conference Virtually to keep the life of participants and also due the challenges of lock down. Conduct IHICPAS virtually bring huge number of participants that non expected due many peoples are unable to attend conference physically, they able to attend our online Conference due to the friendly uses of Virtual Software without spending money for flight tickets or other matters to attend that type of conferences. However, we feel those peoples by attend our conference achieved our goal by inviting very attractive authors and participants who are interest to attending this conference, they will not able to attend it if it's held in non-virtually, However, The organizing committee have achieved these tasks and all sessions organized and managed successfully through Zoom Conference Meeting, where the team attend physically to use the University of Baghdad, College of Education for Pure Science (Ibn al-Haitham), infrastructure to achieve this conference Successfully.

Technology, Technical Difficulties and Drawbacks of Conference Virtually.

IHICPAS Conference Consider the ZOOM Meeting Software as the main software to conduct this conference, as the Main Software for delivering the Session discussions and Meeting information to all participants in Iraq and Other countries. The main advantages of this Technology is to reduce the time and space when someone would like to attend any scientific event and also broken the limitations for the peoples and authors who would like to attend this event from far away countries, in which the provide a facility to provide a platform that able to manage and control large number of participants is the main challenge of choosing the best software, we find Zoom meeting is the best software that fulfill our

requirements and provide amazing virtual platform to manage our authors and participants through our conference sessions.

The main technical difficulty in virtual software is the internet connection, due to covid-19 band, many peoples sitting at home and many jobs transformed from physical to virtual mode, However, internet connection and ISP infrastructure may affected due the large number of traffic devices that join to the network recently and may the ISP companies do not have good infrastructure to provide stable connection through the meeting or sessions. Hence, we conducted our sessions in the early morning time where the Babylon university, SICC, and Dijla Jewel Pvt. Ltd. Infrastructure used to achieve this task successfully. With Blessing of God, we held this conference successfully without any issue and we are looking to conduct this conference in future in physical manner after the world remedy from Covid-19 pandemic.

The Main Technical Difficulties of Virtual Meetings can be summarizing as follow:

Virtual Techniques and software that used to achieve these types of events and conferences in virtual mode, many software can be used, which can be offered by many companies either in free or paid own services. The main challenge to use online technique is to find the good software that able to manage large number of attendees with varied number of traffic data, we feel that the internet connections is the main source for any challenge in any online event. However, if the internet connection became slow, where many users are forced to exit and rejoin many times through the session. So many software's can used to achieve high quality meeting, need some certain limitations, like number of users, to keep the bandwidth little good, however not all interested peoples can attend meeting, difficulty of join and attend the meeting rooms, view and share the content, etc.

Drawbacks of virtual conference, we do not feel the virtual conference have much drawbacks than physical conferences, in which many peoples can avoid many fees payment for travels and hosting, registration fees, as well as flight tickets in which virtual conferences gives free offer for all the above issues. Another thing is, some famous figures and professors can easily join and attend without consider their fees in which they can attend and speak for hours when they sitting at home.

The main drawback we feel that if some authors would like to visit the conference venue for direct discussion and made good collaboration, so virtual meeting can also achieve this task easily, at the current time where all world suffer from Covid-19 pandemic.

With our pleasure to attend our next conferences in Future

Dr. Ahmed J. Obaid, Conference Publication Chair

Peer review declaration

Peer review declaration

All papers published in this volume of Journal of Physics: Conference Series have been peer reviewed through processes administered by the Editors. Reviews were conducted by expert referees to the professional and scientific standards expected of a proceedings journal published by IOP Publishing.

- **Type of peer review: Single-blind / Double-blind / Triple-blind / Open / Other (please describe)**
  ICMAICT Conference follow Double-Blind Review where all received articles are checked for similarity through the official account of Turnitin All the Articles passed the similarity given to random authors for evaluation and given us their reports in certain forms, according to double review decision and Editors decision the paper either accepted, revised or rejected.

- **Conference submission management system:**
  At the beginning of Conference CFP has been received through Easy chair, then we are considering our own design system where the paper can be submitted, and tracked through this system, all papers has its own ID, for evaluation progress later.

- **Number of submissions received:**
  At the Beginning we received more than 525 submissions from all authors that comes from more than 8 countries, we consider only 290 papers for further progress, the conference organizers, scientific committee, guest Editors consider only the suitable submission (289) for further process.

- **Number of submissions sent for review:**
  Total Number sent for reviews was 420 and based on scientific committee decision and guest editor decision and alternative reviewers.

- **Number of submissions accepted:**
  Out of 525, papers we select 420 papers as initial Accepted Articles, we processed only 290 Articles due to the following reasons:
    - Some Corresponding authors do not complete the revision in well.
    - Some Papers do not complete the Copyright and Payments.
    - Some papers either published somewhere.
    - Some papers rejected based on editor's decision.

- **Acceptance Rate (Number of Submissions Accepted / Number of Submissions Received X 100):**

  Total Number of Received Papers = 525.

  Total Number of Accepted Papers = 290

Acceptance Rate = $\frac{Number\ of\ Submission\ Accepted}{Number\ of\ Submission\ Received} \times \% = \frac{290}{525}$ **= 55%**

- **Average number of reviews per paper:** 2 Reviewers for Each Paper
- **Total number of reviewers involved:** 188 Reviewers
- **Any additional info on review process:**
  - Each paper Assigned to 2 reviewers once passed the technical check.
  - Once Review Reports received the decision of Guest Editor will be as 3rd reviewer on each certain paper.
- **Contact person for queries:**

This work was conducted to study the protective role of Moringa oliefera seeds extract (MSE) against the toxic effect of commercial lead nanoparticles (CPbNP) in rats. Twenty eight albino male rats were divided into four groups (seven animals in each one) as follow: (A) control group, (B) 160mg/kg body weight per day (b. wt./d.) of M. oliefera (MSE)seed extract, (C): 5mg CPbNP/kg b. wt./d. and (D): MSE + CPbNP. The experimental period was 45 days. Blood was drawn for protein and enzyme estimation at the end of the period of exposure. The rats were dissected and the liver, kidney, spleen and muscle were isolated for Pb estimation. Results showed that the levels of bioaccumulated lead, serum alanine aminotransferase, aspartate aminotransferase, alkaline phosphatase, malondialdehyde were significantly increased in exposed animals to CPbNP ($P < 0.05$). In contrast, there was a significant reduction of total proteins, albumin, glutathione, superoxide dismutase enzyme and catalase enzyme activities ($P <$

0. 05) in comparison to control. But the administration of the CPbNP with MSE, all the above biochemical changes were improved significantly. It is concluded that CPbNP has a significant toxic effect on rats, and that seed extract of M. Oleifera can reduce it.

Biological control on plant pathogenic fungus, *Pythium* by using some plant extracts *in vivo* and *in vitro*

Rajaa Fadhil Hamdi, Farkad Hawas Musa and Sameer Sarhan Alrawi

The inhibitory activity of 5 plant extracts, *Allium sativum, Opuntia ficus-indica, Malva parviflora, Mentha spicata* and *Plantago lanceolata* with concentration 50 % and 100 % were assessed against the mycelial growth of *Pythium* fungus *in vivo* and *in vitro*. Results showed that all the concentrations of plant extracts give significant inhibition in the mycelial growth of *Pythium* fungus; the highest concentration (100 %) prevented large amounts of mycelial growth followed by lower concentration (50 %) of plant extracts. *Opuntia* extract at 100 % concentration gave great effective in inhibition of *Pythium*'s mycelial production, which gave 100 per cent inhibition ratio while 50 per cent concentration gave 77.28 % inhibition ratio followed by other plant extracts, *Mentha, Allium sativum, Plantago*, then *Malva* respectively. *In vivo* experiments, tomato seed infused in five plant extracts separately and then sown with soil contaminated with *Pythium* fungus and watered after that with these five plant extracts. After 30 days, the length of the stems and roots were measured in centimetres. While the tomato seeds which were soaked with distilled water and then sown in polluted soil with fungus *Pythium*, and watered with distilled water (control) did not show any growth.

Morphological, histochemical and histological study of the ileum in the Iraqi Black Partridge (*Francolinus francolinus*)

Intidhar Mohammed Mnati, Ola Al-Bhadly and Nawar Rushdi Jaber

− Close abstract View article PDF

Objective: This project aimed to study the morphological description and histological structure of ileum in Iraqi black partridge (*Francolinus francolinus*). Methods: To conduct this investigation, 20 healthy Iraqi black partridge were collected from local suppliers. Birds were euthanized, dissected and then specimens were processed for histological and histochemical staining techniques. Results: A morphological study showed that the ileum appears as a short narrow tubular structure. It extends from the wide end of the jejunum and ends in the Ileo-caecal junction region. Histologically, the wall ileum consists of four tunica mucosa, submucosa, muscularis and serosa. The mucosa was lined by simple columnar epithelium with goblet cells. The muscularis mucosa is arranged in two thick layers of smooth muscle fibers, outer longitudinal and inner circular bundles. The tunica submucosa was a thin layer of fibrous connective tissue. Tunica serosa was loose connective tissue covered by mesothelium. The goblet cells gave a positive reaction with PAS stain. Conclusion: Goblet cells neutral

mucopolysaccharide secretions; in fact, the latter stain is an indicator mucin substance which are very important in digestion and absorption and subsequent body growth of the bird.

The Correlation of Histopathological Findings with Ultrastructural Changes in Hepatocytes after Yangonin "Ya"-Intoxicated Rats Alone and In Combination with EtOH: Sub-Acute & Sub-Chronic Study

Mohammed A. Hasan

Yangonin "Ya" has been used for centuries as a herbal supplement, for its mood-altering properties. It has been used as a recreation agent, for relaxation, as well as for pain relief. However, hepatotoxicity is a widespread problem associated with medicines in general. Most herbal supplements are metabolized by the liver, and thus the liver represents the target organ. At present, Yangonin toxicity appears to be "idiosyncratic". Therefore, a study was designed in order to investigate the organelle-based changes in hepatocytes, after treatment with Yangonin alone and in combination with EtOH. Thirty rats were divided into five groups comprising of six animals each. The groups comprised of the control groups {(NCx) & (PCx)}, Yangonin (Ya) group, ethanol (EtOH) group, and the combination of (Ya) and ethanol (EtOH+Ya) group. The experiment was conducted over a period of 14 weeks, as a sub-chronic study. At the end of the 14 th week, mitochondria, peroxisome, rough and smooth endoplasmic reticulum, and nuclei of hepatocytes, were evaluated using a scoring system. The results were compared with histopathological findings, as well. Treatment with Ya significantly induced hepatotoxic scores as compared to the control groups. Organelle injury scores increased significantly with Ya treatment, while rats that received "EtOH+Ya" showed the severest lesions of liver scores such as, severe hepatocellular degeneration, necrosis, and hypertrophy. Ultrastructural and histopathological scores in both groups were in very strong correlation (r = 0.928 for EtOH, r = 0.921 for Ya alone and r = 0.903 for Ya plus EtOH group). In conclusion,

ethanol enhanced the sedative and hypnotic activity of Ya, and markedly increased toxicity. Findings based on TEM examination of organelles, supported the histological results as well as tissue lesions/injuries in hepatocytes, a result of hepatotoxin-induced hepatopathy.

Evaluation of mycotoxins and heavy metals pollution in some types of noodles in local markets

Jameel Mohammed Mohammed, Marwa Ibrahem Abd and Saif Ali Khishan

− Close abstract View article PDF

This study was conducted to estimation mycotoxins and some heavy metals in some types of noodles in Salah Al-din governorate markets. In this study 6 species of Aspergillus were detected which were *A. flavus, A. parasiticus, A. fumigatus, A. terreus, A. ochraceus* and *A. niger* and 5 genus of fungi were *Fusarium verticillioides, Penicillium, Mucor, Alternaria* and *Rhizopus* isolated on the three types of media used. The results show presence of the three types of mycotoxins in all samples. The concentrations of the aflatoxin B1 ranged between 1.145 - 5.041 ppm. Concentrations of fumonisin between 8.498 - 19.496 ppm. Concentrations of ochratoxin A ranged between 3.960 - 52.543 ppm. The results also show that the concentration of copper and cadmium was at (0.50 - 1.23) (0.05 - 0.31) ppm respectively, while the concentration of lead was less than 0.1 ppm in all samples.

Anatomical histological structure of the cerebellum in the Iraqi frog *Rana ridibunda ridibunda*

Nahla A. AL-Bakri and Jumana J. Al-Zuheri

− Close abstract View article PDF

The current study was designed to investigate the histological structure of the cerebellum in the Iraqi frog *Rana ridibunda ridibunda*. The cerebellum was removed surgically from 20 Iraqi frogs, *Rana ridibunda ridibunda*, and preserved in fixative of 10% formalin solution for a period of 72 hr, then the histological sections were prepared by the method of paraffin. The results of the study showed that the cerebellum of the adult Iraqi frog is one of the rhombencephalon regions, and consists of three layers, molecular layer, purkinje cells layer, and granular layer. The present histological findings suggest that the cerebellum of the Iraqi frog is very similar to that of other vertebrates, Therefore it represents the basic rule in understanding the histological formation of the cerebellum.

Assessment of Health Awareness: Spreading and Prevention of Infection with SARS-CoV-2 Virus in the Anbar Governorate-Iraqi Community

Harith Abdulrahman Ahmed, Mustafa Nuhad Al-Darraji and Osama Abdulrahman Ahmed

SARS-COV-2 virus is one of the fastest spreading viruses targeting the respiratory and other system in the body. Therefore, it is necessary to emphasize the needs for preventive measures, particularly at the moment because the virus is spreading fast in various parts of the world, causing various levels of infections: medium to severe, and fatal. The study aimed at assessing health and environmental awareness apart from correcting some scientific healthy concepts related to COVID-19. Additionally, this study also attempted to spread awareness in a simple way that simulates all levels of society. The current study focused on Iraq, specifically Al-Anbar governorate, as it is free from COVID-19 infections according to the reports of the Iraqi Ministry of Health in cooperation with the WHO. In this study, a set of electronic questionnaire was selected to collect relevant data. The electronic questionnaire was chosen because of the quarantine order by the authority due to the COVID-19. The items were built based on a variety of health, preventive, and environmental scientific questions and it was electronically distributed to 2084 individuals in Governorate. The findings revealed that Ramadi city had the most participants responding to the questionnaire (47%). The participation rate for female was 52% while the rate for male is 48%. The biggest age group was 20-24 years old and the highest academic background was a bachelor's degree in education. The findings

indicated a good percentage of health awareness among the participants in the governorate emphasizing on health instructions and preventive measures taken by the Crisis Cell, which had an important role in being infectious-free during the period. It is summarized that the level of health awareness and the role of the Crisis Cell: worked together COVID-19 the infection. Additionally, this questionnaire had a great role in correcting some understanding of scientific concepts among the public.

Detection of *Listeria monocytogenes* in frozen food using a specific *inlB* virulence gene

Aula M. Al-Ghanim and Basil A. Abbas

− Close abstract View article PDF

This study was undertaken to detect the presence of *Listeria monocytogenes* in frozen food. A total of 200 different food samples were collected from Basrah markets, southern Iraq, during September 2015 to March 2016. These samples included frozen fish, frozen burger, frozen chicken and worker's hands swabs, 50 each. The polymerase chain reaction technique was used to evaluate the presence of *Listeria monocytogenes* by using of *inlB* specific gene. The PCR results revealed that only four samples (7.27%) were contaminated by *Listeria monocytogenes*. In conclusion frozen food may carry a dangerous type of bacteria and lead to human illness.

This study aimed to evaluate whether (*1237 T/C*) polymorphism is related with diabetic foot ulcer in type-2 diabetes mellitus of Iraqi patients in Najaf city. Diabetic foot ulcer (DFU) is one of the most prevalent and serious diabetic complications. DFU accounts for about 15% of the diabetic population. It is commonly associated with the increased diabetic morbidities and mortalities. The type 2 diabetes is recognized by aberrations of glucose, lipid and protein metabolism. It is increasingly appreciated that wound healing defect seen in diabetic patients is attributed to the altered protein and lipid metabolism. This study involved (180) subjects, between them, 60 were patients as group one suffering from type 2 diabetes and 60 were patient suffering from type 2 diabetes and foot ulcer as group two. In addition, 60 healthy group three as control subjects. Polymerase chain analysis was used for detection of *TLR-9* genotypes followed by restriction analysis. We observed no significance differences in the distribution of the genotypes and alleles of (*1237 T/C*) polymorphism among the study groups.

Biochemical study of alkaline phosphatase in *Escherichia coli*

Ibtihal Idrees Kanaan and Najwa Khaleel Ibrahim

The present research aimed to isolate and purify Alkaline phosphatase enzyme from crude protein extract (Lysate supernatant) of *Escherichia coli*, by using different biotechnologies. To proceed, the following steps were taken: Firstly, The verification of the existence of enzyme in bacteria, the bacteria were diagnosed by using the API 20 stripe that consists of (20) items. the enzyme was isolated to ensure its availability in bacteria within the logarithmic phase and this was done through proliferating them for 18 hours in a nutrient agar. It had been detected that the enzyme was intracellular because of the occurrence of enzyme activity in the lysate supernatant without occurring it in the cell free culture supernatant. Secondly, Enzyme purification, the enzyme had been purified through three stages: precipitation of protein by ammonium sulphate, dialysis and finally, the protein extract was passed through column chromatography by using Sephadex G-100

gel, the estimated enzyme activity after this step was 22.0 in comparison with its activity before the purification processes (crude protein extract). The approximate molecular weight of alkaline phosphatase was 81.000 Dalton estimated by using gel filtration technique.

Using of RAPD-PCR markers to detect the genetic relationship of number of *Bellevalia Lapeyr* and *Ornithogalum* L. species developing in central and northern of Iraq

Najat Ameen Sa'eed, Akeel Hussein Ali Al-Assie and Naglaa Mustafa Al-Abide

This study evaluates eleven wild plant species belong to two genera of Asparagaceae family, naming of *Bellevalia lapeyr* and *Ornithogalum* L. and discuss the similarities and differences among all species by using eighteen random primers for the Random amplification polymorphic DNA (RAPD) markers were used to study the genetic relationship and genetic distance among these species. The study aimed to determination genetic relationships among all the eleven species by using RAPD markers and the method of extraction DNA from plants was CTAB with liquid nitrogen. The result show 16 primers success in giving 293 bands, of which 263 were polymorphic bands, 25 unique bands and 5 were absent. *B.chrisii* type also succeeded in showing two unique bands at OPG-08 primer without registering any other bands. The lowest genetic distance was 0.306 between *B. longipes* and *B.parva*, while the highest genetic distance was 0.943 between *B.chrisii* and *O.pyrenaicum*. It is concluded from our study based on the results of the RAPD test that the studied species were divided into two main groups, each group was divided into subgroups, the first group included three groups and the second main group included two main groups. The study found that the *O.pyrenaicum* type is distinguished by being far from the rest of the species.

The isolation and identification of cadmium-resistant *Brevibacillus agri* C15

Nadia Jebril, Rich Boden and Charlotte Braungardt

Eight Cd-resistant bacteria were isolated from the soil. Based on the resistance and specific growth rate, one isolate from these was chosen. The 16S rRNA (rrs) gene sequence was used to assert this isolate belongs to the genus of *Brevibacillus* and closely related to *Brevibacillus agri* (*B.agri*) DSM 6348T (AB112716). The isolate was termed *B.agri* C15. The specific growth yields and the Cd-dependent fall in specific growth yield of *B.agri* C15 was determined under different concentrations of Cd. The current study provides a basis for isolation Cd resistant bacteria with maximum tolerable concentration (MTC) 15 mM Cd from a contaminated soil 490±50 μmolal Cd that could be suitable for a new Cd-bioremediation process; therefore, further studies are needed to investigate this possibility.

Production of Cellulase and bioethanol by ethanol-tolerant coculture of *Bacillus cereus* and *Fusarium solani*

Mohammed Fadhil Abood, Haider Mousa Hamzah and Dhafer Fakri Al-Rawii

Cellulase is an enzyme produced by fungi and bacteria that hydrolyzes cellulose by breaking down the glycosidic bond, β-1,4 that binds sugar glucose units. Bioethanol and cellulase enzyme were produced by ethanol-tolerant of *Bacillus cereus* co-culture. So the production of filamentous solani were using the wastes of *Cynodon dactylon* L. The highest activity of enzyme was at 96 hour/30°C of incubation. The optimal pH value was 7.5, while the carbon concentration was 3%. On the other hand, the best inoculum ratio was 0.5/100 mL (52 × 10^8 cell/mL bacterial cells and 10^5 conidia/mL of the fungus). In order to test the efficiency of ethanol production by the co-culture by using different concentrations of pure ethanol was measured in the solid medium. Both *Bacillus* sp. and *B.cereus*

F. solani tolerated incubation with 5% ethanol. The best treatment when using 0.5% sulfuric acid which gave the best concentration of reduced sugars and the results showed a difference in the concentration of sugars produced by the fermentation process, it was 3.9 mg/mL in the first day, whereas it was 2.51 mg/mL after 120 hours of fermentation, the concentration of bioethanol produced after fermentation was 195 g/L. In conclusion *Cynodon dactylon* L. wastes were treated by sulfuric acid, cellulase digestion, and autoclave treatment to be a good source of reducing sugars.

Investigation of fungal contamination in some types of chips in the market in Karbala

Ihsan Ali Al-Zamily

Different types of chips samples sell were collected from some markets in Karbala city, which its made in Jordan (Chipsico and Alsaada), Saudia (Liz, Gillts, Doritos), Iran (Bovac, G Toz and Macho) and Iraq (Hala, Dalia, Al-Aseel). The Iranian Chips were the most contaminated, where Iraqi and Jordanian Chips comes in the second. The results of isolating fungi study in chips types, showed diversity in numbers and kinds of fungi. The genus *Aspergillus* is a fungus predominate on all isolates and followed by *Penicillium*. Also different genera including *Fusarium, Alternaria, Curvularia* and *Rhizopus* have been isolated. It is mentioned that these fungi are dangerous because they produce myctoxins, especially aflatoxin and ochratoxin. It was noted that, the Saudi products are free from contamination. Ammonia test and Fluorescence was used to identify the aflatoxin-producing isolates and it appeared that isolates of *Aspergillus* had great potential to produce these toxins.

Biological control of *Azotobacter chroococcum* on *Fusarium solani* in tomato plant

Sraa Nsayef Muslim, Rawa Abdul Redha Aziz and Asmaa Mansour Al-Hakeem

this experiment aimed to study the effect of *Azotobacter chroococcum* in reducing infection of the tomato plant by *Fusarium solani* under the greenhouse condition. The results show that *Fusarium solani* isolates proved high pathogenicity and chosen isolate (Fs4) for being given a lower percentage of germination of cabbage seeds and the highest disease severity to tomato seedling. Also, the results were indicated that T6 (Biofertilizer at concentrations (25 ml\2Kg soil) with *F. solani* (F.s4) was the past this treatment reduced significantly the disease severity (73.10%) which also recorded a positive effect on the growth parameter of tomato plant compare to T1 (pathogen only).

Evaluation activity of bacteria *Bacillus thurengensis* and different concentrations of plant extracts on adult of house fly *Musca domestica*

Raghad Khalaf Al-Joboory and Elaf Adnan

This research included evaluating the efficacy of plant aqueous extracts for myrtle *Myrtus communis, Nerium oleander, Eucalyptus* spp. and *Bacillus thuringiensis* on adults of the house fly *Musca domestica* L. under laboratory conditions at a temperature of 2 ± 28°C and with a humidity of 50-70 %. it was found that the highest rate of laying eggs was in the extract of eucalyptus leaves, where the number of eggs laid was 60 eggs on average and at a concentration of 5%, while in the concentration of 10% the average egg was 55 eggs then In the extract of the leaves of the oleander was at a concentration of 10% at a rate of 50 eggs and in control treatments the number of eggs reached 80 eggs and the results showed the highest death rate for adults before laying eggs was in the extract of the eucalyptus leaves at a concentration of 15% where the death of 6 adults and the lowest percentage of death by 5% was recorded One adult death and the highest rate priest for eggs; with a concentration of 10%, reached 94%, and the highest percentage of

larval mortality reached 68.12%, with a concentration of 10% in the transactions of extract of oleander leaves, and in it also the highest rate of exclusion is 31.93%. The third larval stage with a concentration of 5% with a ratio of 3.67 days and the highest incidence rate in the third larval stage with a concentration of 2.5% at a rate of 26.70% and the lowest incidence rate of 6.70% with a concentration of 2.5% and 5% and 7.5% in the first and second stages respectively and the lowest dawning rate was recorded in the larval phase the first with a concentration of 2.5% at 16.66% and the highest deformation rate in the third larval stage with a concentration of 7.5% at 66.66%. As for its effect on the number of eggs was a rate of zero% of all concentrations (2.5%, 5% and 7.5%) compared to 80 control egg either its effect on the longevity of the adult was the highest rate of longevity amounting to a concentration of 7.5% by 5.33 day..

The effect of pH, calcium, phosphate and humic acid on cadmium availability and speciation in artificial groundwater

Nadia Jebril, Rich Boden and Charlotte Braungardt

− Close abstract View article PDF

The interface between the ions in groundwater affects the biogeochemical behaviour of metal, and metal bioremediate by bacteria. Therefore, this study was aimed to predict the influence of pH, calcium, phosphate and humic acid on cadmium availability in artificial groundwater (AGW). Speciation and the thermodynamic calculation (MINTEQ program) were used to predict this in AGW theoretically. In results, cadmium availability diminished with an increase in pH, increase of calcium concentration and the addition of phosphate and humic acid of AGW. According to MINTEQ program, cadmium binds to some cations leaving fewer free cadmium ions available in AGW such as $CdHCO_3^+$, $Cd(SO_4)_2^{2-}$, $CdCl^+$, $CdHPO_4$, HA1-Cd, FA1-Cd, FA2-Cd, and HA2-Cd. It is suggested though that pH in AGW is maintained at pH 4.00 for best availability of cadmium and bioremediate by bacteria.

The effect of usage two methods of garlic extraction(foliar and ground application) on the growth of the tomatoes (*Solanum lycopersicum*) plant

Radhiyah Ali Hasan Ahmad

− Close abstract View article PDF

Garlic is rich in nutritional and medicinal value as it has been found that the water extract of garlic plant contains 31% carbohydrates and rich in elements calcium, phosphorus, magnesium, potassium, sodium, iron, zinc, manganese, vitamin C, thiamine, riboflavin, niacin and pyridoxine. The aim of this study was to investigate the effect of garlic extract (*Allium sativum* L.) on tomatoes (*Solanum lycopersicum* L.) plant. The trend is to use plant extracts in foliar and ground fertilization. Three levels of foliar application (4, 6, 8%), three levels of ground application (10, 20, 40%), one treatment 6% of foliar and 20% ground application together and the treatment of control (0) were used. The results showed that the usage of garlic extract led to a significant increase in the height of the plant 98.00 cm, chlorophyll content 46.33 spadm, increase the Carbohydrates 7.95%, the number of branches, the number of leaves, the foliar area, the dry weight of vegetative group, the number of flowers, the leaves content of nitrogen, protein and carbohydrates, fruit weight, fruit size, measurement T.S.S. and solidity of treated plant compared to control plants.

Occurrence and composition of copepods abundance in Tigris river, southern Baghdad, and effects of Rasheed power plant effluents on its biodiversity

Muhanned R. Nashaat, Fatema S. Muftin, Enaam K. Abbas and Ali Eman H

− Close abstract View article PDF

The quantitative and qualitative structure of the Tigris River copepods communities, were identified to investigate the biological composition, especially near the outcome of Rasheed power plant (RPP), on its biodiversity at four sites those were chosen on the

Tigris River in south part of Baghdad Governorate during the period January to December 2012. The sites S2 was located near Rasheed Power Plant to represent the ecological features of the plant site, whereas other sites, S1 was located at the upstream of the RPP as a control site to investigate the ecological characters of the Tigris River. Moreover, the two other sites S3 and S4 were located down to the impact of RPP to reflect the possible effects of the plant on the copepoda fauna biodiversity by comparison with the control site. Thirty-nine taxonomic units of copepoda fauna were identified in the present study, Including 17 taxonomic units of Cyclpoida, 13 taxonomic units of Calanoida, six taxonomic units of Harpacyicoida and three taxonomic units of Parasitic Copepoda. This study found that the highest copepod density was recorded during the winter period on site below RPP. While at sites near RPP during the summer period, Copepoda showed the lowest density. The results also showed that the sites below RPP included the most constant species, while the lowest were included at site near RPP. The results of the biodiversity indexes generally showed the negative actual impact of RPP on the copepoda commu nity..

Prospective gene therapy design against coronavirus COVID-19 by recruiting CRISPR Cas9 approach

Ayman Albanna and Arqam Alomari

A novel Coronavirus disease (COVID-19) has being originated from animals and causing to running outbreak of viral pneumonia in human all over the world. The World Health Organization (WHO) has considered COVID-19 infection as Epidemic disease in March 2020. The high percentages of death rate among people lead the researchers and scientists in different fields of medicine in order to find solution for this threating problem. In this regard, an editing gene technique was employed in this study, in order to deter the viability of coronavirus genetically. The main objective in this paper first has been determined and obtained the essential proteins of COVID-19 coronavirus proliferation by

using NCBI website which included *S, E, N, M, ORF3a, ORF6, ORF7a, ORF7b, ORF8, ORF10* proteins. The second objective is to use a very precise technique of editing gene called CRISPR-Cas9 to make changes to the virus's RNA, through designing single-guide RNA for the essential each protein of COVID-19, in order to inactivate an effective certain protein. These techniques will be provided for each patient and healthy person by injection of all genes components using the Gene-gun machine or spray aerosol to make ensure reach it to the target cell.

Effect of amino acid proline on some growth characteristics of cowpea which exposed to drought stress

Maher Zaki Faisal Al-Shammari and Wael Shakir Hameed Al-Jboory

The study was conducted in Al-Youssoufia region which located in North West of Baghdad city during the growing season of 2018-2019. The experiment was aimed to demonstrate the optimum concentration of amino acid proline that reduce the effect of drought stress. By using three time for irrigation (4, 8, 12) day and four concentrations of proline (0, 20, 40, 60) mg. L-1 and their interaction on some growth characteristics: Root length, dry weight, nitrogen, phosphorous and potassium content, carbohydrate percentage and peroxidase activity in vegetative part. Data were statistically analysed to find out the least significant difference (LSD) between treatments at 0.05 level. The results indicated the increase of proline concentration from (0 to 60) mg.L-1 caused significant decrease in the average of growth characteristics and peroxidase activity unite.mg.proline-1 with increase in the average of irrigation periods under drought stress.

Antioxidant, cytotoxicity and phytochemical analysis of *Laurus nacilatesF.* cocoon aqueous extract against lung cancer

Hanady S. Al-Shmgani, Zainab Thamer Alasady, Ehab M. Ali and Mohammad J. Al-Jassani

Cocoon of larva *Larinus maculates* F. from Curculionidae family (*Echinops* species), locally in Iraq known as Tihan, is one of traditional folk medicine used in the treatment of diversity respiratory system and fever. This study was carried out to assess the bioactive component and the antioxidant capability of aqueous beetle cocoon extract (*Larinus maculates* F.) along with its possible cytotoxic activity against A549 lung cancer cell line. For phytochemical analysis gas chromatography-mass spectrometry (GC-MS) was used, and to detected free scavenging activity 2, 2-diphenyl-1 picrylhydrazyl (DPPH) was used. To determine the cytotoxicity in the cancer cell line 3-(4,5-dimethylthiazol-z-yl)-2,5-diphenyltetrazolium (MTT) was used; peripheral blood monolayer cells (PBMCs) was used as a normal cell. GC-MS analysis identified the presence of 9 phytochemical components. DPPH results suggested a promising antioxidant activity in a dose-dependent, the best antioxidant potential was at 600 $\mu g.ml^{-1}$ concentration. Cytotoxic activity results showed that the increase in extract concentration decreases the cell viability, at 50 $\mu g.ml^{-1}$ concentration the percentage of viability was (86.76±0.87) where at 200 $\mu g.ml^{-1}$ the cell viability was (56.44±0.91) $\mu g.ml^{-1}$ Taken together, the results showed that larva cocoon of *Larinus maculates* F. extract has an important phyto-molecule with great potent antioxidant and cytotoxicity activity against lung cell line A549..

Studying the levels of some Biochemical variables in blood serum for smoking of Tikrit University students

Saria Naji Muhsin, Shurooq hameed majeed Alnassiri and Sina Naji Muhsin

This study included (75) samples of the males students at the Tikrit University, The samples were divided into three groups; the first group: (25) blood samples pulled from healthy non-smoking students (males) as Control sample. The second group: (25 males)

samples of diabetic mellitus (smoker students). Third group: (25 males) samples of hypertension (smoking students). The results of the study indicated a significant increase in the concentration of the levels Cholesterol, Triglyceride, Malondialdehyde (MDA), Lactate dehydrogenase (LDH) at level (P <0.005) in the samples of smoker students when compared to the healthy group. And showed decrease in the concentration level of HDL, Glutathione Peroxidase (GPx) at level (P <0.005) when compared to the healthy group (non-smokers).

New record of fresh water ciliates (Protozoa, Ciliophora) from Tigris river in Baghdad city, Iraq

Zahraa Y. Kadhim

Documenting the biodiversity and biogeography of ciliates will help expand the overall knowledge within the field, as well as, shed new light on the dispersal and survival potential for other microorganisms, such as protists. As organisms at the base of food webs, ciliates are an essential part of the microbial loop and the ecosystems that they support. This study deals with ciliates community in freshwater of Tigris river within Baghdad city. Four sites were chosen at Al-Grea`t & Al-Adhamiya area at the riverbank. Total of 44 ciliophora taxa were detected, 22 taxa of which were identified to the species level and 22 taxa to the genus level. Among them, 11 taxa were new recording for Tigris river in Baghdad city: *Cyrtolophosis* sp., *Monochilum frontatum, Orborhabdostyla bromelicola, Ophrydium sessile, Scyphidia* sp., *Vortecilla convallaria, Vortecilla octava, Zoothamnium Bory, Tokophrya lemnarum, Urostyla* sp. and *Stentor fluiginosus*.

Histomorphological study of olfactory organ in rock dove, *Columba livia* Gmelin, 1789

Hussain A. M. Dauod, Ahmad A. Hussain and May F. Al-Habib

− Close abstract View article PDF

The present study aimed to investigate the morphological description and histological structure of olfactory organ in rock dove (*Columba* livia). Results of the present study revealed that the nasal cavity of the species under investigation is anteriorly located, starting with a pair of external nares which located at the dorsal side of the base of upper beak. The external nares lead to two short nasal cavities. Each nasal cavity consist of three conchae or turbinates represented by anterior or vestibular concha, middle or respiratory concha and posterior or olfactory concha. The nasal cavity ended by a pair of internal nares which opened at mouth cavity. Results related with the histological structure of olfactory organ revealed that the vestibular concha lined by stratified squamous epithelium, the respiratory concha lined by ciliated pseudostratified columnar epithelium, and olfactory concha lined by ciliated pseudostratified columnar epithelium. The last concha showed three types of differentiated cell represented by basal cells, supporting cells, and receptor cells.

Phenotypic, anatomical and phytochemical investigation of Iraqi *Silybum marianum*

Rasha Eldalawy, Widad M K Al-Ani and Wasan Abdul Kareem

− Close abstract View article PDF

Asteraceae (Compositae) famous as the aster, daisy or sunflower family is the biggest flowering family divided into thirteen subfamily that involve approximately two thousand genus, an important member of this family is *Silybum marianum* (Milk thistle). Management of hepatic diseases is the main use of milk thistle in traditional medicine also it has anticancer activity against different type of cancer in addition to antiviral, antioxidant, antiinflammatory and anti-diabetic activity. This study was designed to investigate the pharmacognostical feature and the phytochemical ingredient of Iraqi *Silybum marianum*. The plant were examined macroscopically to investigate the

morphological characters of plant and microscopically to determine the type of stomata and trachoma then flowers, leaves, stems and seeds of the plant were extracted by ethanol in a soxhlet apparatus individually and subjected to standard methods for active constituents identification and that total flaononid, total phenolic and total tannins content were determined using aluminum chloride colorimetric, folin-ciocaltue and acidified vanillin methods respectively. The results shows that *Silybum marianum* leave have a thick cell wall, anomocytic stomata, annual vessel, and unicellular unbranched trichomas. Also an important active constituents have been detected that terpenes, steroid and flavonoids were present in all plant parts, saponin appear only in the leaves and stems while alkaloids and coumarins are not detected in any part. Also the study referred to the seeds as the richest part of the plant with flavonoid and phenolic compounds followed by the flowers, leaves and stems which contain the less amount, while the higher content of tannin were observed in the leaves and stems..

Effect of Chloroquine on antioxidant enzymes and oxidative system on (*Vigna radiata*) plant tissues exposed to water stress

Hayder Nasser Hussain Al-Mentafji

The aim of the present study is to examine the effect of (Chloroquine CQ) on the oxidative stress under water stress effect Recently, this compound is used to treat COVID-19, Hydrogen peroxide H2O2 effect and Stimulate the enzymatic system through the exposure of the plant to water stress and interaction with Chloroquine, where the stress stimulate the production of these Oxidative Factors (Hydrogen Peroxide, Malondialdehyde(MDA), Protease increase the production of these oxidative factors increase activity through the effect of Chloroquine, This process was performed in the meristematic tissues of the cells of the permanent Mung bean (*Vigna radiata*) plants under experimental factors (water stress factor for 10 days with control period of 5 days) (Chloroquine factors and concentrations of 125 and 250 mg.L-1 with control treatment)

were designed using a Factorial Randomized Block Design (R.B.C.D) with three replicates and 18 experimental units The experimental unit area was 2 m. The results have shown the following; The water stress period of 10 days led to the production of toxic hydrogen peroxide and increased concentration by stress. The effect of water stress was Stimulate the Production of hydrogen peroxide in Meristematic tissues. The effect of Chloroquine CQ with increased concentrations had a role in inhibiting the production of enzymatic antioxidants (Superoxide dismutase(SOD) and Catalase (CAT). The interaction between water stress and increased Chloroquine CQ concentrations has been instrumental in stimulating the production of oxidative Factors.

Histological structure of the Tongue in Mongoose (*Herpestes javanicus*)

Iman Sami Ahmed Al-Jumaily, Marwa Khalil Ibrahim and Wijdan Bashir Abid

The aim of the present study was to investigate the histological structure of the tongue in Mongoose (*Herpestes javanicus*) and its related to the feeding pattern. Five adult animals were used in this study. The tongues were dissected and fixed in 10% formalin, then prepared by following stages (dehydration, clearing, and embedding). The serial section(5μ) were stained with(H&E) and some special stains. The histological examination showed that the tongue consists of three tunicae (mucosa, submucosa and musclaris) and the lining epithelium of the filiform papillae is composed of keratinized stratified squamous epithelial tissue. The cylindrical papillae are covered with a highly keratinized stratified squamous epithelial tissue, whereas the keratinized stratified squamous epithelium tissue is weakly keratinized at fungiform papillae, whilst circumvallate papillae are non-keratinized. The medullary of the papillae consists of a loose connective tissue which is considered as the lamina propria of the tongue, while the tunica submucosa consists of dense connective tissue. The muscularis is composed of skeletal muscle fibres arranged in three direction longitudinal, transverse and obliquate.

The lingual glands(Von-Ebner and Weber) placed on both sides of the lingual root at the tunica submucosa and extend to the tunica muscularis. This study pointed out that the secretion of glands is mixed and the mucin is more neutral than acid.

Quality study of the piped water of state company for drugs industry of Samarra and matching with the Iraqi and international drinking specification

Rafah Talal Ahmed Alsamaraay, Riadh Abbas Abdul Jabbar and Tawos Mohammed Alshawany

The research aimed to evaluate piped water that supply the general company for pharmaceutical industry of Samarra and its suitable for drinking through the comparison with Iraqi and international standard for drinking. The study started from May (2015) until January (2016). Moreover, know the physical, chemical and bacterial properties piped water. The results showed that the piped water was matching of the drinking water by WHO and Iraqi standard. Only calcium quantity was higher than determination. The values rate for: Air and water temperature (29.44, 21.33) C° respectively, EC (431.11) µs/cm. TDS (430) mg/L, the pH (7.7). DO (4.75) mg/L, while the BOD5 (1.25) mg/L, while Alkalinity hardness (157.77) mg/L, total hardness (155.55) mg/L, calcium and magnesium hardness (78.66, 72) mg/L Respectively. While chloride (68.22) mg/L, as for the phytonutrient, Nitrate concentration were (1.902) Mg/L, the phosphate concentration values rate (0.050) Mg/L, and silica concentration (1.981) Mg/L. The heavy metals, Cu (0.028) ppm, Iron (0.121) ppm, Zinc (0.203) ppm, Lead (Nil) ppm. And it was free from bacterial growth. Thus, quality of piped water, (completely purity).

First record of *Myxobolus insignis* Eiras, Malta, Varella, Pavanelli, 2005 (Myxozoa: Myxobolidae) in Iraq from gills of the common carp *Cyprinus carpio*

Kefah Naser Abdul-Ameer and Rana Saheb Shalal

− Close abstract View article PDF

The Myxozoan parasite, *Myxobolus insignis* Eiras, Malta, Varella, Pavanelli, 2005 is recorded in the present study from gills of the common carp *Cyprinus carpio* for the first time in Iraq. The fishes were caught from the Al-Ataifiya location on the Tigris River at Baghdad city during the period from January to October 2020. The measurements and description of this external parasite in addition to its illustrations were given.

Detection of *Bacillus cereus* genes responsible for diarrheal and emetic toxins

Ban M.S. Saeed, Basil A. Abbas and Shaker A.N. Al-Jadaan

− Close abstract View article PDF

Bacillus cereus isolated from different food sources. The diarrheal toxin genes such as *cytK*, hemolytic enterotoxin (*hblA, hblC* and *hblD*), non-hemolytic enterotoxin (*nheA, nheB* and *nheC), bceT* and *entFM* in addition to emetic toxin gene were detected by PCR. The *cyt K* gene was observed in 94.87 % of the isolates. *entFM* and emetic toxin gene were found very rare in all food samples at the percentage 2.56% and 7.69% respectively. Uncooked rice which has a highest number of bacterial isolation, also showed relatively high percentage of the *cytK* and *bceT* genes (90%). These two genes present in 100% of *Bacillus cereus* isolates in most food samples. Bacteria isolated from burger meat contain all investigated genes.

Detection of antibiofilm formation by sliver nanoparticles created by tetracycline antibiotic

Alaa Z. Hameed and Nehia N. Hussein

− Close abstract View article PDF

Silver conjugated Tetracycline, was created and characterized by ultraviolet visible spectrophotometry (UV-vis), Fourier transform infrared (FT-IR), X-Ray Diffraction Patterns (XRD). Using antibacterial assays, the effects of tetracycline alone and drugs-conjugated with silver nanoparticles were tested against Gram-ve *Pseudomonas aeruginosa* isolates by well diffusion assay. The UV-vis spectra of silver-drug Nano conjugates showed a characteristic surface Plasmon resonance band in the range of 400–450 nm. FTIR analysis demonstrated the involvement of Hydroxyl groups in both drugs in the stabilization of silver nanoparticles. (XRD) showed that they cubic structure of silver and, antibacterial assays showed that biosynthesis silver nanoparticle conjugation enhanced antibacterial potential of Tetracycline compared with drug alone.

Morphological characterization and its relation with yield traits of *Oryza sativa* L. genotypes in Iraq

Balqees Hadi Al-Musawi and Mohammed A. Al-Anbari

In the current study we reported for agronomic traits and yield of fifteen rice genotypes in season during 2018 and investigated at the field experimental of Al-Mashkab research station (AMRR), Najaf-Iraq. The experiment was conducted following Randomized Complete Block Design (RCBD) with having three replications. These data related days to 50% flowering and heading, plant height (cm), leaf area index (LAI), panicle length (cm), number of tiller per panicle, 1000 grain weight (g) and biological yield, harvest index and grain yield (kg ha-1) were evaluated. The results indicated that the rice genotypes differed in plant growth characteristics and yield and yield components. 1000 grain weight and grain yields both were highest in Gohar genotype. Shiroudi genotype required shorter days to maturity and Anber33 longest days to maturity. Some of the rice genotypes particularly (Gohar) showed high promise with grain yield. Recommended, intensification of introducing more genotypes to select the best rice genotype for Iraqi condition could maximize the benefits of genotype cultivation. Agronomic data collecte

in the current study would be significant to realize the suitability of an individual rice genotypes of the farmer field, also were found more appropriate of the agro climatic status of Iraq.

Epidemiology of hydatid disease in Najaf province/Iraq

Raja Jawad Mohamed, Alyaa Neamah Najm Alsaedi and Jasim Hameed Taher

− Close abstract View article PDF

It was clinically and surgically proven that sixty-four patients were infected with a hydatid cyst. Follow up was done in Al-Sadder Medical City, Najaf/Iraq during the period between January and December 2018. The incidence of the prevalence of hydatidosis female was higher than that of males. The youngest patients infected was five years, and oldest was over than 70 years old. The age group 21-30 years old had the highest percentage of hydatidosis infections. The rate of infection in females 64 (61%) more than males 25 (39%). Compared to males, there was a substantial rise ($P < 0.05$) in females. The percentage of liver hydatidosis relative to other organs was higher (67.18%). There were many patients with big cyst size (>5cm) than those with small cyst sizes (<5cm).

Effect of ginger alcoholic extract on the ovary tissue in quail

Mohammed Hayder Hamad, Nahla Al-Bakri and Abdul-Razak Labi

− Close abstract View article PDF

This research was carried out in quail in the laboratory of histopathology diseases during four months. The objectives of this study was to detecting the effects of the addition of the alcohol extract of ginger to ovary tissue of quail. The two groups of birds were in almost similar weights and were placed in cages. Each group consisted of 8 quails. The first group (control group) fed on regular feeding without adding alcoholic extract of

ginger. The second group (treated group) fed on the same normal food after adding the alcohol extract of ginger at a concentration of 300 mg / kg. The results indicated that ginger have positive effects on folliculogenesis.

Physiological and histological protective role of *Astragalus spinosus* root alcoholic extract against oxidative stress induced by H_2O_2 in rabbits

Moafaq Mutlak Zeidan and Qussay Noori Raddam

This study amid to evaluate the role of plant's root (*Astragalus spinosus*), in biochemical parameters and histological sections effect in reduce the oxidative stress induced by hydrogen peroxide in rabbits *Oryctalagus cuniculus*, 7-9 months age and (1300-1500 g) of weight. Animals were distributed to three groups, every group were included five rabbits; group (1) control received water and diet. Group (2): animals treated with H2O2 (0.05) and drinking water. Group (3): animals treated with H2O2 and alcoholic extract of the plant root (5mg/kg body weight) for period one month. Study showed high significant increasing in Creatinine and ALP, LDH concentrations of animals treated with H2O2 alone (1.74±0.40) (9.900±1.058), (260.40±26.66) respectively, in compared with control (0.838±0.08) (8.420±1.132), (154.0±49.79) respectively while the concentration of Creatinine, ALP and LDH had been decreased with high significant (P≤ 0.05) in group treated with H2O2 and extract of the plant roots (0.79±0.09), (9.220±0.801) and (166.2±36.08) respectively in compared with H2O2 group. And the result of histological sections of liver, kidneys and heart, which showed an improvement of cells in group treated with the extract of the plant which had been induced by oxidative stress.

Evaluation effect of different concentration of povidone Iodine on skin wound healing in rabbits

Falah Mahmood Hameed, Hayder Mohammed Mohsen Al-Tomah, Ali J. AL-Nuaimi and Ail Wasfi Sadeq

– Close abstract View article PDF

The goal of the current study was to assess the effects of povidone iodine 10% in comparison with 5% of povidone iodine on full-thickness cutaneous wounds healing in rabbits. This was on twenty-four healthy male rabbits, weighing from (1.5–1.8 kg). Under the effect of intramuscular administration of a mixture of xylazine hydrochloride 5mg / kg, ketamine hydrochloride 35mg / kg and diazepam 1 mg / kg. On each animal, in the dorsal back area, one square (2 × 2) cm full-thickness skin wounds were made. The animals were divided into two groups, group (A) as the treatment group was treated with 10% povidone iodine daily for 1 time for day 7 post operation. While, at the same time in group (B), the rabbits were treated with 5% povidone iodine. For clinical evaluation, each group was divided into four subgroups (two wounds/subgroup) on 3rd, 5th, 7th, 9th, 14th and 21th days post-wound induction and treatment. Clinically, the result showed that 10 % of iodine was more effective than 5 % of iodine, and the wound healing rate in group (A) was faster than group (B). This was followed by statistical analysis results showing the wound healing process ((20%, 40%), (70%, 85%) contraction) and ((10%, 20%), (50%, 70%) re-epithelization). Respectively, there were significantly more (P≤0.05) than the iodine 5% during the study period. Conclusion; Povidone-iodine solution 10% is more efficient than iodine 5% so that lead to acceleration and enhancement of full-thickness cutaneous wounds healing.

In vitro study of the effect of zinc oxide nanoparticles on *Streptococcus mutans* isolated from human dental caries

Arshad Mahdi Hamad and Qanat Mahmood Atiyea

– Close abstract View article PDF

Dental caries is a public health concern worldwide for which *Streptococcus mutans* has been reported Known as the potential etiology of infection. In recent years, nanotechnology has applied to Creation of novel material properties. The research was studying the effects of Nanoparticles of Zinc Oxide on *Streptococcus mutans* isolate from dental caries. In this research, Different ZnO NPs concentrations were studied as its anti-bacterial effects on *Streptococcus mutans* was isolated from dental caries cases. 27 *Streptococcus mutans* isolates were obtained, which is equivalent to 20% of the total number of 135 isolates. This nanomaterial was chosen because it has a high affinity for human cells and does not cause harm compared to other nanoparticles. The nanoparticles are those very fine materials that can be produced so that their dimensions or the dimensions of their grains range from (1-100) nanometers, and because of the small size of the nanomaterials, which made them behave differently from large-sized materials whose size exceeds 100 nanometers, and because of the small size of the particles. Nanoparticles, which gave them electrical and magnetic properties that differ from large particles of the same compounds. The well diffusion method and the MIC experiment were conducted, and the results were good, as in the well diffusion method the efficacy increased with increasing the concentration of ZnO NPs. In the MIC experiment, it was observed that MIC in the sixth tube, meaning that the MIC of ZnO NPs towards *Streptococcus mutans* equals 0. 312 mg / ml.

Response of model plant *Arabidopsis thaliana* to Plant growth promoting rhizobacteria & phosphate concentration

Sulaiman Abdulhusein Mashkoor and Mushtak F. Karomi Kisko

− Close abstract View article PDF

Several reports have shown that various rhizobia can interact with non-hosted plant species, enhancing mineral nutrition and promoting plant growth. To further investigate the effects of such non-host interactions on plant growth and phosphate nutrition, we inoculated *Arabidopsis thaliana* with the model rhizobacterium *Pseudomonas fluorescens*

at three phosphate concentrations in the nutrient medium. *In vitro*, we showed that root colonization by *Pseudomonas fluorescens* contributes to an increase in the amount of available phosphate that is important in plant growth, especially in the shoots, in all concentrations used in the study. In addition to improving plant growth as well as increasing plant biomass production.

Use of ultraviolet-light mutagenesis to generate a mutant with elevated cadmium resistance, *B. agri* C15 Cd^R

Nadia Jebril, Rich Boden and Charlotte Braungardt

− Close abstract View article PDF

Cadmium (Cd) is toxic to living organisms; however, bacteria are adaptable to severe conditions, including Cd contamination. Bacteria can develop in the natural environment, as they generate resistant strains that can be used to remove Cd, but getting such adaptive strains usually takes a long time. In this study, ultraviolet (UV) light mutagenesis was used to accelerate the strain-resistant ability of *Brevibacillus agri* C15 to generate Cd^R mutant with high resistance to Cd. Its maximum tolerable concentration (MTC) to Cd was 15.00 mM. The UV light mutagenesis process resulted in the generation of the mutant *B. agri* C15 Cd^R (MTC: 20.00 mM Cd). Morphological and biochemical tests showed that there were no major differences between *B. agri* C15 Cd^R and *B. agri* C15. This study provides a basis for developing microbial Cd resistance and facilitating the application of Cd remediation.

Morphological study of bronchial tree and lung in Iraqi weasel (*Herpestes javanicus*)

Baydaa H. Mutlak, Ahmed A. Al-Jawadi and Intidhar M. Mnati

− Close abstract View article PDF

The current study aimed to identify the morphological description and branches of the bronchial tree and lung for the weasel *Herpestes javanicus* as one of the Iraqi mammals inhabiting the Iraqi environment. In the current study, 10 samples with an mean weight of 288-564 g were used, trachea and lung were removed from the samples and confirmed using proven solutions and laboratory tests were conducted on 5 samples of the study to identify the branches of the bronchial tree using the technique of casting resin and then exposing the samples to erosion. Weasel has a pair of bright pink sponge lungs that occupy most of the thoracic cavity. The lungs look similar to the clover leaf have a top and three surfaces represented by the costal surface that is convex, and the middle surface, characterized by a narrow and diaphragm surface and is identical to the diaphragm. The right lung is larger than the left lung and the right lung consists of four lobes: apical, middle, caudal and an accessory lobe, while the left lung consists of three lobes: apical, middle, caudal lobes the top of the right lung appeared small and semi-sharp, while the left lung is round and blind. The right primary trachea branched into two branches, the upper branch enters into the apical lobe and branches in turn into two secondary branches, while the lower branched into three branches, the first of which enters into the middle lobe and the second to the middle lobe, the third branch into two branches enter the accessory lobes, while the primary left trachea branch into three secondary or lobe branches before entering the left lung branch, where the first branch enters into apical lobe when the second enters the middle lobe while the third section enters the caudal lobe.

Metal complexes of 1,6-bis(1-benzimidazolyl) hexane: synthesis, characterization and biological activity against some soil-borne fungi

Abbas Washeel Salman, Jawadayn Talib Alkooranee, Hayder Dawood Arkawazi, Haitham Kadhim Alsharifi and Michaele Hardie

Metal complexes Mn(II), Co(II), Cu(II), Zn(II) and Ag(I) of the ligand 1,6-bis(1-benzimidazolyl)hexane were synthesized by the reaction of the ligand and appropriate metal salts in l: 1 mole ratio. The ligand and its complexes were characterized using IR, Uv-Vis, 1H and 13C NMR, Mass spectroscopy, and elemental analysis CHN. Depending on the abovementioned techniques, a polymeric structure was proposed to the prepared complexes. Further, all the synthesized compounds were tested against some of the soil-borne fungi namely; *Rhizoctonia solani, Fusarium oxysporum, Fusarium solani* and *Pythium aphanidermatum*. The results showed that the tested compounds have an effect on the growth of pathogenic fungi. This leads to thinking that these compounds could be used one day as new chemical pesticides as an alternative to chemical compounds that have been shown to be resistant to pathogens.

Laboratory evaluation of two isolates of *Meterhizium anisopliae* and *Beauvaria bassiana* to control infesting by *Trogoderma granarium* (Coleoptera: Dermestidae) larvae

Nawal S. Mehdi and Aymen W. Al-Fadili

Trogoderma granarium Everts (Khapra beetle) is a serious pest of stored barley and wheat worldwide. The current research evaluates the efficacy of local isolates of *Meterhizium anisopliae* and *Beauvaria bassiana* compared to an imported isolates when khapra larvae sprayed with concentration of later isolates under laboratory condition, mortalities were recorded for more than two weeks after treatment. Results demonstrated that the larvae were more susceptible to the local isolates of the two fungi than the imported isolates. Cumulative mortalities were 86.67 and 50 when larvae sprayed with 10^9 conidia/ml of local and imported isolates of *M. anisopliae* respectively, and 86.67 and 66.67 when larvae sprayed with 10^9 conidia/ml of laocal and imported isolates of *B. bassiana* respectively after two weeks. The findings of the current study clearly showed

that the local isolates caused higher mortalities than the imported one so they may be used as a good candidates for pragmas of integrated pest management of stored grain pests.

Molecular study to detect *bla*$_{TEM}$ and *bla*$_{CTx-M}$ genes in ESpL *Escherichia coli* and their antimicrobial resistance profile

May Abdul Jaleal Raoof and Mohammed A. Fayidh

− Close abstract View article PDF

The common use of beta-lactam antibiotics resulted in the emergence of bacterial strains capable of spreading and extended-spectrum beta-lactamase (ESβL). Up to 70 of clinical samples, 30 of *Escherichia coli* (*E. coli*) were investigated as ESβL isolates. These isolates collected from inpatients and outpatients to some hospitals in Baghdad. The samples include urine, pus, stool, and blood from both genders, different age groups. The VITEK2 was used to check production of ESβL and for the automated diagnosis of rapid antimicrobial susceptibility experimentation and to the identification of the target bacteria. Technique of PCR was applied to detect the presence of *bla*$_{TEM}$ and *bla*$_{C}$*Tx-M* genes. The results demonstrated that 30(43%) isolates of the current study were ESβL producers. The gel electrophoresis of DNA for positive ESβL isolates gives differentiate results of both *bla*$_{TEM}$ and *bla*$_{CTX}$*-M* genes were observed in 15(50%) and 29(96%) isolates respectively. The antibiotic resistance pattern to 20 antibiotics were showed majority of isolates have the multi-drug resistant (MDR) phenotypes and susceptible to

carbapenems of antibiotic. Furthermore, the results of the genetic analysis, along with the pattern of isolates for antibiotic resistance, it may give an acceptable explanation for the higher presence of the $bla_{CTX\text{-}M}$ gene compared with the proportion of the bla_{TEM} gene in the same isolates.

Arabidopsis thaliana L. Seeds are A novel source of somatic embryos

Rasha Fawzi Al-Jirjees, Shifa Mahdi Salih and Mozahim Kasim AL-Mallah

− Close abstract View article PDF

Somatic embryogenesis is a valuable tool for investigating the totipotency of plant cells. A simple and efficient protocol for inducing somatic embryogenesis from seeds of *Arabidopsis thaliana* were established. Surface sterilized seeds were placed on agar-solidified Murashige and Skoog (MS) medium free from growth regulators. Callus initiation began 7 days after seeds culture and became visible with the naked eye within

10-14 days. It was friable and yellowish white in color. Within 20 days, callus was transferred to Gamborg's B5 medium containing 1.0 mgL-1 2, 4-D (2, 4-dichlorophenoxyacetic acid) and 0.05 mgL^{-1} Kin for multiplication. The results indicated that somatic embryos had been recorded only in B5 medium supplemented with 0.4 mgL^{-1} TDZ (N-phenyl-N'-1,2, 3-thidiazol-5-ylurea) and it was the best one. Through our observation, different stages of somatic embryos have been found. The results revealed that the continuous transfer of small masses containing several embryos at different stages to the same induction medium subsequently formed a large cluster of shoots, which were rooted in MS medium free from growth regulators and MS hormone-free medium with 0.2activated charcoal. The percentages of rooting were 63% and 51% respectively. This study proved that Arabidopsis thaliana seeds are a novel source for somatic embryos.

Antibacterial, antivirulence and antifungal activity of silver nanoparticles synthesized using alkhal mother shae

Esam J. Al-Kalifawi, Yasamine. J. Al-Azzawi and Mohammed A. Feaza

− Close abstract View article PDF

Silver nanoparticles were biosynthesized using alkhal mother shae. Nanoparticles were characterized using four methods. The results of the fourth methods proved that silver nanoparticles are spherical shape with a size ranging between 30-40 nm. AMS-AgNPs has antibacterial and antibiofilm activity against gram negative and gram positive tested bacteria, and it has antifungal and antivirulence activity against five types of fungi. Results declare the effect of AMS-AgNPs on the fungus, it can disrupt the integrity fungal cell wall, promoting the permeability and the leakage of the cell constituents, and eventually induce cell death, which is reached from the Congo red dye absorption test and the formation of swelling in the hyphae of the fungal. This study revealed that AMS-AgNPs can be used as an alternative medicin for pathogenic bacteria and fungi.

Synthesis, Theoretical Treatment and Investigation of Adsorption of 4,4'-((1E,1'E)-(Methylenebis(4,1-phenylene))bis(diazene-2,1-diyl))bis(naphthalen-1-ol) on Olive Peel

Zainab J. Khudair, K. Jassim Khawla and Ameena N. Seewan

− Close abstract View article PDF

In this study, the compound 4,4'-((1E,1'E)-(methylenebis(4,1-phenylene))bis (diazene-2,1-diyl))bis (naphthalen-1-ol) synthesized by reaction of 4,4'-Diaminodiphenylmethane with Alpha-naphthol. This compound was identified by using an element C.H.N analyzer, Infra-Red spectrum, Ultraviolet and Visible spectrum, and GC-Mass spectrometry. We used olive peels to adsorb the synthesized dye from an ethanol solution. The results obtained showed that olive peel has a good adsorption on the bis-azo dye. Temperature

and pH effect were studied under multiple conditions. The result showed that the adsorption increased with temperature increasing, and adsorption efficiency according to pH as 7<4<9. Theoretical treatment was studied in gas phase for molecular mechanics and semi-empirical computations using the hyper chem8 program. Dipole moment, formation heat and binding energy were done via the methods (PM_3 and ZINDO/S) at 25°C. Electrostatic potential of active sites were also studied for the newly synthesized bis-azo dye. Vibrational values were evaluate using PM3 method, the theoretical frequencies obtained from the calculations were consistent with the experimental values. HOMO & LUMO (frontier orbitals) were studied by PM_3 method, electronic spectrum was also studied using ZINDO/S method and compared with experimental spectrums. The results obtained were closely related between the theoretical and experimental spectrum.

Synthesis and DNA binding study of Co (II) and V(IV) complexes with O, N, O tridentate 3-methoxysalicylaldehyde-semicarbazide based ligand

Suher M. Dawoud

Cobalt and vanadium complexes with (E)-2-(2-hydroxy-3-methoxybenzylidene)hydrazine-1-carboxamide were synthesized. The ligand was structurally characterized by FTIR, ^{1}HNMR and ^{13}CNMR spectroscopy. The interaction activity of ligand and complexes was investigated with DNA by spectroscopical and physical methods. The results showed an intercalative binding between the synthesized compounds and DNA.

Assessment The Suitable of The Groundwater for Civil uses in Kalhitta Village, Al-Ayadiyah S District, Iraq

Mohammed Hazim Sabry Al-Mashhadany

− Close abstract View article PDF

The current research describes the application of the water quality index (WQI) based on the collection of 50 samples of water sample for 10 wells for five months in the village of Kakhirta in Al-Ayadiyah subdistrict, northwest of Nineveh Governorate. The model was applied using 13 parameters (pH, TDS (total dissolved salts), DO (dissolved oxygen), T.A (Total Alkaline), Cl, Ca, Na, Mg, K, PO_4, SO_4, TPC (Total Plate Count), and F. Colif. (Faecal coliform) depending on the results obtained from the model. The groundwater quality ranged between (218 - 765), which indicates deterioration in water quality due to the high numbers of bacteria TPC and F. Colif., as well as the high total alkaline T.A and hypoxia in the water more the recommended limits for drinking water.

Study of Corrosion Inhibition for Mild Steel in Hydrochloric Acid Solution by a new furan derivative

Israa M H Al-mousawi, Rana S Ahmed, Nafeesa J Kadhim and Ahlam M Farhan

− Close abstract View article PDF

The corrosion inhibition effect of a new furan derivative (furan-2-ylmethyl sulfanyl acetic acid furan-2-ylmethylenehydrazide) on mild steel in 1.0 M HCl was investigated using corrosion potential (ECORR) and potentiodynamic polarization. The obtained results indicated that the new furan derivative (furan-2-ylmethyl sulfanyl acetic acid furan-2-ylmethylenehydrazide) (FSFD) has a promising inhibitive effects on the corrosion of mild steel in 1.0 M HCl across all of the conditions examined. The density functional theory (DFT) study was performed on the new furan derivative (FSFD) at the B3LYP/6-311G (d, p) basis set level to explore the relation between their inhibition efficiency and molecular electronic structure. The final experimental results showed that FSFD act as a good corrosion inhibitor in the acidic solution for mild steel which is in agreement with the results of the theoretical study.

Biochemical Aspect, Antimicrobial and Antioxidant Activities of *Melaleuca* and *Syzygium* Species (Myrtaceae) Grown in Egypt

Omar M. Khalaf, Mohamed S. Abdel-Aziz, Ali M. El-Hagrassi, Abeer F. Osman and Mosad A. Ghareeb

The objective of the present work was to establish the antimicrobial activity of four species of Melaleuca (i.e. Melaleuca leucandron, Melaleuca armillaris, Melaleuca linarifolia, & Melaleuca ericifolia) methanolic extracts and five species of Syzygium (i.e., Syzygium samaragense, Syzygium jambos, Syzygium gratum, Syzygium paniculatum & Syzygium malaccense). To research the chemical composition of the most promising extracts, as well. The antimicrobial activity was evaluated against four pathogenic microbial strains, namely Staphylococcus aureus, Escherichia coli, Candida albicans and Aspergillus niger, the antioxidant activity was evaluated by 2,2'-diphenyl-1-picrylhydrazyl radical (DPPH), while the chemical composition was calculated by gas chromatography coupled to a mass spectrometry method (GC/MS). For the genus of Melaleuca, S. After therapy, aureus pathogens were inhibited with their methanolic extracts with an 8.0-20.0 mm range of inhibition zones, E. Coli with a 0.0-21.0 mm inhibition zone size, C. Albicans with an inhibition zone size of 9.0-18.0 mm, and A. Niger with an inhibition zone scale of 0.0-15.0 mm. Whereas, for the genus Syzygium, S. After treatment with their methanolic extracts, aureus pathogens were inhibited with a 10.0-20.0 mm range of inhibition zones, E. Coli, with an inhibition zone size of 0.0-14.0 mm, C. Albicans with an inhibition zone size of 0.0-21.0 mm, and A. Niger with a range of inhibition zones of 0.0-9.0 mm. The IC50 values in the DPPH assay ranged from 34.60 to 60.97µg/ml for the species Melaleuca. The IC50 values for the Syzygium species ranged from 29.81 to 52.95µg/ml compared to 7.35µg/ml for the normal ascorbic acid. GC/MS research showed that Syzygium gratum's methanolic extract consists of 39 compounds comprising 99.08 percent, with Veridiflorol (7.16 percent) and 2-methyl, 3-

Hexanone being the main compounds (5.74 percent). While Melaleuca armillaris' methanolic extract consists of 30 compounds comprising 97.66%, with Veridiflorol (18.36%) and Globulolol compounds being the key compounds (12.57 percent).

Adsorption Studies of Cobalt (II) Complex By Bentonite clay surface

Sahira S. Abd-Ulrazzaq, Farah A. Dawood and Ahmed T. Numan

− Close abstract View article PDF

This paper is summarized with one of the applications of adsorption behavior; A UV-Vis method has been applied to survey the isotherm of adsorption. Results for experimental showed the applicability of Langmuir equation. The effect of temperature on the adsorption of cobalt (II) Complex by bentonite surface was studied. The results shown that the amount of adsorption was formed to increase, such as the temperature increase (Endothermic process). Cobalt (II) Complex has adsorption studies by bentonite surface at different pH values (1.6-10); these studies displayed an increase in adsorption with increasing pH.

ΔG, ΔH, and ΔS thermodynamic functions of the cobalt (II) Complex for their adsorption have been calculated.

Preparation of Mixed ligand Complexes of Heterocyclic Azo Quinoline Ligand and Imidazole Molecule with Some of Divalent Transition Ions and their Biological Activity Against Multi Drug Resistance Pathogenic Bacteria

Israa N. Witwit, Hawraa M. Farhan and Zahraa Y. Motaweq

− Close abstract View article PDF

Heterocyclic azo compound 2-(8-quinolyl azo)-4,6-dimethyl phenol as a primary ligand and imidazole molecule as a secondary ligand in the basic medium were prepared with novel mixed ligand complexes of Hg(II), Mn(II), Ni(II), Co(II) and Cu(II) ions, these compounds were characterized by Mass, 1HNMR, IR, UV-Vis, Magnetic susbtibility and Molar Conductivity, which suggested octahedral conductivity. Free ligands and five mixed ligand complexes of Hg(II), Mn(II), Ni(II), Co(II) and Cu(II) metal ions with a general formula of [M(L1)(L2)2C1] against eight pathogenic multidrug resistance bacteria, six G-ve bacteria (Pr. mirabilis, S. typhi, E. coli, P. aeroginosa, A. baumanii and K. pneumoniae) and two G+ve bacteria (E. faecalis and S. aureus) were capable of antimicrobial efficacy. The findings show that free ligands have had stronger antibacterial activity on S. Bacterial isolation of typhi and P. aeroginosa relative to other isolates. As for the effectiveness of metal complexes, compared to G+ve bacteria, they usually have a large antibacterial effect on G-ve bacteria, whereas the Hg(II) ion complex has a higher antibacterial effect on most bacterial isolates compared to other metal complexes. Compared with other metal complexes, Mn (II) ion complexes demonstrated poorer antibacterial activity..

Preparation of Polystyrene/Polyacrylonitrile Blends by Electrospinning Technique

Ahmed H Oleiwi, Akram R Jabur and Qusay F Alsalhy

New blend material membranes as fibers produced by electrospinning technology and these membranes were characterized and evaluated their properties in this research. Polyacrynitrile polymer mixed physically with polystyrene to produce the blend membranes. FTIR confirm the occurrence of polymeric blends by establishing the absence of new chemical reactions occurs. The hydrophobicity of the membrane was reduced by increase the PAN percent in the blend. Field emission scanning electron microscopy used to study the morphologies of the membranes and illustrated the average

diameters of produced fibers which found about 1.68-0.73 μm. The average pore size found about 1.28 – 0.31 μm for blend membranes. The result showed an increasing in fibers diameter and pore size with increasing of the PAN percent while the membranes porosity still high percentage about 98%.

Evaluation of Ceruloplasmin ferroxidase activity and lipid profiles in patients with Valvular heart diseases

H K Sacheat, S Z Husseinand and S S Al-Mudhaffar

One of the major health problems causing defects or damage to one or more of the four heart valves [aortic, mitral, pulmonary, and tricuspid] is valvular heart disease [VHD]; it occurs due to congenital abnormalities or acquired pathology. It is a defect that results in weak heart valves and is therefore unable to function as precise pathways of the blood. The aim of the current study was to evaluate the ferroxidase activity of ceruloplasmin (Cp) and the lipid profile of valvular heart disease patients in sera. Ninety subjects were included in this study and 60 patients with HDV were divided into two subgroups according to the affected valve: 33 patients with aortic valve disease (AV) and 27 patients with mitral valve disease (MV group). In addition, 30 healthy individuals were registered in all groups as control(C) group Serum copper (Cu), total protein (TP), activity and specific activity of ferroxidase Cp, and lipid profile were measured. The results showed that there was a highly significant increase in patient (AV & MV) groups compared to the C group in activity, specific Cp and Cu activity levels. In addition, compared to the C group, triglyceride (TG) and very low density lipoprotein (VLDL) levels showed a highly significant increase in the AV and MV groups. No significant differences were found between patients and control groups in TP, Total Cholesterol (TC), Low Density Lipoprotein Cholesterol (LDL-C) & High Density Lipoprotein Cholesterol (HDL-C)

levels. Likewise, for all parameters, there were no significant differences between the AV and MV groups. In conclusion, the high serum level of Cu and the activity of Cp ferroxidase may be considered to be a risk factor for VHD.

Regeneration of Used Oils by Red Mud and DESs (Reline)

W M Saleh, R Z Al-Khayat, S h M Saied, A M SYassin and F fadil

– Close abstract View article PDF

To regeneration of oils which are used in cars engines to lubricate its moving parts, and to get rid of highly contaminants which must be separated to reuse the engine oils. In the column chromatography, the waste oil was treaded as mobile phase (eluent) with petroleum ether (40-60°C), while the red mud (alhuor) is a stationary phase for adsorbed the impurities. The effect of the new method using deepeutectic solvent (DESs Reline) as a kind of ionic liquids to help extract impurities by adsorption (choline chloride and urea). Moreover, some thermal and physicochemical properties like density, thermal and electrical conductivity, ash percentages, viscosity, specific gravity and pH values were determined. Values were determ.using TGA for blank oil for comparison and differential scanning calorimetric analyses (DSC).

Conductometric Study of Proline-Mn (II) Complex in Some Solvents at Various Temperatures, with Computational Factors Calculation

Fanar M Al-Healy, Shayma H Abdulrahman and Anfal R Mahmoud

– Close abstract View article PDF

The equivalent conductivities of proline in water, methanol were studied in the temperature range of 288.15 to 313.15 K at 5 K intervals, in mixtures of methanol and water at percentages of 10 %, 20%, 30%, 40% and 50% of methanol at 37 °C. The

experimental data were treated by the Lee-Wheaton conductivity equation of unsymmetrical electrolytes (1:2) (1 molecule of metal with 2 molecules of ligand) derived to calculate the conductivity parameters, equivalent conductance at infinite dilution Λ_o, ionic conductivity, association constant Ka and the main distance between ions in solution(R) at best fit values of (6Λ). Thermodynamic quantities for the ion-association reaction ΔG°, Δ℧° and ΔS°) have been also measured. The results of the analysis showed that the ions of the complex can be separated by solvent molecules (SSIP). The values of Ka, Λ° and R were found to be different from one solvent to another depending on the interactions in the solution. Furthermore, the chemical structure of the Proline-Mn complex was optimized by using of Gaussian interface version 16.0 program of chem3D to optimiz the features of complex molecule. The suggested statistical model possesses only two parameters with excellent values of the square regression coefficient (r^2) and cross-validation (q^2) are equal to 0.999 and 0.994, respectively, which refers to the perfect relationship between Ka value and the physical properties of the solvent.

Levels of Heavy Metal and Trace Element Among Children with Autism Spectrum Disorders

Furqan Moein Auda, Amar M Ali and Shaymaa Dhyaa

− Close abstract View article PDF

The aim of this study was estimation the concentration of heavy and trace element in blood samples for autism spectrum disorder *material and method*: sixty patients with autism participated in the present study, all of these patients are registered in an autism center in Basrah province(Iraq). At the same time, 30 healthy children contributed in the study as a control group. The heavy levels were estimated and trace elements (chromium, zinc, selenium, copper, lead, mercury and iron) in the patient and control groups by used energy dispersive X-ray spectroscopy (EDS). The basic principle should appear in the X-rays emitted by the different energies coming from the sample at the same time as a beam

of an electron is moving its factors. *Conclusion*: The results showed that there was no significant difference between patients and the control group in all trace elements except zinc. On the other hand, the study showed that there was no significant change between male and female in all levels of trace elements except selenium.

Synthesis and Study Antibacterial Activity of Some New Polymers Containing Maleimide Group

Ruwaidah S. Saeed, Fatimah Ali Hussein, Sana Hitur Awad and Muna S. Al-rawi

By condensation of benzaldehyde with thiourea in absolute ethanol in the presence of glacial acetic acid as a catalyst, the Schiff base(1-benzylidenethiourea)[I] was synthesized by synthesis of 4-(3-benzylidenethioureido)-4-thioxobut-2-enoic acid compound[II] by reaction of maleic anhydride with schiff base [I] in DMF. When treating compound [II] with ammonium persulfate (NH4)2S2O8 (APS) as an ethanol initiator to obtain polymer [III], compound [III] reacted to polymer [IV] with SOCl2 in benzene. Sulfamethizole, celecoxib, salbutamol, 4-aminoantipyrine to yield polymers [V-VIII], compound [IV] reaction with different drugs. Spectral evidence established the structure of synthesized compounds: FTIR and 1HNMR, UV-Vis Spectroscopy and Elemental Analysis (C.H.N-S). These synthesized derivatives [V-VIII] were tested for their antibacterial activity against Bacillus subtilis (G+) and Escherichia coli (G-) by agar well diffusion process, and the results showed that all polymers had a greater diameter of the growth inhibition region. This may be relative to the presence of sulfamethizole medication, maleimide group and Schiff bases, Polymer[V] demonstrated excellent inhibition against Bacillus subtilisa and E.coli.

A Novel Coated Wire Electrode And Coated Graphite Electrode for Potentiometric Determination of Amitriptyline Hydrochloride in its pharmaceutical preparations, urine and blood plasma

Muthana Saeed Ali and Ali Ibraheem Khaleel

This paper uses the potentiometric method to evaluate (amitriptyline hydrochloride, AM) by creating selective electrodes for AM drugs with the active ingredient (Ammonium Reinackate, AR) using a plasticizer (Dibutyl phthalate, DBP). The results showed that for (Coated Wire Electrode (CWE)) and Coated Graphite Electrode (CGE) respectively, the Nernstian slope of the prepared Am-AR-DBP electrodes is (57.293, 58.803 mV / decade). With a pH range of (4-7) and a concentration range of 1 ?? 10 ?? Λ(-6)-1 ?? 10 ?? Λ(-1) M for both electrodes, the upper and lower limit of detection for the Am-AR-DBP CGE is 0.2042M, 4.8 ?? 10 ? Λ(-7) M, and the upper and lower limit of detection for the Am-AR-DBP CWE electrode is 0.2051M, 4.91 ?? 10Λ(-7) M, respectively. The response time ranges from 20-83 sec, 14-76 sec for CWE and CGE electrodes respectively. For the CWE electrode, the age of the electrodes is 26 days, and for the CGE electrode, 42 days. The research included calculating the selectivity with the presence of interferers of these electrodes where the K(i, j)Λpot values for all ions were less than 1. In the estimation of the drug Amitriptyline Hydrochloride in the pharmaceutical preparation (Amitriptyline tablets), the manufactured electrodes were used by following the direct process, the standard method of additions, the possible titration method and the homogeneity of the material sample, as well as the drug was estimated in urine and blood plasma with a recovery of not less than 100.57 for urine and 99.46 f for urine.

Influence of ultrasonic pre-treatment on Pyrolysis and Combustion of Sewage Sludge by TG

Ruaa O. Taha and Farah Ali Mohammed

The combustion and pyrolysis processes of sewage sludge were studied in the current report. Two kinds of sewage sludge(SS) were used, SS the sewage sludge was not treated, while SS-U90KHz the ultrasonic bath pre-treated sewage sludge with a frequency of 90KHz was not treated. Wastewater treatment plants are the origins of waste sludge. Analyses were performed roughly and finally. Thermogravimetric research analyzed the thermal behaviour of the analysed sewage bucket (TGA). The samples were heated at a constant rate of 25 to 800 Celsius by air (combustion) and nitrogen flow (pyrolysis). For sludges which have been investigated. In the TG/DTG curves, comparable thermal profiles were available. All of the TG/curves DTG's were divided into three periods. At the same time, during the combustion stage, the sewage sludge decomposition occurred in the 180-580 0C range. The pyrolysis procedure took place at a lower rate, but less weight loss..

Pretreated Fishbone as Low Cost-Adsorbent for Cationic Dye Adsorption from Aqueous Solutions: Equilibrium, Optimization, Kinetic and Thermodynamic Study

Muna Abd Ul Rasool Al-Kazragi and Dhafir T.A. Al-Heetimi

− Close abstract View article PDF

The present study investigated the use of pretreated fish bone (PTFB) as a new surface, natural waste and low-cost adsorbent for the adsorption of Methyl green (MG, as model toxic basic dye) from aqueous solutions. The functional groups and surface morphology of the untreated fish bone (FB) and pretreated fish bone were characterized using Fourier transform infrared (FTIR), scanning electron microscopy (SEM) and Energy dispersive X-ray spectroscopy (EDS), respectively. The effect of operating parameters including contact time, pH, adsorbent dose, temperature, and inorganic salt was evaluated. Langmuir, Freundlich and Temkin adsorption isotherm models were studied and the results showed that the adsorption of basic dye followed Freundlich isotherm. Kinetic modeling of the data at different temperatures confirmed pseudo-second-order(P-2-O) model, along with calculated thermodynamic parameters depicted that the adsorption

process is spontaneous and endothermic in nature. Diffusion studies suggested that intra-particle diffusion is not the singular rate-controlling factor. The results indicated that 92% of MG capable of being sequestered under optimum adsorption conditions: pH 10.64, adsorbent dose 0.1 g/L, and 60 min contact time. Finally, the results showed that the pretreated fish bone can be effectively used as a proper adsorbent for the adsorption of cationic dye from aqueous solutions.

Metal Complexes of Multidentate N_2S_2 Heterocyclic Schiff-base Ligands;Formation, Structural Characterisation and Biological Activity

Baidaa K Al-Rubaye, Mohamad J. Al-Jeboori and Herman Potgieter

The synthesis of ligands with N_2S_2 donor sets that include imine, an amide, thioether, thiolate moieties and their metal complexes were achieved. The new Schiff-base ligands; N-(2-((2,4-diphenyl-3-azabicyclo[3.3.1]nonan-9-ylidene)amino)ethyl)-2-((2-mercaptoethyl)thio)-acetamide (H_2L^1) and N-(2-((2,4-di-p-tolyl-3-azabicyclo[3.3.1]nonan-9-ylidene)amino)ethyl)-2-((2-mercaptoethyl)thio) acetamide ($H2L^2$) were obtained from the reaction of amine precursors with 1,4-dithian-2-one in the presence of triethylamine as a base in the CHCl3 medium. Complexes of the general formula $K_2[M(Ln)Cl_2]$, (where: M = Mn (II), Co(II) and Ni(II)) and [M(Ln)], (where: M = Cu(II), Zn(II) and Cd(II); n =1-2, expect $[Cu(HL^2)Cl]$) were isolated. The entity of ligands and complexes including their purity were confirmed using elemental microanalysis (C.H.N.S), atomic absorption (A.A), chloride content, conductivity measurement's, melting point and thermal analysis technique. The molecular structures were elucidated with FT-IR, UV-Vis, magnetic susceptibility, ^{1}H-and ^{13}C-NMR and mass spectroscopy. The synthesised compounds were evaluated for their activity against bacterial strains (G+ and G-) and fungi species. The tested compounds indicated that; the ligands have not shown any antimicrobial activity against *Escherichia coli*. The Cd(II) complexes, for ligands $H2L^1$ and $H2L^2$, display the higher antimicrobial activity,

compared with the other complexes. The H_2L^1 and H_2L^2 have not shown any activity against *Candida albicans*. All complexes for ligands (H_2L^1 and H_2L^2) exhibited less activity against *Candida albicans*, compared with other types of fungi.

Removal Congo Red Dye on Surface of Nano Charcoal Activated by Used Central Composite Chemometric Method

Aayad Ammar Sayhood, Noor Hassan Abdulrudhaand and Mohanad Hazim Halboos

In this paper; the modern method was used to remove the congo red dye (CR) from its aqueous solutions by chemometric separation. The nano charcoal activated (NCA) was used to remove the CR and the factors affecting the adsorption process were studied simultaneously to reduce the number of experiments followed and to rely on central composite design and the method of response surface by used statistica 12 program. This gives the relationship between all the variables simultaneously. It was found that the removal efficiency reached to 98.371%.

Loading and Activating a Carbon Surface and Applied for Congo Red Adsorption, Kinetic Study

Russol Abdul Salam Faraj and Ahmed Mohammed Abbas

this paper contains preparation of Active carbon surface (AC) from pro so millet grain husks and Loading and activating by Iron oxide and hydrogen peroxide sequentially to obtain surface (ACIPE). The changes of previous processes on Active carbon surface were diagnosed by Fourier transform infrared spectroscopy (FTIR) and Scanning electron microscopy (SEM). These surfaces (AC and ACIPE) were using as adsorbent for

removing of congo red dye from aqueous solutions under certain conditions through batch system. More than one kinetic model was applied to congo red dye adsorption process and it was found that the most kinetic model applied to it is a model (pseudo second order model). In addition to the adsorption efficiency of the surface after activation and loading, it was much better than the main surface where the adsorption efficiency of the first and second surface was equal (27%, 85%) sequentially at higher temperatures.

Audio source separation using supervised deep neural network

Riham J. Issa and Yusra F. Al-Irhaym

The speech signals inserted in the computer may be mixed as a result of interference with signals from other sources. These signals may be speech signals or noise. One of the most famous examples of this problem when a group of people speaking in the same time is the "Cocktail Party". This problem produces a mixture of different speech signals, called the mixed signal. To solve this problem, the audio signals that make up the mixed-signal must be restored to their sources. This task is called separating audio sources. In this paper, supervised Deep Recurrent Neural Networks with Bi-directional Long Short Term Memory (Supervised DRNN-BLSTM) were used. To achieve a monaural source separation, we build a model to separate audio signals from a monaural mixed signal. This mixed signal consists of two different audio signals (male-female). We predict two types of time-frequency masks (Ideal Ratio Mask (IRM), and Optimal Ratio Mask (ORM). They are used to achieve the separation of the target audio sources from the mixed signal. We test the model on a dataset with (500) mixed signals. Each mixed signal three seconds in length and consists of two speaker signals (Female-Male). They are recorded in a stereo format at 8192kHz, our approach achieves Signal-to-Distortion ratio

(SDR) (0.183.db), Source-to-interference Ratio (SIR) (0.198.db), and Source-to-Artifacts Ratio (SAR) (0.13.db) gain using (ORM) mask compared to the existing model using (IRM) mask.

A Parallel Adaptive Genetic Algorithm for Job Shop Scheduling Problem

Wathiq N. Abdullah and Salwa A. Alagha

In order to enhance the production efficiency, scheduling problem of job-shop has used that thought of complex problem with complicated constraints and structure. This problem is characterized as NP-hard. In most cases, the excessive complexity of the problem makes it difficult to discover the best solution within affordable time. Hence, searching for estimated solutions in polynomial time rather than precise solutions at excessive cost is favored for challenging situations of the problem. In this paper, a parallel genetic algorithm with proposed adaptive genetic operators and migration operation is applied for job-shop scheduling problem. Through tests on numerous different experimental cases, the adaptive operator of genetic algorithm and the parallelism strategy are considerably improving the results effectively while decreasing the computation time. Also, the migration operation gives a greater effect on the performance of the algorithms.

Human Activity Diagnosis System Based on the Internet of Things

Mohammed Khammas Jabar and Ali Kadhum M. Al-Qurabat

The Cognitive Internet of Things (CIoT) is the next step in enhancing the accuracy and reliability of the Internet of Things (IoT) technology used for Cognitive Computing, which plays a main role in health and disease diagnosis. The study was suggested a diagnosis method to sound sensitivity by developing a framework with IoT and cloud based on a facial expression recognition system. It was achieved through the creation of a cognitive IoT hardware-based environment and the elements of the programs that are implemented to test the behaviour of people suffering from sound sensitivity, this operation is done by using a camera and image processing and it used Convolutional Neural Network (CNN) as a facial recognition software to track human facial emotions through live video. The sentiment values were analysed that they were collected and stored in a cloud using Transmission Control Protocol (TCP) protocol. These emotions were categorized as abnormal or normal. Normal states represented by happy or natural feelings that give the impression that the environment is suitable for people's senses and that they do not suffer from discomfort towards this environment, therefore; the system operates on a mechanism to increase the volume in this environment by using an Arduino microcontroller. Although the device operates automatically in the event of hypersensitivity detection, it reduces this severity. The obtained results showed the efficiency of the proposed system in recognizing facial emotions with 80% accuracy.

Personal identification system based on multi biometric depending on cuckoo search algorithm

Ansam Nazar Younis

In modern devices, many personal identification systems are used using various biometrics to confirm the identity of an individual and identify him for several purposes. Some of these essential biometrics are used in this paper to help identify a person while attaining social distance because of the widespread epidemics. The features of the face, eyes, nose, and finally, the features of the mouth are used in this article. The work begins

by detecting the parts of multibiometric from the input images using Viola-Jones face detection algorithm with a modification to it then segment them. After that, various initial treatment processes begin which helps clarify them to facilitate subsequent operations. Also, a Histogram of oriented gradient method(HOG) is used to extract the significant features of those image segments. The extracted features from these segments are entered into the developed cuckoo search algorithm(DCSA), the best image segment within the used dataset is searched for similar in terms of characteristics to the entered image segment. The work has also been developed so that the system is executed on two cores using parallel processing technology to utilize the processor as much as possible and reduce the time it takes to implement the system and identify the person concerned. A high identification rate has been reached, reaching 99.25%, and overall speed up 1.40323 sec relative to serial execution.

Predictions of COVID-19 Spread by Using Supervised Data Mining Techniques

Wid Akeel Awadh, Ali Salah Alasady and Hadeel Ismail Mustafa

In the wake of the outbreak of the new coronavirus, the countries in the world have fought to combat the spread of infection and imposed preventive measures to compel the population to social distancing, which led to a global crisis. Important strategies must be studied and identified to prevent and control the spread of coronavirus COVID-19 disease 2019. In this paper, the effect of preventive strategies on COVID-19 spread was studied, a model based on supervised data mining algorithms was presented and the best algorithm was suggested on the basis of accuracy. In this model, three classifiers (Naive Bayes, Multilayer Perceptron and J48) depended on the questionnaires filled out by Basra City respondents. The questionnaires consisted of 25 questions that covered fields most related to and that affect the prevention of COVID-19 spread, including demographic, psychological, health management, cognitive, awareness and preventive factors. A total

of 1017 respondents were collected. This model was developed using Weka 3.8 tool. Results showed that quarantine played an important role in controlling the spread of the disease. By comparing the accuracy of the algorithms used, the best algorithm was found to be J48.

Knowledge management model to enhance Enterprise Resource Planning system in Green software development process

Sarah M Yahya and Mustafa S Khalefa

The global economy is constantly evolving and corporate technology and business are an important factor in this development and because of the accompanying negative impact on the environment and society, the role of sustainability and sustainable development highlights. To further investigate the scope of the green software development process and its integration with information systems such as the Enterprise Resource Planning (ERP) system, we presented this study due to its importance in minimizing the negative effects of information technology on our natural environment. In this connection, there is a have to combine sustainability and information technology allow organizations to behave in a manner to going greener. Comprehending that the Enterprise Resource Planning (ERP) system is one of the very effective commercial enterprise solutions for organizations, it is necessary to align its use with sustainability factors through the utilization of green IT practices, the objective of this research study is to provide a design model to enhance ERP system in green software development process. So every company must look into the impact of the utilization of Information and communications technology (ICT) on our natural environment and take care to adopt methods to decrease the effects negative on its. Therefore, knowledge management (KM) can be used as the facilitation tool. This research paper presents the results of qualitative research, which

proposes a model that to the possibility of enhancing the implementation of the ERP system in the Green Software Development Process by using green IT practices and knowledge management as facilitation tools.

The Prediction of COVID 19 Disease Using Feature Selection Techniques

Rasha H. Ali and Wisal Hashim Abdulsalam

COVID 19 has spread rapidly around the world due to the lack of a suitable vaccine; therefore the early prediction of those infected with this virus is extremely important attempting to control it by quarantining the infected people and giving them possible medical attention to limit its spread. This work suggests a model for predicting the COVID 19 virus using feature selection techniques. The proposed model consists of three stages which include the preprocessing stage, the features selection stage, and the classification stage. This work uses a data set consists of 8571 records, with forty features for patients from different countries. Two feature selection techniques are used in order to select the best features that affect the prediction of the proposed model. These are the Recursive Feature Elimination (RFE) as wrapper feature selection and the Extra Tree Classifier (ETC) as embedded feature selection. Two classification methods are applied for classifying the features vectors which include the Naïve Bayesian method and Restricted Boltzmann Machine (RBM) method. The results were 56.181%, 97.906% respectively when classifying all features and 66.329%, 99.924% respectively when classifying the best ten features using features selection techniques.

The Classification of Fetus Gender Based on Fuzzy C-Mean Using a Hybrid Filter

Ahmed S Aljuboori, Firas A. Abdullatif and Duraid Y. Mahmmed

− Close abstract View article PDF

This paper proposes a new approach, of Clustering Ultrasound images using the Hybrid Filter (CUHF) to determine the gender of the fetus in the early stages. The possible advantage of CUHF, a better result can be achieved when fuzzy c-mean FCM returns incorrect clusters. The proposed approach is conducted in two steps. Firstly, a preprocessing step to decrease the noise presented in ultrasound images by applying the filters: Local Binary Pattern (LBP), median, median and discrete wavelet (DWT), (median, DWT & LBP) and (median & Laplacian) ML. Secondly, implementing Fuzzy C-Mean (FCM) for clustering the resulted images from the first step. Amongst those filters, Median & Laplace has recorded a better accuracy. Our experimental evaluation on real data from the Kadhimiya teaching hospital shows that the proposed CUHF is a better method when compared to the accuracy of the other integrated filters.

Air Pollution Monitoring based Fuzzy Controller with Embedded System

Saja Sattar Hasanh, Abbas Hussein Miry and Tariq M. Salman

− Close abstract View article PDF

Air pollution has a wide and great influence on the concentration of constituents of the atmosphere, which leads to many effects such as acid rains and global warming. In order to avoid such unwanted adverse imbalances in the nature, designing an air pollution monitoring system (APMS) is very important. This paper discussed the development of an effective solution for monitoring the air pollution by making an Arduino-Based Air Pollution Monitoring System (APMS). Carbon monoxide and Carbon Dioxide concentration levels in air were measured and monitored using MQ4 and MQ7 gas sensors and Arduino atmega microcontroller. These sensors can detect many harmful gases and can be used for measuring their amount very accurately. The concentrations of CO and CO2 in particle per million (PPM) will be monitored and displayed on the LCD

very easily. Based on these measurements the pollution level could be monitored, determined, and displayed. The experiments were carried out using the developed wireless APMS under various physical conditions. The results showed that the designed system collects reliable and reasonable real time pollution data. Three hour sampling time was executed in each location. One of the logical functions that are widely used is fuzzy logic. A fuzzy logic artificial intelligence for gas sensors is used which clarifies the presence as well as the concentration of CO and CO2 efficiently. Fuzzy logic will gives the decision about whether the air is polluted or unpolluted. This logic function we can process some existing data into a form of output which can be in the form of a status or state of action that will be performed by a tool. This proposed system will contribute in the construction of an APMS in the outdoor or even in the indoor environment.

An Automated Mammals Detection Based on SSD-Mobile Net

Elham Mohammed Thabit A. Alsaadi and Nidhal K. El Abbadi

Animal detection techniques are one of the researcher's interests and challenge. There are many difficulties faces by the researchers in this field that reduce the detection performance and efficiency, such as variation of image illumination, animal occlusion, the similarity of animal colors with background environment, etc.

Multi-label Image Detection and classification of Mammals animals is the goal of this paper which we proposed to achieve in this proposal by using Single Shot Multi-Box Detector (SSD) and MobileNet v1 coco_2017 model. Localizing and classifying multiple objects (animals) of the Mammal category in digital images is another goal. The suggested SSD is regarded as a more accurate, fast, and efficient way to detect objects of different sizes based on deep learning technology.

In this proposal, we used 2000 images in the network were collected from the standard dataset (such as Caltech 101) and the net. The SSD framework improves the detection and recognition processes of Convolution Neural Network (CNN). During the prediction time, the network introduces scores to the presence of every object class and bounded each object in the image with a box. Each box has a label that indicates the type of the object and the score represents the probability of the relationship of the object to that type. Boxes during the process are modified for getting the best matching to the object's shape. The experimental results of this work proved the efficiency of classifying and detecting animals even in the variation of illumination, pose, and occlusion. Detection and classification accuracy is up to 98.7 %. This suggestion is more reliable and accurate than other similar works and detects a wide range of Mammals animals, unlike other similar works.

Image Steganography using Dynamic Threshold based on Discrete Cosine Transform

Namar A Taha, Amna Al Saffar, Alaa A Abdullatif and Firas A Abdullatif

The art of preventing the detection of hidden information messages is the way that steganography work. Several algorithms have been proposed for steganographic techniques. A major portion of these algorithms is specified for image steganography because the image has a high level of redundancy. This paper proposed an image steganography technique using a dynamic threshold produced by the discrete cosine coefficient. After dividing the green and blue channel of the cover image into 1*3-pixel blocks, check if any bits of green channel block less or equal to threshold then start to store the secret bits in blue channel block, and to increase the security not all bits in the chosen block used to store the secret bits. Firstly, store in the center of the block and then store another bit in the write or left bit depended on differences between them.

The proposed method was applied to many color images and many measurement terms used to show the efficiency of it. The experiment result showed good result that the PSNR = 53.76, MSE = 0.273, SSIM= 0.999, with embedding rates 0.55

Impact of Feature Selection for Data Classification Using Naive Bayes Classifier

Eman Hato

In the field of data processing and analysis, the dataset may be a large set of features that restrict data usability and applicability, and thus the dimensions of data sets need to be reduced. Feature selection is the process of removing as much of the redundant and irrelevant features as possible from the original dataset to improve the mining process efficiency. This paper presented a study to evaluate and compare the effect of filter and wrapper methods as feature selection approaches in terms of classification accuracy and time complexity. The Naive Bayes Classifier and three classification datasets from the UCI repository are utilizing in the classification procedure. To investigate the effect of feature selection methods, they are applied to the different characteristics datasets to obtain the selected feature vectors which are then classified according to each dataset category. The datasets used in this paper are the Iris, Ionosphere, and Ovarian Cancer dataset. Experimental results indicate that the filter and wrapper methods provide approximately equal classification accuracy where the average accuracy value of the Ionosphere and Ovarian Cancer dataset is 0.78 and 0.91 for the same selected feature vectors respectively. For Iris dataset, the filter method outperforms the wrapper method by achieving the same accuracy value using only half number of selected features. The results also show that the filter method surpasses when considering the execution time.

An Improved Data Hiding using Pixel Value Difference Method and Hyperchaotic System

Sameera Abbas Fadhel, Zeena N. Al-Kateeb and Muna Jaffer AL-Shamdeen

– Close abstract View article PDF

The present paper builds a security system to encrypt and hide important text data. The system utilized an AES method to conduct an encryption process, followed by hiding the encrypted data using an improved Pixel Value Difference (PVD) technique. The method works to builds a map to hide data in a non-sequential way by relying on a hyperchaotic system to increase the security level. The system methodology proposed that the data embedding process is in one of the three levels of the colour image (Red, Green, and Blue), where the embedding level will determined based on the coordinates of the PVD pair points that is increase the efficiency of performance. A set of measures was used to measure the quality of steganography where we used MSE, PSNR, SNR, and Corr, and the results are well and satisfactory. The proposed method records the least MSE value with 0.85348784908256, while the Corr values did not decrease about 0.994145776227782. The proposed method also proved successful and effective in retrieving and decoding data, where the BER scale was equal to zero for all retrieved text.

– Close abstract View article PDF

In this paper, we propose an experimental study of multi-camera collaborative network for surveillance the highway traffic turn in real life scenario, the target of surveillance based offline video processing is capturing the violated vehicles that driving violated paths in many cases specified by user-defined rules. Best topology of the experiment zone is considered and covered by four pillars; each has two (fixed and motorized) cameras that casing the entire specific effective field of view. As to author knowledge, there is no

such available experiment, and hence, it could serve researchers that interested in. However, the experiment is done for around 180 recorded hours for 8 videos during 9 days, each video for one camera. It is designed based on the collaborative cameras principle for intelligent video surveillance systems and the outcomes show that the surveillance and the tracking of violated vehicles have been successes in most user-defined rules cases for more than 90 % cases.

Higher Education's Certificates Model based on Blockchain Technology

Mustafa A. Ali and Wesam S. Bhaya

Blockchain technology has revolutionized economic transactions, and it is expected to spread and influence other fields. It can create innovative and destructive effects on the systems that need to be executed, store, verified, and continually update digital data among participating parties. Moreover, it provides security, privacy, trust, and transparency. In the education field, there is a shy presence of some blockchain applications, and the majority of them have a pilot character. Hence, a model based on blockchain is introduced in this study, which aims to provides easy to apply for certificates, as well as share and verify these certificates with a third party. Moreover, the mechanism of the proposed model proposes permanent distributed hashes records of students' certificates in Higher Education to reduce forgery. In conclusion, the study discussed the opportunities, benefits, features, and challenges are represented by deploying this model in the Higher Education field.

Brain Computer Interface using EEG Based Sequential Minimal Optimization algorithms

Batool Abd Alhade, Israa Safaa Ahmed and Baidaa Zahid Kamil

− Close abstract View article PDF

The concept of interfacing brains with robots/machines has been capturing human interests for a long time. The technology of the Brain-computer interface (BCI) has been aimed at building an interface between the brain and any electronic/electrical device (such as, smart home appliance, a wheelchair, and robotics devices) with the use of the electroencephalogram (EEG) that can be defined as a non-invasive approach for the measurement of the electrical potentials from the electrodes that have been placed on the scalp, produced by the activity of the brain. Over the past years, pattern classification was a highly challenging research field. Presently, the tasks of the pattern classification. In this paper, we chose motor imagery with the use of the single trial EEG signal, the SOM has been utilized to classify the signal processing algorithm (FICA). In comparison to other algorithms of the EEG signal analyses. It has achieved a classification accuracy of up to 88.% in comparison with the other method where the reported accuracy has been 65%. The SOM classification algorithm has been fast, simple, efficient, and easy to use. It achieved satisfactory results at the BCI.

Digital Modulation Classification Based On Chicken Swarm Optimization and J48 Algorithm

Zainab Kadhm Obeas, Shaimaa Safaa Ahmed Alwaisi and Nadie Kadom Abd

− Close abstract View article PDF

Automatic Modulation Recognition (AMR) has a significant impact in the military as well as civil applications. Recognizing the modulation of the received signal has been considered as an intermediate step between the detection and demodulation of the signal. Which is why, in many military and communication systems, the AMR is considered as part of the system. Presently, due to increasing digital modulations in military and civil applications. Digital modulation recognition is especially important. Usually for the AMR, a small number of the received signal features are obtained and utilized. The choice

of the suitable feature plays an important part in the increase of AMR efficiency. The presented paper indicates hybrid intelligent system for the recognitions of digital signal types, consisting of 3 major modules: classifier module, feature extraction module and J48 Classifier that was used for the first time in our research in the field of classification of modulated signals and optimization module by Chicken Swarm Optimization (CSO). To get better results of the system suggested optimization the features to discard weak or irrelevant features in the system and keep only strong relevant features Chicken Swarm Optimization. The results of simulation confirm the high accuracy of recognition that is related to the suggested system even at low SNR.

TSCO: Trust-based secure and cooperative opportunistic resource utilization networks

Abduljaleel Al-Hasnawi

− Close abstract View article PDF

An opportunistic resource utilization network (denoted as Oppnet) is a type of network that enables its node to cooperate in an opportunistic and ad hoc manner. Cooperation in oppnet includes sharing node computational resources, rather than only opportunistic communication in the traditional opportunistic networks. The key idea of oppnet is its ability to grow from seed node (initiator) to expanded oppnet via joining more nodes until getting the desired resources in a timely manner. This expansion raises the security risk of joining malicious nodes and threatens the oppnet including nodes and data. Besides, uncontrolled oppnet expansion might allow joining nodes with low computational capabilities or limited resources that have delayed responses, and hence affect the performance of oppnet. This study aims to mitigate these two problems by proposing a new oppnet paradigm (an enhanced version of original oppnet) called Trust-based Secure Cooperative Oppnet (TSCO) that utilizing a trust as a foundation for security and cooperation. Trust foundation is the major aspect of TSCO, which relies mainly on establishing trust value for each oppnet node and updating these values based on

cooperation experience with those nodes. In TSCO, oppnet nodes have classified based on their trust values in which the highest trust value has the priority to join oppnet, if it exists within the specific range. Otherwise, the second-highest trust value takes priority, and so on. To test the feasibility of TSCO in realistic systems, a framework of using TSCO as an oppnet expansion control regarding security and cooperation is simulated. The experimental results show that TSCO has a better performance in terms of secure, success expansion, and cooperation. The success rate of TSCO is higher than the success rate of the original oppnet (our experimental baseline). In addition, regarding the time of satisfying oppnet tasks, TSCO shows less average latency than the baseline.

Three Weighted Residuals Methods for Solving the Nonlinear Thin Film Flow Problem

Areej Salah Mohammed and Majeed A Al-Jawary

In this paper, the methods of weighted residuals: Collocation Method (CM), Least Squares Method (LSM) and Galerkin Method (GM) are used to solve the thin film flow (TFF) equation. The weighted residual methods were implemented to get an approximate solution to the TFF equation. The accuracy of the obtained results is checked by calculating the maximum error remainder functions (MER). Moreover, the outcomes were examined in comparison with the 4^{th}-order Runge-Kutta method (RK4) and good agreements have been achieved. All the evaluations have been successfully implemented by using the computer system Mathematica®10.

Improving Flower Pollination Algorithm for Solving 0–1 Knapsack Problem

Ghalya Tawfeeq Basheer and Zakariya Yahya Algamal

Binary knapsack problem has received considerable attention in combinational optimization. Various meta-heuristic algorithms are dedicated to solve this problem in the literature. Recently, a binary flower pollination algorithm (BFPA) was proposed, which has been successfully applied to solve 0-1 knapsack problem. In this paper, two new time-varying transfer functions are proposed to improve the exploration and exploitation capability of the BFPA with the best solution and short computing time. Based on small, medium, and high-dimensional scales of the knapsack problem, the computational results reveal that the proposed time-varying transfer functions not only to find the best possible solutions but also to have less computational time. Compared to the standard transfer functions, the efficiency of the proposed time-varying transfer functions is superior, especially in the high-dimensional scales.

Radiative peristaltic transport of Ree-Eyring fluid through porous medium in asymmetric channel subjected to combined effect of inclined MHD and convective conditions

Hayat A Ali

− Close abstract View article PDF

This study emphasizes the flow phenomenon of trapped bolus traveling along the interior walls of asymmetric inclined channels contains a non-Newtonian Ree-Eyring. The flow was exposed to influenced by inclined MHD field, thermal heat radiative, and porous media. Further, no slip and convective thermal conditions are considered. Mathematical expression for governing equations are reformulated and in accordance with lubrication approximations, nonlinear partial differential equations of the flow reduced into a system of ordinary differential equations associated with boundary conditions an approximate solution is deduced by implementing perturbation strategy for tiny A Ree-Eyring fluid parameter. Finally, a graphical description is presented to figure out the elevation behavior of flow quantities i.e. velocity profile, temperature distribution, pressure rise, and streamlines formulation due to variation of emerging involved parameters. The study analyzed that the velocity profile reveals mixed behavior via increment of Ree-Eyring parameters η, A as well as Hartman number H and Darcy number Da. whereas the thermal radiative parameter Rn accelerates the temperature distribution profile. The study calculations are made by the "Mathematica 11.3" package.

We present the notion of bipolar fuzzy k-ideals with thresholds (θ, λ) of a KU-algebra with semigroup and give some basic properties of this ideal. Also, we study some relations about a bipolar fuzzy k-ideal with thresholds (θ, λ) and a k-ideal of a KU-semigroup.

Solution BBM-Burger Equation via Quartic Trigonometric B-spline Approach

Hamad Salih

– Close abstract View article PDF

In the present work, the new quartic trigonometric B-spline approach based on finite difference scheme is described to solve the one dimensional non-linear equation of (Benjamin – Bona-Mahony-Burger). Dirichlet boundary with the help of applying the von-Neumann stability analysis is also used in this description. While the time derivative

part is discretized by using the finite difference scheme. In the space dimension, the quartic trigonometric B-spline is also used as an interpolation function. The execution of this method which is used in the present work showed that the quartic trigonometric B-spline method is a more efficient and effective tool and gives better results according to the comparisons that are made with the precise solution for a different time and some other published numerical methods.

On semi strongly (*E, F*)-convex functions and semi strongly (*E, F*)-convex optimization problems

S N Majeed and A A Enad

− Close abstract View article PDF

In this paper, a new class of non-convex functions called semi strongly (*E, F*)-convex functions are presented. This class represents a natural extension of semi strongly *E*-convex functions shown in the literature. Different properties of this class of functions are discussed. Optimality properties of constrained optimization problems in which the objective function or the inequality constraints functions are semi strongly (*E, F*)-convex are proved for this class.

Stabilization study of a non-Linear self-regression model using Linear Approximation Technique

Kawther Abbood Neamah and Safa Abood Namah

In this paper, stability in a polynomial model called a polynomial self-regression model with trigonometric boundaries was studied. A linear approximation technique was used, and the Box-Genghis method was used in data analysis, and time series modeling of numbers of people with media. Data were obtained from AL-Yarmouk Hospital in Baghdad AL-Karkh for the period (2011-2016) shows the numbers of patients with the disease through the technique of Linear approximation. Then we found the single point and the stability of the final cycle, and we tried to apply the results that we obtained on the correct data for audit.

The Analytic of Image Processing Smoothing Spaces Using Wavelet

Asma Abdulelah Abdulrahman, Mohammed Rasheed and Suha Shihab

Image analysis took wide areas in many fields, including medicine, physics, and other areas where you need a tool to deal with it smoothly and softly without losing the original image information. Using an image of a sample of a physical atom that was analyzed and highlighting the compression and raising the noise, histogram and statistics the image statistics where the best results were recorded when using a specific threshold i.e. when pressing the methods were used the first has the threshold methods is Balance sparsity-norm, Remove near 0 and Bal-sparsity-norm(sqrt). As for the methods of raising the noise are fixed form thresholding method with soft threshold, penalize high with hard threshold, penalize medium with hard threshold, penalize low with hard threshold, Bal sparsity norm (sqrt) with soft threshold, where image parameters were divided into

approximation coefficients and details coefficients. Through the analysis, a suitable threshold value was obtained, which helps to restore energy that leads to the fact that the compressed necessity did not lose much of its original information, which proves the new wavelets in the field of physical and medical imaging.

The Homomorphism of a cubic set of a semigroup in a KU-algebra

Omniat Adnan Hasan and Fatema F. Kareem

− Close abstract View article PDF

The study of homomorphisms in cubic sets is considered one of the important concepts that transfer algebraic properties between different structures, so we study a homomorphism of a cubic set of a semigroup in a KU-algebra and defined the product of two cubic sets in this structure. Firstly, we define the image and the inverse image of a cubic set in a KU-semigroup and achieve some results in this notion. Secondly, the Cartesian product of cubic subsets in a KU-semigroup is discussed and some important characteristics are proved.

New Exact Operational Shifted Pell Matrices and Their Application in Astrophysics

Mohammed Abdulhadi Sarhan, Suha Shihab, Bushra E. Kashem and Mohammed Rasheed

− Close abstract View article PDF

In this work, the exact operational matrices for shifted Pell polynomials are achievable; so one can integrate and product the vector of basic functions s. The general form of the matrix of integration *P* is established, the dual matrix of integration *Q* is derived with general formulation, and the general form of the matrix derived from the product of two

shifted Pell polynomials has been given. This idea is implemented on shifted Pell basis vector. Using such exact matrices, then the resident function of the equation is reached which can be written as $R.P(x)$, where R is an algebraic equation vector and $P(x)$ is the shifted Pell basis vector. The presented matrices can be utilized to find the approximate solution of differential equations, integral equation and the calculus of variations problems. An investigation for the convergence and error analysis of the proposed shifted Pell expansion is performed. Numerical treatment for problems in physics are included in this work to demonstrate the accuracy, easy to implement as well as accurate and satisfactory results with a small number of shifted Pell basis. Using operational matrices and the spectral technique are used together for solving Lane-Emden equation.

Two Embedded Pairs for Solve Directly Third-Order Ordinary Differential Equation by Using Runge-Kutta Type Method (RKTGD)

Firas A. Fawzi, Zeyad M. Abdullah and Nazar K. Hussein

In this paper, two pairs of embedded Runge-Kutta (RK) type techniques for straightforwardly tackling third-order ordinary differential equations (ODEs) of the form $v''' = f(x, v, v')$ signified as RKTGD strategies were proposed and explored. Relying on the order conditions, the primary pair with mathematical order 4 and 3 was called RKTGD4(3), while different has order 5 and 4, and was named RKTGD5(4). The new strategies were determined so that the higher-order techniques were exact and the lower order techniques would bring about the best error estimates. At that point, variables step-size codes were created to support the methods and utilized in solving a lot of third-order problems. Comparisons were made between mathematical results and existing embedded RK pairs within the scientific literature, that require the problems to be reduced into a system of first-order ODEs, and the effectiveness of the new RKTGD pairs have appeared.

Estimation the Shape Parameter for Power Function Distribution

Alaa M. Hamad and Bareq B. Selman

In the paper estimate of the shape parameter for power function distribution was proposed. For different sample sizes (small, medium, and large). Using different methods, Maximum likelihood method, Moment method, Shrinkage methods, and Least square method. mean square error (MSE) was implemented as an indicator of performance and comparisons of performance have been carried out through data analysis and computer simulation between the estimation methods according to the applied indicator. It was observed from the results that the shrinkage method (constant weight factor (sh_2)) estimates for the shape parameter are the best in performance for each case.

Parameters estimation of new mixed Weibull Rayleigh and Exponential distribution

Jassim N. Hussain and Ashraf Mohammed Shareef

A new idea of mixing was introduced in this paper. Mixing parameters; p_i where $0 \leq p_i \leq 1$ and $\sum_{i=1}^{n} p_i = 1$ are used to find a new distribution from mixing some distributions. Therefore, we can get many mixed distributions with several parameters. Three distributions Weibull, Rayleigh, and Exponential are mixed to get a new distribution which is more flexible than these distributions. The mixed distribution with a new parameter is representing the ratio of contribution of each of these distributions which are mixed. Several values of the mixing parameter were taken, and the properties of the mixed distribution were found. Two methods (MLE and OLS) of estimation are used to

estimate the parameters of the new distribution. Simulation studies are used to prove the properties of new distribution and to apply the estimation method to estimate the parameters of new distribution.

g-Closed Soft Sets in Soft Closure Spaces

R N Majeed and S T Ekram

− Close abstract View article PDF

The aim of the present work is to define a new class of closed soft sets in soft closure spaces, namely, generalized closed soft sets (*gc*-soft sets, for short) which are defined over an initial universe set with a fixed set of parameters. This new class is a generalization to the class of closed soft sets. A necessary condition for a *gc*-soft set to be a soft closed is also obtainable. Moreover, the union and intersection of two *gc*-soft sets are discussed. Besides, some properties of *gc*-soft sets in the product soft closure spaces are also studied. Also, as an application of *gc*-soft sets a new soft separation axiom, namely $T_{\frac{1}{2}}$-soft closure space is introduced and its basic properties are investigated.

*E-mail: sc.thakerscianb@uoanbar.edu.iq

Abstract. This work was conducted to study the protective role of Moringa oliefera seeds extract (MSE) against the toxic effect of commercial lead nanoparticles (CPbNP) in rats. Twenty eight albino male rats were divided into four groups (seven animals in each one) as follow: (A) control group, (B) 160mg/kg body weight per day (b. wt./d.) of M. oliefera (MSE)seed extract, (C): 5mg CPbNP /kg b. wt./d. and (D): MSE + CPbNP . The experimental period was 45 days. Blood was drawn for protein and enzyme estimation at the end of the period of exposure. The rats were dissected and the liver, kidney, spleen and muscle were isolated for Pb estimation. Results showed that the levels of bioaccumulated lead, serum alanine aminotransferase, aspartate aminotransferase, alkaline phosphatase, malondialdehyde were significantly increased in exposed animals to CPbNP ($P < 0.05$). In contrast, there was a significant reduction of total proteins, albumin, glutathione, superoxide dismutase enzyme and catalase enzyme activities ($P < 0.05$) in comparison to control. But the administration of the CPbNP with MSE, all the above biochemical changes were improved significantly. It is concluded that CPbNP has a significant toxic effect on rats, and that seed extract of M. Oleifera can reduce it.

Keywords. *Moringa oliefera*, Toxicity, Lead Nanoparticles, Antioxidants, liver functions.

1.Introduction

Medical plants are traditionally used in treatments of different healthy cases because it has active biological materials. A significant number of researches have been done to using extracts from medicinal plants as preventive agents against specific pathogens or against xenobiotic toxicity [1, 2, 3, 4]. *Moringa* belongs to the Moringaceae family and spread in Africa, especially in Ethiopia, Kenya, and Sudan. It grows in tropical areas, originally in India, but known in Africa [5]. Each part of the Moringa has a lot of essential components. For example, the leaves contain minerals [6], vitamins [7, 8]. In addition to anti-cancer agents (such as glucosinolates, isothiocyanates), phytochemicals such as terpenoids, flavonoids, alkaloids and sugar reduction [9]. According to [10], *Moringa* leaves have significantly higher antioxidant contents. Other authors have reported the leaves' antioxidant potential [11, 12]. The study of [13] observed that folate's bioavailability from *Moringa* leaves using the rat model was 82%, suggesting that the *Moringa* leaves can be a potential dietary folate source. *Moringa* seeds are also found to have significant biological activity. Powder of seeds was investigated for its

antidiabetic activity in induced diabetic rats due to the presence of glucomoringin, phenols and flavonoids [14]. Ethanol extract of *Moringa* seed showed antifungal activity against *Trichophyton rubrum*, *Trichophyton mentagrophytes*, *Epidermophyton xoccosum* and *Microsporum canis* [15]; while the water extract of Moringa seed kernel possessed potent antioxidant activity [16].
Several studies were found that the seeds of *Moringa* have a protective effect against toxicants, prevented the elevation of triglycerides, glucose, and urea in rats exposed to arsenic [17], worked as a prevention against the toxic effect of mercury on rat testicular function [18], can act against liver damage caused by CCl4 and fibrosis in rats, hepatoprotective action against hepatocellular harm caused by DMBA in mice [19], alleviates (TiO2-NPs)-induced cerebral oxidative damage, and increases cerebral mitochondrial [20]. Lead is a toxic metal to the environment and organisms. Mining, smelting, refining, recycling, lead paint, and lead gasoline are significant sources. Children are sensitive to lead's poisonous effects and can suffer different health effects, particularly the brain and nervous system's development. Lead also causes harm in adults, including blood pressure, liver and kidney damage, miscarriage and stillbirth [21]. Lead nanoscale particles (PbO-NPS) may be released into the surrounding air and water during different activities, increasing the possibility of exposure to it. The high toxicity of nanoparticle raised concerns about particles impact with their nanoscale on human and animal health [22]. The study of [23] reported that in the exposed rats to lead sulfide nanoparticles caused changes in the fatty acid of lipids of the liver by increasing arachidonic fatty acid and reduction of the stearic fatty acid content. Long exposure of rats to lead sulfide nanoparticles had a harmful effect. They led to significant body and liver weight changes, total protein, albumin, glucose, lipids, triglycerides in blood serum, and dystrophic changes in the liver [24]. The exposure of mice to lead oxide nanoparticles (PbO-NPS) caused a formation of clusters inside the cytoplasmic vesicles in the lung. It was demonstrated that the liver, kidney, spleen, and brain were as tissue-specific subcellular processing [25]. This research was undertaken to determine the protective role of *Moringa oleifera* seed extract's against commercial lead nanoparticle toxicity in rats.

2.Materials and Methods

2.1. Plant material

Moringa oleifera seed was obtained from the Iraqi National herbarium (Baghdad) on 1-April-2019, after being picked from the trees, dried and crushed to be powder by using a Laboratory Grinder.

2.2. Moringa oliefera seed Extraction

Moringa seed was extracted by using the Soxhlet device in solvent acetone/ethanol (1:1). A 300 grams of the sample was used. The extraction process continued for 72 hours, and then the extract concentrated by using a vacuum rotary evaporator [26].

2.3. Commercial lead Nanoparticles

The nanoscale powder was obtained from NANOSHEL company and was less than 100 nm in diameter. Lead Oxide Nanopowder was dissolved in distilled deionized water using a sonicate device to prevent nanoparticles' aggregation [27].

2.4. Experimental animals

The adult white male Swiss Wistar Rats (*Rattus norvegicus*) were used in this experiment. It's were brought from the College of Veterinary Medicine, University of Tikrit, Iraq-with ages ranging between 12-14 weeks and with an average weight of 250 grams. The animals were reared under standard laboratory conditions (24 ± 1° C, 12h light and 12h dark, fed freely).

2.5. Design of the experiments

Article I. Four groups of animals were used with seven rats in each group. *Moringa* and commercial lead were given to the rats following [28] method. Group A or the control group was given distilled water. Group B was treated with 160 mg/kg body weight per day (b. wt./d.) *Moringa* seed extract (MSE) through the stomach (24Aleksiichuk et al., 2018). Group C was injected with 5 mg/kg commercial nanoscale lead (CPbNP.) via peritoneum [29]. Group D was administered with *Moringa* extract and commercial lead nanoparticles (CPbNP).

2.6. Animal dissection

After the end of the exposure period, the rats were left untreated for two days; on day 3, they were anesthetized with chloroform. Afterward, they were dissected, and their liver, kidneys, spleen and muscles were removed and digested for lead estimation. The blood was drawn from the animals by stabbing their hearts. The serum was separated by a centrifuge (3500 rpm) for 10 minutes to obtain blood serum, keeping in the freezer at -20° C until conducting chemical tests.

2.7. Determination of lead concentrations in tissues

The accumulated lead in rats' organs was determined using a Flameless Atomic Absorption spectrophotometer (Analytik Jena-Germany), following the method described by [30]. One gram was digested by 2.5 ml of HNO_3+0.5 ml $HCLO_4$ in a conical flask (100ml). The flasks were left for an hour at room temperature, then placed on Hotplate at 100° C until the appearance of red fumes, then the temperature was raised to 200 °C, until the formation of white vapor. The remaining yellow color liquid was dissolved in nitric acid and used for lead detection after suitable dilution.

2.8. Biochemical tests

Alkaline phosphatase (ALP), Alanine aminotransferase (ALT), Aspartate aminotransferase (AST) activities, total protein and albumin concentrations were determined by using the Spanish origin Biosystem A15 automated device. GSH was measured according to [31]. SOD and CAT activities were determined by Using the Elab science Analysis Kits. MDA was measured according to the method described by [32].

2.9. Statistical analysis

Statistical analysis of the results by using the statistical program SPSS (V.21), as the statistical analysis included calculating the mean and the standard error. The complete random design was used, and the mean of the coefficients was compared using a modified Least Significant Difference test at a 0.05 significant level.

3.Results

Rats were treated with 160 mg/kg b.wt./d. of seed extract of *M. oliefera* for 45 days. All rats in this group remain healthy. They did not show any significant changes in their behaviour or all studied parameters (accumulated lead, the activity of enzymes and concentration of proteins). The bioaccumulated lead was estimated in the liver, kidney, spleen and muscle of rats (Table 1). The lead concentrations in the control animals (group A) and animals, which given *Moringa* seed extract MSE (Group B) were between 5.1-8.4mg/kg in all tested organs. Its concentrations in animals exposed to commercial lead nanoparticles CPbNP (group C) in all tested organs were between 25.3 -30.8 mg/kg, which revealed a highly significant difference in comparing with groups A and B ($P \leq 0.05$). whereas in rats treated with MSE+CPbNP (group D) was 12.5 and 16.5 mg/kg, which differs significantly

(P≤0.05) in comparison with other groups. The liver's accumulated lead was the highest among other organs in different groups except for the animals' liver treated with *Moringa*.

Table 1. Lead bioaccumulation in the organs of rats. A (control), B, MSE (*Moringa* Seed Extract), C, CPbNP (commercial lead nanoparticles).

Organs / **Groups**	Liver (mg/kg)	Kidney (mg/kg)	Spleen (mg/kg)	Muscle (mg/kg)

Table (2) showed the concentrations of total serum proteins, albumin and the enzymes serum ALT, AST and ALP. By comparison, to control (group A), the CPbNP group (C) displayed significantly elevated levels of serum ALT, AST and ALP, (P≤0.05) but significantly reduced levels of total serum proteins and albumin (P≤0.05). There is an improvement in hepatic function parameters observed in the PbNP +MSE (group D).

The levels of the antioxidants GSH, SOD, CAT and MDA were estimated (Figure 3). A significantly elevated level of MDA was found in the PbNP exposed animals (group C) in comparison with control animals (group A) (P≤0.05), but significantly reduced levels of GSH, SOD and catalase (P≤0.05). *Moringa* revealed improvement changes in oxidative stress markers in the MSE+PbNP (D group).

4.Discussion

This study aimed to investigate the protective role of *Moringa* seed extract (MSE) against the toxicity of commercial lead nanoparticles (CPbNP). The lead was found to be accumulated in different organs of rat [33]. The accumulation was mainly in the liver, led to toxic effects, enzymes inhibition, oxidative stress [34]. In this investigation, rats were treated with lead nanoparticles (CPbNP). The organs: liver, kidney, spleen and muscles accumulated significant concentrations of lead. The liver got a high concentration of lead (CPbNP group), but *Moringa* seed extract in combination with lead (CPBNP+MSE- group D) reduced accumulated metal to about a half. This reduction may be due to the *Moringa* ability to bind with toxic metal ions and form complex structures out of the body, as in chelating agents [35]. The present study revealed that exposed rats to CPbNP exhibited higher activities of serum ALT, AST and ALP and reduced levels in total serum proteins and serum albumin in comparison to control, which may indicate the cellular leakage and hepatic cell membranes functional disability. These results and conclusions were in agreement with those obtained by the effects of MSG [36, 37, 38], 4-tet-acetyphenol [39] and acetaminophen [40]. The ameliorative alterations observed in the accumulated lead, hepatic enzymes ALT, AST, ALP, total protein and albumin in rats treated with PbNP in combination with seed extract of *Moringa,* corroborating other studies' results [41, 42]. The cause for cellular toxicity may be due to lipid peroxidation in the presence of PbNP. This study reported that the PbNP group had significantly higher serum MDA levels ($P<0.05$) and considerably lower levels of GSH, SOD and catalase ($P< 0.05$). Thus, high levels of lipid peroxidation may be deduced to damage the hepatic tissue and inhibit the capacity of antioxidants to remove excess ROS output [43]. The obtained results were in agreement with [41], where that *M. oleifera* increased antioxidant enzymes' activity, improving the condition of liver antioxidants, while neutralizing the hepatotoxic effect triggered by paracetamol. Our study is also consistent with [44], who found that *Moringa* seed extract can neutralize acetaminophen's hepatotoxic effects. As a result, the current study presents evidence that the acetonic-alcoholic *Moringa oliefera* seeds extract provides effectively, protection against the changes caused by commercial lead nanoparticles in rats.

Abstract. The inhibitory activity of 5 plant extracts, *Allium sativum, Opuntia ficus-indica, Malva parviflora, Mentha spicata* and *Plantago lanceolata* with concentration 50 % and 100 % were assessed against the mycelial growth of *Pythium* fungus *in vivo* and *in vitro*. Results showed that all the concentrations of plant extracts give significant inhibition in the mycelial growth of *Pythium* fungus; the highest concentration (100 %) prevented large amounts of mycelial growth followed by lower concentration (50 %) of plant extracts. *Opuntia* extract at 100 % concentration gave great effective in inhibition of *Pythium*`s mycelial production, which gave 100 per cent inhibition ratio while 50 per cent concentration gave 77.28 % inhibition ratio followed by other plant extracts, *Mentha*, *Allium sativum*, *Plantago*, then *Malva* respectively. *In vivo* experiments, tomato seed infused in five plant extracts separately and then sown with soil contaminated with *Pythium* fungus and watered after that with these five plant extracts. After 30 days, the length of the stems and roots were measured in centimetres. While the tomato seeds which were soaked with distilled water and then sown in polluted soil with fungus *Pythium*, and watered with distilled water (control) did not show any growth. .

Keywords. *Pythium*, biological control, plant extracts, *Mentha*, *Allium*, *Opuntia*, *Malva*, *Plantago*, *in vivo*, *in vitro*.

1. Introduction

Fungiform diseases cause a significant loss of many economic crops worldwide. Fungi have the greatest impact on the reduction of crop productivity or post-harvest losses, leading to a massive loss for the human race [1]. It is estimated that crop losses from fungal infection are around 14 percent [2]. World annual crop losses as a result of diseases were estimated at US$ 25,000 million, a major part of which is due to seed-borne fungal pathogens [3]. Several pathogens, including *Alternaria* species are degrading the fruit quality, reducing and making market values unsuitable for human consumption [4]. Plants are the sources of natural pesticides that lead to the development of new pesticides [5]. The use of plants or plant products as fungicides is very critical and requires further attention [6]. The extracts and oils of plants in particular formed the basis of many applications, including raw and processed food preservation, pharmaceutical, alternative medicinal products and natural therapies [7]. Extracts from many plants have recently become popular and have become scientifically interested in their

antibacterial and antifungal function [8]. With a view to creating an eco-friendly antifungal control strategy, in the present study, different concentrations of five plant extracts including *Allium sativum, Opuntia ficus-indica, Malva parviflora, Mentha spicata* and *Plantago lanceolata* were assessed for their antifungal activity.

2. Materials and Methods

2.1. Plant extracts preparation

Cold, aqueous extracts of five plants' leaves: *Allium sativum, Opuntia ficus- indica, Malva parviflora, Mentha spicata* and *Plantago lanceolata* were obtained to prepare of 50 % and 100 % of plant extracts by using sterilized distilled water; 10 g of leaves of each plant were washed, then mortar and pestle were used to grind leaves with 100 ml distilled water. The plants material was homogenized for 10 min by homogenizer then filtered with two layered of gauze then with filter paper. The filtrate was centrifuged at 3000 rpm for 15 minute, those solutions were considered traditional (100 per cent) solutions. The other 50 per cent concentration was prepared by adding equivalent amounts of distilled water to the normal solution.

2.2. The experiment (in vitro)

The plant extracts were combined with the medium potato dextrose agar (2 ml of extract for 18 ml of PDA), then Sprinkled on Petri dishes, Petri dishes were inoculated after media solidification by placing 4 mm mycelial disks of *Pythium* fungus (from the active colony) in the center of each plate. The pure fungus was obtained from laboratory fungi, Department of Biology, University of Al-Anbar. Three replicates for each concentration were packed, then the plates were incubated at 28º C and recorded the results after 7 days of incubation. Petri dishes without plant extracts considered as control.

2.3. Inhibition factor calculation (Percent)

The percent inhibition for Various concentrations were computed as follows:

Inhibition of growth (percent)= [(Dc-Dt)/Dc]* 100 (percent) [9].

Dc= Fungal colony average diameter in control

Dt= fungal colony average diameter in treatment.

2.4. The experiment (in vivo)

2.4.1. Seeds preparation

Tomato seeds *Lycopersicon esculentum* was soaked with plant extracts (100 %) in petri dishes for 24 h. In the first dish, tomato seeds was soaked in sterile distilled water (control); the second dish, tomato seeds was soaked with *Allium sativum* extract ; the third dish, tomato seeds was soaked with *Opuntia* extract; and soaked with *Plantago* extract in the fourth dish, and soaked with *Malva* and *Mentha* in the fifth and sixth dish.

2.4.2. Soil and peatmoss sterilization and planting tomato seeds

In our research, we performed a pot culture experiment to test the efficacy of five plant extracts against damping-off and root rot of tomato, *Lycopersicon esculentum*. Disinfected tomato seeds in 2

per cent sodium hypochlorite for 1 minute, rinsed in distilled sterile water and dried overnight [10]. Tomato seeds were grown at four seeds per pot. mixed soil and peat moss with ratio 1 : 2 and sterilized by autoclave for 30 min then left for 7 days, and putting in the pots. The soil polluted with *Pythium* fungus (three day-old actively growing mycelial discs) five discs, 4.5 mm for each pots then the seeds (soaking seeds) were planted in the pots and watered with the five extracts (each one alone) the control watered with distilled water every two days then left for growth (in greenhouse) until reach to 30 days in age. For each treatment three replicates were preserved . The shoot length and root length (cm) were recorded at 30 days after planting.

3. Results and Discussion

3.1. In vitro

The results of the study referred, That the inhibitory function of all plant extracts showed major variations against mycelial growth of the *pythium* fungus.

3.2. Impact of 5 plant extracts on in vitro growth of Pythium fungus.

The results showed (Table 1, Figure 1, 2, 3, 4, 5, 6) that five plant extracts triggered a significant inhibition of the growth of *Pythium* fungus. The 50 per cent concentration of *Opuntia* extract was the most effective against *Pythium* and caused the highest inhibition of mycelia production (77.28 %) followed by *Allium sativum* (60.60 %), *Mentha spicata* (53.30 %), *Plantago lanceolata* (26.65 %), *Malva parviflora* (15.06 %). The results also showed, *Opuntia* with concentration 100 % was the most effective against *Pythium* and gave great inhibition of mycelia growth (100 %) followed by *Mentha spicata* (69.85 %), *Allium sativum* (60.78 %), *Plantago lanceolata* (38.72 %) and *Malva parviflora* (38.35%). [11] Zena *et al*. (2013) mentioned that *Mentha* extract contain tannins, alkaloids, phenols, flavones, resins and saponins which have very important role in inhibition of many pathogenic organisms. Also [12] mentioned that the alkaloids compound has direct contact with plasma membrane of microorganisms which has proteins and lipids, or it interferes with a series of metabolic reactions of the microscopic organism which is very necessary for the growth and production of spores.

Table 1. Impact of 5 plant extracts on in vitro growth of *Pythium*.

Plant extracts	Growth inhibition (%)	
	Mean. 50 conc.	Mean. 100 conc.
Allium sativum	60.60	60.78
Opuntia ficus-indica	77.28	100
Malva parviflora	15.06	38.35
Mentha spicata	53.30	69.85
Plantago lanceolata	26.65	38.72
Control (PDA without extract)	0	0

Abstract. The most important features that we have reached through this study, are shown the cross-section of root were in the secondary growth stage and the epidermis of leaf were studded by stomata complex, the type of it was anomocytic that's mean no have subsidiary cells around the guard cells, the mesophyll bifacial also the midrib region of leaf like the pear and the vascular bundle located in the center crescent in shape. The cross-sections of petiole ovate shape with two ears in the lateral side and the vascular bundles crescent in shape. The cross-section of fruits circular component of three-layer the outer layer pericarp, mesocarp, and the endocarp, surrounding the ovary or the seeds.

Keywords. *Solanum nigrum*, Solanaceae, Anatomy, Iraq.

1. Introduction

Solanum nigrum, the common name wolf grape, black nightshade or blackberry nightshade, also refer that it is an annual herbaceous plant belonging to the Solanaceae family, it is a widespread species that contain alkaloids and is considered toxic [1]. The species may reach a meter height, leaves are Flat with white-colored flowers appear in numbers from four to ten, the fruits of the plant are green in the first place, and then they become black or blue, juicy, sweet when ripe, and contain many small kidney-shaped seeds, and are collected in the autumn, the plant distribute in fields, orchards, gardens, canal banks, deserted places, and spreads all over the world [2]. The whole plant contains Solanine, Asparagine, Lutein, Tannin, linoleic acid, and Palmitic acid, the plant is used medicinally as a sedative and skin softening agent. This plant began to be used since its anesthetic and paralytic effect on nerve endings was known. Fruit juice has a pain-relieving effect by letting a drop of the juice evaporate over the sore tooth [3]. [4] refers that the fruits of the plant cause poisoning in children when they are eaten, especially if the fruits are not fully ripe and their color is between red and purple, and too much eating the loss of the latter cause of memory and consciousness and often leads to poisoning and then death because they contain steroidal alkaloids. The foliage also harms livestock when grazing on them. This is not recommended to use the plant internally due to its toxic effects, but it can be used externally to relieve some pain such as joint pain [5]. There are a few studies and data concerning the anatomy of *S. nigrum* in describing some species of the family Solanaceae only original anatomical characteristics

have been given by [6]. [7] also studied the morphological and anatomical characteristics of vegetative parts of some species belonging to Solanaceae family like S. *nigrum, S. americanum, S. sarrachoides*, and *S. ptycanthum*. They noticed that they varied in relation to environmental conditions. As well as [8] refers to the Anatomical and Comparative study of selected wild species from the family Solanaceae in Iraq included *S. nigrum*.
The aim of this study is to investigate the important anatomical features for the parts of the species *S. nigrum*, to recognize the tissues and cells, and to be able to distinguish between the other species in the same genus.

2. Materials and Methods

The species collected from the herbal garden at AL- Rashidiya city north of Baghdad (Latitude of Rashidiya: 33, 5528 (3333'10.080"N), Longitude of Rashidiya: 44, 3725 (4422'21.000"E)) at April 2019. The plant material was identified and authenticated by Flora of Turkey [9] and flora of Nouvelle Flore du Liban et de la Syrie [10]. Firstly the parts of plant like as root, stem, leaves and fruits were kept in formalin acetic acid alcohol (FAA) for 48 hours, which was prepared according to [11] as follow: 50 ml of Ethyl alcohol, 5 ml of Glacial acetic acid, 10 ml of Formaldehyde 37 to 40% concentration and 35 ml Distilled water, then the samples were washed by distilled water and were kept in 70% Ethyle alcohol. The epidermis of leaves was prepared according to[12] were peeling by a razor blade and washing with distilled water then put in 5% sodium hypochlorite for 5 mins to remove the chlorophyll pigment. The sectioning parts of root, stem, leaf, petiole, and fruit were done by hand section, the procedure was performed according to [13], the fresh material sectioned by a razor blade into thin and small pieces then put in 0.5% sodium hypochlorite for 5 mins to clear the tissue and remove the chlorophyll pigment. Finally all the samples are put on the slide and mounted by cover slides and fixed by Olympus KRÜSS light microscope then photographed using AmScope camera.

3. Results and Discussion

3.1. Cross section of root

The shape of the outline root is circular, and in the secondary growth stage, that's mean that this stage consists of the first annual ring in the plant. The root covered by the periderm, the thickness of it reached to 16.2 µm followed by several rows of parenchyma tissues longitudinal and ovate cells known the cortex and they are interspersed the cells of the cortex the ordinary schizogenous intercellular spaces and the thickness of it 25.4 µm. The vascular cylinder is consist of xylem and phloem, the thickness of it 266.7 µm, the pith located in the center of the stem filled with parenchyma cells and the thickness of it reached to 75.8 µm (Figures 1).

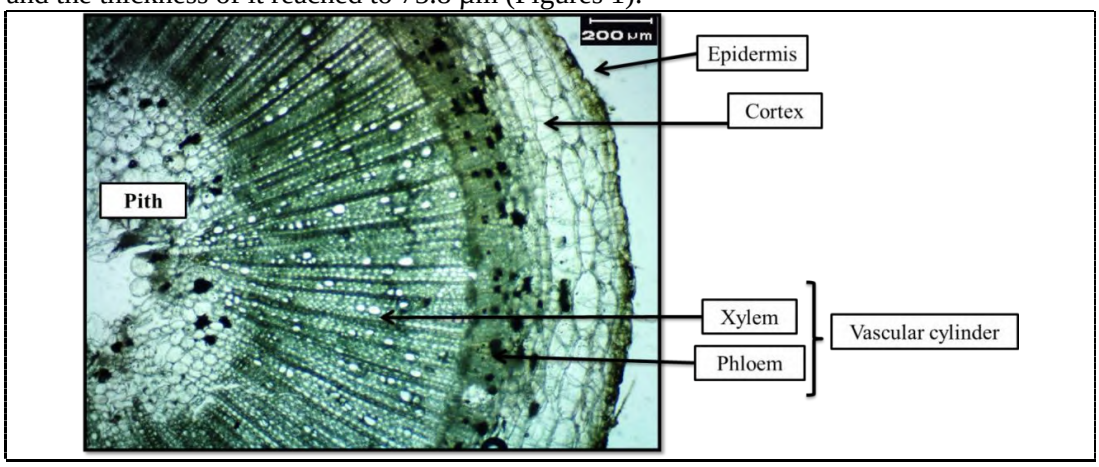

Figure 1. Root cross section of *Solanum nigrum.*

3.2. Cross section of stem

The shape of the outline stem is tetragonal, the cross section of the stem consists of a uniseriate epidermis covered by cuticle, the cuticle thickness 3.4 µm and the epidermis thickness 18.9 µm, and the cortex consists of 2 layers, the first one is located under the epidermis and consist of the collenchyma tissue and after it comes the second layer of parenchyma tissues, the thickness of cortex 34.7 µm. The vascular bundles are collateral and open and take the shape of a stem, consist of xylem and phloem, the vascular thickness is 107.9 µm, the pith located in the center of the stem filled with parenchyma cells and the cells circular and the ordinary schizogenous intercellular space among it (Figures 2), the result agrees with [6].

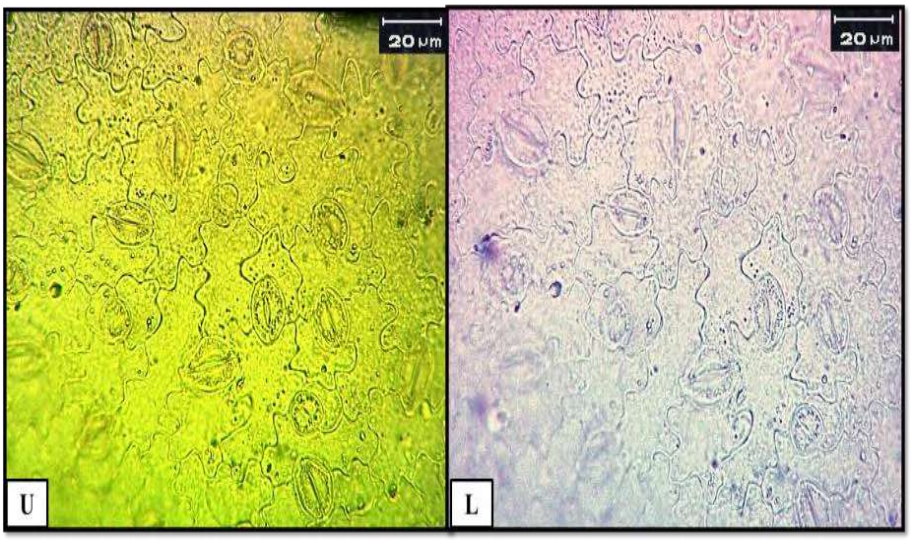

Figure 2. Stem cross section of *Solanum nigrum*.

3.3. Study of leaves

The epidermis of the leaf shows the stomata complex, the type of stomata was anomocytic that's mean it has no subsidiary cells around the guard cells, the guard cells are kidney shaped and the anticlinal walls of epidermal cells are wavy, (Figures 3), this agrees with [7] who refer that the stomata of these species are anomocytic to anisocytic, somewhat larger in *S. nigrum*, which can be explained by its polyploidy. The transfer section of the leaf consists of the upper and lower uniseriate epidermis, the upper epidermis is covered by cuticle with the thickness ranging from 2.1µm, also the cells of upper epidermis ovule shape and the thickness of it is 35.5 µm, while the thickness of the lower epidermis is 20.4 µm. The leaf described as the bifacial mesophyll consists of palisade layers and spongy layers, the thickness of palisade layers was 95.5 µm and the thickness of spongy layers was 153.7 µm (Figures 4). The midrib region of the leaf have a pear-like shape, the epidermis is covered with the eglandular uniseriate and multicellular trichomes followed by the cortex and the vascular bundle located in the center have crescent in shape ranged to 195.5 µm include xylem and phloem (Figures 5), the results agree with [14].

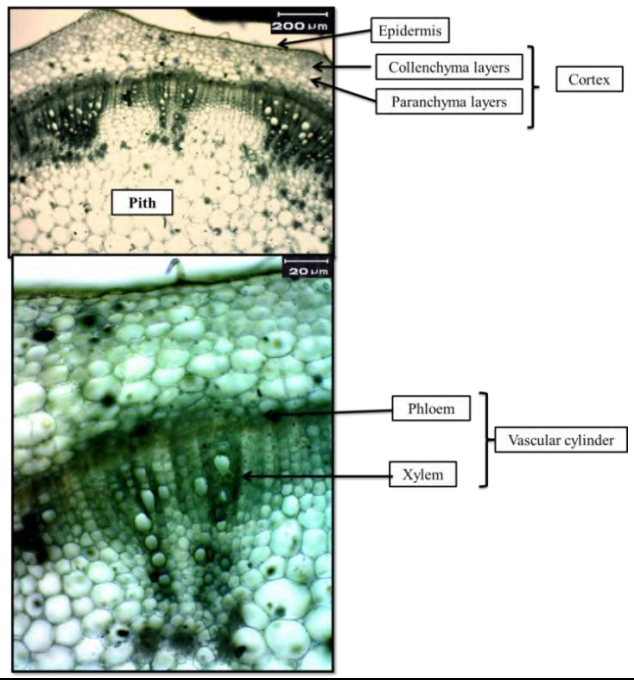

Figure 3. Surface view of epidermis in the species *Solanum nigrum*.

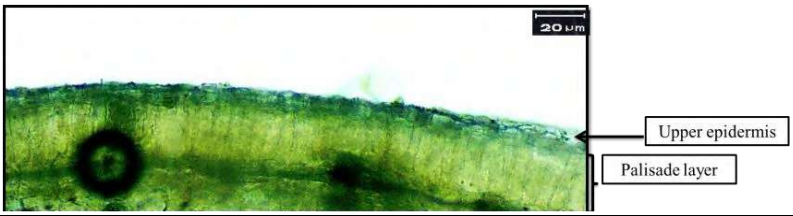

Figure 4. Leaf blade cross section of *Solanum nigrum*.

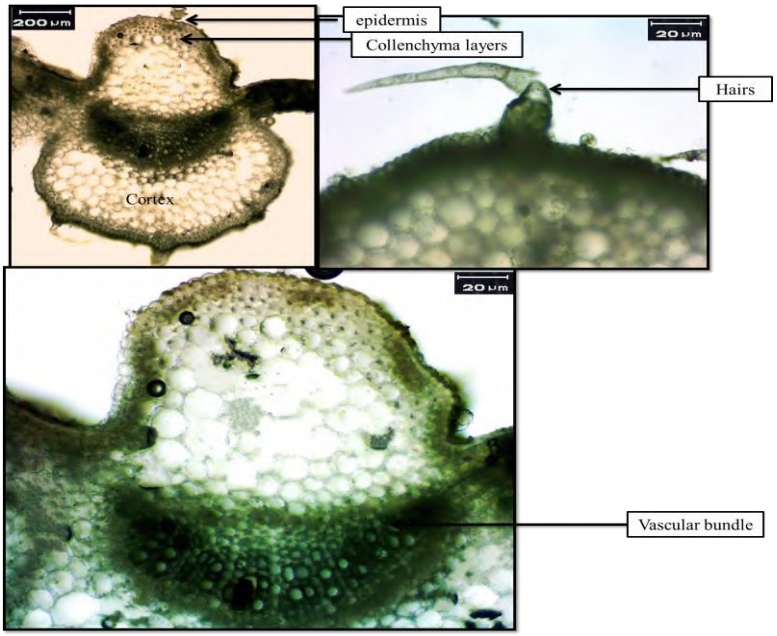

Figure 5. Cross section of leaf midrib of *Solanum nigrum*.

3.3.1. Petiole cross section:

The cross sections of petiole ovate shape with two ears in the lateral side, the epidermis was uniseriate covered with a cuticle, the average thickness of it 1.5 µm and many unicellular and uniseriate trichomes diffuse on it, the average thickness of the petiole epidermis reached to 16.5 µm. And below the epidermis, the cortex is located, the average thickness of the cortex ranged from 38.2 µm. Whilst the vascular bundles are crescent in shape and are found in the center of the pith which consists of xylem and phloem (Figures 6), the results agrees with [8].

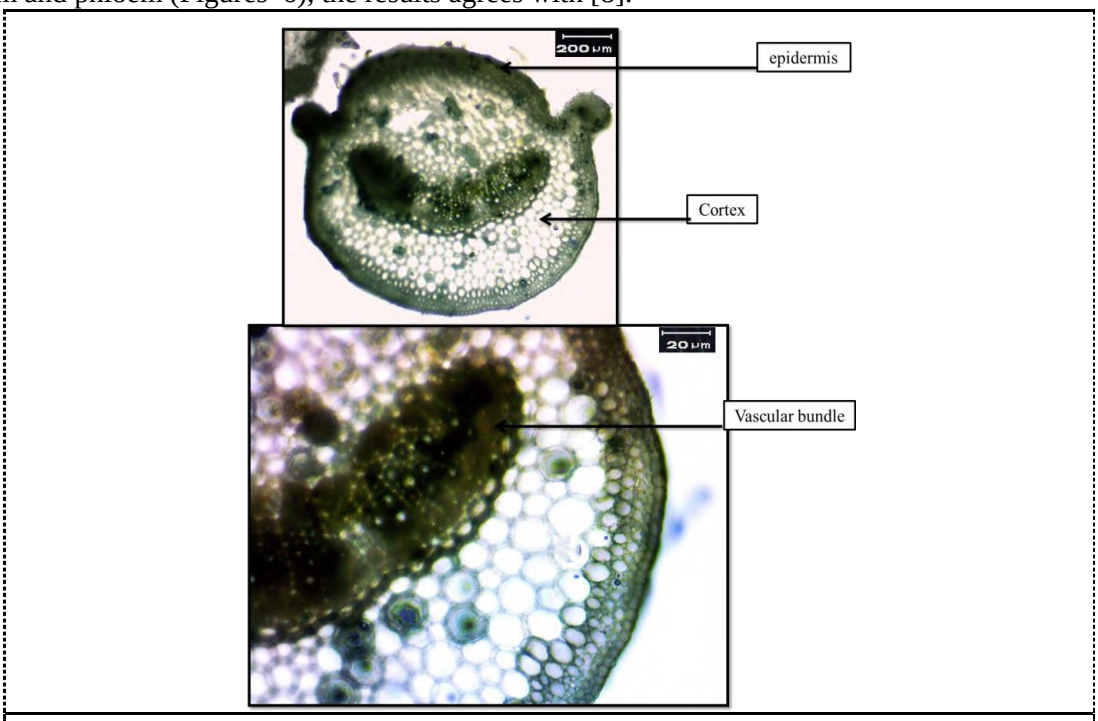

Figure 6. Petiole cross section of *Solanum nigrum*.

3.4. Cross ***section of fruits and seeds:***

The cross section of the fruits have circular component of three layers; the outer layer is known as the pericarp, followed by the mesocarp, and the endocarp, which (the endocarp) is the inner layer surrounding the ovary or the seeds (Figures 7).

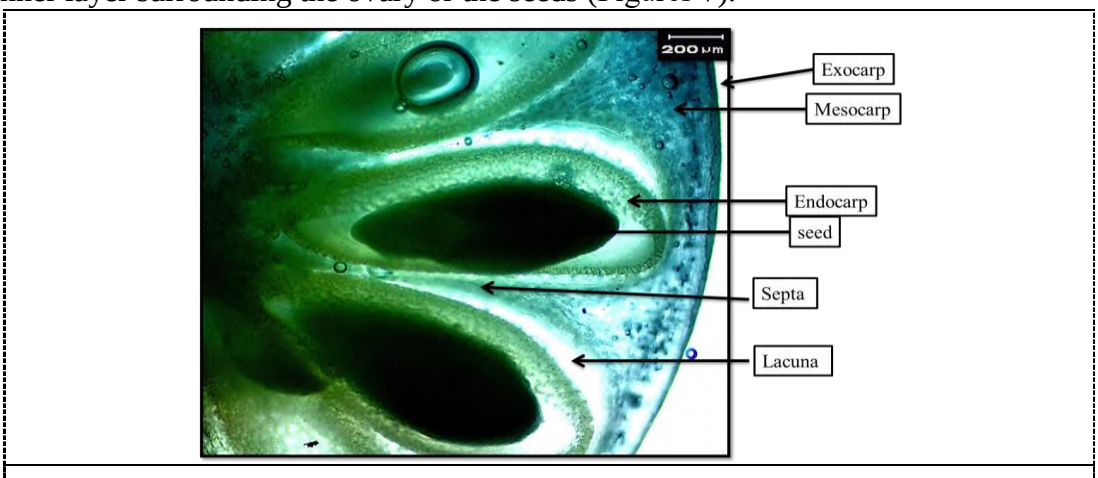

Figure 7. Fruit cross section of *Solanum nigrum*.

Abstract. Objective: This project aimed to study the morphological description and histological structure of ileum in Iraqi black partridge (*Francolinus francolinus*). Methods: To conduct this investigation, 20 healthy Iraqi black partridge were collected from local suppliers. Birds were euthanized, dissected and then specimens were processed for histological and histochemical staining techniques. Results: A morphological study showed that the ileum appears as a short narrow tubular structure. It extends from the wide end of the jejunum and ends in the Ileo-caecal junction region. Histologically, the wall ileum consists of four tunica mucosa, submucosa, muscularis and serosa. The mucosa was lined by simple columnar epithelium with goblet cells. The muscularis mucosa is arranged in two thick layers of smooth muscle fibers, outer longitudinal and inner circular bundles. The tunica submucosa was a thin layer of fibrous connective tissue. Tunica serosa was loose connective tissue covered by mesothelium. The goblet cells gave a positive reaction with PAS stain. Conclusion: Goblet cells neutral mucopolysaccharide secretions; in fact, the latter stain is an indicator mucin substance which are very important in digestion and absorption and subsequent body growth of the bird.

Keywords. Histomorphological study, Ileum, Iraqi Black Partridge.

1. Introduction

The food mechanism is an important determinant of the success of the adaptation of birds in their environment, also the nature of nutrition and the way it is obtained is considered as an effective factor on the morphological and histological composition of the digestive tracts parts [1, 2]. The digestive system in birds is necessary to convert the food intake by the bird into simple materials used by the body to carry out its daily activities. Food is then transformed into crude materials that synthesis, nutrition and restore the cells of the body through the destruction of food molecules, absorption and transmission through the bloodstream and the body disposes of its remains. The small intestine is the first site concerned with the breakdown of enzymes, in addition to absorption of carbohydrates, fatty acids, and amino acids [3]. The small intestine in birds is characterized by its length and frequent wrap, the small intestine begins from the back end of the stomach and ends with the ileo-caecal junction and divides into three parts: duodenum (part one), jejunum (middle part) and ileum (last part)

[4, 5]. Iraqi black partridge (*Francolinus francolinus*) returns to Phasianidae family of Galliformes order, and all of this family's birds are wild and are called the same name to the male and female as well as they rely on the grains as food (Graniivorous) [6]. The aim of study is designated to determine the Morphological description and histological structure of ileum in Iraqi black partridge (*Francolinus francolinus*).

2. Materials and Methods

2.1. Birds Collection

Twenty of Iraqi black partridge (*Francolinus francolinus*) collected from local suppliers in Baghdad Province.

2.2. Morphological Study

Gross morphology, topographical relationship in situ and other anatomical observations were studied. The ileum was identified and photographed in situ using a Digital Sony camera.

2.3. Histological and Histochemical Preparation

For histological study, the specimens were fixed in neutral buffered formalin of 10% concentration for 48 hours. After well fixation, the specimens were dehydrated by passing them through a series of ascending ethanol concentrations (70, 80, 90 and 100 %) and then the specimens were cleared by xylene. After that, they were embedded in paraffin wax, then the blocks were sectioned at 3-5 μm thickness and stained with the following stains: Hematoxylin and eosin routine stain for general features identification. The histological examination was done by using light microscope (Kruss) and photographed using (14.1) mega pixels power digital Sony camera. In the histochemical study, sections were stained with Periodic Acid Schiff (PAS) and was used for the illustration of the goblet cells and the basement membranes of the epithelial lining of the ileum [7].

3. Results and Discussion

3.1. Morphological Study

The results of the gross examination showed that the ileum appears in the form of a short tubular composition of a thin diameter, the jejunum is associated with ileum by a fold of mesenteric membrane to form together a group of coils or irregularly shaped open twists. The ileum begins at the wide end of the jejunum and ends with the ileo-caecal junction. The caeca appear conjoined along the sides of the ileum, as the ileum appears less diameter at the bottom near the area of contact with the caecum (Figure 1). Because of the absence of vitlline diverticulum or what is known as Meckel's diverticulum, there is no separation border between the jejunum and the ileum but there is a clear difference in diameter (Figure 2). The results of the current study are consistent with those of [8] in *Coturinx coturinx* and are contrary to the results of [9] in *Anas platyrhynchos*, which stated that the jejunum and the ileum were arranged in large parallel rings taking the letter U overlapping with each other.

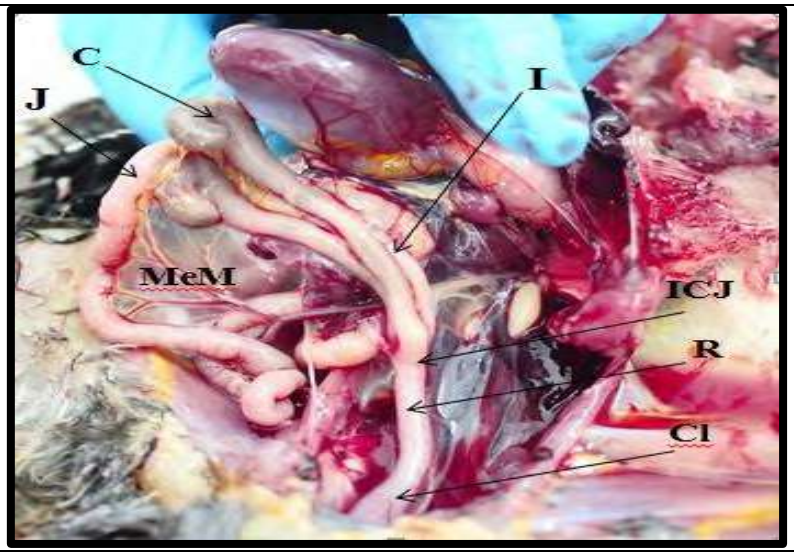

Figure 1. The position of jejunum and ileum is illustrated within the body of Iraqi black partridge, jejunum (J), ileum (I), ileo-caecal junction (ICJ), mesenteric membranes (MeM), the rectum (R), the cloaca (CI).

Figure 2. difference between jejunum (J), ileum (I), caecum (C), duodenum (D), pancreas (Pa), mesenteric membranes (MeM) in the Iraqi black partridge.

3.2. Light microscopic observation

The ileum wall consists of four main tunicae represented by the tunica mucosa, the tunica submucosa, tunica muscularis, and tunica serosa (Figure 3), which is consistent with the results of [10] study. However, it contradicts the results of [11] when the researcher studies the Japanese Quail (*Coturnix Coturnix Japonica*) study which showed that the ileum consists of three tunicae represented by mucosa, muscularis and serosa. This variation in compatibility seems to have something to do with the structural composition based on functional need as well as the specificity of the bird in this study.

3.2.1. Tunica Mucosa

Tunica mucosa consists of three secondary layers represented by the lining epithelium, lamina propria and muscularis mucosa (Figure 4) this result in agreement with [12] when the researcher studies the guinea fowl, while differ from those of *Corvus albus* study [13], which showed the absence of muscularis mucosa layer in the tunica mucosa.

3.2.1.1. Lining epithelium

The tunica mucosa consists of villi coated by simple columnar epithelium tissue, in which the main columnar cells have a pale cytoplasm, and the nucleus is spherical clearly pigmented, located in the last third of the cell, and based on a membrane basement membrane. The apical surface of the cell is characterized by the presence of a striated border and spread between the columnar cells. Many of the goblet cells possess a swollen apical surface (Figure 5) and this result was identical to the results of [12]. Epithelial cells absorb sugars, amino acids, fatty acids, water and other useful substances [14]. The results of histochemical study showed a positive reaction with periodic acid Schiff (PAS) stain (Figure 5) and used this reagent to confirm the presence of glycoprotein and polymucosaccharides in the goblet cells, basal membrane and striated border. Therefore, the mucin substances stained by purple color and this result came with similar of [15] study. The villi in ileum is characterized by different lengths and some of them take a finger shape (Figure 6) while a few of them show a leaf shape containing some meanders (Figure 7). This result was in full compliance with the results of *Tyto alba* and *Columba palumbus* [16] and *Anas platyrhynchos* [17]. The presence of meanders in leaf shape villi may be due to the fact that nutrient absorption is more efficient when the villi are arranged in this way than if they were parallel; as well as the passage of nutrition will take less time than if the surface was plane. Moreover, the connection between the nutrients and the surface of the cells would be better [18]. The results of the current study differ from those of the Japanese quail *Coturnix coturnix japonica* study [11], where the villi appeared in the spatula shape. The goblet cells produce a mixture of glycoproteins called mucinogen that acts to lubrication of the intestinal tract as well as protecting them from infection with pathogens, viruses and stomach acidity [19].

3.2.1.2. Lamina propria

The lamina propria is composed of loose connective tissue in which blood vessels, lacteal lymphatic vessels, smooth muscle fibers and nuclei of connective tissue cells are spread as well as positioned intestinal glands (Figure 4). This finding is consistent with the results of *Ara ararauna* [20], while contrary to [11] study in the Japanese quail *Coturnix coturnix japonica*, as it was shown that the lamina propria is composed of irregular dense connective tissue contain on reticular fiber, smooth muscle fiber and many blood vessels. This variation in tissue type may be due to the tissue structure associated with the functional specificity performed by the small intestine. The connective tissue that is the component of the lamina propria in partridge at the current study is composed of most connective tissue cells whose main function is support as well as the collagenous and elastic fibers that gain strength and flexibility. Intestinal glands, or Crypts of Lieberkuhn, open in the base of the villi which are simple tubular gland and their wall consists of low columnar cells with pale cytoplasm and spherical nuclei located near the base of the cell. The presence of goblet cells with mucin secretion and basal cells (Stem cells) these cells are based on a basement membrane and surround these cells with a small cavity (Figure 8) and this result corresponds to [12, 21]. These glandular units produce a large number of digestive enzymes whose role lies in facilitating the digestion and absorption of food such as peptidase enzymes and disaccharides that digest dietary bonds [22]. Enteroendocrine cells that appear within the cells lining the intestinal glands are few in number, and are characterized by their pyramidal shape and nucleus spherical shape and occupy a base position of the cell. These cells are characterized by the presence of secretion granules near the bottom of the nucleus present mainly in

the crypts and occasionally on the villi, these Enteroendocrine cells are of different types. (Figure 8). The histological examination also showed the presence of a limited number from Paneth cells in the bases of the intestinal glands. Paneth cells are characterized as pyramidal cells with cytoplasm containing secretory granules receptive to acidic stains (Figure 9). The importance of enteroendocrine cells is that they are responsible for the secretion of hormones that control the movement of the intestine are organized. Paneth cells are responsible for the production of lysozyme enzymes, which play an important role in the elimination of pathological bacteria [22].

3.2.1.3. Muscularis mucosa

This layer consists of two layers of smooth muscle fibers, longitudinal and circular. The longitudinal muscle fibers lie out wards in the form of bundles thicker than circular muscle fibers. Circular muscle fibers located inward the layers of muscle are separated with auerbrach's plexus of nerves (Figure 10). The results of the current study are similar to the results of *Anas platyrhynchos* [17] and are contrary to the results of *Otus scor brucie* study because of this layer is missing [23]. The importance of this secondary layer lies in the mixing process and the movement of nutrients through contraction within the gut, particularly in the small intestine [24].

3.2.2. Tunica Submucosa

It consists of areolar connective tissue which contains blood capillaries, lymphatic and nerves in the ileum (Figure 10) and this result is consistent with the results of the Guinea fowl study [12].

3.2.3. Tunica Muscularis

This tunica consists of two smooth muscle fiber layers, where the inner smooth muscle fiber sits in a circular order and thicker. While the second layer appears with a longitudinal order and a lower thickness located outward, as interspersed between these two secondary layers are thin tapes of fibrous connective interspersed with blood and lymphatic vessels and nerves (Auerbach's plexus) as well as collagenous and elastic fibers (Figure 10 and 11). This result is consistent with the result of *Tyto alba* [16] and a contrast with Japanese quail *Coturnix coturinx japonica* study, as the tunica muscularis consists of three secondary layers interior and external longitudinal arrangement, while the middle is circular in order [11]. Circular muscles contribute to the expansion of the small intestine diameter while the longitudinal muscles work in the mechanism of pushing food towards the large intestine, and therefore we find that both layers come together to complement the other to complete digestion.

3.2.4. Tunica Serosa

This layer is represented by loose connective tissue. The areolar connective tissue is covered by simple squamous mesothelium interspersed with blood vessels, nerves and adipose tissue and bordered from the outside by a row of mesothelium cells (Figure 11). This result was consistent with the results of [18], in the brown falcon *Falco berigora*.

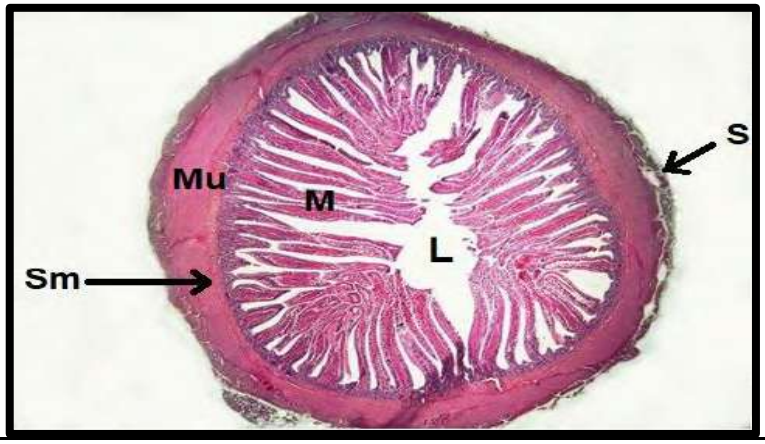

Figure 3. Cross section in the ileum wall for the Iraqi black partridge showing the four tunicae: mucosa (M), submucosa (Sm), muscularis (Mu), serosa (S), lumen (L) (H&E x4).

The Correlation of Histopathological Findings with Ultrastructural Changes in Hepatocytes after Yangonin “Ya”-Intoxicated Rats Alone and In Combination with EtOH: Sub-Acute & Sub-Chronic Study

The Correlation of Histopathological Findings with Ultrastructural Changes in Hepatocytes after Yangonin "Ya"-Intoxicated Rats Alone and In Combination with EtOH: Sub-Acute & Sub-Chronic Study

Abstract. Yangonin "Ya" has been used for centuries as a herbal supplement, for its mood-altering properties. It has been used as a recreation agent, for relaxation, as well as for pain relief. However, hepatotoxicity is a widespread problem associated with medicines in general. Most herbal supplements are metabolized by the liver, and thus the liver represents the target organ. At present, Yangonin toxicity appears to be "idiosyncratic". Therefore, a study was designed in order to investigate the organelle-based changes in hepatocytes, after treatment with Yangonin alone and in combination with EtOH. Thirty rats were divided into five groups comprising of six animals each. The groups comprised of the control groups {(NCx) & (PCx)}, Yangonin (Ya) group, ethanol (EtOH) group, and the combination of (Ya) and ethanol (EtOH+Ya) group. The experiment was conducted over a period of 14 weeks, as a sub-chronic study. At the end of the 14th week, mitochondria, peroxisome, rough and smooth endoplasmic reticulum, and nuclei of hepatocytes, were evaluated using a scoring system. The results were compared with histopathological findings, as well. Treatment with Ya significantly induced hepatotoxic scores as compared to the control groups. Organelle injury scores increased significantly with Ya treatment, while rats that received "EtOH+Ya" showed the severest lesions of liver scores such as, severe hepatocellular degeneration, necrosis, and hypertrophy. Ultrastructural and histopathological scores in both groups were in very strong correlation (r = 0.928 for EtOH, r = 0.921 for Ya alone and r = 0.903 for Ya plus EtOH group). In conclusion, ethanol enhanced the sedative and hypnotic activity of Ya, and markedly increased toxicity. Findings based on TEM examination of organelles, supported the histological results as well as tissue lesions/injuries in hepatocytes, a result of hepatotoxin-induced hepatopathy.

Keywords. Hepatopathy, Yangonin, alcohol, ultrastructure, sER, mitochondria.

1. Introduction

Drug-induced hepatotoxicity has been cited as the most common reason for the withdrawal of approved drugs from the market. In addition, 50% of acute liver failure cases in the United States, have been attributed to drug-induced hepatic injury. The actual incidence of drug-induced hepatic

injury is difficult to estimate, as most cases are under-reported, or sourced from retrospective studies. Another problem associated with determining prevalence, is the lack of information or data pertaining to self-medication and use of herbal products that could interact adversely with prescription and non-prescription drugs [1, 2, 3]. Though the incidence of drug-induced hepatic injury appears to be quite low, data from the Centers for Disease Control and Prevention (CDC) in the U.S., has reported that, about 1600 new acute cases of liver failure are reported annually, of which 41% are due to paracetamol hepatotoxicity [4].The cases of adverse drug reactions and fatalities related to drugs, has more than doubled, during the period between 1995 and 2005 [5]. A lot of the cases of drug-induced liver injury are idiosyncratic, which means that the drug reactions cannot be predicted based on the known pharmacological properties of the substance, and therefore are often missed during pre-clinical stages of development. Regardless of their etiology, drug-induced hepatotoxicity is of major concern to the pharmaceutical industry, during the development of drugs, not only due to the increased risk for patients undergoing clinical trials but also to patients, after the launch of a new drug into the market. It could also result in increased costs and losses for pharmaceutical industries, due to the recalling of a drug at the later stages of development, or after it has been launched [6]. *Piper methysticum* Forster, is an ancient crop originating from Oceania (Polynesia, Melanesia and Micronesia [7]. *Piper methysticum* is cultivated for its rootstock which has been traditionally used to produce a drink. *Piper methysticum* extracts (both fresh and dried rhizome and roots) were prepared by grinding it into an aqueous suspension with water or coconut milk, and then strained and directly consumed [8, 9]. The effects of Yangonin (is found in *Piper methysticum* root as the main component) are considered to be mild, and less drastically mind-altering than most common drugs like alcohol, and when consumed in moderate amounts, there are no aftereffects such as "hangovers". *Piper methysticum* drinks when consumed, gives a sense of well-being, which is associated with its anxiolytic, sedative, muscle relaxant, and diuretic properties, among others [8].8 Commonly observed side effects related to *Piper methysticum* consumption include allergic reactions, red eyes, yellowing of the skin, gastrointestinal complaints and lethargy, which affects the individual's appetite and ability to sufficiently eat [8, 10, 11]. In addition, due to confounding factors that may have contributed to the toxicity, it is difficult to confirm whether there is a direct association between *Piper methysticum* and severe liver toxicity. Therefore, we hypothesize that, a synergistic interaction between alcohol and Yangonin contributes to marked increasing in cell toxicity, particularly hepatocytes. The main aim of this study was to determine whether Yangonin (with or without alcohol) may predispose oxidative stress and free radicals and then cytotoxicity, by affecting levels of availability of hepatic glutathione. Also, to search the organelle-based changes in hepatocytes after Yangonin treatment (alone and in combination with EtOH) in experimental rats. As well as, to determine the correlation of histopathological changes with ultrastructural findings..

2. Materials and Methods

2.1. Reagents

Yangonin is one of the six major kavalactones found in the kava plant. Commercially available Yangonin extract, a medium yellow powder was used (70% Yangonin HPLC Piper Methysticin Root extract) was obtained from Shaanxi Herb Sky Biotech Co., Ltd (Fiji) in one lot, which was received in batch (JT160314). The powdered extract was gavaged to each animal after being dissolved in distilled water (800 mg/kg. body weight/day). Below the chemical structure of “Yangonine” 4-Methoxy-6-[(E)-2-(4-methoxyphenyl) ethenyl] pyran-2-one (Figure 1).

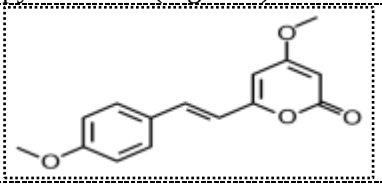

Figure 1. Chemical structure of Yangonine.

2.2. Animals and Exposure

The study was conducted in the Pathology Lab (Vet. Med/UPM). The protocol of the study was approved by Animal Care and Use Committee (ACUC), Faculty of Veterinary Medicine, University Putra Malaysia (UPM) with UPM/IACUC/AUP-R082/2015, the reference number for notice of approval. Thirty, nine-weeks-old Sprague-Dawley rats, weighing about 200±25gm were supplied with LAR Unit. They were housed in animal cages under standard conditions with a period of 12 h light/dark at 22 to 28°C and 70 to 80% relative humidity in the animal house, UPM. The animals were allowed to acclimatize for seven days before the start of the experiments. The animals were dosed with a standard rat chow pellet and allowed to drink water *ad libitum.*

2.3. Experimental Design

Animals were equally divided into five groups of approximately equal initial body weight, which are considered as negative control (NCx), positive control (PCx) and treated groups (EtOH, Ya and EtOH+Ya). The rats were examined for changes in body weight, feed and water intake, biochemical, liver parameters, macroscopically, microscopically histological changes and ultrastructural changes. At the end of the investigational period and under appropriate anesthesia by 87 mg ketamine/kg (b.w) mixed with 13 mg xylazine /kg (b.w), the animals were subjected to cardiac puncture to collect blood samples into sterile heparinized and non-heparinized test tubes for clinical chemistry study; the animals were then sacrificed by cervical dislocation, and finally, liver was dissected and weighted after being washed and blotted dry to somatic index determination. The absolute and the relative weights [(Liver W./ body W.) × 100)] were recorded [12].

2.4. Histological examination

At sacrifice, whole necropsies were performed on all rats utilizing standardized methodology. Liver weight, size and color were determined from all animals. Tissues including macroscopic abnormalities were removed, fixed, and preserved in 10% neutral buffered formalin for microscopic evaluation. Four to five micrometers (µm) thick sections were cut and mounted onto glass slides, stained with hematoxylin and eosin (H & E), while for Transmission Electron Microscopy, small pieces of liver (1mm3 slices) were immediately fixed in 4% glutaraldehyde buffer. Ultra-thin sections were collected on copper grids, double-contrast staining was applied with uranyl acetate (100 mL methanol and 5 g uranyl acetate) and Reynold's lead nitrate solution (1.76 g sodium citrate, 1.33 g lead nitrate, 50 mL distilled water and 8 mL 1N NaOH). Thin sections were examined under a transmission electron microscope (Hitachi H7100 TEM, Japan) [13]. Twenty-Five cells from each specimen were examined. Mitochondria, peroxisome, nuclei and smooth endoplasmic reticulum (sER) of hepatocytes were evaluated by using a previously described scoring system (Table 1). Twenty-Five nuclei, 60 mitochondria and 20 sER were examined for each animal.

2.5. Statistical analysis for histopathologic scores

The data was presented as mean ± SEM. In order to determine significant differences between groups, the Mann-Whitney U test was used for histopathologic scores, and for ultrastructure scores the Student's t-test was employed. The Pearson correlation procedure was used to evaluate the correlation of histopathological and ultrastructural scores. Values of $P < 0.05$, were considered statistically significant.

Table 1. Criteria for histopathological scoring system (light and transmission electron) microscope.

Light microscopy (H&E)		
Severity of Hepatopathy	Grade	Description
Minimal	1	0% of organ affected (normal histological appearance of hepatocytes).
Mild	2	1–39% of organ affected (congestion with slight sinusoidal space and central vein dilatation).
Moderate	3	40–79% of organ affected (cystic and fatty degeneration, hepatocellular hypertrophy and necrosis), and dilatation with congestion of sinusoids and central vein.
Marked (severe)	4	80%–100% of organ affected. Greater severity of changes noted in grade 3 with Kupffer cells hyperplasia and hypertrophy and possible pathological evidence of liver damage/fibrosis and cirrhosis.
Transmission Electron Microscopy/TEM		
Ultrastructure changes	Grade	Description
Nucleus affected	0	Normal
	1	Irregular chromatin distribution (margination, clumping)
	2	Increased and aggregation of heterochromatin with fragmented irregular envelope
	3	Degenerated and necrotic nucleus
sER and peroxisome proliferation	0	Normal
	1	Slight dilatation
	2	High proliferation and dilatation
	3	Presence of large degenerated area and highly vacuolization of sER and highly proliferation of peroxisome
Cytoplasmic vacuoles and lipid droplets accumulation	0	Normal
	1	Slight vacuolation of cytoplasm
	2	Moderate number of lipid droplets with cytoplasmic vacuoles
	3	Severe accumulation of lipid droplets in cytoplasm

3. Results

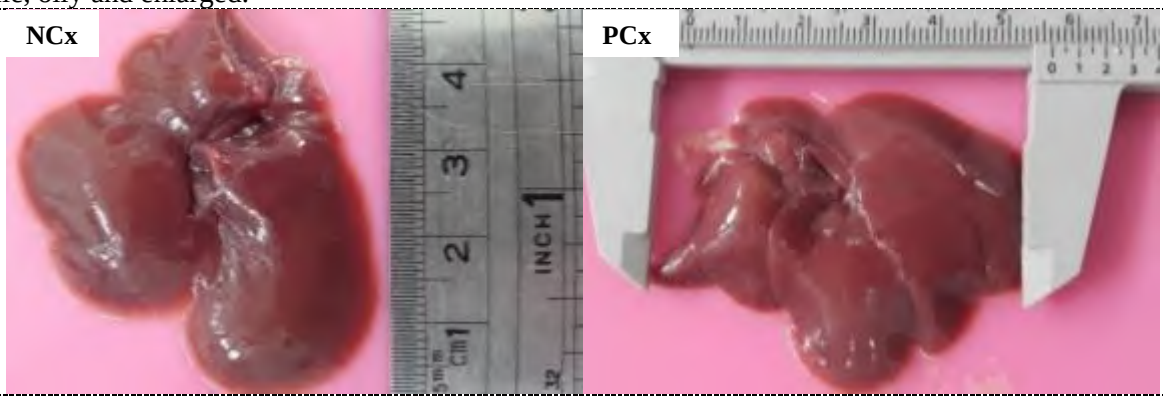
Throughout the course of the sub-acute experimental study, mortality was not observed in either of the "Ya" alone groups, Ya in combination with EtOH group, nor any of the other treatment groups. The most notable clinical abnormalities were observed in rats that were administered Ya, mainly those given Ya in combination with EtOH. The abnormalities were observed from the first week of the trial and increased gradually with time; this persisted for the duration of the experimental study. Clinical findings included, abnormal breathing, ataxia, dehydration due to loss of appetite, indigestion, lethargy, and loss of coordination. On the other hand, the withdrawal of 800mg/kg per day of Ya ingestion (alone and in combination with alcohol), after the third week induced a detectable change in behavioral patterns such as, increased sleeping time which subsequently lead to a decrease in the amount of feed intake and water consumption. While, at the end of the experimental period, most of clinical signs were as arching of the back, twitching as well as seizures, cutaneous lesions, characterized by flaky, dry skin with at times yellowish discoloration, which caused peripheral scaly

eruptions followed by hair loss (alopecia) beneath the lower jaw, known as Kani Kani lesions (Figure 2).

Figure 2. Photographs demonstrating the clinical observation throughout the sub-chronic trial. Ya group: abnormal red, congested eyes of rats, ruffled coat with alopecia area (dermopathy lesion/ Kani Kani lesion) beneath the lower jaw and under two eyes. Et+Ya group: severe eyes and lids congestion with more severe Kani Kani lesion approximately for whole head especially under eyes with severe weight loss, hunched posture, ruffled coat, head tilt.

3.1. Macroscopic investigation

Gross examination of the liver revealed various gross pathological changes among animals in the Ya and EtOH+Ya groups. Multiple necrotic foci around 2-3 mm in diameter were seen in the liver of rats belonging to both the Ya and Ya+EtOH groups, at 14 weeks. Significant lesions were observed in the enlarged oily heavy liver of the Ya-intoxicated group, and similar gross changes in the liver were also seen in the EtOH+Ya supplemented group, but much more severe. Also, the liver of rats from the EtOH+Ya group, were mottled with a yellowish or pale appearance, sometimes darkened color, with hepatic granuloma, as compared to the NCx group. The liver of EtOH intoxicated group, were mostly pale, oily and enlarged.



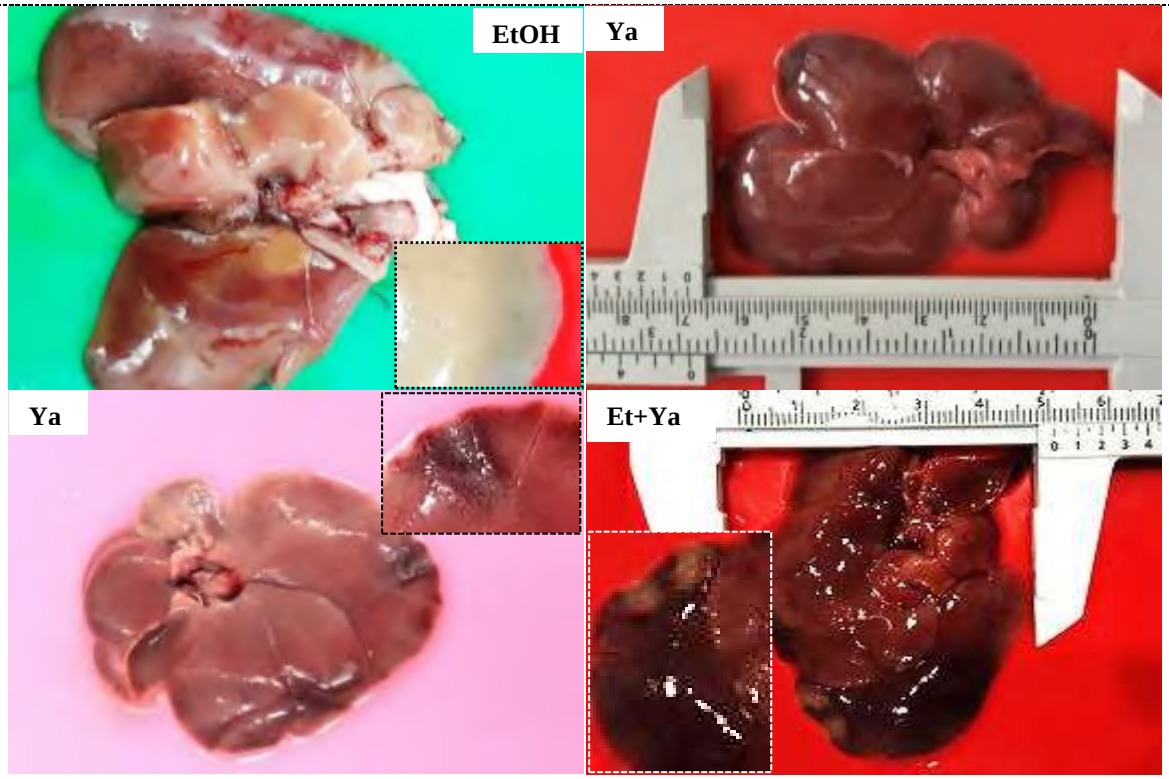


Figure 3. Photograph illustrating the gross morphological changes of liver. At necropsy, control (Cx) showing a normal structure, color, size and weight for all rats. Moderate to severe fatty changes is observed in liver of rats from EtOH group and Ya group with necrotic dark area demarcated from unaffected region and rounded edges showing in Ya group. Et+Ya group showing congested, severe dark red colored liver, necrotic black area with rounded edges and increase size and weight compare to Cx group.

3.2. Light Microscopic evaluations

Through H&E microscopic examination, the liver of the control (Cx) group, appeared a normal architecture of hepatic tissue while, Ya-intoxicated rats revealed different histopathological changes, which observed primarily (initial 3 weeks) in the centrilobular zone and the two zones were significantly less affected. Later, at week 14th most of hepatic lesions were seen in the outer/periportal zone. Angiectasis, vacuolization and dilatation of hepatic sinusoids with hyperplastic of the endothelial layer of the central vein. Clear hepatocellular necrosis and hypertrophic (3-4 times larger than normal hepatocytes), other hepatocytes showed cystic and fatty degeneration (macrovesicular and microvesicular steatosis). The lesions observed in the sections of Ya-intoxicated rats, were also seen in the EtOH+Ya group, but with more severity and more diffuse, especially in the periportal zone and the hypertrophic cells appeared to be six times larger than normal hepatocytes.

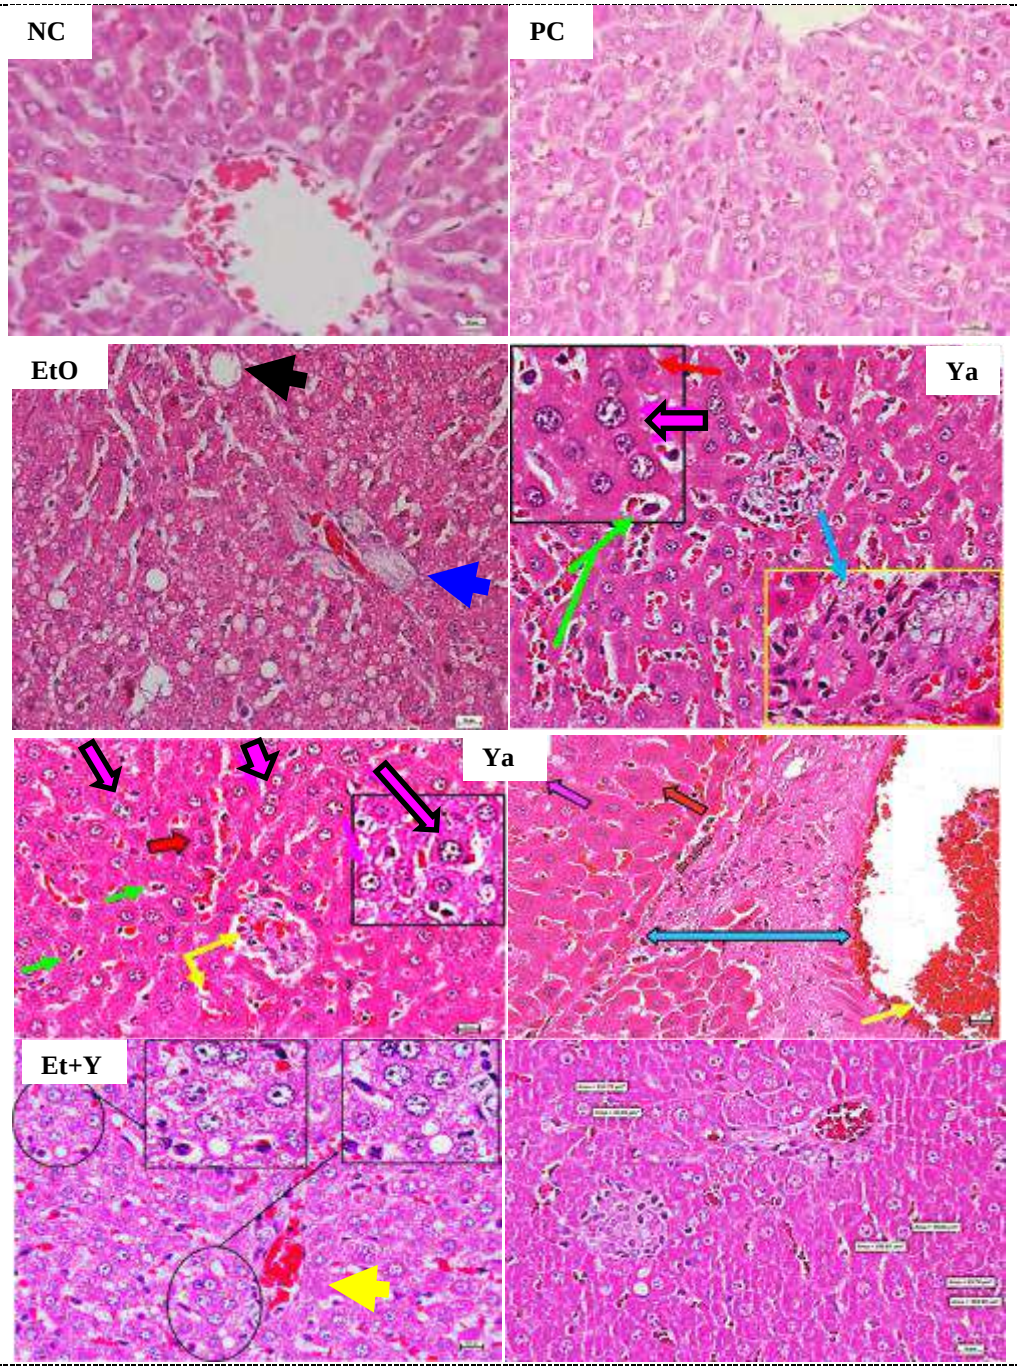

Figure 4. Figure 3: Photomicrograph of liver from, Control groups showing normal limit, represented by normally arranged hepatocytes around the central vein together with normal sinusoidal capillaries. Fatty change (steatosis) was observed in diffuse manner all over the hepatocytes (black arrow) with severe dilatation and congestion of central vein and sinusoidal space, moderate centrilobular necrosis, hypertrophic of some Kupffer cells, with slight periductal fibrosis surrounding the bile ducts (blue arrow) in Ya treated group. Et+Ya group showing clear centrilobular necrosis (red arrow) and centrilobular cystic degeneration (black arrow), hepatocellular hypertrophy in central zone (purple arrow), Kupffer cells hypertrophy and hyperplasia (shiny green arrow), dilation and multifocal angiectasis of sinusoids (yellow arrow), proliferation endothelial layer if central vein (light blue arrow) (H&E 40X).

3.3. Electron Microscopic evaluations

TEM displayed numerous vacuoles and fat droplets in the cytoplasm of hypertrophic hepatocyte, severe degeneration and necrosis of hepatocytes organelles, an irregular nucleus with highly irregular chromatin distribution and dense electron membrane-bound granules in cytoplasmic affected cells of Ya and EtOH+Ya groups. Many of nuclei displayed an indistinct membrane, and dark staining revealed a dense amorphous mass of clumped nucleoplasm, and most of the nucleus of the hepatocellular necrotic cells were in pyknosis and sometimes in karyolysis. Large activated Kupffer cells with hypertrophic stellate cells in dilated blood sinusoids, were also seen. The higher magnifications revealed, many lysosomes in KCs, filled with electron-dense nanoparticles and extensive swollen mitochondria. Massive dilated/expanded sER with well-developed cisternae of rER and high proliferation of peroxisomes were also observed.

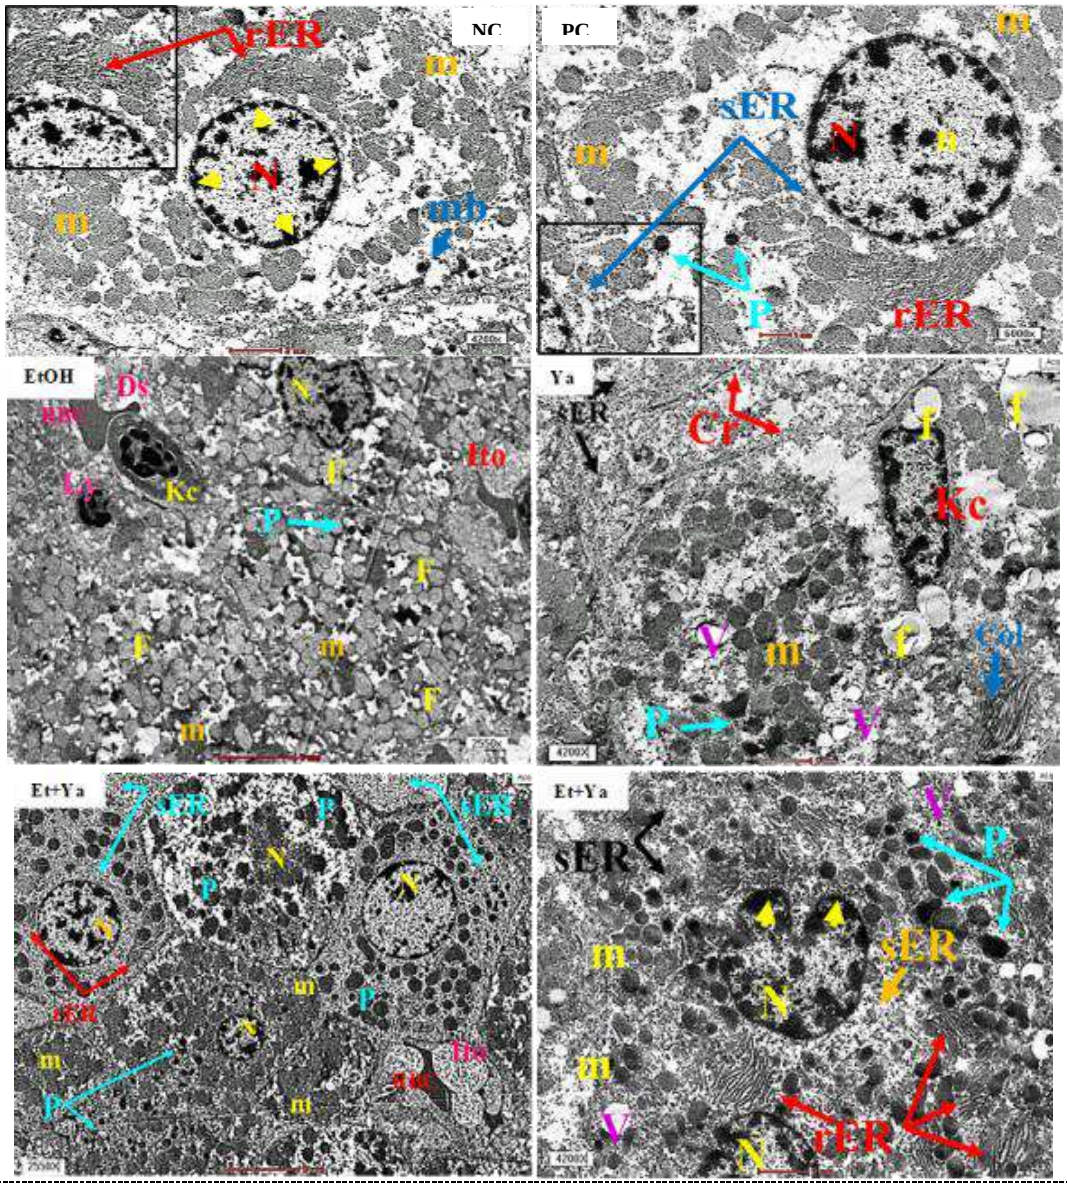

Figure 5. Transmission Electron micrographs from untreated (Cx) normal manifestation of hepatocyte with a euchromatic nucleus (N) as well as developed a nuclear membrane (yellow head arrow), and the cytoplasm contains normal mitochondria (m), an array of rough endoplasmic reticulum (rER) and smooth endoplasmic reticulum (sER), normal peroxisome (P). EtOH-treated rat showing hepatocytes

with intracytoplasmic vacuolization (V), clumping of its organelles, extensive lipid droplets "steatosis liver" (f), swollen mitochondria (m), and large stellate "Ito" cells in the space of Disse, dilatated blood sinusoids (S) with hypertrophic Kupffer cells (KC) and degenerative hepatic nuclei (N) surrounded by a fragmented irregular nuclear envelope, while the hepatocytes of Ya-treated rats (alone and in combination with EtOH) showing intracytoplasmic vacuolization (V), swollen mitochondria (m), dilatated blood sinusoids (S) with severe hypertrophic Kupffer cells (KC), severe dilated smooth endoplasmic reticulum (sER) and highly proliferation of peroxisome (P), electro-dense bodies (mb) and debris of necrotic nuclei, a lot of lysosomes (Ly) and collagen fibers adjacent to Kupffer cells.

Table 2. Lesion scoring for liver tissue obtained at 14th weeks sub-chronic trial.

Groups	NCx & PCx	EtOH	Ya	EtOH+Ya
Histopathological scoring (Mean ± SE)				
Hepatocellular necrosis	0.00	0.86±0.04	1.78±0.14	2.18±0.10
Hepatocellular hypertrophy	0.00	0.74±0.02	1.76±0.14	2.03±0.13
Cystic and fatty degeneration	0.00	1.67±0.07	1.26±0.06	1.72±0.12
Total lesions score	0.00	3.27±0.29	4.80±0.17	5.93±0.14
Organelle injury scores (Mean ± SE)				
Nucleus affecting	0.00	0.42± 0.03	0.63± 0.02	0.93± 0.02
sER & Peroxisome Proliferation	0.00	0.55± 0.06	1.02± 0.04	1.19± 0.03
cytoplasmic vacuoles and lipid droplets accumulation	0.00	0.83±0.04	1.03±0.05	1.24±0.03
Total lesions score	0.00	1.80±0.12	2.68±0.13	3.36±0.1

The histopathologic lesions scores of light microscopes in EtOH, Ya and EtOH+Ya groups are a very strong correlation with Ultrastructural changes scores in that groups (r = 0.928 for EtOH Group, r = 0.921 for Ya group and r =0.903 for EtOH+Ya group) (Figure 5). While the table (3) represent the correlation between lesions under light and transmission electron microscope.

Table 3. The correlation between lesions of light and transmission electron microscope.

TEM lesions	Light microscope lesions (H&E)		
	Hepatocellular necrosis	Hepatocellular hypertrophy	Cystic and fatty degeneration
Nucleus affecting	.988**	.978**	.893*
sER & Peroxisome Proliferation	998**	.995**	.873*
Cytoplasmic vacuoles and lipid droplets accumulation	.966**	.955**	.954**

** Correlation is high significant at the level 0.01, *Correlation is significant at the 0.05.

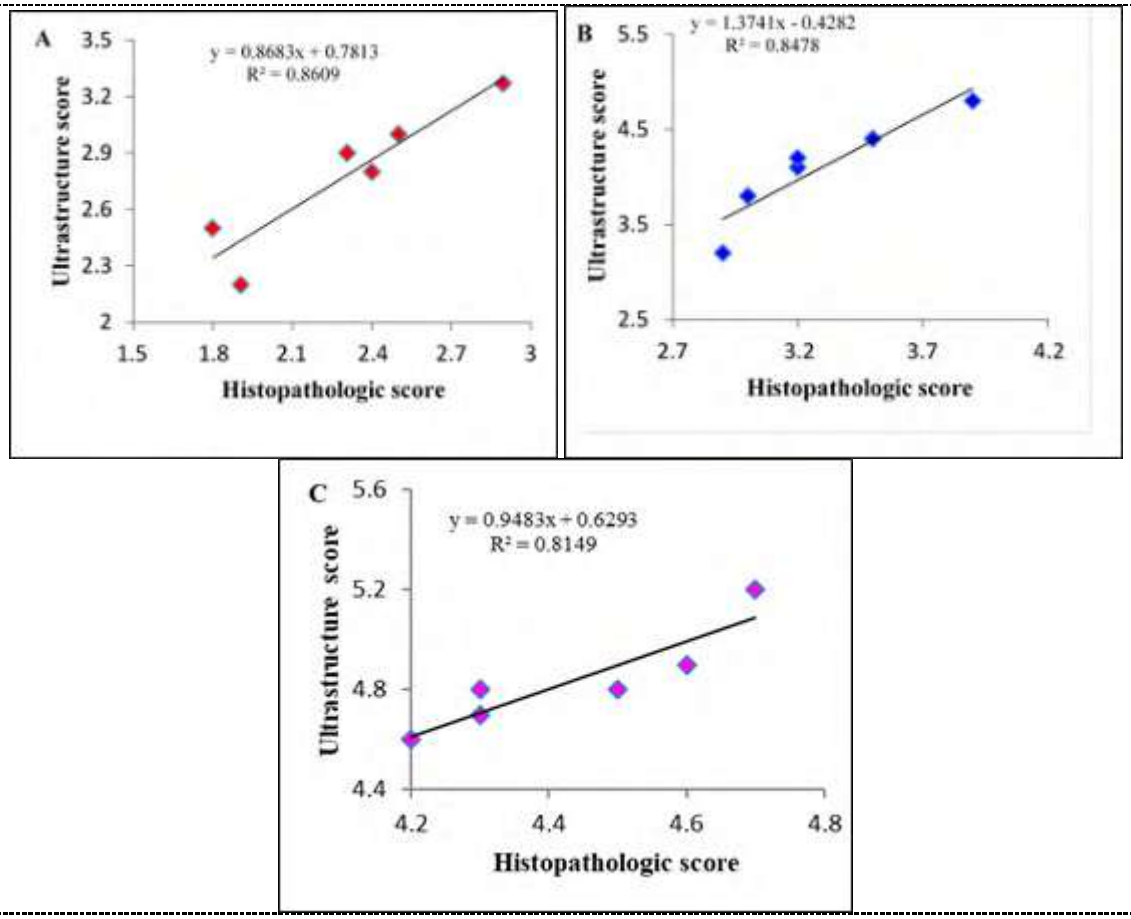

Figure 6. Correlation of histopathologic and ultrastructure scores in A: EtOH treated group (r = 0.928); B: Ya treated group (r = 0.921) and C: EtOH+Ya treated group (r = 0.903).

4. Discussion

The current study investigated the histopathological findings and their correlation with ultrastructural results in hepatocytes, after EOH treatment in “Ya" induced experimental liver toxicity. As described previously in a few studies, *Piper methysticum* 'awa' feeding induced histopathological changes in the liver of experimental animals [12, 14]. Examination of the H & E-stained liver sections from Ya-gavaged rats under the light microscope, revealed different histological changes in hepatic architectures, such as clear cytoplasmic vacuolation and lipid droplets accumulation, other hepatocytes showed degeneration and necrosis with deep acidophilia and pyknotic nuclei; sometimes extensive karyorrhexis or fragmented nuclei were indicative of acute hepatocellular necrosis. Therefore, TEM examination revealed that, Ya induced alterations in chromatin distribution in the nuclei of hepatocytes. Furthermore, abundant heterochromatin was detected, disorganization of nuclear content as margination and clumping of chromatin, in Ya treated animals could be morphological evidence of injury in the nucleus. In addition, severely degenerated nuclei were detected, and most of the nuclear content was abnormal in appearance such as, fragmented irregular nuclear envelope and disturbed heterochromatine among the Ya group, which has been previously reported to induce DNA damage [14, 15]. These results support the well-known fact that, nucleoplasmic constituents represent the structural counterpart of transcription and processing of messenger and ribosomal RNAs and are therefore highly sensitive indicators of cellular activity [16]. Such a scoring system may be potentially useful for the researchers, in monitoring the changes in the ultrastructure of hepatocytes under pathogenic stress, or medications. The most significant ultrastructural changes with Ya treatment,

occurred in the mitochondria, sER and peroxisomes. The molecules in the electron transport chain, which play the central role in ATP synthesis, are found in the cristae mitochondria. It is also well known that mitochondria are a major source of endogenous production of ROS [17]. The major mitochondrial pathology observed in this study was, edema, the major ultrastructural sign of cellular injury, extensively invading the matrix resulting in swelling of the organelle and structural damage to cristae. Though edema was seen in both groups, it was much more pronounced in EtOH+Ya treated animals. In addition, there was marked disruption in cristae with EtOH+Ya treatment, and cristae integrity was highly affected. Swelling and a loss of regular cristae structure with a ruptured outer membrane, characteristics of deteriorated function of mitochondria [18, 19, 20], were observed among the rats of the EtOH+Ya group. In rats receiving "EtOH+Ya", an increase in liver weight was consistent with an increase in the incidence of hepatocellular hypertrophy, as observed under the light microscope. Hepatocellular hypertrophy was recognized as, an irregular, diffuse increase in cell size associated with ground-glass cytoplasmic eosinophilia and cytoplasmic glycogen content and enlarged nuclei, primarily located in the centrilobular regions. Severely dilated ERs are indicative of severely damaged hepatocytes [21]. When the ER of rats treated with Ya were examined under TEM, serious damage was observed in the form of irregular lamellar organization, large dilatations and focal breaks in rER, vacuolisations, myelin figures and high proliferation in sER in various regions. However, more severe changes (focal and dilatations) were observed in rER and sER of EtOH+Ya treated animals. Besides the absence of a normal or intact appearance, that is known to be irreversible in the toxic state, as a result of the synergistic action of more than one toxic compound [22], sacs forming lamely-like shapes (disorganization) and vacuolization with high dilatation, contribute to the abnormal functioning of the ERs. The possible mechanisms that could explain the hepatocellular hypertrophy observed in Ya-intoxicated rats, suggest that the induction of drug-metabolizing enzymes by administration of *Piper methysticum* extract could cause the intrahepatic accumulation of proteins and lipids. It is a result of a slowdown in protein catabolism and particularly those intracellular proteins degraded in lysosomes by autophagy, after the intake of awa in combination with EtOH [12, 23, 24, 25, 26] Another possible mechanism suggests that, hepatomegaly occurs because the awa extract causes a significant induction and modulation of drug metabolizing enzymes particularly CYP isozymes [27, 28]. It is associated with a concomitant increase in peroxisome proliferation in hepatocytes and proliferation of the smooth endoplasmic reticulum (sER). Furthermore, the expansion and proliferation caused significant hepatomegaly, and these findings are in full agreement with previous results of [29] and [30] who reported that hepatocellular hypertrophy is indicative of enzyme induction, protein synthesis enhancement, and increased hepatocyte size could be a result of the proliferation of subcellular cytoplasmic organelles (typically sER and/or peroxisomes) or formed due to the accumulation of glycogen, lipid and water (hydropic degeneration). In addition, the results of the current study corroborated with the findings of previous studies, in respect to hypertrophic hepatocytes that could be caused by acetaldehyde, after the induction of CYP during alcohol consumption [31]. Through the process of binding the tubulin of microtubules, acetaldehyde blocks the secretion of proteins, which leads to increased levels of protein, lipid, water and electrolytes, causing hepatocytes to enlarge, a hallmark of alcoholic liver disease [32]. The excessive generation of free radicals following Ya supplementation, significantly increased MDA levels and was more pronounced in combination with EtOH, which adversely affected cellular membrane integrity and mitochondrial function, as demonstrated by the TEM results. This could be responsible for the enlargement of hepatocytes, via a decreased activity and/or levels of the Na-K ATPase pump (located in the plasma membrane), due to decreased levels of ATP following mitochondrial change, or through direct membrane damage caused by ROS, generated after Ya consumption, resulting in the influx of sodium (accompanied by water) causing cellular swelling/enlargement. These findings were in accordance with a previous study, which reported that, awa root extract induced mitochondrial dysfunction, and a 35% to 40% decrease in total cellular ATP after 3 to 4 hrs of treatment, respectively [33]. However, the highest increase in lesion scores particularly hepatomegaly, observed in the EtOH+Ya combination group, could be a result of a synergistic action or herbal-drug interaction, of ethanol with *Piper*

methysticum, which produced more severe adverse effects. To date, electron microscope findings in hepatocytes as a result of hepatotoxins, have not been defined systematically. Moreover, it was unclear whether the changes observed in various organelles wee reversible or not. However, the present study was not only able to identify the specific changes observed in different organelles, but also provided a better assessment and measurement of ultrastructural injury. Furthermore, this study is the first of its kind, a preliminary investigation of the histopathological lesion scores under a light microscope, following treatment with Ya and in combination with EtOH.

5. Conclusion

In conclusion, this study elucidated changes in morphology of hepatocyte organelles, following the induction of a certain hepatotoxin. Ya was shown to change or alter the morphology of major organelles of hepatocytes and hastened the development of hepatopathy, particularly in combination with EtOH. The structural adverse changes observed in hepatocyte organelles in this study, are likely the cause of significant histological injuries. Since the transmission electron microscope is the highest magnification tool at present, modeling new ultrastructural scoring systems including more organelles and parameters can be useful in estimating the degree of injury and outcome of alternative treatment strategies in management of chronic liver diseases.

*E-mail: m_jamel68@yahoo.com

Abstract. This study was conducted to estimation mycotoxins and some heavy metals in some types of noodles in Salah Al-din governorate markets. In this study 6 species of Aspergillus were detected which were *A. flavus*, *A. parasiticus*, *A. fumigatus*, *A. terreus*, *A. ochraceus* and *A. niger* and 5 genus of fungi were *Fusarium verticillioides*, *Penicillium*, *Mucor*, *Alternaria* and *Rhizopus* isolated on the three types of media used.The results show presence of the three types of mycotoxins in all samples. The concentrations of the aflatoxin B1 ranged between 1.145 - 5.041 ppm. Concentrations of fumonisin between 8.498 - 19.496 ppm. Concentrations of ochratoxin A ranged between 3.960 - 52.543 ppm. The results also show that the concentration of copper and cadmium was at (0.50 - 1.23) (0.05 - 0.31) ppm respectively, while the concentration of lead was less than 0.1 ppm in all samples.

Keywords. Noodles, Aflatoxin, Ochratoxin, Fumonisin, Fungi, Heavy metals.

1. Introduction

Instant noodles is one of breakfast and staple food item of East Asian countries, whose consumption is gradually increasing day by day worldwide. Noodles, being a poor source of proteins due to use of refined flour in its production [1]. Worldwide, China ranks first in the consumption of noodles followed by Indonesia, Japan, and Vietnam [2]. [3] listed the ingredients of Instant Noodles (product) Neoguri Udon (Seafood & Spicy) consist of, noodles, potato starch, wheat flour, palm oil and salt, Dried solids packet, Mussel, green onion, carrot. Powder soup packet, salt, monosodium glutamate, glucose sugar, Soy sauce powder, Spices, corn flour, caramel color. Mycotoxins can be produced at the growth and storage of crops [4]. Aflatoxins considered toxic secondary metabolites of fungal origin contaminate agricultural crops before, during and after harvest [5]. Aflatoxins are a poisonous, carcinogenic of mycotoxins that are produced by the fungi *Aspergillus flavus* and *Aspergillus parasiticus*, there are 20 different types of aflatoxins identified until now, four groups of aflatoxins B1, B2, G1 and G2 [6]. Aflatoxins are toxic products by fungal metabolism, associated with serious health consequences and substantial economic losses for agriculture, livestock and poultry sectors in the developing countries [7]. One hundred wheat product samples (50 instant noodle and 50 bread samples) were collected from supermarkets in Bangkok, Thailand aflatoxin B1 contamination in these products 1 ng / g [8]. In another study no contamination with Afla B1 was detected in wheat flour in

Italy [9]. A broad spectrum of *Fusarium* species causes diseases in plants and produces important mycotoxins like trichothecenes, zearalenone and fumonisins, which are the major threats to animals and humans [10]. Fumonisin B1 (FB1) is a mycotoxin produced in some grains (mainly corn) by *Fusarium* species such as *Fusarium verticillioides* and *Fusarium proliferatum* [11]. Fumonisin B1 include many types FB1, FB2, and FB3, occured with the highest frequency, whereas FB1 found at the highest concentrations [12]. Fumonisins cause health effects in the liver and kidney, the health effects of fumonisins in humans was limited [13]. Fumonisins contamination most commonly in the cereals (rice, barley, wheat, maize, oat, rye and millet) [14, 15]. Ochratoxin (OTA) has been to be nephrotoxic, hepatotoxic, and immunotoxic in various animals and was classified by the International Agency for Research on Cancer as possibly carcinogenic to humans [16]. The mode of action is not clear discussed [17, 18]. *Aspergillus ochraceus* known to produce OTA and OTB, is a contaminant in many foods including wheat (grains and berries) and cereals [19]. Ochratoxin A content in the corn and wheat samples ranging 0-25.90 ng /g [20]. Concentration of OTA in raw wheat grain including (durum wheat, spelt, and emmer) should contain at maximum 5 μg/kg [21]. Heavy metals on the earth's crust are significantly contaminated to environment by mining and processing metal, Human activity such as pesticide and herbicide also occured heavy metals in environment [22]. Studies on heavy metals considerd important from public point, where the attention has drawn to necessity of measuring the accumulation of heavy metals, those metals which serious hazards to human [23]. The study aimed to detect the presence of fungi, mycotoxins and the levels of Cd, Pb and Cu in instant noodle types (packets) that manufactured in some different countries which may effect on human consumption.

2. Materials and Methods

2.1 Collection of samples

Ten types of noodles samples (curry with vegetables, spring vegetables, cream of mushrooms, chicken cream, maggi mushroom cream, bechamel mix, chicken with noodles, creamy vegetables, pasta flavored chicken, lentil soup) were collected from Salah al-din Governorate markets with three replicates and it was saved until the estimate.

2.2 Isolate and identification of fungi

The fungal isolates were depending on classification key ([24, 25, 26] by observing growing on (CYA) Czapek Yeast Capek extract Agar, and Rose Bengal agar and PDA media, and the physical characteristics of the mycelia such as features (shape, size, color, and hyphae) by the compound microscope contain a digital camera and using a lactophenol cotton blue stained on slide mounted with small parts of mycelium.

2.3 Quantification of aflatoxin B1, fumonisin B1 and ochra A by ELISA

The mentioned method was followed by a company Shenzhen Lvshiyuan Biotechnology Co. Ltd. China prepared for the materials and solutions used in extraction and determining the aflatoxin B1, fumonisin B1 and ochratoxin A using the ELISA method [27]. This method depends on mixing a specific amount of the complex of each poison-enzyme with a specific amount of the sample to be examined and mixed well and added to the titration plate covered with antibody surface. After incubation for a period of 15 minutes at room temperature, competition is between the toxin in the sample and the toxin associated with the enzyme with these bodies. Then the substance subject to the enzyme is added to the reaction solution and the reaction is stopped when the blue turns yellow. The optical intensity of the color of each slide was read using the spectrometer of the ELISA plates Bio_Tek Korean origin at a wave length 450 nm, in the central laboratory of Tikrit University.

2.4 Determination of heavy metals

Determination of heavy metal in 10 duplicate Noodles samples are analysis by the Atomic Absorption type ELCO [28]. A known volume of noodles samples was transferred to electric oven for drying and Muffle Furnace USA at 600 ^{0}C to weight stable. Ashed taken up in 5 ml of 5 % HNO_3 and filtration by Whatman No. 1. The contents of Cd, Cu and Pb were direct determined by Atomic Absorption Spectrophotometer type Shimadzo-6200 (Japan) for each heavy metals copper, cadmium and lead to be determined and measured by placing the sample in a transparent liquid form.

3. Results and Discussion

3.1 Occurrence of fungi in noodles

In this study 6 species variety of *Aspergillus* were detected such as *A. flavus*, *A. parasiticus*, *A. fumigatus*, *A. terreus*, *A. ochraceus* and *A. niger* and 5 genus of fungi were isolated on the three types of media used, other genus *Mucor* spp., *Fusarium verticillioides*, *Penicillium* spp., *Rhizopus* spp. and *Alternaria* spp. (Table 1). *A. flavus*, *A. parasiticus*, *A. ochraceus* and *Fusarium verticillioides* found in all samples, other genus were isolate from some samples. Numerous studies have shown that fungi generating toxins, especially *Aspergillus considerd* one of the main pollutants in foods and fungi *A. flavus* and *A. niger* are the most isolated species [29].

Table 1. Number of Fungi isolates in some types of noodles.

No.	Fungi	Isolates No.
1	*A. flavus*	15
2	*A. parasiticus*	12
3	*A. fumigatus*	5
4	*A. terreus*	4
5	*A. ochraceus*	11
6	*A. niger*	8
7	*Mucor spp.*	3
8	*Fusarium verticillioides*	15
9	*Penicillium spp.*	6
10	*Rhizopus spp.*	3
11	*Alternaria spp.*	2

The current results coincided with [30] isolate and identify fungi from food resources (Indian rice, rice, popcorn, pasta, pistachios and noodles), showed to 577 isolates of fungal genera and species, *A. flavus*, *A. niger*, *Altrenaria*, *Penicillium*, *Aspergillus terreus*, *Rhizopus* and *Aspergillus prasiticus* are 249, 149, 91, 43, 28, 10, and 7 isolates, respectively. One of the most common types is found in food sources *A. niger*, *A. ochraceus*, *A. terreus*, *A. flavus*, *A. fumigatus*, *A. parasiticus* and *A. versicolor* [31]. The reason for the emergence of fungal in foodstuffs is that the species possesses the ability to secrete a large number of enzymes that analyze foodstuffs that are used in nutrition and growth as well as increasing its spreading capacity, especially since some of its types can grow in a low moisture content as well as the relative density of the boards that produce them [32].

3.2 Concentrations of mycotoxins in noodles samples

Figures 1, 2 and 3 show the concentrations of the toxins of aflatoxin B1, fumonisin B1, and ochra A in some types of noodles in Salah El-Din Governorate markets. The results show the presence of the three types of mycotoxins in all samples. The concentrations of the aflatoxin B1, fumonisin B1and ochratoxin A between (1.145 - 5.041) (8.498 - 19.496) (3.960 - 52.543) ppm respectively. This may

be due to infection with molds that produce toxins in the field or during storage, and provide the appropriate conditions for the production of these types of mycotoxins [33].

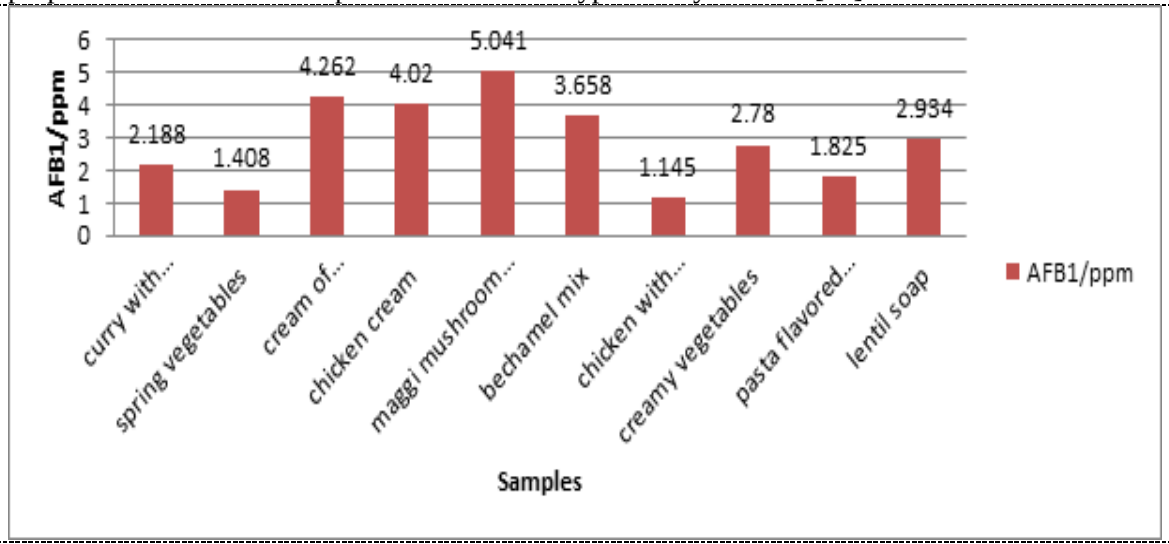

Figure 1. Concentration of aflatoxin B1 in some types of noodles

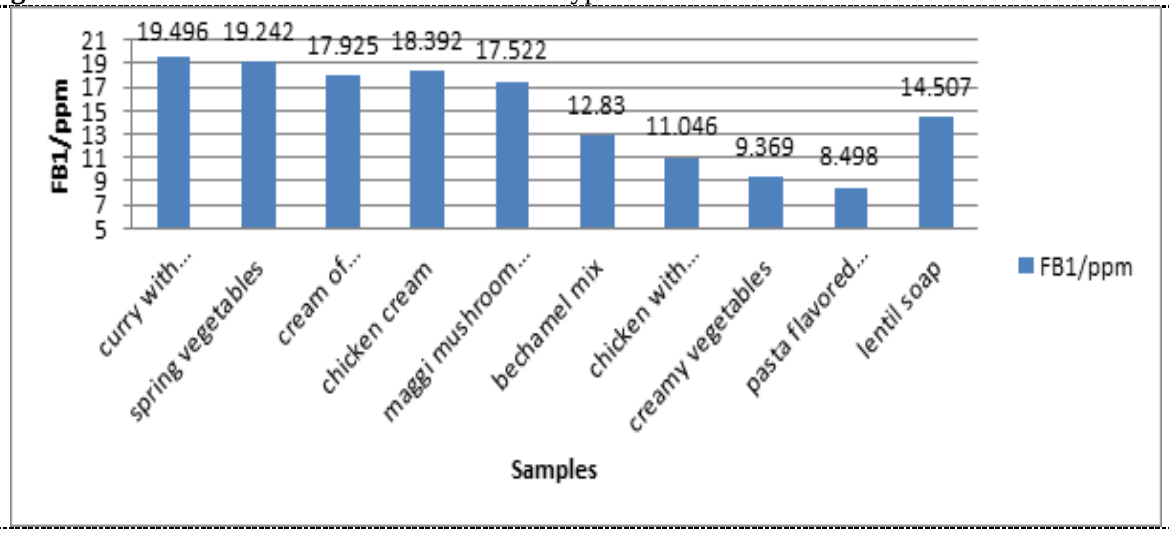

Figure 2. Concentration of fumonisin B1 in some types of noodles.

The highest of aflatoxin concentrations of Afla B1, Afla B2, Afla G1 are 65.77, 19.27, 1.02 µg/kg respectively. For the cereal food category, CBS11 recorded the quantities of Afla B1, Afla B2, Afla G1 and Afla G2 at 35.46, 4.92, 3.39 and 0.32 µg/kg respectively, the pasta category, PS1 recorded the highest quantities of 0.94 and 0.85 µg/kg for Afla B1 and Afla B2 respectively [5]. The highest fumonisin B1 value 1.46 and 0.46 mg/kg was measured in 64 maize flour and corn flakes samples respectively [34]. [35] showed positive OTA levels ranging from 0.6–3.4 in wheat flour samples µg/kg. OTA was detected in forty samples contain corn flour, corn flakes, wheat flour, bread and biscuits samples was 0 - 25.90 ng /g, the greatest level was measured at 360 ng /g of ochratoxin A in biscuit sample [20]. And that these results obtained were higher than the allowable limit by the European Union, which is 2 µg / kg of aflatoxins, also the concentrations of fumonisin B1, the permissible limit ranges between 200 - 800 ppb, according to the standard specifications set by the Codex Committee [36].

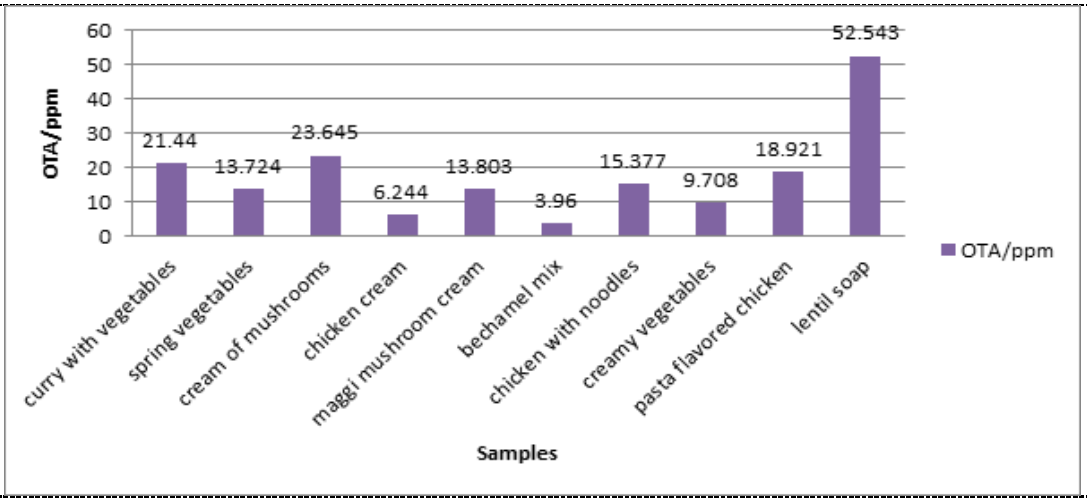

Figure 3. Concentration of ochratoxin A in some types of noodles.

FB1 toxicity affects mainly the liver organ, which is characterized by apoptotic, necrosis, and regeneration [37]. A recent study has found that FB1 can cause changes in the tissues of liver, lung, and kidney such as apoptosis and necrosis, leading to infiltration of inflammatory cells which were observed in these organs [38] .As well as for other agricultural crops, such as wheat, rice, field pistachios, and soybeans, where many studies have recorded high rates of pollution of these crops from aflatoxins [39]. The JECFA (FAO)/ (WHO) has set the provisional acceptable weekly intake of OTA at the rate of 100 ng / kg and 14 ng / kg of body weight per day [40].

3.3 Concentration of heavy metals in noodles samples

Figure 4, 5 and 6 showed that the concentration of heavy metal in some types of noodles. The results indicate to the concentration of Copper and Cadimium at (0.50 - 1.23) (0.05 - 0.31) ppm respectively. While the concentration of Lead less than 0.1 ppm in all samples. These results was accepted with [41] reported the concentrations of Cd, Pb and Cu in Iranian noodles at 0.469, 2.797 and 1.563 mg/kg and in imported noodles 0.62, 3.07 and 11.866 mg/kg respectively. Also accepted with [42] found the magnitude of heavy metals as Pb Ca Ni and Ar (1.17-1.67), (0.53-0.82), (0.27-0.43), (0.17-0.41) mg/kg respectively contamination in noodles samples. The concentration levels of heavy metals Tin, Cadimium, Zinc, Manganise, Iron, and Cobalt in six type of noodles, i.e., Maggi, Knorr, Shan shoop, Shinramayun, Indomie, and Mama observed at (3.3–9.7), (0.066–0.59), (6.2–11.4), (2.4–6.3), (4.8–17.5), and (0.39–0.74) mg / kg respectively [43].

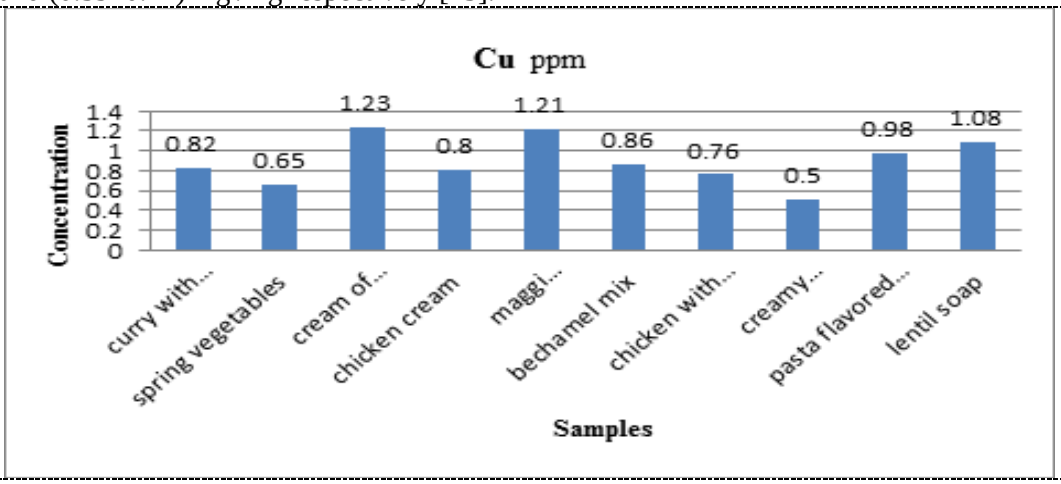

Figure 4. Concentration of Copper in some types of noodles.

The concentration of lead, Cr, cadimium and alominium in Iranian instant noodle at 1.21, 0.08, 0.03 and 9.15 mg/kg and in imported instant noodle at 1.00, 0.07, 0.04 and 15.90 mg/kg, respectively [44]. [45] reported that cadmium concentration determined in some foods and beverages in Japan follows cereals, seasoning and canned in syrup at (0.004 - 0.380) (0.01 - 0.06) (0.01) ug/ g respectively. [46] reported that the conventional agriculture was contaminated by lead, the possible sources of Pb in wheat include irrigation with contaminated water, metal based pesticides, industrial emissions, transportation and method of harvesting and storage. According to [47, 48] weekly intake of metals from sources not exceed 0.05 and 0.075 mg/kg body weight for Pb and Cd respectively, it accumulation in the skeleton and cause renal tubular damage and may give rise to kidney damage, Cd is among the most heavy metals and is particularly toxic. [49] Showed that changes were recorded in various parameters of oxidative damage, while the accumulation of metals in tissues with disturbances of hematological and biochemical parameters, it was observed levels of heavy metals in tissues had different pattern after mixture and single exposure.

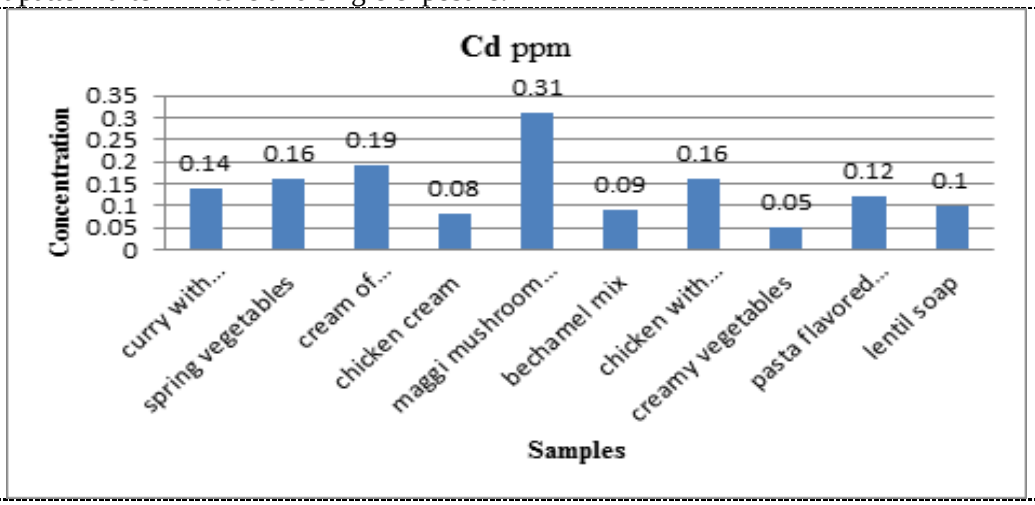

Figure 5. Concentration of Cdimium in some types of noodles.

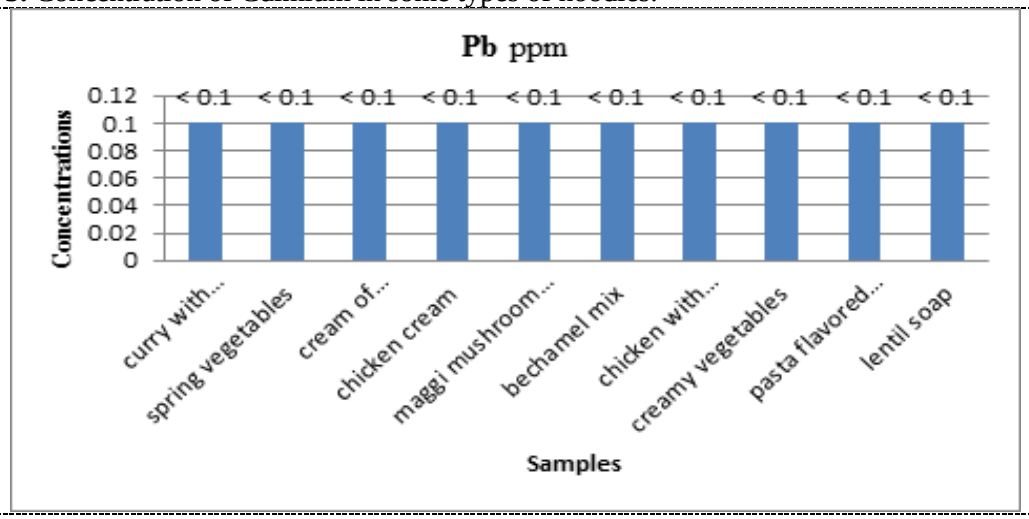

Figure 6. Concentration of lead in some types of noodles.

4. Conclusion

The current study represents for detecting mycotoxins AFB1, OTA, FB1 by ELISA. Isolate and identify fungi and determination of heavy metals in some noodles samples. The results show to the all samples of noodles were contamination with aflatoxin B1, ochratoxin A and fumonisin. Fungi *A.*

flavus, *A. parasiticus*, *A. fumigatus*, *A. terreus*, *A. ochraceus* and *A. niger*, other genus *Mucor*, *Fusarium verticillioides*, *Penicillium*, *Rhizopus* and *Alternaria*. Heavy metals copper, cadmium and lead.

Abstract. The current study was designed to investigate the histological structure of the cerebellum in the Iraqi frog *Rana ridibunda ridibunda*. The cerebellum was removed surgically from 20 Iraqi frogs, *Rana ridibunda ridibunda*, and preserved in fixative of 10% formalin solution for a period of 72 hr, then the histological sections were prepared by the method of paraffin. The results of the study showed that the cerebellum of the adult Iraqi frog is one of the rhombencephalon regions, and consists of three layers, molecular layer, purkinje cells layer, and granular layer. The present histological findings suggest that the cerebellum of the Iraqi frog is very similar to that of other vertebrates, Therefore it represents the basic rule in understanding the histological formation of the cerebellum. .

Keywords. Cerebellum, Brain tissue, *Rana ridibunda*, Iraqi Frog.

1. Introduction

Cerebellum is the part of brain responsible for balance and movement, it is incomplete developed in amphibian, while it is well developed in other advanced vertebrates, all the sensory neurons pass through cerebellum with the exception those responsible for vision and olfaction, the reflex induces of hearing, respiration and engulfing [1]. The cerebellum is responsible the metencephalon and is histologically formed in amphibians from the corpus cerebelli and the auricular lobes [2, 3]. The corpus cerebellum presents the center of the cerebellum and consists of a transverse plate consisting of three layers: the molecular layer consisting mainly of fibers and a few neurons, purkinje cells layer which is characterized by containing large-sized purkinje cells, and granular cells layer that contains dense granular cells, auricular lobes are less developed [4].

2. Materials and Methods

A total of twenty adult Iraqi frog (*Rana ridibunda*) samples were obtained from some gardeners at Baghdad governorate during the period of 2018 to 2019. The samples were anesthetized by Chloroform. The isolation of frog brain as followed method by[5], the frog was attached at the dissection board and its back facing up, then cutting the skin crosswise behind the head and pulling forward to remove it from above the head area using the scalpel, and the edge of the scalpel was

placed above the dorsal midline of the skull, and moving the scalpel forward and backward several times with slight pressure until the cranium is opened to raise the roof cranium bones with the edge of the scalpel and cut it to reveal the brain. After the brains have been removed from the skulls, fixed in 10% formalin solution for 72 hr [6]. later, the samples washed by tap water and kept in 70% ethanol, after that the fixed tissues were processed by successive in a series of ethanol treatments, then cleared by xylene, two times was treated half an hour each, infiltrated and embedded into two changes of soft paraffin, one hour each at oven 58° C, Then paraffin blocks were obtained, serial sections of (7) µm thickness were cut and stained with the following histological stains [7, 8]. Stained with haematoxylin-van gieson stain and methylene blue stain and crystal fast violet stain for histological study [9, 10]. The sections were observed with an Olympus light microscope and were photographed with a digital camera Canon mounted on the microscope.

3. Results and Discussion

The sections view of cerebellum in adult Iraqi frog (*Rana ridibunda*) showed that its consists of three layers, which are from top to bottom the molecular layer, purkinje cells layer, and granular layer (Figure 1 and 2).

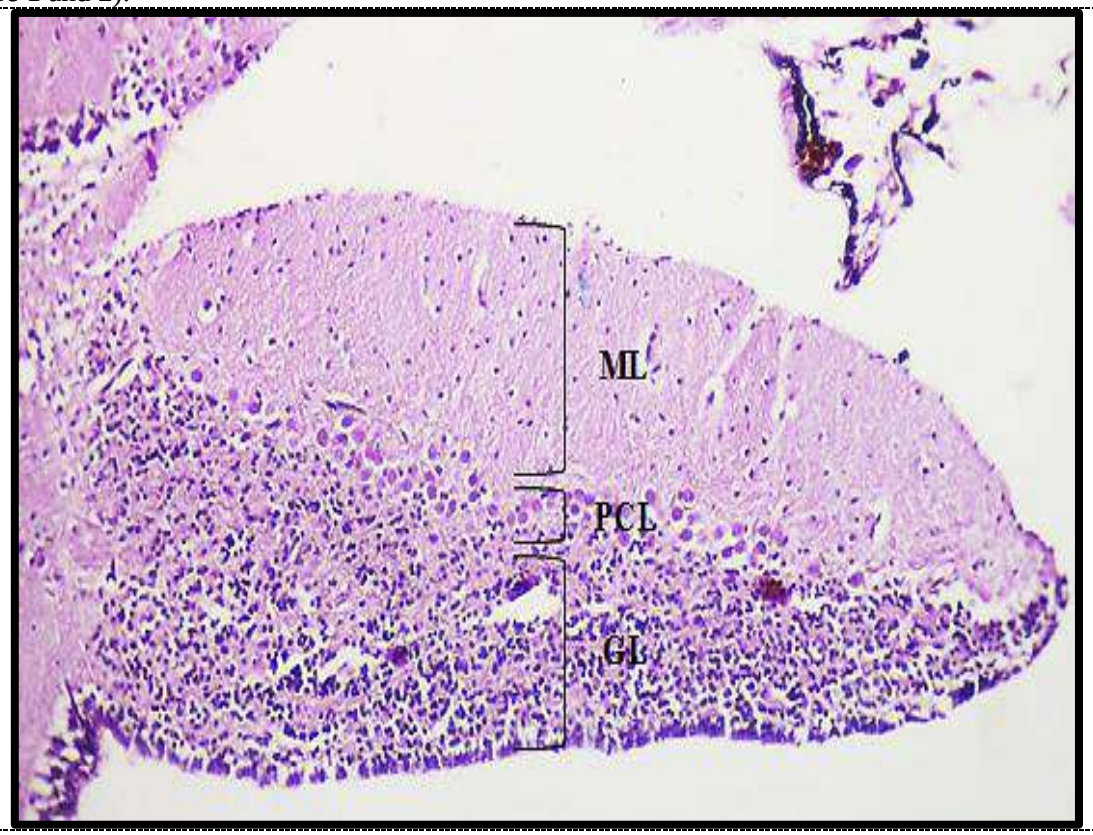

Figure 1. Sagittal section of the Iraqi frog's brain passing through the cerebellum, note: molecular layer (ML), purkinje cell layer (PCL), granular layer (GL), (Haematoxylin- Van Gieson stain, 10X) .

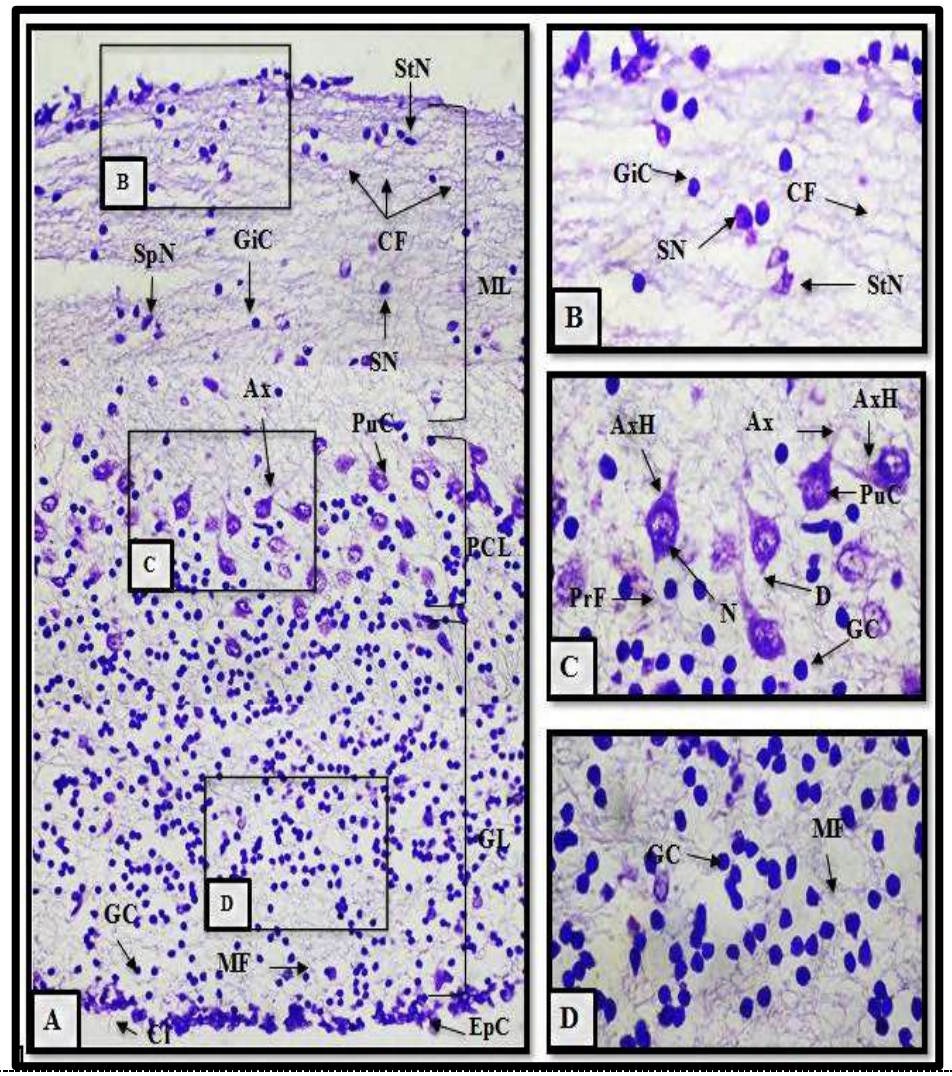

Figure 2. Sagittal section passing through the cerebellum of the brain Iraqi frog, note: molecular layer (ML), purkinje cell layer (PCL), granular layer (GL), ependymal cell (EpC), purkinje cell (PuC), spherical neuron (SN), satellite neuron (StN), spindle neuron (SpN), granular cell (GC), parallel fiber (PrF), climbing fiber (CF), mossy fibers (MF), axon hellock (AxH), dendrite (D), axon (Ax), glial cell (GiC), cilia (Ci) , (Crysel fast violet stain), A- cerebellum layers (10X), B- molecular layer (100X), C- purkinje cell layer (100X), D- granular layer (100X).

3.1. Molecular later

In the outer surface layer, It was observed when using the (crysel fast violet stain), the presence of irregularly distributed neurons such as spherical neurons with an average diameter of 6 micrometers, and satellite neurons with an average diameter of 4 micrometers , and spindle neurons with an average diameter of 3 micrometers (Figure 2 B). All of these cells have dendrites and axons that extend towards the layer of purkinje cells and intertwine with their dendrites, in addition to the presence of diffuse glial cells, and it was also observed when using (methylene blue stain) that the molecular layer contains neurofibers that extend vertically called climbing fibers formed from the extensions of the

dendrites of purkinje cells through the surface layer and the dendrites of the cells of the molecular layer. These fibers represent the main component of the molecular layer (Figure 3). .

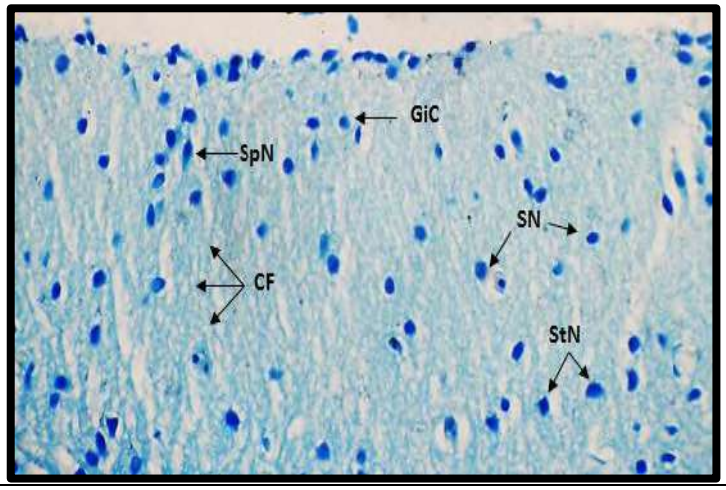

Figure 3. A sagittal section through the molecular layer in the cerebellum of the brain Iraqi frog, note: the spindle neuron (SpN), the spherical neuron (SN), satellite neuron (StN), Climbing fibers (CF), (Methylene blue stain 40X).

3.2. Purkinje Cells Layer

In the middle layer of the cerebellum, which is a narrow region located between molecular layer and granular layer, A sagittal section showed that its consists of two to three rows of purkinje cells, which are characterized by large cells with an average diameter of 11 micrometers, characterized by their elliptical or spherical shape It is characterized by its elliptical or spherical shape, containing large nuclei of central location, as well as containing the Nissl's granules, and the axon hellock is evident, which is devoid of Nissl's granules, and attached to the axon which is long and extends towards the outer molecular layer (Figure 2C). Purkinje cells are also distinguished by their dendrites that intertwine with the parallel fibers and with the dendrites of the cells of the molecular layer as well (Figure 4).

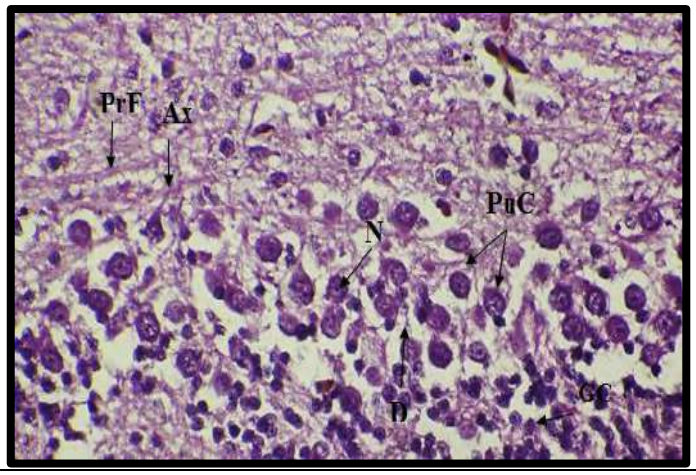

Figure 4. A sagittal section passing through the cerebellum of the brain Iraqi frog, note: purkinje cell (PuC), parallel fiber (PrF), granular cell (GC), nuclei (N), axon (Ax), dendrite (D), (Haematoxylin- Van Gieson stain, 40X).

3.3. Granular Layer

The inner layer of the cerebellum, which is a thick layer, is made up of granular neurons smaller than purkinje cells. They are dense in number, spread in a converging way and have a spherical shape with an average diameter of 5 micrometers. They have dense dendrites, its axons extend up towards the molecular layer and then branch into two branches, each opposite in direction to the other if it extends in a direction parallel to the outer surface of the cerebellum in the shape of a (T), forming a bundle of parallel fibers (Figure 2D and 4). It has been observed, by using the methylene blue stain, the presence of filamentous nerve fibers located between granular cells called mossy fibers, which are intertwined with granular cells, below the granular layer lies ependymal cells that lining of the cerebellum, which is made up of a single row of columnar cells ciliated towards the 4th ventricle (Figure 5).

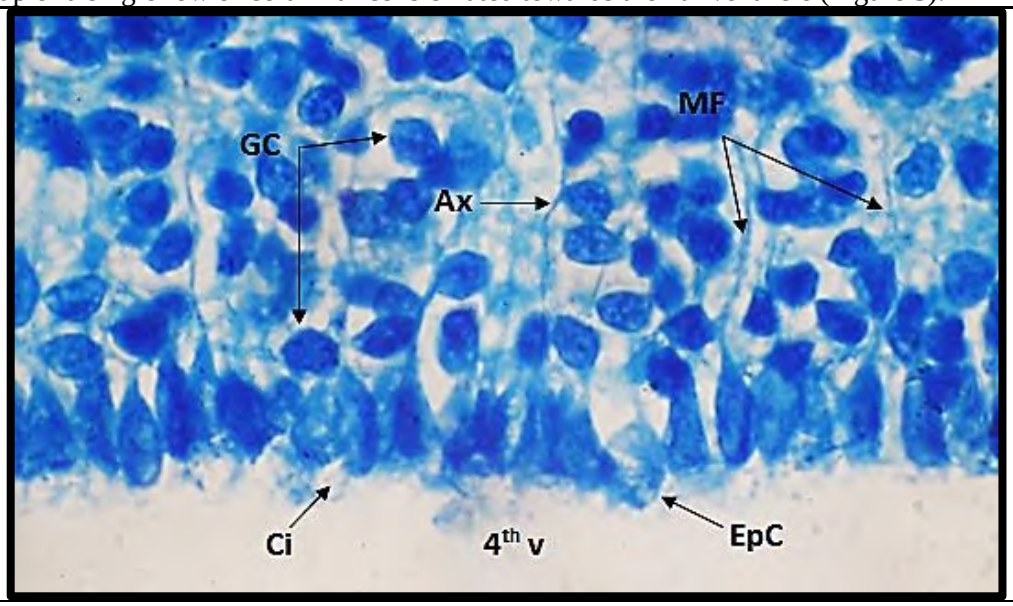

Figure 5. Sagittal section of Iraqi frog's brain passing through the granular layer in the cerebellum. Ependymal cell (EpC), granular cell (GC), mossy fibers (MF), axon (Ax), cilia (Ci),fourth ventricle (4th v), (methylene blue stain 100X).

4. Discussion

In the present result, the cerebellar wall appeared that consisting of three layers, which are from top to bottom: the Molecular layer, the Purkinje cells layer and the Granular layer and this is in agreement with what [3, 4]. In their study of different amphibians as well as similar to what was found in other vertebrates as in the study of [11] in their study on the bird *Coturnix coturnix*. The current result also showed that, the molecular layer represents the outer layer of the cerebellum, and it consists of irregularly scattered neurons such as spherical neurons with an average diameter of (6) µm, and satellite neurons with an average diameter of (4) µm, and spindle neurons with an average diameter of (3) µm .These cells have dendrites and axons that extend towards the purkinje cell layer and intertwine with the dendrites of purkinje cells, and this is consistent with [12] in his study of *Rana esculenta* frog as he indicated that the molecular layer is composed of spherical and pyramidal cells, and astrocytic cells reached (7-13) µm. The molecular layer also contains nerve fibers (climbing fibers), it extends vertically and consists of the extension dendrites of purkinje cells to the surface layer and cell dendrites in the molecular layer, this is consistent with the study of [12] on a group of frogs, *Rana cateshiana*, *Rana pipiens* and *Hyla regilla*. On the other hand, the current result showed that the layer of purkinje cells represents the middle layer of the cerebellum, which is a narrow region located between the outer molecular layer and the inner granular layer, consisting of rows of purkinje cells, characterized by being large cells with an average diameter of (11) µm, characterized by their elliptical

shape. Spherical, containing large nuclei in central location, and this corresponds to[13] as he indicated that purkinje cells are distinguished by their elliptical or pear-shaped shape and have an average diameter of (16) µm in his study on the cerebellum of the frog *Rana esculenta*. The granular layer, it represents the inner layer of the cerebellum, and it consists of dense granular neurons close to each other, small in size, smaller than purkinje cells of a spherical shape with an average diameter of (5) µm and have dense dendritic dendrites that extend their axons towards the molecular layer to the top and then branch to two branches, each opposite in direction to the other, if it extends parallel to the outer surface of the cerebellum forming parallel fibers a bundle of T-shaped. This is consistent with the study of [14] in their study of amphibians that the granular layer consists of small-sized granular cells with a spherical shape with an average diameter of (5-9) µm, and their dendrites and axons extend towards the molecular layer and then branch into two branches each they are opposite to each other, forming a bundle of parallel fibers T-shaped, [15] also indicates the presence of filamentous nerve fibers located between granular cells called mossy fibers, which are intertwined with the granular cells, and this is evident in the present result as well, as the mossy fibers were found intertwined with the granule cells in the form of anastomosis. The function of the moss fiber is that it is one of the incoming fibers that communicate information to the cerebellum [16]. The ependymal cells layer which lies below the granular layer, consists of a single row of ciliated columnar ependymal cells, and this is consistent with what was reported by [17] in their study of the cerebellum in the different species of frogs.

*E-mail: kefahnaser59@yahoo.com

Abstract. The A total of 118 specimens of the mugilid fish *Planiliza abu* (Heckel, 1843) were collected weekly from Al-Graiat region at the Tigris river in Baghdad city, during the period from July 2015-March 2016. In this study, investigated of fish gills of *Planiliza abu* and was noticed of Monogenean *Gyrodactylus hrabei*, Ergens, 1957 and registered for the first time in Iraq. The description and measurements of this parasite as well as its illustrations were given.

Keywords. *Gyrodactylus hrabei, Planiliza abu,* Gyrodactylidae, Tigris river, Iraq.

1. Introduction

The genus *Gyrodactylus nordmann*, 1832 belongs to the family Gyrodactylidae, class Monogenea, of the phylum Platyhelminthes [1]. This genus is one of 23 genera of the family Gyrodactylidae, with 19 viviparous genera and four oviparous genera [2]. Species of this genus have a direct life cycle and the young newborn has several generations of embryos within its uterus in consecutive stages of development. This "Russian-Doll" mode of reproduction, termed hyperviviparity, joined with a fast generation time (< 24hrs at 25°C for the 1st born daughter in some species), can lead to quickened parasite population outgrowth on a single host [3]. This directly transmitted viviparous gyrodactylids have high species richness but low morphological and biodiversity, this group has the broadest host range of any monogenean family, as it is found on 19 orders of bony fishes [4]. The 409 valid *Gyrodactylus* species are reported from about 400 host species from a wide diversity of fish groups [5]. Species of this genus are common ectoparasites of fishes, living on the gills, skin and fins of many of teleost fishes and place in freshwater and brackish and marine environments [6]. In Iraq, the first species of Gyrodactylidae, includes of *G. elegans* was described from gills of both *Cyprinus carpio* and *Planiliza abu* (which was reported as *Liza abu*) [7], Later on, many studies on fish parasites revealed the record of 56 Gyrodactylidae species from different water bodies of Iraq [8]. For this, more studies on parasites of fishes are in need to record further species and to increasing knowledge on the fish parasites of Iraqi freshwater. This paper documents the first record of *Gyrodactylus hrabei*, Ergens, 1957 in Iraq from gills *Planiliza abu* (Heckel, 1843) from the Tigris river at Al-Graiat region in Baghdad city.

2. Materials and Methods

During the period from July-December 2015, a total of 118 specimens of *Planiliza abu* (Heckel, 1843) were collected weekly from Al-Graiat region river at the Tigris in Baghdad city (33° 24' 18' N, 44° 20' 53' E). The fishes were transported alive to the laboratory and were identified according to an account on freshwater fishes of Iraq [9], then freshly examined for ectoparasites. Skin and gill smears prepared and microscopically examined. Care was taken to isolate and flatten the parasite specimens, which were then stained with aqueous neutral red. Permanent smears were prepared with glycerin. Drawings of the sclerotized pieces of the haptor were done by using a Camera Lucida. Parasite identification was performed in accordance [10]. In the current study, all the measurements used in the description of the parasite were mentioned as follows: minimum-maximum (mean) values. Updating the scientific name of fishes based on widely used electronic sites [11]. All recordings of Gyrodactylidae species in fishes of Iraq were reviewed with the index-catalogue of parasites and disease agents of fishes of Iraq [8].

3. Results and Discussion

3.1. Gyrodactylus hrabei Ergens, 1957

This parasite was found in the gills and fins of three out of 118 specimens of the *Planiliza abu* with a percentage of 2.5% and a density of 2.7. In the follows is a concise description and measurements of this parasite (in mm established on four specimens of parasites) as shown in Figure 1.

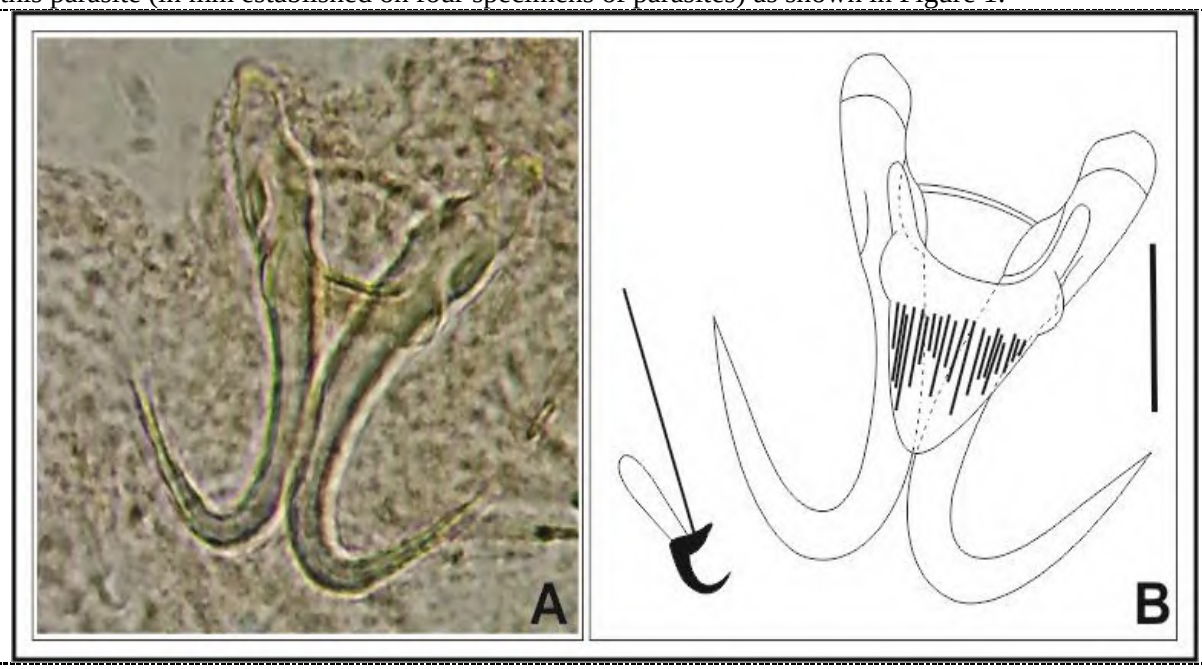

Figure 1. *Gyrodactylus hrabei.*
A- Photomicrograph of the haptor (400x), B- Camera Lucida drawing of the haptor (Scale bar = 0.02 mm)

Body length 0.57-0.61 (0.59). Total length of marginal hooks 0.037-0.04 (0.038), hooklet 0.008. Total length of anchor 0.062-0.068 (0.065), main part 0.044-0.048 (0.046), point 0.031-0.035 (0.033); inner root 0.018-0.022 (0.02). Size of ventral bar 0.008-0.009 (0.0085) x 0.025-0.027 (0.026), membrane 0.018-0.02 (0.019); size of dorsal bar 0.002 x 0.019-0.023 (0.021).
The description and measurements of the present *G. hrabei* are in agree with those reported by [10] from gills of *Cottus gobio* and *C. poecitopus*.

According to the index-catalogue of parasites and disease agents of fishes of Iraq [8], the present record of *G. hrabei* considers the first time in Iraq, as no previous report was given for this parasite in Iraqi fishes. Many species belonging to the genus *Gyrodactylus* were so far recorded from freshwater fishes in Iraq, among which some were reported from *Planiliza abu*. The following report, is the alphabetical arrangement list with the show of only the first registration from *Planiliza abu* for each *Gyrodactylus* species in order to economize space and references: *G. baicalensis* from Tigris river at Al-Rashidia, north of Baghdad [12], *G. cotti* fromTigris River in Baghdad city [13], *G. elegans*: from ponds and in Tigris- Al-Tharthar canal region [7], *G. jalalii* and *G. varicorhini* from Tigris river at Baghdad city [14], *G. markevitschi* and *G. masu* from Tigris river in Al-Kamirah region at north of Baghdad province [15], *G. menschikowi* from Hilla River [16], *G. sprostonae* from Tigris river at Baghdad city [17], *G. tincae* and *G. umbrae* from Euphrates river at Al-Qaim city Al-Anbar Governorate [18], and *G. vicinus* in a man-made lake at Baghdad area [19]. With the current record of *G. hrabei*, the number of *Gyrodactylus* species from Iraqi fishes has so far become 57 species [8] in comparison with 25 *Gyrodactylus* species which were known from fishes of Iraq till 2013 according to [20].

4. Conclusion

The present study revealed the monogenean *Gyrodactylus hrabei*, Ergens, 1957 from gills of mugilid fish *Planiliza abu* (Heckel, 1843) for the first time in Iraq.

5. Acknowledgement

Thanks to Prof. Dr. Furhan T. Mhaisen for his permission to use his index- catalogue of parasites and disease agents of fishes of Iraq to provide us with the information on the previous account records of parasites in Iraq, as well as the data of *Gyrodactylus* species registrations in the fishes at the different parts of Iraq.

A first record of seven species of terrestrial isopoda-crustacea in central Iraq

A first record of seven species of terrestrial isopoda-crustacea in central Iraq

Maysaloon Lafta Al-Doori[1*], Talal Aboud Hansh[1] and Nibrass Lafta Al-Doori[1]

[1]Department of Biology, College of Education for Pure Science (Ibn Al-Haitham), University of Baghdad, Baghdad, Iraq.

*E-mail: maysaloon.l@ihcoedu.uobaghdad.edu.iq

Abstract. This study is the first kind of it in Iraq. The samples were collected from April to Junuary 2018, we recorded seven species for the first time in Iraq (*Procellio laevis*, *P. cingendus*, *Lacasius pallidus*, *Armadillidium album*, *A. assimile*, *Orthodillo chiltoni*, *Cylisticus convexus*). These species belong to four famillies (Procellionidae, Armadillidae, Armadillidae, Cylistieidaeà). The samples were saved in the natural histroy museum in Baghdad-Iraq.

Keywords. Isopoda, Porcellionidae, Armadillidae, Armadillidae, Cytisticidae.

1. Introduction

There are about 3000 species recorded of terrestrial isopoda belong to 18 families in the world [1]. The isopoda vary in size, it ranges from 0.3-50 cm [2], at the end of its body there is a telson which varies in size and form between species. In addition there are the uropods which used to distinguish between types, and an essential characteristics of classification of them are long and concile such *Porcellides*, other are short, truncated or similar of hounglass like *Armadillidium* [3]. The color of the isopoda varies from white to grey [4], some are red, green or brown, depending on the type of feeding [5]. It's study is important because of its role in the food chain in stimulating the soil [6].

2. Materials and Methods

Central Iraq has been identified for this study, it included specific areas that were distinguished by their geographical nature, as they varied between agricultural, gardens and residential areas (Figure 1). 560 samples were collected for the period (April to Junuary 2018) from various places on the surface of the soil and under it to a depth of 6 cm and between trees, weeds, dead decomposing plants, fresh fruits and cracks of buildings randomly. The samples were collected manually, then isolated and then stored in 70% ethanol [7] in the laboratory. The samples were identified by using a dissecting microscope 1x and 2x . A phone camera Galaxy note 5 was using to photographed., Identification of isopods species were done on the basis of their morphological characters by using taxonomic keys available in the local and regional publications [8, 9, 10, 11, 12, 13].

Figure 1. A map showing the study areas in Iraq.

3. Results and Discussion

This Samples were diagnosed using some distinct parts of the isopods body, included the difference in the thoracic region and distribution of the ocelli, the frontal lobes of the head, the shape of the endo and exopod and the difference of the telson. The recorded species were distinguished in lengths from 4 to 17 mm. Seven species of four families were diagnosed which were:

3.1. Family: Procellionidae (Brandl, 1831)

The outline of its body in cross section not strongly arched, then the flagella of antennae two sections, we found three species as first record in Iraq which were:

3.1.1. Procellio laevis (Latreille, 1804).

Its mean length was 17 mm and dark grey with brown spots in color (Figure 2-a), cephalothorax with three lobs, black eyes with 18 ocelli. The dorsal surface is smooth and the posterior edge of the pereonite is convex (Figure 2-b). The edge of pereon straight with poleon, the exopod was spear-shaped (Figure 2-c (A, B)), this compatible with [14, 15].

3.1.2. Procellionides cingendus (Kinahan, 1857).

Its mean length was 7 mm, reddish brown with yellow spots in color (Figure 3-a), cephalothorax was small and not convex, large eyes with 32 ocelli and without lobes (Figure 3-b). The edge of peleon narrower than edge of pereon, exopod is long and thin and the uropod was small not tapered (Plat2-c). it was observed that this diagnosis is appropriate with [16].

3.1.3. Lucasius pallidus(Budde-Lund, 1885).

Its mean length was 8 mm, it's color is bright orange with white short tentacle (Figure 4-a). The cephalothorax is small in size without lobes and triangular, small black eyes (Figure 4-b). The endopod and exopod are small white the telson was distinguished by its wide and triangular basal (Figure 4-c (A, B)). The results of this study were consistent with the diagnostic samples in Australia [17].

Figure 3. *Procellionides cingendus* (a-The mean length (mm), b-The cephalothorax, c-The pelean and pereon not straited, the uropod and telson).

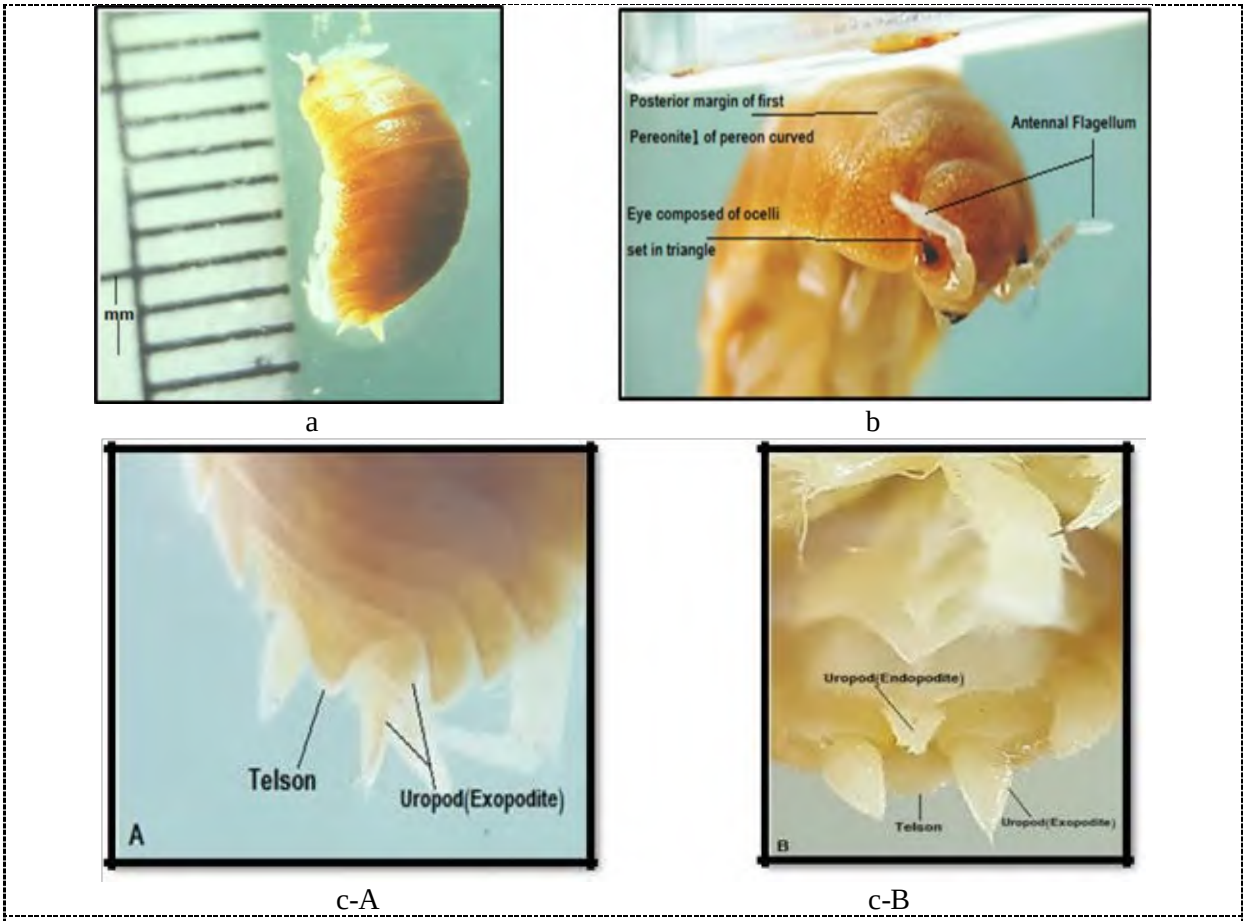

Figure 4. *Lucusius pallidus* (a-The mean length (mm), b-The cephalothorax, c-A-A dorsal veiw of the uropod and telson, c-B- A ventral veiw of uropod and telson).

3.2. Family: Armadillididae (Brandt, 1833).

It control itself into a ball, we found two species as a new record in Iraq it was:

3.2.1. Aramadillidium album (Dollfus, 1887).

It is pale sand with yellow spots in color, the mean length was 4 mm, with small spines on the dorsal surface and it roll into a not completely ball (Plate 5-a (A, B)). The cephalothorax was small not lobeded with small eyes consisting 9 ocilli (Plate 5-b). The exopod was truncated and the endopod was very small than telson is flat and curved (Plate 5-c (A, B)). So [18] has demonstrated the same characteristics to the species.

3.2.2. Aramadillidium assimile (Budde-Lund, 1885).

It's mean length 6 mm, brown in color with yellow anterior region (Plate 6-a). small oval cephalothorax with small eyes consisting 12 ocilli (Plate 6-b) its fifth peleon with keel, and the edge peleon narrower than pereon (Plate 6-c). The exopod was wide, the endopod was small narrow and the telson was wide triangular (Plate 6-d). It was noted that this study was similar to other studies in U.K [19].

3.3. Family: Armadillidae (Brandt, 1831).

This family is distinguished by its rough surface, the uropods was small and the telson hour-glass shaped [20], there was one species as a first record in Iraq which was:

3.3.1. Orthdillo chiltoni (Vandel, 1973).

It's mean length was 15 mm, dark grey in color (Plate 7-a), the cephalothorax was small with black eyes consisting 10 ocilli (Plate 7-b), the exopod was square shape and the endopod was small and cylindrical than the telson quad-angle and it's holy edge was hour-glass shaped (Plate 7-c (A, B)). This results came compatible with the results of [21].

Figure 7. *Orthodillo chiltoni* (a-The mean length, b-The cephalothorax, c-A, B: The dorsal and ventral veiw of uropod and telson).

3.4. Family: Cylisticidae (Verthaff, 1949).

This family has distinguished by its curry surface, we found one species as a first record in Iraq which was:

3.4.1. Cylisticus convexus (DeGeer, 1778).

It's mean length was 17 mm, and dark brown in color (Plate 8-a), the cephalothorax with three lobs, dark grey eyes with 22 ocilli a,d long antenna (Plate 8-b). The edge of peleon very narrower than the edge of pereon (Plate 8-c). The exopod was large and long while the endopod was small and the telson was square in shape (Plate 8-d).This study is the similar with [22].

Abstract. SARS-COV-2 virus is one of the fastest spreading viruses targeting the respiratory and other system in the body. Therefore, it is necessary to emphasize the needs for preventive measures, particularly at the moment because the virus is spreading fast in various parts of the world, causing various levels of infections: medium to severe, and fatal. The study aimed at assessing health and environmental awareness apart from correcting some scientific healthy concepts related to COVID-19. Additionally, this study also attempted to spread awareness in a simple way that simulates all levels of society. The current study focused on Iraq, specifically Al-Anbar governorate, as it is free from COVID-19 infections according to the reports of the Iraqi Ministry of Health in cooperation with the WHO. In this study, a set of electronic questionnaire was selected to collect relevant data. The electronic questionnaire was chosen because of the quarantine order by the authority due to the COVID-19. The items were built based on a variety of health, preventive, and environmental scientific questions and it was electronically distributed to 2084 individuals in Governorate. The findings revealed that Ramadi city had the most participants responding to the questionnaire (47%). The participation rate for female was 52% while the rate for male is 48%. The biggest age group was 20-24 years old and the highest academic background was a bachelor's degree in education. The findings indicated a good percentage of health awareness among the participants in the governorate emphasizing on health instructions and preventive measures taken by the Crisis Cell, which had an important role in being infectious-free during the period. It is summarized that the level of health awareness and the role of the Crisis Cell: worked together COVID-19 the infection. Additionally, this questionnaire had a great role in correcting some understanding of scientific concepts among the public. .

Keywords. Awareness, COVID-19, Crisis Cell, Health, Prevention.

1. Introduction

Coronavirus (CoVs) is a form of single-stranded RNA viruses that can infect peoples and animals, causing respiratory, other diseases of which gastrointestinal, hepatic, and neurologic diseases. [1]. As

large family known RNA viruses, coronavirus are further divided into genera: alpha-coronavirus, beta coronavirus, gamma-coronavirus, and delta coronavirus [2]. As well, (CoVs) are the largest of respiratory viruses that can cause mild to moderate diseases, ranging from the common cold to severe respiratory syndromes [3]. COVID-19 disease is an infectious disease caused by the newly discovered coronavirus. The most common symptoms of COVID-19 disease are fever, fatigue, and dry cough. Some patients may experience pain and aches, nasal congestion, cold, sore throat, or diarrhea. These symptoms are usually mild and begin gradually. Some people become infected without showing any symptoms and without feeling ill. Most people (about 80%) recover from the disease without the needs for special treatment [4]. Also, the severity of the disease intensifies in approximately one person out of every six people who develop COVID-19 infection, who suffer from difficulty breathing. The risk of the elderly and people with underlying medical problems such as high blood pressure, heart disease, or diabetes are severe. About 2% of people who have contracted the disease have died. People with fever, cough, and breathing difficulty should seek medical care. The disease can be transmitted from a person to a person through small droplets scattered from a nose or mouth when a person with COVID-19 disease coughs or sneezes. These droplets fall on the objects and surfaces surrounding the person. Other people can then develop COVID-19 disease when they are exposed to these objects or surfaces and then touch their eyes, nose, or mouth. People can also get COVID-19 disease if they breathe droplets that come out of the person with the disease with a cough or exhale. Therefore, it is important to stay away from a sick person more than one meter (3 feet) [4]. In December 2019, an outbreak of pneumonia due to unknown cause occurred in Wuhan, China and rapidly spread throughout the country within 1 month. Coronavirus disease 2019 (COVID-19) is an announced universal pandemic, by a WHO on 30 January 2020 [5]. It then resulted in a challenging outbreaks in many regions in China and expanding globally [6]. Serious pandemic continues to progress until most invaded the world, reaching Iraq, recorded the first case with COVID-19 in late February in Baghdad [7]. The incidence started to increase, reaching 1,400 COVID-19 cases by mid-April according to Iraqi Ministry of Health. The highest incidences were in the southern governorates of Iraq, for example, Basra, Najaf, and Karbala, as well as the northern governorates such as Erbil and Sulaymaniyah. The number of incidence in the middle governorates was very few, such as Anbar, Nineveh, and Salah Uddin, compared to other governorates according to the Iraqi Ministry of Health. Al-Anbar Governorate is the largest governorate of Iraq, with an area equivalent to a third of the country's area, with an area of 138,500 square kilometers, and a total population of 1,818,318 people (2019 census) according to the yearly report of the Planning Directorate in Anbar Governorate. It is a border to the north by Salah al-Din and Nineveh governorates, to the northwest by Syria, to the west by Jordan, to the east by the Baghdad governorate, to the south by Saudi Arabia, and the southeast by governorates of Karbala and Najaf. It is worth mentioning that the Anbar Governorate did not record COVID-19 incidence except for two cases according to the Iraqi Ministry of Health. This study aimed to assess health awareness and investigate the extent to which citizens in Anbar Governorate have absorbed this serious pandemic, invading most of the countries in the world and claimed the lives of many people in various regions in very short periods. However, the issue cannot be compared to a similar pandemic in previous periods. It is stressed that this study did not have the intention to spread fear among people and curb their hopes for recovery, but rather to show the reality of seriousness and ways to survive from this pandemic. The effective role of the Crisis Cell (Al-Anbar Governorate) was also highlighted to face this disease, especially referring to the decisions taken by the Iraqi Government generally and Al-Anbar Governorate particularly as a distinct role in the non-expansion for the disease among the citizen. Besides, it aimed to investigate the requirements that must be provided to citizens by the Crisis Cell in terms of health and services during this period, which contributed to overcoming this dangerous stage.

2. Materials and Methods

The responses from the questionnaire were received from April 8 to April 20, 2020 during the quarantine period in the Al-Anbar Governorate. This period was chosen because it is considered the most appropriate time for people to sit at homes, thus, this condition resulted in a large number of participants. A large number of participants are an advantage for this study to build their health awareness and to correct misconceptions of some people about COVID-19. The research team decided to collect the data online: the questions was developed through a Google Form and sent to a large number of residents in cities of Al-Anbar through the social media such as WhatsApp, Viber, Messenger, and others [8]. The questionnaire was followed by an explanation on objectives of the questionnaire and also an instruction on responding to the items based on their beliefs which they feel appropriate. The participants were residents of Al-Anbar province aged 20 years and above who agreed to participate and were instructed to complete the questionnaire by clicking the provided link. The approval in distributing the questionnaire was obtained from the President of the Crisis in Al-Anbar Governorate. The questionnaire was designed to investigate the demographic details and evaluation of health awareness among the participants. The questionnaire consisted of several parts. The first part includes demographic details: place of current residence, gender, age, education [9] as illustrated in Table 1.

Table 1. Demographic details of the participants

No.	Demographic details	Options		
1	**Place of residence**	Ramadi	Fallujah	Haditha
		Khalidiya	Aana	Rawah
		Heet	Ratba	Qaam
2	**Gender**	Male		Female
3	**Select your age group**	20-24	25-29	30-34
		35-39	40-44	45-49
		50-54	55-59	+60
4	**Education**	Master’s degree and above		
		Bachelor's degree		
		Diploma degree		
		Middle school and below		
		I did not get a degree but read and write		

The second part consisted of seven questions about the coronavirus: its existence, origin, methods of spreading, assessing health awareness, and the role of environmental pollution in addition to other questions related to the virus SARS-CoV-2. The third part investigated the participants’ views on assessing health awareness and ways to prevent COVID-19 and the role of the Crisis Cell in the province in controlling the disease in addition to health and services provided to the citizens. The last part consisted of an assessment of health awareness about how to curb COVID-19 in the society, as well as how those who had recovered from COVID-19 joined into the society again. More than one correct answer was discovered from the responses; however, there was more correct answer, as well as incorrect answers. Rates were used to present the correct answers and various practices. The results from the questionnaire were presented through percentages in terms of knowledge scores, attitudes and practices of the participants according to the level of health awareness among them. In addition, the demographic details were independent variables and knowledge score as the outcome variable. These were conducted to identify factors associated with knowledge.

3. Results and Discussion

There were 2084 participants in this study who came from different cities in the Governorate of Anbar and were divided according to their approximate ratio from high to low. Where Ramadi was the largest number of respondents participating in the questionnaire with 47%, and then followed by the

city of Fallujah (21.1%), Haditha (11.9%), Khalidiyah (7%), Heet (6.8%), Al Qaam (1.9%), while the rest of the cities was 1% and less. The female participation rate was 52%, while the male participation was 48%.The percentages of age groups were 38.6%, 16.7%, 14.7%, 9.3%, 9.0%, 4.8%, 3.8%, 1.3% and 1.7 for age groups of 20-24, 25-29, 30-34, 35-39, 40-44, 45-49, 50-54, 55-59 and 60 above respectively. As for the level of education, the percentages were 17.6%, 54.8%, 21.6%, 5.3% and 0.7% master's degree and above, Bachelor's degree, diploma degree, Middle school and below, and I did not get a degree but read and write, respectively. All the demographic details are illustrated in Table 2.

Table 2. Demographic details of the questionnaire.

No.	Demographic details	Options	Number of participants	Percentage %
1	**Place of living**	Ramadi	985	47.3
		Fallujah	440	21.1
		Khalidiya	145	7
		Heet	142	6.8
		Haditha	249	11.9
		Aana	33	1.6
		Rawah	24	1.2
		Qaam	41	1.9
		Ratba	25	1.2
2	**Gender**	Male	1006	48.3
		Female	1078	51.7
3	**Age group**	20-24	804	38.6
		25-29	348	16.7
		30-34	307	14.7
		35-39	194	9.3
		40-44	188	9
		45-49	100	4.8
		50-54	80	3.8
		55-59	27	1.3
		60+	36	1.7
4	**Education**	Master's degree and above	367	17.6
		Bachelor's degree	1141	54.8
		Diploma degree	450	21.6
		Middle school and below	111	5.3
		I did not get a degree but read and write	15	0.7

In this part, the results of the questionnaire on evaluating health and environmental awareness of the community in Anbar Governorate were presented based on the responses to each item in the questionnaire.

3.1. Item 1: Do you think there is a disease called COVID-19 (or locally called the Corona) caused by a type of corona virus?

Based on the analysis, 68% of the respondents chose (A) Yes, there is a reasoned virus COVID-19 according to reports by WHO, which confirms this [10]. This is the most correct answer if compared

to answers to others. While 10% of the respondents chose (B) I think it is a way to control and fabricate the global economic crises, followed by 6% who chose (C) Do not think a virus but the sarin gas according to what is circulating in social media [11]. Next, is followed by 7% who chose (D) I think it is simpler than that because its symptoms are somewhat similar to flu, I do not think it is so scary [12]. While the last choice indicated 9% who chose (E) I do not know. These findings are illustrated in Figure 1.

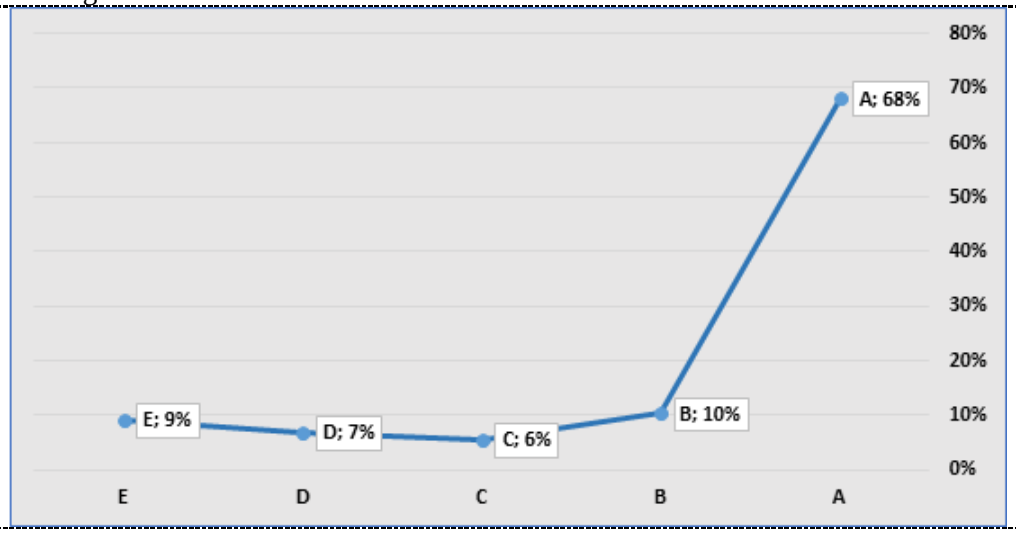

Figure 1. Findings for Item 1: Do you think there is a disease called COVID-19 (or locally called the Corona) caused by a type of corona virus?

3.2. Item 2: How do you rate your knowledge about viruses in terms of infection and prevention methods and others?

There are four options of answers the participants can choose for their respond. Based on the findings, it revealed that 30% of the respondents chose (A) excellent through published scientific research and reports WHO while 30% chose (B) very well through the instructions posted by the Crisis Cell on governorate. In addition 25% of the respondents chose (C) good through reports on social media and finally 10% of the respondents chose (D) I have no interest in the subject. This findings indicated a danger to the society because they are lack of interest in personal protective methods against COVID-19.

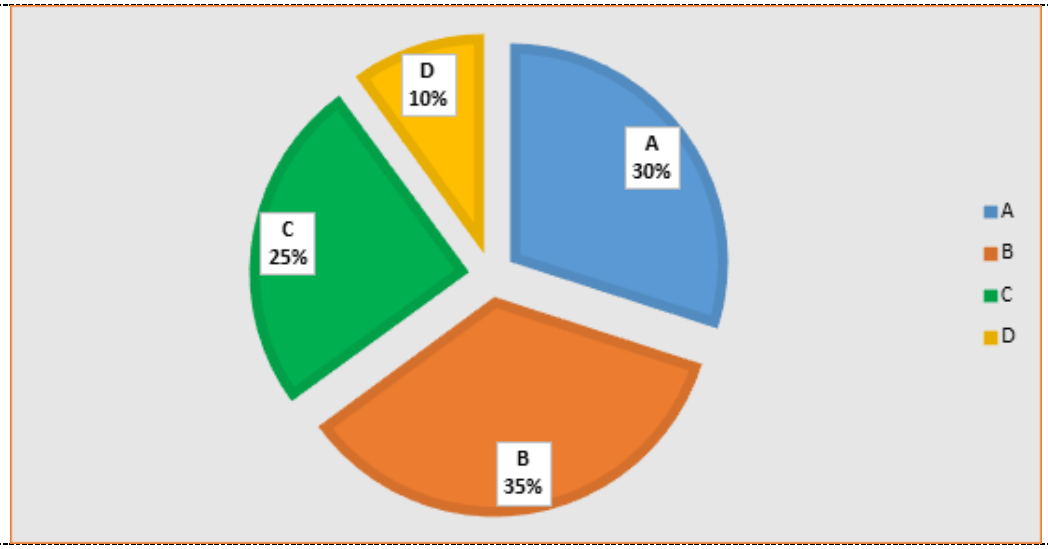

Figure 2. Findings for Item 2: How do you rate your knowledge about viruses in terms of infection and prevention methods and others?

3.3. Item 3: What distinguishes the SARS-CoV-2 causing COVID-19 from other viruses?

According to the findings, 59% of the respondents chose (A) Rapid spread in societies, this answer was considered correct because since the outbreak of the disease in late December 2019 till the present time, according to the reports of the World Health Organization, the infection has reach 3 million worldwide [13]. While 10% chose (B) Style of infection through the respiratory tract. This answer is considered correct as it indicates that the virus is characterized by a respiratory infection. However, a new study showed that the virus infects blood hemoglobin and reduces its efficiency in carrying oxygen and carbon dioxide [14]. This is followed by options (C), (D), and (F) which obtained 6% respectively. The choice of (C) Multiple strains and mutations of the virus is considered correct because the statement is proven by studies on the virus [12]. However, it is not considered a characteristic because most viruses have this characteristic. This is followed by choice (D) The number of deaths caused by the virus, which this is also not a distinctive characteristic due to the fact that the number of deaths does not exceed 3%, according to the statistics of the WHO [13]. As for option (F) I did not know what distinguishes this virus, 6% of the respondents had chosen this option. Finally, as for option (E) few studies are available on the virus, 12% of the respondents chose this option, thus this answer is considered an incorrect answer because there are thousands of studies on this pandemic. The findings are illustrated in Figure 3..

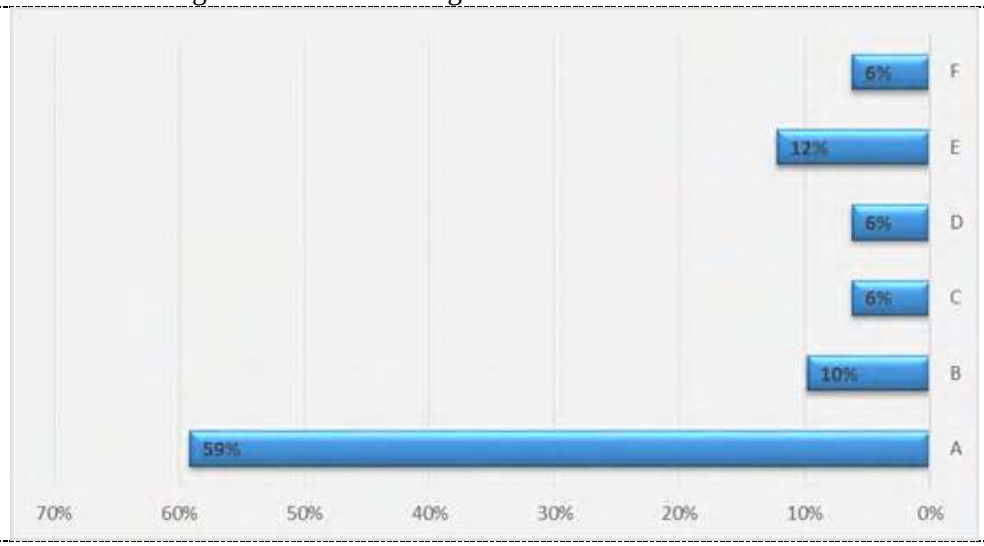

Figure 3. Findings for Item 3: What distinguishes the SARS-CoV-2 causing COVID-19 from other viruses?

3.4. Item 4: So far, no treatment or vaccine has been found against the disease. What do you think are the methods that increase your body's immunity against COVID-19 disease?

Based on the analysis of the questionnaire data, foods rich in vitamins A, C, E, B6 and B12, zinc, and iron such as citrus fruits, dark green leafy vegetables, nuts, and dairy products were some of the responses given by the participants [15]. From the findings, evidence showed that there is a 12% overall protective effect of vitamin D supplements against bacterial and viral acute respiratory tract infection. In addition, vitamin C (L-ascorbic acid) has a pleiotropic physiological role, and there is evidence supporting the protective effect of high dose intravenous vitamin C against COVID-19 [16]. Maintain a healthy lifestyle by exercising (home-exercises), regular sleep and meditation and avoid

smoking, alcohol, and drugs [15] but high-intensity exercises probably due to the production of oxidants and suppression of the immune system may be dangerous, however, it helps to exacerbate the COVID-19 virus. It means that moderate-intensity exercise should be recommended as a non-pharmacological, inexpensive, and viable way to cope with the COVID-19 virus [17]. This COVID-19 epidemic has aroused an increasing attention worldwide. Patients, health professionals, and the public are under insurmountable psychological pressure, which may lead to various psychological problems, such as anxiety, fear, depression, and insomnia. Psychological crisis intervention plays a pivotal role in the overall deployment of the disease control. In addition, awareness regarding the devastating consequences of hoarding and panic buy should be spread in the community [18]. The item consists of two correct options (A) Through exercise sport, healthy nutrition, and mental health and (B) may be by using some vitamins that increase my immunity. This is followed by the third options (C) that contains the previous two options which obtained 90% compared to the other first two options. Finally, option (D) I have obstacles that prevent me from changing my lifestyle, and so I do not think as affecting which is the wrong answer, and therefore resulted in only 10% of the overall percentage. These findings are shown in Figure 4.

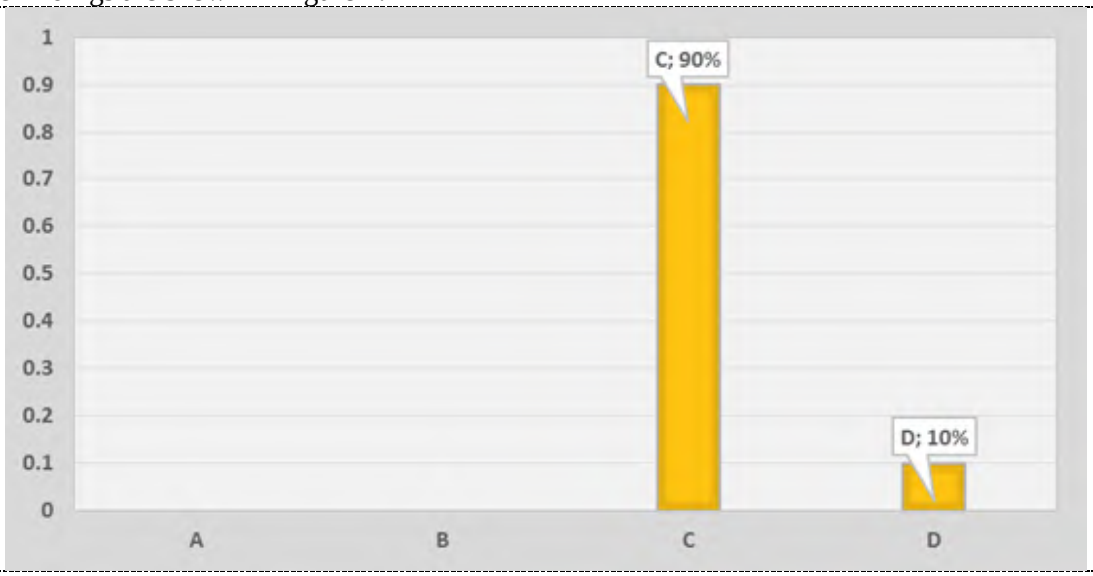

Figure 4. Findings for Item 4: So far, no treatment or vaccine has been found against the disease. What do you think are the methods that increase your body's immunity against COVID-19 disease?

3.5. Item 5: In light of the advanced scientific capabilities, why have not been reached so far as a treatment or vaccine for COVID-19 disease?

The first three options for Item 5 were considered wrong or not yet proven. From the options provided, option (A) Difficulty dealing with this type of virus due to its dangers obtained 22% from the overall response. As for option (B) This is a virus genetically modified and has many mutations, the findings indicated 20% of the response rate by the respondents. This is followed by option (C) Failure to unify efforts and consider the matter materially which obtained 7%. The current COVID-19 pandemic is an international public health problem. There have been rapid advances in what we know about the pathogen, how it infects cells and causes disease and clinical characteristics of the disease due to the rapid transmission around the world [19].As for option (D) the rapid spread led to the dispersion of efforts between researches and redress health reality, the findings indicated that this option obtained 26% of response rate. Currently, there is not sufficient evidence that any existing antiviral drugs can efficiently treat COVID-19 pneumonia. In addition, the vaccines and therapeutic antibodies aimed to specifically target SARS-CoV-2 are also being tested; this solution is more long-term, as they require

thorough testing of their safety [20]. This is similar to option (E) the topic needs time to ensure the safety and security of the treatment or vaccine which obtained 25% of the response rate. These findings are shown in Figure 5.

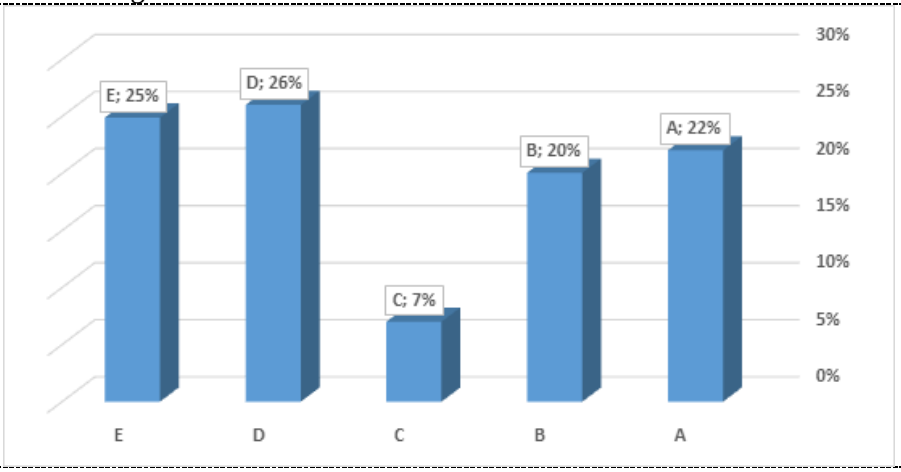

Figure 5. Findings for Item 5: In light of the advanced scientific capabilities, why have not been reached so far as a treatment or vaccine for COVID-19 disease?

3.6. Item 6: One of the theories of the emergence of viruses due to environmental pollution. Do you think that environmental pollution has a role in the emergence of viruses?

One theory hypothesizes that viruses arose from circular DNA (also called a plasmid) that can replicate independently and move between cells, transferring genetic information from one organism to another. For example, some plasmids carry the genes responsible for antibiotic drug resistance. According to this theory, the plasmid escapes from cells and evolves in a way that allows it to enter another cell to produce viruses. Another theory suggests that viruses could have evolved from more complex free-living organisms, such as bacteria or cells. A recent study showed that a protein called ARC that is important for memory in humans could form virus-like particles and transfer RNA between cells. In all cases, environmental pollution contributes significantly to the emergence of viruses [21]. This is somewhat similar to option (A) Yes, a belief that it contributes significantly to the emergence of viruses, which received 36% of the response rate. This is followed by option (B) I do not think that environmental pollution cause it with 20% response rate, option (C) I think this virus is laboratory-produced which suggests the conspiracy theory circulated in various media outlets and obtained 35% response rate, and the final option (D) I do not know obtained 9% response rate. These findings are shown in Figure 6.

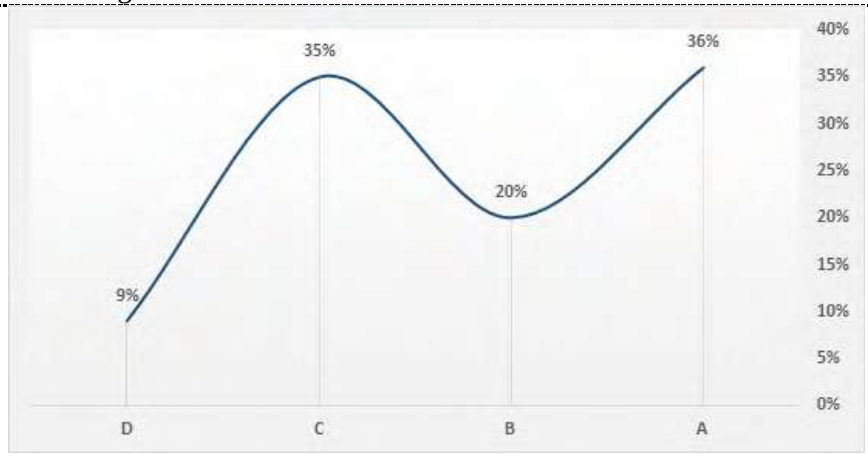

Figure 6. Findings for Item 6: One of the theories of the emergence of viruses due to environmental pollution. Do you think that environmental pollution has a role in the emergence of viruses?

3.7. Item 7: In your opinion, what are the most important ways to spread the virus in societies?

According to WHO Guidance, it is suggested to maintain at least 1-meter distance between two people. When someone coughs, sneezes, or speaks he or she sprays small liquid droplets from their nose or mouth which may contain viruses. If a person is too close to someone else, he or she can breathe in the droplets, including the COVID-19 virus if the person has the disease because it is considered the primary method of virus infection. From the analysis of Item 7, option (A) Through flying drizzle from coughing and sneezing of a person with COVID-19 obtained 55% response rate [4]. Likewise, WHO considers option (B) touching surfaces, food, or commercial goods contaminated with the virus to be correct and obtained 20% response rate. It can be considered as a correct answer if it is assumed that a person sneezes or coughs on certain surfaces that may be touched by a healthy person and then places his hand on his mouth, nose, or eye [4]. As for option (C) studies are indicating that animals a role has been of Virus transport, the findings indicated that this option obtained 7% response rate where bats harbor viruses including sars-COV-2. In some circumstances, facilitating spillover happens which includes direct contact with bats (bites, scratches, consumption of bats), contact with materials contaminated by bat saliva, feces or urine, and amplification via intermediate hosts such as domestic animals or other wildlife species. Due to this reasons, a person must stay away from bats to reduce the transmission risk of viruses from bats to humans and livestock [22, 23]. The last option (D) overpopulation, received 18% response rate. This indicated that a person must avoid going to crowded and overpopulation places because when people are together in crowds, they are more likely to come into close contact with someone who has COVID-19 and it is more difficult to maintain a physical distance of 1 meter, thus, this has been confirmed by the World Health Organization [4]. The findings for Item 7 is illustrated in Figure 7.

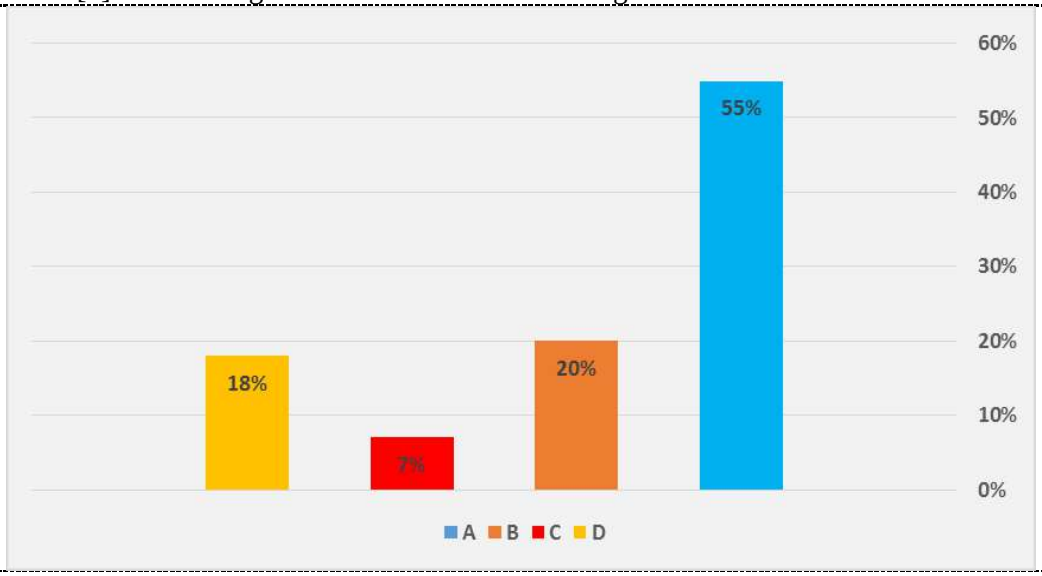

Figure 7. Findings for Item 7: In your opinion, what are the most important ways to spread the virus in societies?

3.8. Item 8: WHO urges to stay at home, not go out except when necessary, follow good hygiene practices, practice social spacing, and take preventive measures such as wearing masks and gloves to reduce the spread of COVID-19, do you follow these procedures?

Findings for Item 8 revealed that 67% of the respondents chose option (A) I apply it at all times to protect the community and myself, and this is evident as what was observed in the cities of Al-Anbar Governorate who applied the procedures of the home quarantine approved by the Crisis Cell in the Governorate. Nevertheless, option (B) I am committed to staying at home, but sometimes when I leave the house cannot apply precautions obtained 21% response rate. This is considered an incorrect answer because it is a failure not to apply preventive measures that are not available continuously during this period and their prices are high. In addition, option (C) I Apply it well but I cannot stay home is considered valid because this is the same for some categories of employees if he applies the preventive measures recommended by the WHO [24] and this option obtained 8% response rate. As for the final option (D) I do not expect these measures to work, this option is considered a wrong choice and obtained only 4% due to community fear of COVID-19 infections. The findings are shown in Figure 8.

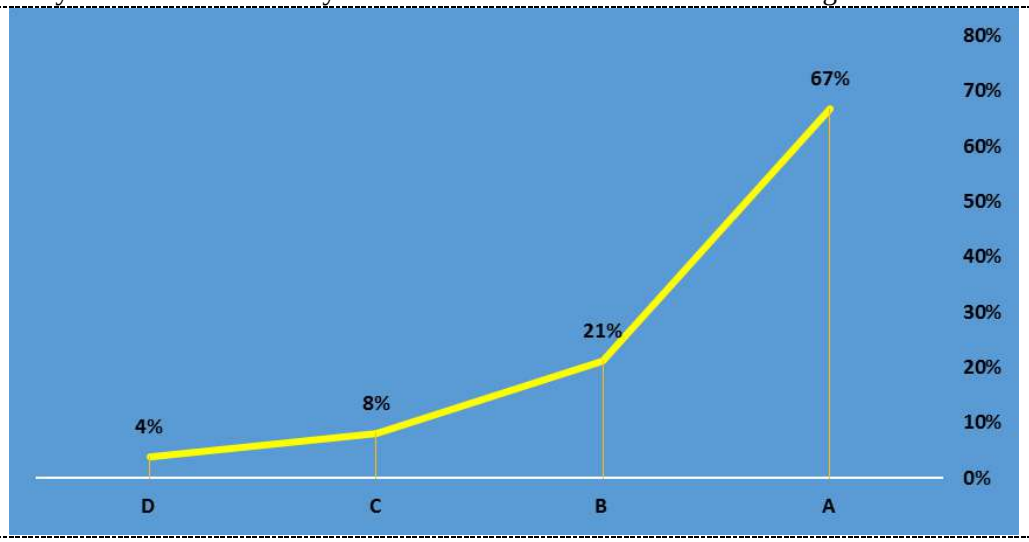

Figure 8. Findings for Item 8: WHO urges to stay at home, not go out except when necessary, follow good hygiene practices, practice social spacing, and take preventive measures such as wearing masks and gloves to reduce the spread of COVID-19, do you follow these procedures?

3.9. Item 9: At this difficult time, Iraq is going through in general and Anbar Governorate in particular because of the spread of COVID-19. What aspects do you think need to be strengthened during this period in the al Anbar governorate inside the health aspect?

In this period, some of the options which can be done in combating COVID-19 are increase sterilization, spread health awareness in the community about methods of prevention from COVID-19, as well as establish quarantine places and examine samples. As for the options for Item 9, option (A) By increasing the sterilization and fumigation processes for institutions health, streets, and methods of basic preventive e obtained 42% response rate. In addition, option (B) By spreading community health awareness around methods infection, disease prevention, and others obtained 26% of response rate, followed by option (C) Create more places of quarantine and examine the samples inside the governorate which obtained 4% of the response rate. Based on the correct options mentioned, the total response rate was 72%. As far as the incorrect options are concerned, option (D) Perform a field examination of all the regions of the governorate to ensure that they are free from the incidence of COVID-19 obtained 20% of the response rate because there is no record of cases in the governorate. This is followed by option (E) Providing mobile ambulances in the governorate areas for helping citizens who are unable to reach hospitals which obtained 8% because of our needs to have all health personal and medical equipment to fight COVID-19. The findings are shown in Figure 9.

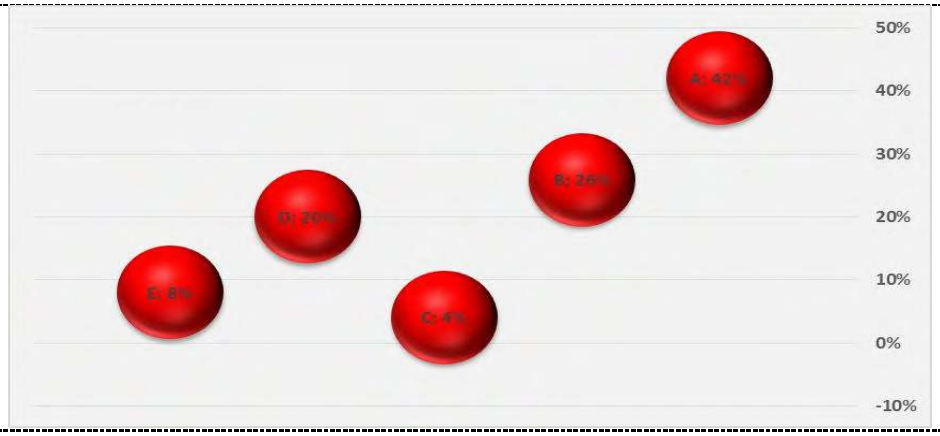

Figure 9. Findings for Item 9: At this difficult time, Iraq is going through in general and Anbar Governorate in particular because of the spread of COVID-19. What aspects do you think need to be strengthened during this period in the al Anbar governorate inside the health aspect?

3.10. Item 10: What do you think of the Crisis Cell in the Al Anbar governorate in terms of security and service, and what aspects need to be strengthened during this period?

From the analysis, 76% of the participants chose option (A) Preventing the entry of expatriates to the governorate except after making sure of their safety from an incidence of COVID-19 no matter how important. This option obtained the highest percentage because all the recorded cases in the governorate were imported cases which may cause an epidemic in the governorate. Therefore, all expatriates must be ensured to be free from the disease in order to make sure of their safety from COVID-19. As for option (B) Sterilization and fumigation of all goods and foodstuffs entering into governorate, it obtained 5%. This option is correct, however, it is less important than option (A). Based on this findings, the correct choices for Item 9 obtained a total of 81% response rate. Referring to the wrong choices, the total percentage is 19%. This findings included option (C) Providing the necessary services that the citizen needs, for example, electricity, the Internet, and others which obtained 2%; having services is one of the essential things in life, not just in times of crisis. This is followed by option (D) Open the ban is partially for helping the citizen to fetch his needs, especially after the end of the official working hours with 7% response rate; this option is unnecessary because the crisis cell allowed the opening of food stores and pharmacies to provide people with their basic needs. Finally was option (E) Providing the necessary foodstuffs to the low-income individuals during this period which obtained 10% response rate. The findings for Item 9 are illustrated in Figure 10.

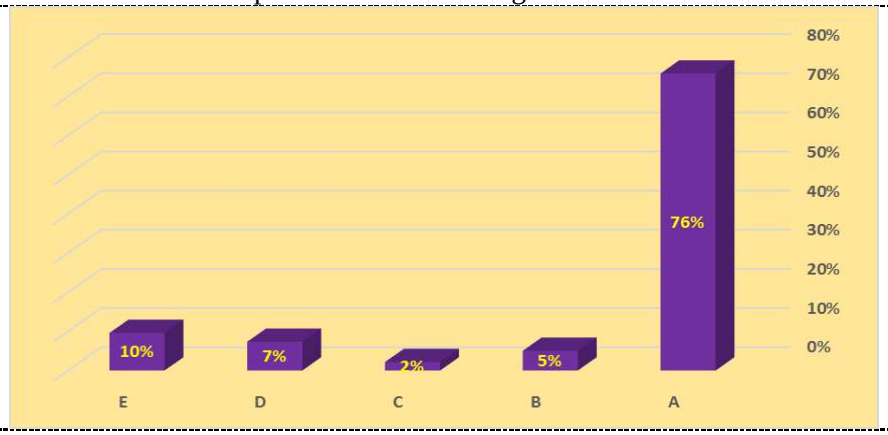

Figure 10. Findings for Item 10: What do you think of the crisis cell in the Al Anbar governorate in terms of security and service, and what aspects need to be strengthened during this period?

3.11. Item 11: Will the Crisis Cell in Anbar Governorate succeed in overcoming the COVID-19 crisis by keeping the province free of casualties?

Based on the analysis, 80% of the respondents in the cities of Al-Anbar province trust the work of the Crisis Cell by applying the preventive measures recommended by the WHO [4] by selecting option (A) yes, by implementing preventive measures for the Crisis Cell in Al-Anbar Governorate and thus constitutes a kind of healthy cultural awareness to overcome the COVID-19 crisis. While option (B) Perhaps there will be no the infection of COVID-19 in the governorate, but I am not sure about the work of the Crisis Cell obtained 13% response rate, and the reason is due to unavailability of some preventive and hygienic supplies in the world in general [25]. While option (C) I do not expect its success and often infection of COVID-19 will occur in the future obtained 5% response rate due to the two new cases; it was found that the person had COVID-19 and the Crisis Cell sent the person to their governorate for further action. As for the last option (D) thinks they do not care about the success or failure of the Crisis Cell the findings indicated 2% response rate. It is considered as a negative view and lack of awareness. The findings are shown in Figure 11.

Figure 11. Findings for Item 11: Will the crisis cell in Anbar Governorate succeed in overcoming the COVID-19 crisis by keeping the province free of casualties?

3.12. Item 12: When reading health reports about COVID-19, how would you rate the health status of any community?

From the analysis of Item 12, option (A) according to the number of registered epidemic infections obtained 60% response rate, this referred to the WHO recorded cases according to its latest report on April 30, 2020, in which the number of infections reached more than 3 million [26]. This is the correct option in which the health situation in the world is assessed, and for Al-Anbar Governorate, the number of infections in Al-Anbar did not exceed five cases since the first infection recorded in Iraq. As for the remaining options, they were considered wrong because the WHO has yet to find an approved treatment from this pandemic and always the right choice. The society can be protected by not recording through cases of the disease [4]. As for the remaining options, option (B) according to the number of deaths recorded obtained 10%; through it the quality of health care can be assessed and the only case remained in the isolation hospital in the governorate was cured. As for option (C) according to cases of recovery from illness, it obtained 21% response rate. In addition, option (D) I don't know obtained 9% response rate. Therefore, the society needs to be educated more about protecting themselves from the COVID-19 pandemic. The analysis of the findings is shown in Figure 12.

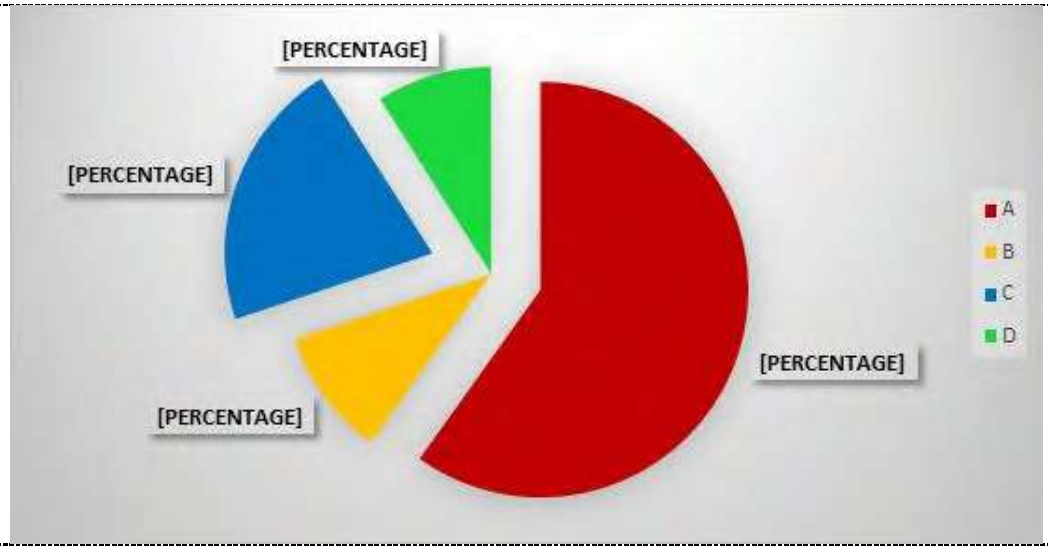

Figure 12. Findings for Item 12: When reading health reports about COVID-19, how would you rate the health status of any community?

3.13. Item 13: If one day, if you notice symptoms of COVID-19 what will you do?

According to the data anlaysed for Item 13, option (A) I call the Crisis Cell or go to the hospital, and check for infection with COVID-19 obtained 60% response rate. A high percentage indicated that the respondents are aware of their health and environment towards this epidemic in order not to spread the epidemic in the governorate. As for option (B) I will quarantine myself at home until you confirm I hit of COVID-19 and I will not approach anyone obtained 37% response rate. This answer is also considered correct despite fears in the case of infection, the disease may be transmitted to one of the family members, but the WHO confirms this until symptoms appear and then the patient is transferred to the special quarantine hospitals of COVID-19 [4]. As for the last two options which were considered incorrect answers, they only obtained 3% response rate: option (C) I do not care about the topic and go to work because I do not think I am infected COVID-19, but I will not come close to my family and option (D) Even if I have infected COVID-19 I will go to work, but I take care of preventive measures. These are illustrated in Figure 13.

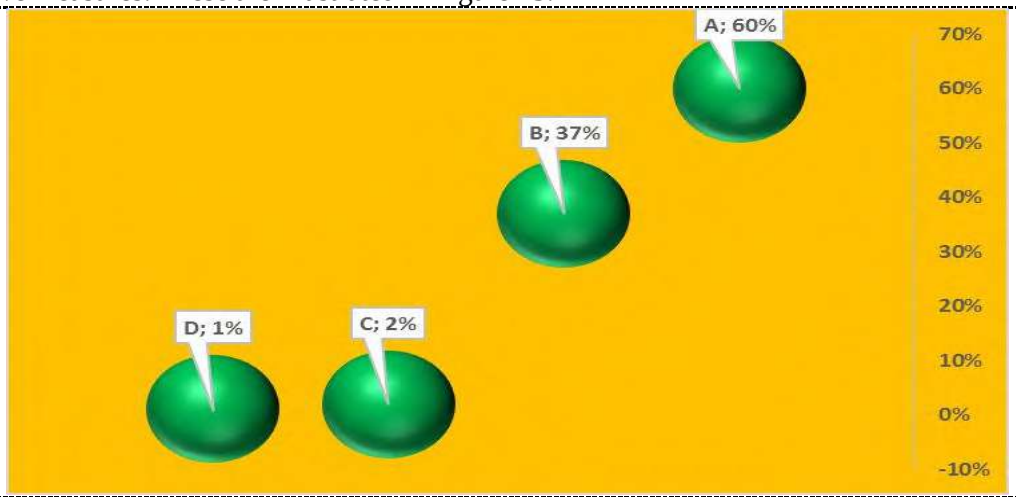

Figure 13. Findings for Item 13: If one day, if you notice symptoms of COVID-19 what will you do?

3.14. Item 14: What is your personal opinion is it possible for people who have recovered from COVID-19 to integrate into society and practice their lives as they were before the infected occurred?

The data analysis for Item 14 revealed that option (A) Yes, after ensuring complete recovery obtained 72% response rate and it is considered as the wrong option because many cases in the world which were recovered from COVID-19 were infected again as a result of the virus developed again and infectious. Patients who recovered from the disease need health care so that the infection will not repeat [27]. This is similar to option (B) Maybe, but it may adversely affect the health of the recovered in the future which obtained 14% followed by option (C) Often appear to have future health problems which obtained 6% response rate. While the last incorrect option (D) I don't know obtained 8% response rate, therefore, the total percentage of response rate for incorrect options for Item 14 is 80%. This findings indicated that the Crisis Cell must educate people about this pandemic despite their recovery from COVID-19 because the possibility of them being infected again is very high. In addition, it is also observed that those who discovered from COVID-19 were then infected by other diseases such as cirrhosis of the lungs, testicular atrophy in males [27]. Therefore, good awareness among the society is crucial and required in the aspect mentioned before. The findings are illustrated in Figure 14.

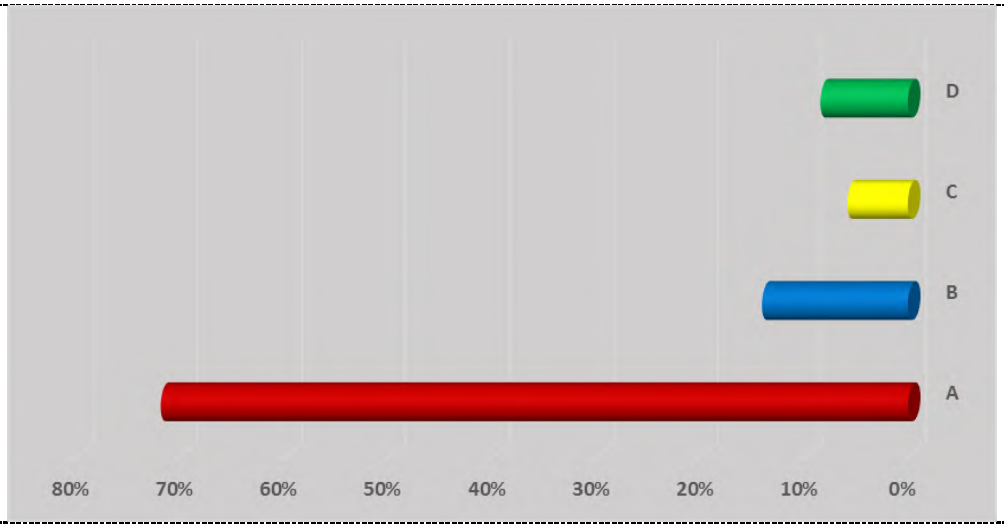

Figure 14. Findings for Item 14: What is your personal opinion is it possible for people who have recovered from COVID-19 to integrate into society and practice their lives as they were before the infected occurred?

4.Conclusion

From the results of the questionnaire on the evaluation of health and environmental awareness of citizens in Al-Anbar Governorate, it revealed a very good level of awareness about the virus, its causes, and methods of prevention. This is demonstrated through the commitment of citizens in obeying the quarantine procedures by the governorate very well. However, some aspects about health and environmental culture about COVID-19 need to be delivered to the society including how to deal with the recovering patients from COVID-19. In addition, environmental pollutants need to be avoided because it is harmful to human health and one of the etiologies of viruses. It is a need to pay a tribute to the main roles of the Crisis Cell in Al-Anbar Governorate in the process of fighting this pandemic by following procedures, as well as through the awareness methods used in addition to all the possibilities that were harnessed to serve the citizens in Al-Anbar.

5. Acknowledgments

Thank you to Dr. Ali Farhan Khalaf, head of the Crisis Cell in the governorate and the Governor of Al-Anbar for the assistance provided in particular moral support in completing this research and spread health and environmental awareness to the residents of the province in order to control the Corona epidemic.

*E-mail: basilabbas63@yahoo.com

Abstract. This study was undertaken to detect the presence of *Listeria monocytogenes* in frozen food. A total of 200 different food samples were collected from Basrah markets, southern Iraq, during September 2015 to March 2016. These samples included frozen fish, frozen burger, frozen chicken and worker's hands swabs, 50 each. The polymerase chain reaction technique was used to evaluate the presence of *Listeria monocytogenes* by using of *inlB* specific gene. The PCR results revealed that only four samples (7.27%) were contaminated by *Listeria monocytogenes*. In conclusion frozen food may carry a dangerous type of bacteria and lead to human illness.

Keywords. *Listeria monocytogenes*, meat, burger, chicken, *inlB*, Basrah.

1. Introduction

Contamination of raw meat is one of the main sources of food-borne diseases [1, 2]. The presence of microbes in meat products cannot be detected visually [3]. This increases the risks of food borne microbes and the incidence of human illnesses [4]. Food associated bacteria are on two types; pathogenic bacteria which cause a disease and spoilage bacteria which may cause loss of quality of food and developing a bad smell or texture. Pathogenic bacteria that cause food-borne disease and cannot be detected during food consumption such as *Salmonella*, *Escherichia coli* O157:H7, *Campylobacter jejuni*, *Listeria monocytogenes*, *Staphylococcus aureus*, etc.[5]. *Listeria* causes a food-borne disease called Listeriosis that has become a major problem for the public health in developed countries in addition to food industry [6, 7]. The disease also affects humans, and rised during the 1980s. There was rising in the numbers of human cases in several countries together with evidence for food-borne transmission of this disease [8]. The uterus of pregnant and the central nervous system or the blood stream are mostly affected by listeriosis. In non-pregnant women or in the immunocompromised or elderly people, listeriosis usually presents as meningitis or septicemia [9]. At the studied area less attention has been made for studying listeriosis or isolation of *Listeria* from imported meat and meat products. Milk was extensively studied previously including isolation of *Listeria* [10] and other types of bacteria [11, 12, 13, 14, 15, 16]. The aim of this study was to evaluate the microbial quality of imported frozen meat regarding Listerial contamination, which cause severe health problems.

2. Materials and Methods

2.1. Samples collection

Imported frozen food samples were collected from different local markets and workers in Basrah city for bacterial investigation of *Listeria monocytogenes*. A total of 200 samples were collected during the period from September 2015 to March 2016,including 50 samples of each frozen burger, frozen chicken, frozen fish and swabs from worker's hands.Twenty-five grams of the samples were collected in a sterile containers and immediately transported inside ice box to the laboratory for bacteriological analysis.

2.2. Culturing the samples

Cold enrichment procedure was applied by adding 10gm of each sample to 90 ml of TSB broth (Himedia, India) which was kept at 4ºC for 4 weeks [17]. The samples were streaked on TSB agar containing nalidixic acid (40µg/ml) and lithium chloride 0.5gm /L and incubated for 48 h at 37°C [18].

2.3. Detection of Listeria monocytogenes

Fifty-five samples showing bacterial growth including 15 frozen fish,15 frozen burgers,15 frozen chicken and 10 swaps of worker's hand were selected. These samples were subjected to detection of *Listeria monocytogenes* by detecting the presence of the *inlB* specific gene by PCR technique.

2.4. Extraction of bacterial DNA

This procedure was done by using commercially available DNA extraction and purification kits (Geneaid, Korea). Five hundred microlitres of the culture, containing approximately 1 x 109 cells, were transferred to a 1.5 ml microcentrifuge tube. The tubes were centrifuged for 1 minute at 14,000-16,000 xg to pellet the cells and the supernatant was then carefully discarded by pipetting or pouring . One hundred and eighty microlitres of GT buffer were added to the tubes, and mixed by pipetting, and then followed by adding 20 µl of proteinase K. The samples were then incubated at 60°C for at least 10 minutes. During incubation, tubes were inverted every 3 minutes.

2.5. Primers

Oligonucleotide primers of inlB gene with a length of 343bp were used in this study [19]. Sequences of primers were;

F: CTGGAAAGTTTGTATTTGGGAAA

R:TTTCATAATCGCCATCATCACT

The electrophoresis of amplified product was carried out in 1.5% agarose gel (Promega, USA) using7µl DNA ladder as molecular weight marker and 7µl of PCR reactions at 70V for 30 min,and then at 80V for 20 min. The gel was visualized by UV transilluminator (Verlber Louemal, EEC), and then photographed

3. Results

3.1. Enrichment procedure

Out of 200 samples only 55 samples showed bacterial growth after cold enrichment. These samples were 15 from frozen fish,15 from frozen burgers, 15from frozen chicken and 10 from worker's hand (Table 1).

Table 1. Number and percentage of positive bacterial culture isolated from frozen food and worker's hand.

Sample source	No. of samples	No. of culture positive samples	% culture Positive
Frozen fish	50	15	30
Frozen burger	50	15	30
Frozen chicken	50	15	30
Worker's hand	50	10	20
Total	200	55	27.5

3.2. PCR results for inlB gene in Listeria monocytogens

PCR amplification of 343bp of inlB gene was applied on the extracted DNA from all the culture positive samples (Figure 1). According to PCR results out of 55 examined samples, the positive PCR results were observed in 4 samples only at the rate of 7.27% (Table 2).

Table 2. Molecular identification of *Listeria monocytogenesin* studied samples according to PCR assay using *inlB* gene.

Sample	No. of culture positive samples	No. of *inlB* positive samples	% PCR Positive
Frozen fish	15	2	13.3
Frozen burger	15	1	6.6
Frozen chicken	15	1	6.6
Worker's hand	10	0	0
Total	55	4	7.27

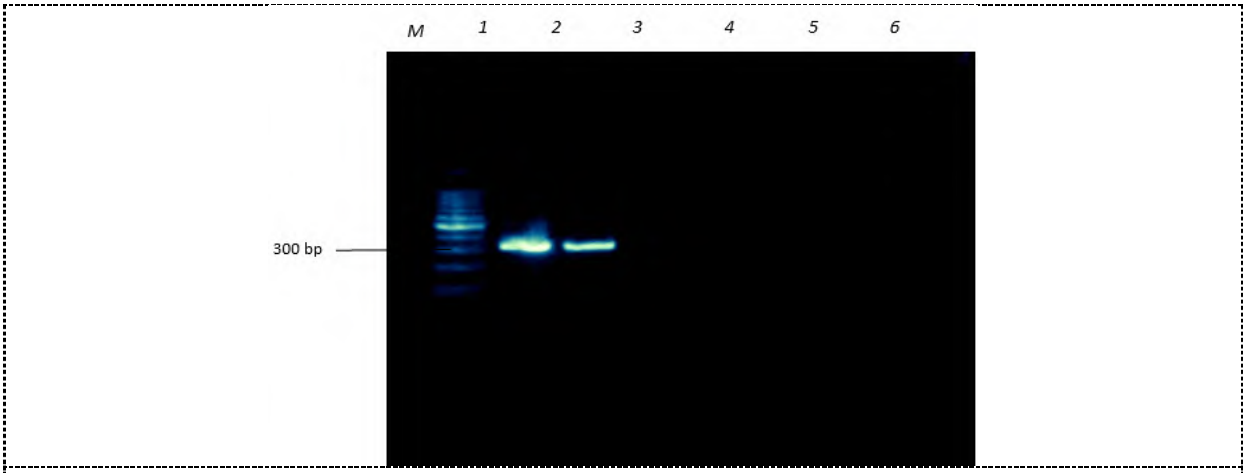

Figure 1. PCR amplification of *Listeria monocytogenes inlB* gene (343 bp) on 1.5% agarose gel and stained with ethidium bromide. Lane: M, Marker; Lane 1 and 2 *Listeria monocytogenes inlB* gene positive; Lane 3-6 negative results.

4. Discussion

Listeria monocytogenes considered as a cause of listeriosis disease in humans and animals [20,21]. Many deal with *Listeria* spp show that these bacteria can be found in a different food sources such as dairy products [22], meat and poultry [23], and in vegetables [24]. Different listeriosis outbreaks were found to be associated with milk consumption. This case is causing high concern in the industry of dairy due to the number of cases and increasing in the rate of mortality in these outbreaks to 30% [25]. Special groups of risk also observe in listeriosis outbreaks which include pregnant women, new born, immunecompromized patients and the old persons [26]. Polymerase chain reaction technique is a highly sensitive and more accurate than culture-based methods for detecting the pathogenmicroorganismsin the contaminated food. Many samples gave a positive result in their tests for *L. monocytogenes* by using the method of PCR while it gave a negative result by cultural methods. The attribute authors the sensitivity of PCR detection method increase over culturing methods to the truth that the former does not have selection initial step. Polymerase chain reaction detectionmethod solved the problem of some cells that cannot grow in the selective media when there is a small number present only. The false–negatives of some reported for the cultural detection methods are sometime these methods depended on using color changes for differentiate between species. These methods are influenced by the observer ability [27,28]. The target gene of *L. monocytogenes* is the primer pair,inlB-F and inlB -R of the inlBgene which detected by PCR [19;29; 30; 31] will amplify and produce a double-stranded fragment of 343bp. At this study, the rate of isolation *Listeria monocytogenes* was 4/55 isolates (7.27%) by inlB gene. this result is in agreement with [32] who found (6.2%) of *Listeria monocytogenes* by inlB gene.

5. Conclusion

From the above results, it can be concluded that the imported frozen food are not safe from a pathogenic bacteria such as *Listeria monocytogenes*. Culture method without more investigation is not sufficient for bacteria identification and PCR techniques is a rapid sensitive method for this purpose.

Role of toll like receptor-9 (*1237 T/C*) gene polymorphism in patients with type 2 diabetes and diabetic foot ulcer

Role of toll like receptor -9 *(1237 T/C)* gene polymorphism in patients with type 2 diabetes and diabetic foot ulcer

Abstract. This study aimed to evaluate whether *(1237 T/C)* polymorphism is related with diabetic foot ulcer in type-2 diabetes mellitus of Iraqi patients in Najaf city. Diabetic foot ulcer (DFU) is one of the most prevalent and serious diabetic complications. DFU accounts for about 15% of the diabetic population. It is commonly associated with the increased diabetic morbidities and mortalities. The type 2 diabetes is recognized by aberrations of glucose, lipid and protein metabolism. It is increasingly appreciated that wound healing defect seen in diabetic patients is attributed to the altered protein and lipid metabolism. This study involved (180) subjects, between them, 60 were patients as group one suffering from type 2 diabetes and 60 were patient suffering from type 2 diabetes and foot ulcer as group two. In addition, 60 healthy group three as control subjects. Polymerase chain analysis was used for detection of *TLR-9* genotypes followed by restriction analysis. We observed no significance differences in the distribution of the genotypes and alleles of *(1237 T/C)* polymorphism among the study groups.

Keywords. Type-2 diabetes mellitus, Diabetic foot ulcer, Toll Like Receptor-9 gene polymorphism, RFLP-PCR.

1. Introduction

Type 2 diabetes is considered the most prevalent metabolic aberration, and its consequences constituted the leading cause of morbidity and mortality. It comprises the majority of diabetic cases (85%) [1]. The macro- and micro-vascular complications, such as diabetic retinopathy, nephropathy and neuropathy are strongly associated with metabolic aberrations. The risk of hypertension, atherosclerosis and coronary artery diseases are also increasing. The underlying mechanisms, explaining the metabolic aberrations and its consequences are not fully clear [2]. It is increasingly demonstrated that most subjects diagnosed as overt type-2 diabetics showed relative diminution in insulin secretion and dysfunction of the β-cells of the pancreas. It probably preceded by compensative hyper-secretion of β-cells and peripheral resistance of insulin. Nevertheless, it is increasingly considered that the peripheral resistance and insulin hyper-secretion are just initiating events, whilst β-

cells dysfunction and insulin defects are considered the critical main event for development of overt type-2 diabetes [3]. Moreover, type-2 diabetes is multi-factorial. Environmental factors combined with the genetic component to explain the dramatic increase in the prevalence of type 2 diabetes. TLR4 and TLR9 genes as a molecular risk factors forT2DM and its complications such as foot ulcer in the discrete diabetic population [4]. Wound healing refers to the natural dynamic process which is responsible for removal and replacement of the devitalized skin structures in response to tissue injury to restore the normal skin integrity. It is characterized by a stepwise pattern of 4 consecutive phases. The first and second phase are inflammation and hemostasis. The ultimate goal of this phase is limitation of the tissue damage and conditioning of the field for reconstruction. The third phase comprises activation and proliferation of fibroblasts to form granulation tissue. The final step concerned about maturation of the granulation tissue to restore the tensile surface of the skin. Importantly, wound healing requires harmony between multiple factors to obtain its maximal benefits. Nevertheless, certain pathological, nutritional and metabolic aberrations may interfere with the process of wound healing [5]. Diabetes is one of the most common metabolic aberrations that interfere with wound healing. It has been reported that diabetic subjects show prolonged inflammatory and proliferative phases of wound healing. In addition, diabetic foot ulcer (DFU) occurs in 15% of the diabetic population, and responsible for 85% of the associated lower extremity amputations [6]. In both innate and adaptive immunity, the toll like receptor (TLR) have essential role. The different infectious diseases are related with genetic diversity in the toll like receptor genes. Different autoimmune disease is associated with toll like receptor 9, because it is contributes in the maturation of dendritic cells and proinflammatory cytokines production [7]. In European Americans, the high risk of asthma disease is associated with the genetic variation at position -1237 [8]. Further studies needed to confirmed the relationship between the very low frequency of these toll like receptor variants and the lower incidence of different diseases like diabetes.

2. Materials and Methods

2.1. Subjects

This study included 180 Iraqi subjects. Group 1 including 60 patients with T2DM and DF, their age mean, disease duration, and body mass index were 56.9±9.2year, 10.7 ±4.8year,and 27.1± 3.8kg/m2, respectively. Group 2 including 60 patients with T2DM and without DFU, their mean of age, duration of disease and body max index were 47.9± year 8.6, 2.9±year 3.0, 30.1± 4.1kg/m2, respectively. Group3 including 60 the healthy control their age mean and BMI were 45.0±8.9, 45.0±8.9 respectively. Also, the gender and smoking history were performed for three groups. The patients were recruited to Al-Sader hospital in Najaf city and the study protocol was approved by Kufa University ethical committee. The medical history, clinical examination, and assessment of BMI are taken from all participants. The parameters like fasting and glycated hemoglobin, Urea and creatinine , total cholesterol, and triglycerides data as shown in (Table1). Polymerase Chain Reaction-Restriction Fragment Length Polymorphism analysis was used for detection the genotypes of *TLR-9(1237 T/C)* polymorphism.

2.2. Genotyping of TLR-9 (1237 T/C)

From peripheral blood leukocytes, the genomic DNA extracted by using Flexi Gene DNA kit (Qiagen), Restriction fragment length polymorphism technique used for detection the genotypes of *TLR-9* polymorphism. The total volume of PCR reactions consist of 25mL includes 2 µl of DNA, 12.5X of Master Mix, 0.3 µl of each forward and reverse primers for detection of *TLR-9(1237 T/C)* polymorphism. The set of primer used was included the forward primer: 5'ATGGGAGCAGACATAATGGA-3' and reverse primer: 5'CTGCTTGCAGTTGACTGTGT-3' [4].

3% agarose gel electrophoresis was performed and run at 60 volt for 3hrs for visualized the PCR products under UV light by using ethidium bromide dye.

2.3. The cycling conditions

The conditions includes 5 minutes of initial denaturation at 95°C followed by 40 second of 35 cycles of denaturation at 95°C, in addition to 40 seconds of annealing at 62°C and 1 minute of extension at 72°C with a final extension step at 72°C for 10 minutes. The created is about 135 bp fragments. The PCR product was then restricted with BstNI enzyme. The T allele represent the wild type consist of 108 and 27 bp fragments while the C allele represent the mutant type and composed of 60, 48 and 27 bp fragments.

2.4. Statistical Analysis:

ANOVA test, and student t test was used to test the level of significance (p-value) for all parameters between the study groups. Chi-square test, Odds ratios (ORs) and 95% confidence intervals was used also to determine the significant level of the categorical variables. The Statistical Package of Social Science software (Version 22, SPSS Inc., Chicago, IL, USA) was used to performed for all data statistical analysis [9].

3. Results and Discussion

There were no significant differences between study groups regarding gender, as shown in Figure 1. About smoking patients, there was highly associated between diabetic foot ulcer group (P<0.001) comparing with diabetic patients and control, as shown in Figure 2. The mean-fasting blood glucose, glycated hemoglobin, urea and creatinine were highly significant in group I, as in Table 1. There was a non-significant association in the allocation of the polymorphic *TLR-9* genotypes or allele frequency between different study groups, as shown in Table 2. The *TLR-9* gene polymorphism was done by using the *BstNI* restriction enzyme. The (TT) homozygous allele, (CT) heterozygous and (CC) homozygous mutant alleles were result from digestion by restriction enzyme, as shown in Figure 3.

Homozygous TT genotype and Heterozygous TC genotype results. M: DNA molecular marker 50bp size by ethidium bromide stained bands in the gel.

4. Discussion

The Current study showed a considerable difference (P<0.001) of age on the development of DFU. A similar observation was reported in the studies of [10, 11, 12], whose found that the prevalence of DFU increases with rising age. This is reasonable because the old age patients have higher risk for development of DFU. According the gender, our study revealed to a non statistical association (P=0.6). This result was related with study by [13, 14], whose found a non statistical association in pervasiveness of DFU in patients gender. In contrast to [9, 15], show that male sex has been recognized as a riskiness factor to the development of diabetic foot ulcer. This may be due to a small female population in the study. Additionally, this study refers to enormous difference about smoking on the prevalence of DFU and these results was compatible with the results of [16, 17] whose proved a connection of cigarette smoking with the development of DFU. In the present study, the finding that the mean duration of diabetes in patients with DFU was highly significant (P < 0.001) compared with non-DFU patients. The present study in agreement with a study conducted by [18, 19, 20, 21] whose found that the long duration of diabetes was the main factor causing DFUs. About BMI (P<0.001) and these results were in agreement with a number of studies conducted by [22, 23], significant difference between BMI and development of DFU in T2DM. Previous studies have also shown that HbA1c was a contributory factor for DFU [13, 24]. But the current study differ from other studies conducted by [15, 25], whose demonstrated that poor glycemic control is an independent risk factor for the development of ulcers. This may be due to the method of assessing ,sample collection and patients number . There was no significant association between DFU group and metabolic factors that includes, cholesterol, triglyceride, HDL and LDL, this consequence was correlated with a study accomplished by (25). In regard to serum urea and creatinine there was high significant differences in DFU (P<0.001) compared with other studied groups. The result of this study agrees with other studies conducted by [15, 26], whose demonstrated that the possibility of kidney dysfunction associated with the diabetic foot disease. According to the several studies, the development and complications of type 2 diabetes are associated with different types of toll like receptors [27, 28]. Genetically susceptibility

to diabetic complication such as a foot ulcer involving several factors that are associated with the stimulation of immune response. *TLR-9* is a necessary endosomal member of the TLRs family [4] reported that *TLR-9* was associated with severity of diabetic injury. Unfortunately, in Iraq there are no studies involved the effect of TLR9-1237T/C polymorphism on development of DFU and T2DM. Our study demonstrated a non correlation among all groups of *TLR-9 (1237T/C)* genotype frequencies (P= 0.5). Also, allele frequencies showed non significant difference among all groups for *TLR-9 (1237T/C)* gene polymorphism (P= 0.5) and these results were close to the results of [8], who found that the recurrence of *TLRs- 2, 4* and 9 gene polymorphism don't detected in T2DM as well as coronary artery disease (CAD), otherwise, it is still not full clarified correlation of the very relatively low-frequencies of these variants of TLRs with the incidence of T2DM and CAD in the or population. Furthermore, the present study results were disagreement with the studies conducted by [4, 29], whose reported that the (TC and CC) polymorphic genotypes frequencies have high significant among DFU and T2DM groups compared with healthy individuals. Ethnic diversity may be linked with the variation of above results.

5. Conclusion

Current study have shown that the TLR-9 gene polymorphism may not have a role in diabetic foot ulcer disease. There is no significant association between this polymorphism gene and development of diabetic foot ulcer disease in T2DM.

Abstract. The present research aimed to isolate and purify Alkaline phosphatase enzyme from crude protein extract (Lysate supernatant) of *Escherichia coli*, by using different biotechnologies. To proceed, the following steps were taken: Firstly, The verification of the existence of enzyme in bacteria, the bacteria were diagnosed by using the API 20 stripe that consists of (20) items. the enzyme was isolated to ensure its availability in bacteria within the logarithmic phase and this was done through proliferating them for 18 hours in a nutrient agar. It had been detected that the enzyme was intracellular because of the occurrence of enzyme activity in the lysate supernatant without occurring it in the cell free culture supernatant. Secondly, Enzyme purification, the enzyme had been purified through three stages: precipitation of protein by ammonium sulphate, dialysis and finally, the protein extract was passed through column chromatography by using Sephadex G-100 gel, the estimated enzyme activity after this step was 22.0 in comparison with its activity before the purification processes (crude protein extract). The approximate molecular weight of alkaline phosphatase was 81.000 Dalton estimated by using gel filtration technique.

-Keywords. Alkaline phosphatase, *Escherichia coli*, Molecular weight.

1. Introduction

Escherichia coli is a bacillus bacterium negative for a gram stain, located within the family of Enterobacteriaceae, negative for oxidase, facultative anaerobic, animated by peripheral flagella, capable of fermentation for various carbohydrates with gas and acid production [1] (Colonies of bacteria are circles, small, slightly convex, pale, and on the MacConkey agar appear to be pink because of its fermentation of lactose sugar. *E. coli* bacteria widespread in nature and in the intestines of humans and animals. It has the potential to cause many opportunistic infection such as Urinary infection, Cystitis and Pyelonephritis pelvic inflammatory [2]. Alkaline phosphatase enzyme is referred to as ALP (EC 3.1.3.1), [3, 4, 5], which was approved by the International Association of Enzymes. The Alkaline phosphatase enzyme is also called Orthophosphate monoester-phosphohydrolases [6, 7], a hydrolases enzyme [8], and metalloenzyme [9], to contain its active positions on four zinc ions Zn^{+2} and ioni magnesium Mg^{+2} [10, 11,12], as many researchers pointed out that the wide-ranging peculiarity of the enzyme of the foundation material [12] led to the study of its role in the processes of: analysis of both phosphoester phosphate compounds [5], and phosphate

endings of DNA and in the transfer of phosphates to their receptors Trans phosphorylation, especially when there are high concentrations of phosphate receptors such as Tris-buffer and Ethanol amine. The Alkaline phosphatase enzyme is positioned in bacteria within the periplasmic space [13]. While it is associated with the plasma membrane in the leubes [7, 14]. This explains his role in the latter with cellular transport mechanics [5]. The synthesis of the enzyme begins during the logarithmation and under the conditions of phosphate limitation [15] in the bacterial cell cytoplasm. It is characterized by a molecular weight of (110,000-67,000) Dalton [4] and its lack of both carbohydrates and fatty acids within its composition. As well as its stability towards temperatures up to (80) °C [16], it has optimum pH at 8 [17]. The alkaline phosphatase enzyme in the mamliam is characterized as sugar and protein [18] contains between 12 [19] to 15% [20] carbohydrates from the total weight of protein. There is no evidence of the participation of carbohydrate units in stimulation [21]. The enzyme is associated with the plasma membrane in most animal cells [4, 22], which releases from the membrane to the bloodstream in the case of inflammation and when regeneration, redivision of cells [23], and in body fluids, cancer cells. Therefore it is used to track the development of malignant diseases [24]. The enzyme has a molecular weight of (130,000-170,000) Dalton [25], and plays a defensive role in its removal of phosphate from the exocellular ATP molecule, which is considered as Pro-inflammatory. It has a role during acute inflammatory response by removing endogenous dephosphorylating when it is in great need [9].

2. Materials and Methods

2.1. Bacteria used and sources of access

Escherichia coli bacteria, obtained from microbiology laboratories / Al-Salam Hospital in, Mosul, which was diagnosed using the tape (API 20) (Analytical profile Insera, Biomeriuex France).

2.2. Isolation of the alkaline phosphatase enzyme

2.2.1. Detection the logarethmetic phase of bacteria

This phase was determined by the measurement of the bacterial turbidity in the nutrient broth after every two hours of incubation in a rocking incubator of the type (Wink Hamp, England) at a temperature (37) °C in succession for 24hours, using spectrophotometer (Sartorius BL 210S, Labomed, Inc. sepec setrosc), at (600) nanometer [26].

2.2.2. Preparation bacterial suspension

Prepare the nutrient broth media in a glass sized (1000 cm3) and sterilized by autoclave under temperature (121) °C and pressure (1) atmosphere for (20) minutes. Then leave to cool to a (45-50) °C and culture with *E.coli* for (18) hours at temperature (37) °C in a vibrator incubator (180 cycles / minutes).

2.2.3. Isolation of alkaline phosphatase

Measured the bacterial growth at the wavelength (600) nm, the bacterial cells precipitated using a centrifuge Cooling ultracentrifuge (Heraeus chrest Gm bH, Cryofuge 6-4) at speed (19470xg), temperature (4) °C for 30 minutes, cell-free broth preservation at (4) °C, washed sedimentary cells (3) times using Tris - HCL buffer 8.0 mM [16] (Kumar et al., 2008). The walls of bacterial cells were destroyed using the Ultrasonic MSE, SEP. No PG 1545) by exposing it to (20,000) pulse / seconds, for (30) seconds and repeated the process (3) times with stops of (30) seconds at a temperature (4) °C. Separate the sediment from the precipitated cells using a refrigerated centrifuge, at the same

conditions mentioned above, preservation of broken cells supernatant (lysate supernatant) at a temperature (4) °C [27].

2.3. Purification of alkaline phosphatase

2.3.1. Precipitation of protein by ammonium sulphate

Ammonium sulfate has been added in its solid state to the lysate supernatant and with full saturation to (75%). Then separate the mixture with the cooled centrifuge for (30) minutes (19470Xg), and quickly after which it was obtained on the deposit and melted in the 100 mMTris HCL buffer pH 9.8 [16, 27].

2.3.2. Dialysis

It was carried out by placing the protein solution in the plastic tying cellophane bags. Then plunged into a volume container containing the 100 mM Tris HCL buffer 9.8 [16]. The screening process was conducted at a temperature of (4) °C with movement using the magnetic motor)

2.3.3. Gel Filtration Chromatography

2.3.3.1. Gel preparation

Use Sephadex-G100 gel [28, 29], which separates protein compounds with molecular weights that fall within range (150,000-4000) Dalton [30]. Swelling of the gel and then degassing gas exhalation was performed under a sieve using the Aspirator A-2S Eyela of Japanese origin [27].

2.3.3.2. Packing of the Column

Use the column with the (1.7×75) cm dimenostraion to separate the enzyme that was filled with gel quickly on the walls of the column [27].

2.3.3.3. Add standard materials

Recovery volumes were estimated for five standard proteins known as molecular weight (blue dextran, cow serum albums, egg albums, a pepsin enzyme, insulin).

2.3.3.4. Add the sample

(2.5) cm^3 of protein solution resulting from dialysis and standard materials were injected circularly on the walls of the column. By the addition of (2,5) cm^3 of distilled water, which was used as an Elution solution for the purpose of pushing the model inside the column. Then the protein material was recovered manually and followed up with its protein content by reading the absorption at 280 nm using a UV-Visible spectrophotometer from APEL company. In addition, the effectiveness of the alkaline phosphatase enzyme was followed up in each of the separated parts. When the unknown protein solution was injected into the separation column for the purpose of follow-up the enzyme during the separation process, that's the combination of protein parts that are in enzyme-effective. A linear relationship was then drawn between standard protein recovery volumes. It is known as molecular weights for use in estimating the approximate molecular weight of the Alkaline phosphatase enzyme [27].

2.4. Cooling Drying Technology (Lyophilization)

Lyophilization of the protein pack produced by the gel filtration technique was dried using a lyophilization device after freezing at a temperature (-20) °C to obtain a concentrated protein solution (Crude protein).

2.5. Estimation of alkaline phosphatase activity

The activity of the enzyme was estimated in both lysate supernatant and cell-free broth. After each step of purification by rapid detection of the phenol liberated from the reaction using the 4-amino antipyrine reagent and Potassium ferric amide. The reaction was stopped by adding Sodium arsenate using Ready packaging) alkaline phosphatase –kite (manufactured by Biomerieu xsa).

2.6. Estimation of total protein

The amount of protein was estimated in both lysate supernatant and cell-free broth. After each step of purification using the Folin-Lowry method [31] and modified by researchers [32]. Bovine Serum Albumin (BSA) was used as a standard solution to prepare the standard protein curve with optical absorption coefficient (Extinction coefficient) equal to 0.67 [33]. Figure 1 shows the typical standard curve of protein.

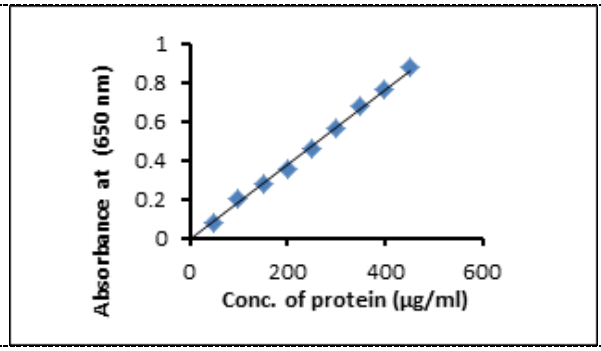

Figure 1. Illustrates a typical standard curve for a protein.

3. Results

3.1. Diagnosis of Escherichia coli bacteria

This Based on the biochemical tests and tests found in the API20 strip, *E.coli* bacteria are diagnosed in Figure 2.

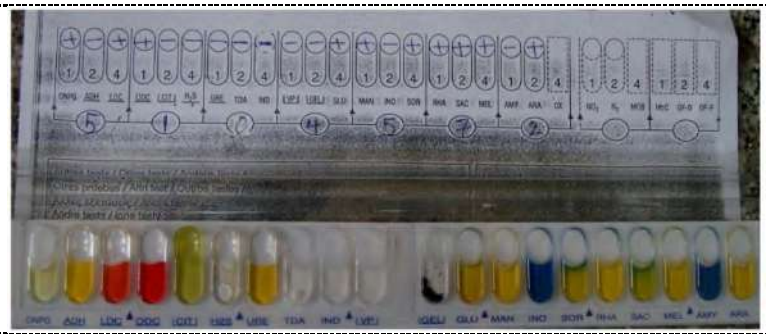

Figure 2. Results of the API20E diagnostic System.

3.2. Alkaline phosphatase enzyme

3.2.1. Determine the Logarithmic growth phase

The logarithmic growth phase of *E. coli* bacteria was determined, and due to the fact that the bacteria in this phase are almost all of their cells are alive and the speed of growth is constant. So the Spectrophotometer was used to calculate the bacterial growth in the nutrient broth media used under the study, after every two hours of incubation for a period of 24 hour (Figure 3). It was found that this phase starts approximately from the hour (4) to the hour (20) (Figure 3), and accordingly, the bacteria were adopted at an age of (18) hours, which is the logarithmic growth phase, for use in subsequent experiments.

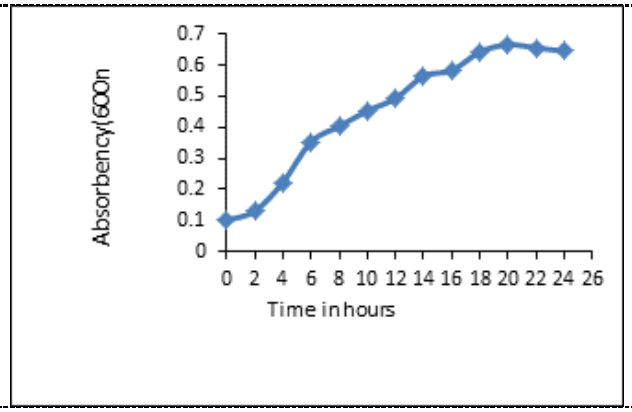

Figure 3. Growth curve and logarithmic phase determination of *Escherichia coli*.

3.2.2. Growth curve and logarithmic phase determination of Escherichia coli

The location of the alkaline phosphatase enzyme was determined by measuring its effectiveness according to paragraph (Isolation of alkaline phosphatase) described in the materials and methods of work. After the growing of bacteria in the nutrient broth for 18 hours, and after depositing their cells using a refrigerated centrifuge. The results showed lack of effectiveness of the enzyme in the cell-free filtrate and its presence in the layers of broken cells by the ultrasound device. The total activity reached (1.52) units (Table 1), and the total protein amount (47.48) mg (Figure 4). This confirms that the alkaline phosphatase enzyme is an internal enzyme. It is located inside the cells and not outside it. Therefore, the suspension of broken cells was approved as a raw extract of the enzyme in experiments related to its purification.

3.3. Purification of the alkaline phosphatase enzyme

Use lysate supernatant as a pure extract of the alkaline phosphatase enzyme, which has been purified and according to the following sequential steps:

3.3.1. Protein precipitation using ammonium sulphate

Proteins found in the raw extract were deposited by adding ammonium sulfate gradually and saturation (75%). And after obtaining the protein deposit dissolved in the 100 ml mollur tris-HCl pH9.8. Then estimated the enzymatic activity, where the specific activity of each protein extract was observed to increase by (2.0). Once compared to the raw extract as shown in Table (1), the amount of protein in it (according to the Lowry modified method) where a decrease in the amount of the total protein is about in the raw extract and as shown in Figure (4).

3.3.2. Dialysis

The results showed an increase in the specific activity of the alkaline phosphatase enzyme , which amounted to (0.10) Unit /amalgam Table (1), with low protein content compared to raw protein extract as shown in Figure (4).

3.3.3. Gel filtration chromatography

After the treatment of the lysate supernatant (crude protein) by ammonium sulfate and dialysis was separated the protein compounds by passing the separation column (containing the gel Sephadex G-100). It gave two protein packs (A and B), and by measuring the effectiveness of the alkaline phosphatase enzyme in all parts collected separately, it was found that the effectiveness is concentrated in the protein pack (B), as shown in Figure (5). A percentage increase in specific activity of (22.0) times was observed compared to its effectiveness in the crude protein, as shown in Tables (1) which confirms the purification of the enzyme by this technique. As well as a decrease in the total protein intake during the purification stages of the enzyme as shown in the Figure (4).

Table 1. Steps of purification alkaline phosphatase from *Escherichia coli*.

Steps of purification	volume (cm^3)	Total enzymatic activity unit (U)	Specific activity** Unit/mg	Percentage increase in specific activity%	Percentage of restoration %
Crude extract	20	1.52	0.03	1.0	100.0
Precipitate solution of ammonium sulfate	4	1.37	0.06	2.0	90.0
dialysis	7	1.32	0.10	3.3	86.8
Gill filteration by Sephadex G-100 Peak (B)	75.5	1.15	0.66	22.0	75.7

**Specific activity: the number of enzyme units [the enzyme unit measured in (Kind and King U / dl)] / mg protein. Kind and King: It expresses the amount of enzyme needed to release (1) mg of phenol in 15 minutes at a temperature of (37)° C.

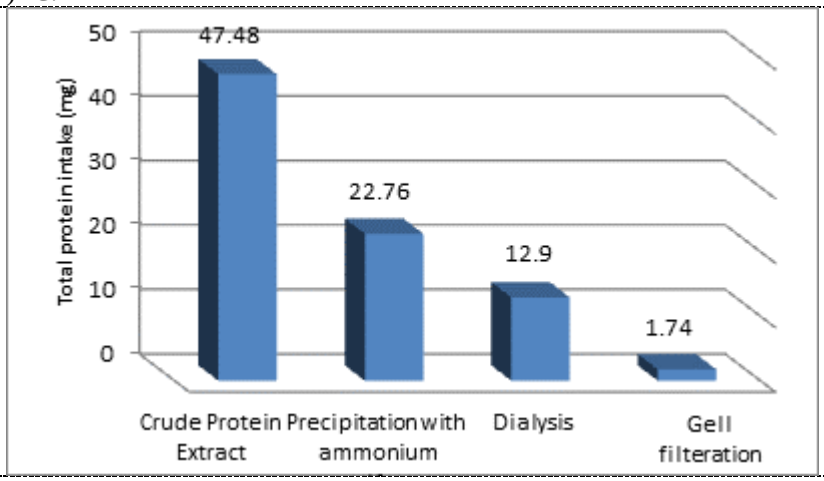

Figure 4. Total protein intake during the purification phases of alkalinel phosphatase for *Escherichia coli*.

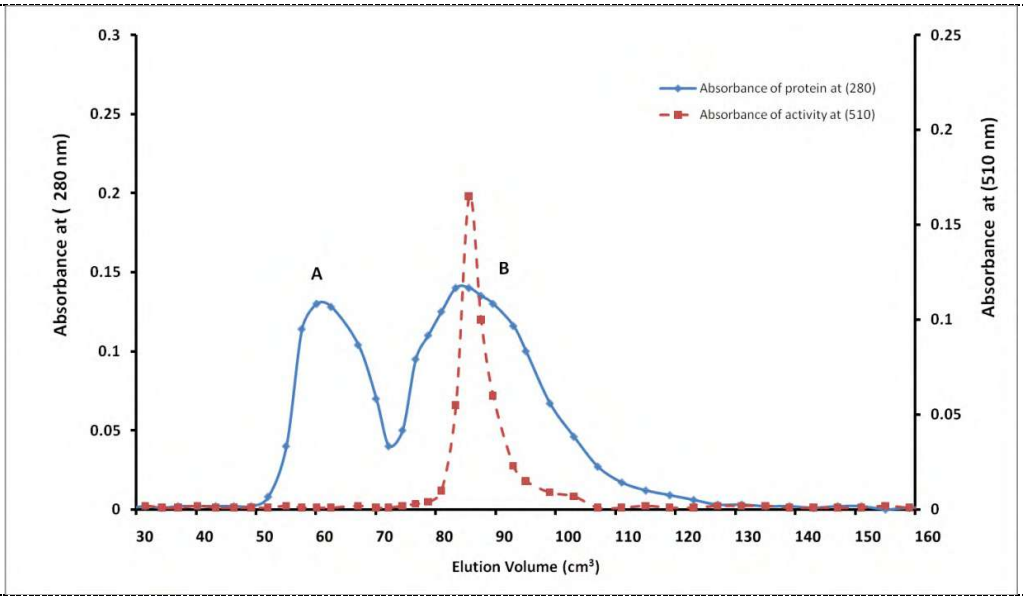

Figure 5. Profile of *Escherichia coli* proteolytic extract profile using gel filtration technique by using a separation column with dimensions (1.7 × 75 cm^3) containing the gel material (Sephadex G-100) at a height of 70 cm) at a flow velocity of 36 cm 3 / hour, volume Each segment is (3) cm^3**.**

3.4. Estimating the molecular weight of the alkaline phosphatase enzyme using the technique gel filtration

The approximate molecular weight of the protein pack (B) was estimated for *E. coli* bacteria containing the alkaline phosphatase enzyme by the researcher method (Andrews, 1965) using the gel filtration technique. The number of compounds known as molecular weight were passed by its molecular weights range from (2,000,000-204) Dalton on the separation column for the purpose of setting the characteristics of the column in terms of internal size (Vi). As well as the empty size of granules (Vo). The standard curve was then drawn Figure (6), based on the size of the organ for each substance versus the molecular weight of the lugarium. The approximate molecular weight (81,000) Dalton was determined based on the sizes of the Proteins bundle (83.3) cm^3.

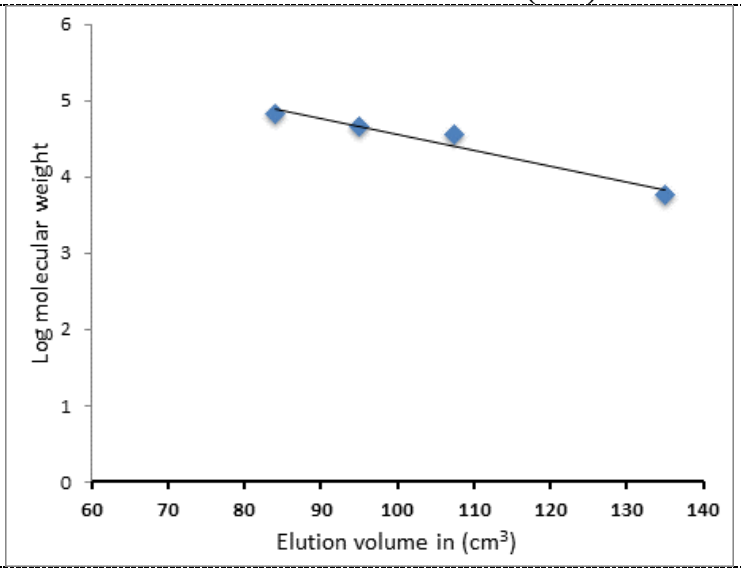

Figure 6. Standard curve for determination of molecular weight by gel filtration technology using sephadex G-100.

4. Discussion

The current study was based on the isolation and purification of the alkaline phospatase enzyme (EC 3.1.3.1) from the pathogenic bacteria *Escherichia coli*. It is based for its diagnosis on the shape of its cells after staining it with a gram stain and on the biochemical tests in the API20 strip. It is one of the rapid diagnostic methods used worldwide as well as the easy and accuracy of diagnosis. The logarithmic phase is one of the most important phases that bacteria go through during their growth, because the cells in it are highly metabolically effective [34] and have distinct physiological and chemical properties. Therefore, bacteria at this stage are suitable for use in physiological and biochemical studies [35]. Because the formation and production of the alkaline phosphatase enzyme begins during this phase in the cytoplasm. Then it is exported through the plasma membrane to the area surrounding the plasma [15]. The effectiveness of the enzyme increases only after folding, which occurs only after it is transferred to the space around the plasma. Then the formation of the dimethyl sulfur [16, 36] which is considered the important part of in bacteria because they contain most of the enzymes necessary to obtain phosphate and carbon sources [37]. So this phase of bacteria under study has been identified and is approximately 20-4 hours long. Previous studies have identified this phase within the time period (15-6) hours [38], and within the period (16-6) hours in bacteria *E. coli* [39]. The relative disparity observed with the results of this study, may be due to the size of the inoculum and the type of nutrient media, noting that increasing the size of the inoculum and adding a new nutritional medium shortens the printing period to a few hours. As well as the source of bacteria isolation and the extent of their virulence, play an important role in determining the period of the phases of the bacterial growth curve [40]. The alkaline phosphatase enzyme was isolated from the bacteria under study after it was grown in the appropriate nutrient medium incubated for about 18 hours. The study revealed that the alkaline phosphatase enzyme is one of the endogenous enzymes [41]. In terms of the absence of any activity of enzyme in the cell free culture supernatant. Its specific activity was recorded in the extract of broken cells (Lysate supernatant) (0.03) because the outer membrane of the gram-negative bacteria acts as a barrier that prevents the enzyme from escaping into the medium surrounding the bacteria [42]. The phospholipid layer present within the plasma membrane in the Gram-negative bacteria also acts to prevent the secretion of the enzyme externally. The enzyme is located within the space surrounding the plasma and it is one of the proteins that are never secreted outside the bacterial cells into the growing culture medium in it. [43] So the total enzyme units were obtained from the extract of broken cells and not from the full and Intact cells [41]. As the researcher [44, 45] pointed out the presence of the enzyme is also present in the expanse surrounding the plasma of a bacterium *Pseudomonas aerogenosa*. The enzyme was purified after obtaining the crude protein from the broken cell of the ultrasonic frequency device through the following steps; First: Protein percipitation with ammonium sulfate. This step is one of the first stages of purification during which proteins found in the crude extract are deposited depending on the degree of saturation of Ammonium sulfate [27]. By gradually adding it to the protein extract, because it is a salt that is characterized by its ability to dissolve at high speed, and its non-effect on enzymes, and depending on the type of competition between ammonium sulfate and proteins to dissolve and combine with water molecules, protein molecules tend to combine aggregation with each other in high concentrations of salt which is due to strong protein-protein interferences that overcome protein-solvent overlaps [46]. So they were used in the current study of alkaline phosphatase enzyme deposition and saturation (75%). It was shown that the results compared to the raw protein extract increase dissertated in quality efficacy and correspond to the results obtained by many researchers who used ammonium sulfate at different saturation rates [47, 48]. Second: dialysis, which is one of the methods widely used during the purification stages to get rid of salts and materials with low molecular weights in enzymatic solutions. [27] such as proteins with molecular weights that are smaller than 14,000 Dalton and some carbohydrates. Although from the reduction of the extract as a result of this process, an increase in qualitative effectiveness was observed about three times that of the raw extract and in comparison to the increase referred to by [16]. Third: The technique of gel filtration

chromatography. This technique is one of the methods used globally to separate compounds depending on the difference in the size of the rogane Elution volume. Large particles pass through a column separation of gel granules while small particles take longer due to their entry into their granules. Therefore, this technique has been used to separate protein compounds that were made and obtained from sedimentation with ammonium sulfate (after the process of dialysis and reduction of its volume by lyophilization method) using Sephadex G-100 gel. This is because it separates protein compounds with weights of molecular that falls within range (150,000-4,000) Dalton[29]. A protein pack (B) was obtained and as shown in Figure (5) and when measuring the enzymatic effectiveness of the package, it was found that the protein pack (B) is highly enzymatic. This confirms the presence of one type of alkaline phosphatase enzyme in *E. coli* bacteria [49]. The results also showed an increase in the specific effectiveness of the enzyme by about 22.0 times it in the raw protein extract, which confirms that the enzyme purification using this technique [50]. Also, the decrease in the total protein amount along the purification stages indicates that the enzyme has been purified. This is consistent with the results of many researchers in studies related to this aspect [41, 47, 48, 50]. Also, using gel filtration technology, the approximate molecular weight of the molecularly purified alkaline phosphatase enzyme was determined, as it was found that its molecular weight in *E. coli* (81,000) Dalton was similar to what was found by [5]. [5] indicated that the molecular weight of the enzyme in these bacteria is located within the run (90,000-85,000) Dalton.

Abstract. This study evaluates eleven wild plant species belong to two genera of Asparagaceae family, naming of *Bellevalia lapeyr* and *Ornithogalum* L. and discuss the similarities and differences among all species by using eighteen random primers for the Random amplification polymorphic DNA (RAPD) markers were used to study the genetic relationship and genetic distance among these species. The study aimed to determination genetic relationships among all the eleven species by using RAPD markers and the method of extraction DNA from plants was CTAB with liquid nitrogen. The result show 16 primers success in giving 293 bands, of which 263 were polymorphic bands, 25 unique bands and 5 were absent. *B.chrisii* type also succeeded in showing two unique bands at OPG-08 primer without registering any other bands. The lowest genetic distance was 0.306 between *B. longipes* and *B.parva*, while the highest genetic distance was 0.943 between *B.chrisii* and *O.pyrenaicum*. It is concluded from our study based on the results of the RAPD test that the studied species were divided into two main groups, each group was divided into subgroups, the first group included three groups and the second main group included two main groups. The study found that the *O.pyrenaicum* type is distinguished by being far from the rest of the species. .

Keywords. Asparagaceae, Genetic relationship, *Bellevalia*, *Ornithogalum*, RAPD.

1. Introduction

Asparagaceae family of plants belong to monocots plants, and it is a widely spread family in the temperate zones, tropical and subtropical zones. It includes around 114-143 genera and 3632 [1] species, and they were mentioned, for the first time, by the scientist Jussieu [2] and considered part of the lily family. Asparagaceae family is characterized by a perineal herbal nature or seasonal. The species of this family are characterized by their economic importance as they are used for ornamental purposes of as fodder or livestock [3]. According to the scientific researches, the two genera *Bellevalia lapeyr* and *Ornithogalum* L. belong to the Asparagus family [4], but they were considered for a long time that they belong to Liliaceae family. In the Turkish flora, [5, 6, 7] mentioned that *Bellevalia*

belongs to the Asparagus family. [8classified it within the same family in the Iranian Flora and [9] mentioned *Bellevalia* in Asparagus family in his study to the Italian Flora. Moreover, the study of [10] categorized both of the genera within the liliaceous family in the Iraqi Flora. The molecular markers are regarded as markers of the stable genetic material, which have specific locations on the genome, through which we can identify the specific genetic differences and the type of mechanisms responsible for a certain characteristic and also the inhibitory genes. Amongst the molecular markers is the DAN Markers, through which we can detect the genetic variations in any piece of the genetic material whether it was DNA or RNA or cytoplasmic DNA or cpDNA (mtDNA), whose sizes range from one pair of nitrogen base to a couple of thousands [11]. Researchers and authors endeavored to use techniques that depend on the plant genetic material to identify the kinship relations amongst the plant species and genetic distance between them [12]. One of these techniques is the Polymerase Chain Reaction (PCR), and one of the markers that depend on the PCR technique is the Random Amplified Polymorphic DNA. The number of the amplified pieces is dependent upon the primer length, the genome size, and its sequence sample, rapid and needs small quantities of DNA (20-25) nanograms [13]. The purpose behind using these techniques, which rely on the genetic material is to solve several problems related to the classification of plants, identifying the genetic print and variation as well as using the results of these techniques in asserting the deduction of new dynasties and the selection of high quality and specifications species that contribute to enhancing the agricultural production [14]. Therefore, The current study aims to identifying the genetic relation among eleven wild species, which belong to *Bellevalia lapeyr* and *Ornithogalum* L.

2. Materials and Methods

2.1. Samples collection and identification

A total Plant samples were collected during one season from March to May 2019 from many areas in the middle and north of Iraq, which included four governorates: Salahaldeen (Sherqat, Haweejah, AlAlam, AlAbbasi, Balad and Amerli), Nineveh (Rabee'a, Zummar and Qayyarah), AlTa'meem governorate (Kirkuk center, Haweejah and Lower Zab, Erbil governorate (Koysanjaq) and the information related to each species were registered. The information about specimens was recorded; and they identified by the second author. Also assured by comparing them with the specimens available at the National herbarium of Iraq.

2.2. Genomic DNA extraction

The DNA was isolated from the fresh leaves of the plants and 2 grams were taken from the leaves, using the (CTAP) in accordance with the method mentioned by [15, 16] and which is used by [17]. The DNA was extracted from the fresh leaves, purified and then its concentration and pureness were measured by the Nanodrop.

2.3. RAPD – PCR reactions [18]

According to the method mentioned by [19], the reactions of RAPD for the DNA samples of the plant species *Bellevalia* and *Ornithogalum* L. The number of primers used were provided by Promega company they were 18 random primerֹ and their sequence is shown in table (1). The reaction solution was prepared.

Table 1. Shows the random primers used in the study of RAPD – PCR.

No.	Primer code	Nucleotide sequence 5 to3
1	OPA-01	CAGGCCCTTC
2	OPA-06	GGTCCCTGAC
3	OPB-14	TCCGCTCTGG
4	OPB-20	GGACCCTTAC
5	OPC-08	TGGACCGGTG
6	OPC-16	CACACTCCAG
7	OPD-03	GTGGCCGTCA
8	OPD-18	GAGAGCCAAC
9	OPE-03	CCAGATGCAC
10	OPE-11	GAGTCTCAGG
11	OPF-05	CCGAATTCCC
12	OPF-20	GGTCTAGAGG
13	OPG-08	TCACGTCCAC
14	OPG-14	GGATGAGACC
15	OPH-08	GAAACACCCC
16	OPH-16	TCTCAGCTGG
17	OPI-02	GGAGGAGAGG
18	OPI-19	AATGGGGGAG

Tubes with capacity of 0.2 ml contained the reaction mixture were prepared as shown in table (2), put in the ice to complete the required additions and then the mixture was cast away for 2-5 seconds by the Microfuge to make reaction components mix well. After that the tubes were put in the Thermo cycler according to the program shown in table (3).

Table 2. Materials used in the main reaction mixture of PCR.

No.	Components	Final concentration	Final volume of each sample/µL
1	Premix	**-**	2
2	Nuclease free water	**-**	15
3	Primer	10 pmol	1
4	DNA template	50 ng/µg	2

Table 3. The steps of the PCR reaction program.

Stage	Temperature	Time	No. of cycles
initiation denaturation	94	7 min.	1
denaturation	93	45 sec.	
annealing	36	45sec.	40
extension	72	90 sec.	
Final extension	72	7 min	1

When time of reaction was ended, the mixture was kept in the fridge. An amount of 5 microliter was withdrawn from each tube to be borne in the Holes of Agarose gel which was prepared previously in a concentration of 1.5% and the marker was put. Samples electrophoresis gel was conducted for 60 minutes in 70 volt, after that the gel was subjected to ultraviolet ray in UV-Transilluminator and photographed with a high resolution camera.

2.4. Estimation of the genetic distance using RAPD markers

In depending on the RAPD reactions results, the genetic distance for the plants species in question was estimated by means of the Genetic statistical package (2.02i NTSYS-PC.Version), which relies on the bands shared between the genetic structures according to the equation mentioned by [20]. A tree diagram that elucidates the genetic relation between the species was drawn by using SAS program.

3. Results and Discussion

Results of the current study revealed that there are two types of primers; the productive primers and the non-productive primers, which are two OPB-14 and OPD-03, that showed no bands on the Agarose gel. All the productive primers, which are 16 random primer, produced Polymorphic loci. The sizes of the molecular bands ranged between (100-1500 bp). Using of many number of primers is regarded as an marker of the increase of the genetic distance accuracy [14], and eventually results in more accurate results which can identify the genetic relation amongst the species as 293 bands appeared, 263 of them are polymorphic band, 25 are Unique bands and 5 are Absent bands. The unique bands appeared in several primers such as OPA-01, OPE-11, OPG-14 and OPA-06 and their appearance varied on the molecular volumes 400, 800, 1000 and 1250 bp. Both the species *B.flexuosa* and *B.parva* were distinguished in a number of the productive unique bands when using the primers OPC-08, OPD-18, OPF-20 and OPH-16. The species *O.brachystachys* recorded three unique bands at the primers which are: OPA-06, OPE-03 and OPI-19, while the species *B.saviczii* produced two unique bands at the two primers OPA-01 and OPA-06 in two different locations and the same was for *B.kurdistanica* which recorded two unique bands at the primers OPD-18 and OPF-05 at two different locations and we notice the superiority of the primer OPC-08 in terms of the number of the bands, followed by OPF-20. So, we concluded that all the primers shared the feature of showing unique bands for different species except for the primers OPB-20 and OPC-16 which did not produce unique bands. This emergence demonstrates Genomic DNA sequence of that species per se and it can be considered as a diagnostic feature to discriminate between the species. The second type of the distinguished bands was represented by the absent bands, which emerged at the primers OPC-16, OPE-03, OPF-05, OPG-14 and OPI-02. The appearance of the absent bands is regarded as a type of mutations that took place at the location of the primer identification of one genetic structure that led to abolishing the identification location and eventually that band did not emerge [14]. In table (4), we observed the primers varied in their proficiency values, which result from their capability to show that variance among the genetic structures of plants species in question. The primer OPG-08 was less proficient and with less distinguishing capability (0.6) and (0.7) respectively, while the primer OPI-19 was characterized with the highest proficiency and distinguishing capacity amongst the primers (8.8) and (8.9) respectively in terms of producing 26 different bands. From the other hand, the proficiency and the distinguishing capability of the two primers OPE-11 and OPF-05 were similar. Therefore, it is concluded that more bands are more proficiency the primer has. At the same time, the increase of the primers used in RAPD markers results in increasing the accuracy of identifying the genetic distance and the increasing the possibility of detecting larger area for the genome [21]

Table 4. Represents the results of the random primers used in RAPD.

No	Primer-name	No. of loci	Polymorphic bands	Total bands	unique bands	absent bands	primer's efficiency	Discrimination power
1	OPA-01	6	6	20	1	-	6.8	7.6

From table (5), we find that the values of the genetic distance ranged between (0.306 - 0.943). the least genetic distance was 0.306 between the species *B.longipes* and *B. parva*, and thus they are the most similar among the species because they belong to the same genus and in spite of the difference between them in some morphological characteristics, but the a proximity in the genetic distance value demonstrates the similarity in the genetic material. From the other hand, the highest genetic distance was 0.943 between *B.chrisii* and *O.pyrenaicum* they were least similar to those which belong to two different genera; *B.chrisii* belongs to the genus *Bellevalia* and *O.pyrenaicum* belong to the genus *Ornithogalum* and this lead to why they are genetically distant.

Table 5. The genetic distance amongst the species in this study.

S1: *B.chrisii,* **S2:** *B.flexuosa,* **S3:***B.kudistanica,* **S4:** *B.longipes,* **S5:** *B.macrobotrys,* **S6:** *B.parva* **S7:** *B.pycnantha* **S8:***B.saviczii,* **S9:***O.brachystachys,* **S10:***O.neurostegium* **S11:***O.pyrenaicum*.

In depending on the values of the genetic distance shown in table (5), the tree diagram was drawn, according to which the plants species were divided into two main groups, as follows:

3.1. The first main group:

It included seven species, included : *B.chrisii*, *B.flexuosa*, *B.kudistanica*, *B.longipes*, *B.macrobotrys*, *B.parva* and *B.pycnantha*.

3.1.1. The first secondary group:

It involves the species *B.chrisii*, this species is alone in a genetic group indicated in the dissimilarity of its genetic material with other species and it has a genetic distance of 0.446.

3.1.2. The second secondary group: It contains three species:

The genetic distance of *B.flexuosa* and *B.macrobotrys* was 0.315, while it was 0.433 between *B.macrobotrys* and *B.kurdistanica* and the same genetic distance is between *B.flexuosa* and *B.kurdistanica*. This indicates that the three species belong to one common origin and approved by the morphological classification results as they belong to the same genus.

3.1.3. The third secondary group:

It involves *B.longipes*, *B.parva* and *B.pycnantha* with genetic distance of 0.306 between the two species *B.longipes* and *B.parva*; and 0.461 between *B.parva* and *B.pycnantha*. From the other hand, the genetic distance between *B.longipes* and *B.pycnantha* was 0.352 and the genetic convergence of these species is in accordance with their similarity in several morphological features.

3.2. The second main group:

It includes *B.saviczii*, *O.brachystachys*, *O.neurostegium* and *O.pyrenaicum*. They are divided into two secondary groups involve:

3.2.1. The first secondary group:

It included three species,: *B.saviczii*, *O.brachystachys* and *O.neurostegium*. The genetic distance between *B.saviczii* and *O.brachystachys* was 0.432 and between the species *O.brachystachys* and *O.neurostegium* was 0.389. The presence of these species in one group indicates that they share the same origin, despite the fact that the species *B.saviczii* belongs to the *Bellevalia* genus and the other two species belong to the *Ornithogalum* genus according to the morphological classification.

3.2.2. The second secondary group:

It included one species, which is *O.pyrenaicum* and its presence in an independent genetic group confirms that its genetic material is different from the rest of the species according to the results of RAPD – PCR, this species showed no band at the primers OPC – 08, OPF – 20 and OPI – 19. From the other hand, the species *O.pyrenaicum* was characterized with four unique bands at the primers OPA – 01, OPD – 18, OPH – 08 and OPI – 02 at the molecular size (300, 1500, 1500 and 1250) respectively, with three absent bands when using the primers OPC – 16, OPF – 05 and OPI – 02.

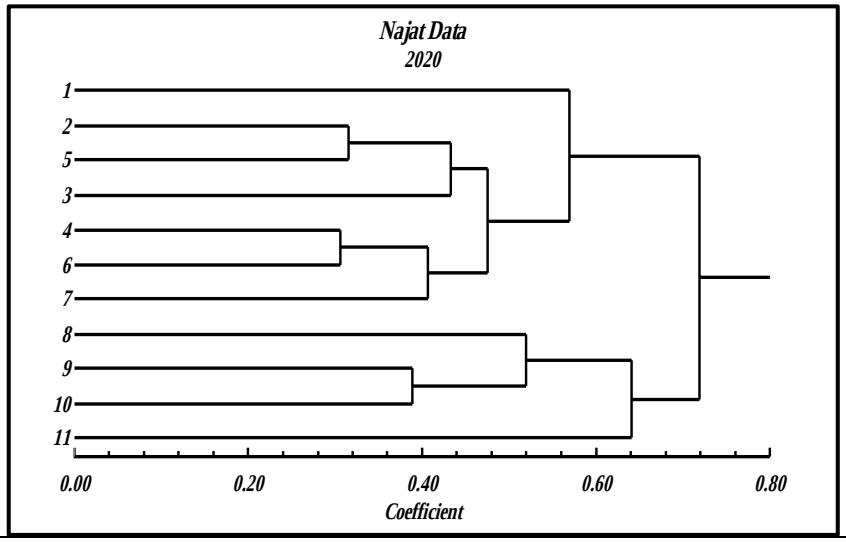

Figure 7. The genetic relationship between the plants species according to the Genetic distance values of RAPD markers.

The use of plenty molecular markers indicates its efficiency and accuracy in giving the results besides being inexpensive. Regarding the molecular studies of plants species which they are not available except for the study of [22] for three species belong to the genus *Ornithogalum*, they are: *O.brevipedicellatum*, *O.oligophyllum*, and *O.pamphylicum*. Study used the PCR technology using two

specific genera, trnL and rbcL. The study of [23] was a cellular study of the number, size and shape of the chromosomes of three species that belong to *Bellavalia* genus, whereas [24] studying the shape and number of chromosomes for the species *O.alpigenum*, which belong to -*Ornithogalum* genus. The results show the primer OPC-08 was unique to the appearance of 4 unique bands, 3 unique bands recorded by type *B.parva*, two with molecular size ranging from (1250 to1500), the third band of the same species with a molecular size (300bp), and the fourth unique bands of the primer OPC-08 recorded by *B.flexuosa* at molecular size (250bp) thus being the most unique prime in the number of unique bands. Whereas, the primers OPB-20 and OPC-16 did not produce any unique bands. The two species *B.parva* and *B. flexuosa* similar to each other in having 4- unique bands, this meaning they are similar in many morphological characters like color of flowers are violet and the long leaves so they are related to each other, while the species *O.pyrenaicum* have shown no bands in many primers, this mean that the species is genetically divergent from the rest of the species.

4. Conclusion

The Results showed that there was a high genetic variance amongst the plant species, they were characterized with the emergence of different bands and distinguished bands (unique and absent). Also, the results showed the efficiency of using RAPD-PCR markers in defining the genetic relation between these species and the genetic print.

5. Acknowledgment

The author would like to thank the Department of Biology, and the Central laboratory, University of Tikrit, Iraq for providing the facilitating to the research work. I also would like to thank my Supervise, Dr. Akeel H. Al- Assie, and Dr. Naglaa M. Al-abide for their supporting in my studies and providing me with information.

Abstract. Eight Cd-resistant bacteria were isolated from the soil. Based on the resistance and specific growth rate, one isolate from these was chosen. The 16S rRNA (rrs) gene sequence was used to assert this isolate belongs to the genus of *Brevibacillus* and closely related to *Brevibacillus agri* (*B.agri*) DSM 6348T (AB112716). The isolate was termed *B.agri* C15. The specific growth yields and the Cd-dependent fall in specific growth yield of *B.agri* C15 was determined under different concentrations of Cd. The current study provides a basis for isolation Cd resistant bacteria with maximum tolerable concentration (MTC) 15 mM Cd from a contaminated soil 490±50 µmolal Cd that could be suitable for a new Cd-bioremediation process; therefore, further studies are needed to investigate this possibility.

Keywords. *Brevibacillus agri*, cadmium, growth rate, isolation, soil.

1. Introduction

The contamination of environments with metals has become a global challenge in the relation to human health. Cadmium is a non-essential element for life, and it is toxic to Homo Sapiens. The United States Environmental Protection Agency (US EPA) and the International Agency for Research on Cancer (IARC) classified some elements, including Cd, As, Hg, and Pb, as human carcinogens [1]. Furthermore, chronic exposure to low levels of Cd is associated with several diseases, such as deranged blood pressure regulation, osteoporosis, early onset of diabetic renal complications, and end-stage renal failure. The Cd contamination, exceeding the US EPA limit of 3 µg/L, has become a major concern, especially in the relation to increasing groundwater withdrawals for human use and agricultural irrigation. This contamination may be subject to regulatory requirements for treatment, and more effective methods for removing Cd are required. Techniques, such as physiochemical methods (precipitation, adsorption and ion exchange) biological methods (bioremediation) are used to remove Cd from groundwater [2]. Bioremediation is the process of transfer, forming contaminants to less harmful substances, and depending on the type of pollutant, different approaches can be employed. One approach is the isolation of bacterial resistance to the pollutant with the aim of

enhancing remediation efficiency. The first use of bacteria for Cd removal was investigated in species of Citrobacter in the batch experiment [3, 4]. Following these studies, this Citrobacter was also studied for cadmium removal in reactor experiments [5, 6]. And later, more modification methods were applied for using Citrobacter sp. in cadmium removal such as in solutions supplemented with phosphatase substrate [7, 8]. Also, *Citrobacter* MCM B-181 was used for removal of cadmium by [9]. The main aim of the present study was to isolate Cd-resistant bacteria from well-known contaminated soil, identify the strain, optimise its growth, and determine its tolerance to Cd.

2. Materials and Methods

2.1. Soil sampling from the contaminated site and isolation of bacteria to resistant cadmium

2.1.1. Soil sampling

In the current study, for the isolation of Cd-resistant bacteria, HayTor quarry, Dartmoor, England was chosen as a source for the isolation of the strains, as this soil has been contaminated with cadmium copper, tin, silver, and lead due to historic mining activities [10]. The global positioning system (GPS) coordinates of HayTor are 50-577054" N latitude and 3.75549" W longitude. One kg of clayey soil from the surface was collected in a sterilised plastic box, and transferred to the laboratory, then stored in a refrigerator at 4 ºC until required at 24 hrs.

2.1.2. Soil analysis

For elemental analysis, a sub-sample of the soil was dried at 50ºC–60ºC for 72 hrs., then disaggregated and ground using a mortar and sieved by 180-micrometer particle sizes. Cadmium was extracted from the soil via aqua regia digestion [11], and the concentrations in the extract were determined using inductively coupled plasma mass spectrometry (ICP-MS). The ICP-MS analysis was conducted according to work carried out by [12]. Briefly, 1.0 g of sieved soil (n = 3 samples) was processed following aqua regia digestion using a Tecator digestion at 60ºC for 2hrs. After digestion, the solution was cooled, filtered (Whatman 541) into a clean volumetric flask, and the volume was completed with 2% HNO_3. The limit of detection (LOD) for the ICP-MS analysis for Cd (0.02 µM) was established from the five standard deviations (SDs) of measuring the lowest standard (n = 10). As no certified reference material (CRM) containing appropriately high Cd concentrations was available and hence, an in-house reference material, contaminated soil SS-2, was used to indicate recovery. The percentage recovery of ICP-MS via the use of contaminated soil- SS-2 was Cd (50%), which was calculated from the recorded (4.0±0.3 µmolal Cd) and certified (8.0±0.06 µmolal Cd) values of the reference material. However, the procedural blank (n = 3 samples) was of a similar magnitude (3.0±0.03 µmolal Cd) as this reference material, explaining the poor recovery obtained.

2.1.3. Isolation of Cd resistant bacteria

For the enrichment of bacteria, 0.5 g of the soil sample was transferred into 250 mL of Erlenmeyer flask containing 50 mL of E-Basal salts media (EBS) supplemented with D-fructose (10 mM) as a carbon source [13]. The flask was incubated at 37°C for five days, and the turbidity was monitored regularly. After incubation, 5 mL of enriched bacterial culture was transferred to 45 mL of EBS/D-fructose. The serial subculture was repeated for four-time cycles until an enriched bacterial growth was obtained, at which point isolation was attempted. The isolation was preliminarily done in terms of MTC to Cd [14]. Five mL of the bacterial culture was inoculated into 45 mL of EBS/D-fructose in Erlenmeyer-flasks (250 mL) in triplicate, amended with Cd and incubated at 37°C for 48 h. The nominal concentration of Cd (supplied as Cd $(NO_3)_2 \oplus 4H_2O$) started at 1 µM and increased by 2 µM at each transference of the screening process. A control without Cd was used to determine whether there

was growth at each step. The concentration at that below no growth occurred, and was accepted as the MTC. After the determination of MTC values, three cultures were grown with Cd at their MTC values, which is 10 mM for two cultures and 15 mM for the third. To obtain single colonies from each bacterial culture (the MTCs of 10 mM and 15 mM), 100 ♣L of the culture was spread onto EBS/ D-fructose agar plates supplemented with Cd (in triplicate). The nominal concentrations of Cd (mM) were below and above MTC values of the bacterial culture. The plates were incubated at 37°C until the colonies were visible. After growing the colonies, each one was purified, and considered as a Cd-resistant isolate.

2.2. Optimising growth conditions and the selection of isolates

Different bacterial growth conditions, including temperature, carbon, and nitrogen sources, were studied in 50 mL of EBS in the Erlenmeyer-flasks (250 mL) in triplicate, and the amount of biomass was determined. The optimum temperature for the isolate was first studied by growing of the culture in EBS/D-fructose and incubation at different temperatures of 4°C, 18°C, 25°C, 30°C, 37°C, 42°C, 44°C, 50°C, and 60°C for 4 days. The most suitable carbon source for the growth of isolates was studied using glucose and fructose (10 mM concentration), acetate, pyruvate, and sucrose (20 mM concentration), separately. The experiments were carried out at an optimised temperature of 37°C for seven days and incubated at a shaking speed of 100 rpm. Finally, the suitable nitrogen source for the growth was studied by the addition of ammonia, urea, thiocyanate, cyanate, nitrate, or glycine (3 mM concentration), in addition to the dinitrogen in the air. The experiments were performed at 37°C, and the carbon sources were either fructose for some isolates or pyruvate for other isolates. Based on their Cd MTC value, four out of eight Cd-resistant isolates with the highest MTC ability (C15-1, C15-2, C15-3 and C15-4), were chosen for further study.

2.3. Estimation of the specific growth rate and selection of one isolate

The specific growth rate was determined for isolates C15-1, C15-2, C15-3, and C15-4 under their respective optimised conditions. One mL of the growing culture of each isolate was inoculated into 50 mL of EBS/ pyruvate (20 mM), or D-fructose (10 mM) for isolate C15-4. During the incubation at 37°C, samples were collected at regular time intervals, and the amount of biomass was determined. The growth of cells in the EBS was determined in terms of dry biomass. From the batch cultures, samples were collected at regular times, and the dry biomass was determined. The growth of bacterial strains was determined by measuring the optical density (*OD*) at 440 nm using a UV visible spectrophotometer against a cell-free EBS medium as a blank. The *OD* should be within the range of 0.2 to 0.9. It was assumed that 0.1 of *OD* was equivalent to 23 mg/L of dry cell biomass of strains. After determining the dry biomass of the growth culture at regular times, the logarithmic dry biomass against the times was plotted to obtain the bacterial growth curve as a semi-logarithmic graph. The curve was fitted with the nonlinear regression of the biomass mean data using the SigmaPlot (version 13). The growth curve was used to measure the specific growth rate by plotting one point of the exponential phase of the amount of biomass of bacterial growth (axis y) and its double point against time (axis x). Monod`s equation (1949) was used to calculate the growth rate. Based on the specific growth rates of four isolates, the isolate with the highest growth (re-coded as 'C15'), was chosen to achieve the objectives of the present study.

2.4. Characterisation of B.agri C15

The morphology isolate of *B.agri* C15 was observed after being stained with Gram stain and observed under a light microscope, according to the work of [15]. Biochemical tests, including indole, methyl red, Voges-Proskauer, and citrate tests (IMVIC) were performed in triplicate, with control. The genomic DNA (gDNA) isolate of *B.agri* C15 was extracted according to the JGI (Doe Joint Genome

Institute) method [16]. Quality and quantity of gDNA, agarose gel electrophoresis, gDNA quantification using Nanodrop spectrophotometer, gDNA quantification using the Qubit 2.0 Fluorometer were used. The electrophoresis was run at 60 V for 60 mins and then the gel was illuminated with a UV transilluminator to be photographed using the gel-imaging system. The quantity of pure gDNA was determined using a NanodropTM 1000 spectrophotometer (Thermo Scientific Ltd., DE, USA) at 260 nm based on the measurement ratios of A260/A230 and A260/A280. A260/A230 ratio indicates residual phenol and protein contaminations, whereas the A260/A280 ratio indicates isopropanol or phenol contaminations. The accurate method for the quantity of pure gDNA was determined using the dsDNA BR Assay Kit (catalogue number Q32850, Q32853, Life Technologies) and the Qubit 2.0 Fluorometer (Life Technologies). The Qubit 2.0 fluorimeter was turned on for three h, before starting the measurements, to stable its signal. Two µL of the gDNA sample was diluted with 199 µL of Qubit dsDNA BR buffer and with 1 µL of Qubit dsDNA BR reagent (200X concentrate in DMSO) in an Eppendorf tube. A calibration curve, zero ng/µL DNA (Qubit® dsDNA BR standard #1) and 100 ng/µL DNA (Qubit dsDNA BR standard #2) were diluted with 190 µL of Qubit dsDNA BR buffer and with 1 µL of Qubit dsDNA BR reagent (200 concentrates in DMSO) in an Eppendorf tube. All samples were incubated for 2 mins, and the concentrations of gDNA were measured using the fluorimeter by sequentially putting in 2 µL from each sample and recording the gDNA concentrations. The acceptable gDNA samples for sequencing required a concentration of 10 – 30 ng gDNA /µLTris-HCl. The gDNA was subjected to 16S rRNA (rrs) gene sequence. MUSCLE (Multiple Sequence Comparison by Log-Expectation) was used to make the multiple sequence alignment to be tested for the best fit of models, based on the Bayesian Information Coefficient (BIC). The Phylogenetic analysis was done using MEGA software (Version7.0.26); the trees were reconstructed accordingly (with a percentage of 5,000 bootstrap replications) with a discrete gamma distribution to model rate differences across the sites (5 categories and gamma parameter 0.1466) allowance for some (40.39 %) evolutionarily invariant sites.

3. Results

3.1. Isolation of bacteria resistant to cadmium

The isolation was carried out from the soil of HayTor quarry. For the soil, a concentration of 490±50 µmolal Cd was determined after aqua regia acid extraction and analysis by ICP-MS. Although the reference material used for quality control showed poor recovery (50%), this concentration is two orders of magnitude higher than Cd in the reference material. Therefore, the Cd concentration in the soil clan is seen as a reasonable, probably low estimate. Compared to soil contamination assessment criteria in the UK (EA, 2015; CLEA: e.g., for residential lifetime exposure: 98 µmolal Cd or allotment soil: 9.38 µmolal Cd, both at pH 7) and the US EPA [17] guidelines for soil (recommendation: Cd < 44 ♣ molal). This soil is considered as contaminated with Cd concentrations greater than one order of magnitude higher than the guidelines levels. Based on the MTC values of bacterial cultures, eight Cd-resistant bacteria were isolated from three different Cd-tolerant bacterial cultures. These isolates were named depending on their MTC abilities as C10-1, C10-2, C10-3, C10-4, C15-1, C15-2, C15-3, and C15-4 (Table 1). The isolates C15-1, C15-2, C15-3, and C15-4 showed the highest MTC (15 mM Cd), followed by the isolates C10-1, C10-2, C10-3, and C10-4 (10 mM Cd).

Table 1. MTC values of Cd-resistant bacterial isolates. The isolate names were coded depending on the MTC values; 10: Means the isolate resist to 10 Cd mM, 15: Means the isolate resist to 15 Cd mM, and 1, 2, 3, and 4: Mean the number of the isolate from each resistant culture.

Isolate	MTC (mM Cd)
C10-1	10
C10-2	10
C10-3	10
C10-4	10
C15-1	15
C15-2	15
C15-3	15
C15-4	15

3.2. Optimising growth conditions and selection of isolates

The growth conditions were optimised. The amount of the biomass of eight Cd-resistant isolates at different temperatures (4 °C, 18 °C, 25 °C, 30 °C, 37 °C, 42 °C, 44 °C, 50 °C, and 60 °C), as summarised in Figure 1. The optimum temperature for the growth of these isolates was 37°C, which showed the significant highest dry biomass (Figure 1, $^{a}P<0.05$). At 37°C, the lowest growth was demonstrated by the isolates C10-1 and C10-2, compared to isolates C10-3 and C10-4, respectively. Similarly, the isolates C15-1, C15-2, C15-3, and C15-4 demonstrated the highest dry biomass at 37°C, and there were no differences observed among them (Figure 8,$^{a}P<0.05$). Eight isolates showed no growth at temperatures, 4°C, 18°C, 50°C, and 60°C compared to other temperatures. With the temperature increase to 25°C and 30°C, all the isolates displayed a significant increase in biomass amounts compared to lower temperatures. However, the increase in the temperatures to 42°C and 44°C significantly decreased the biomass amounts.

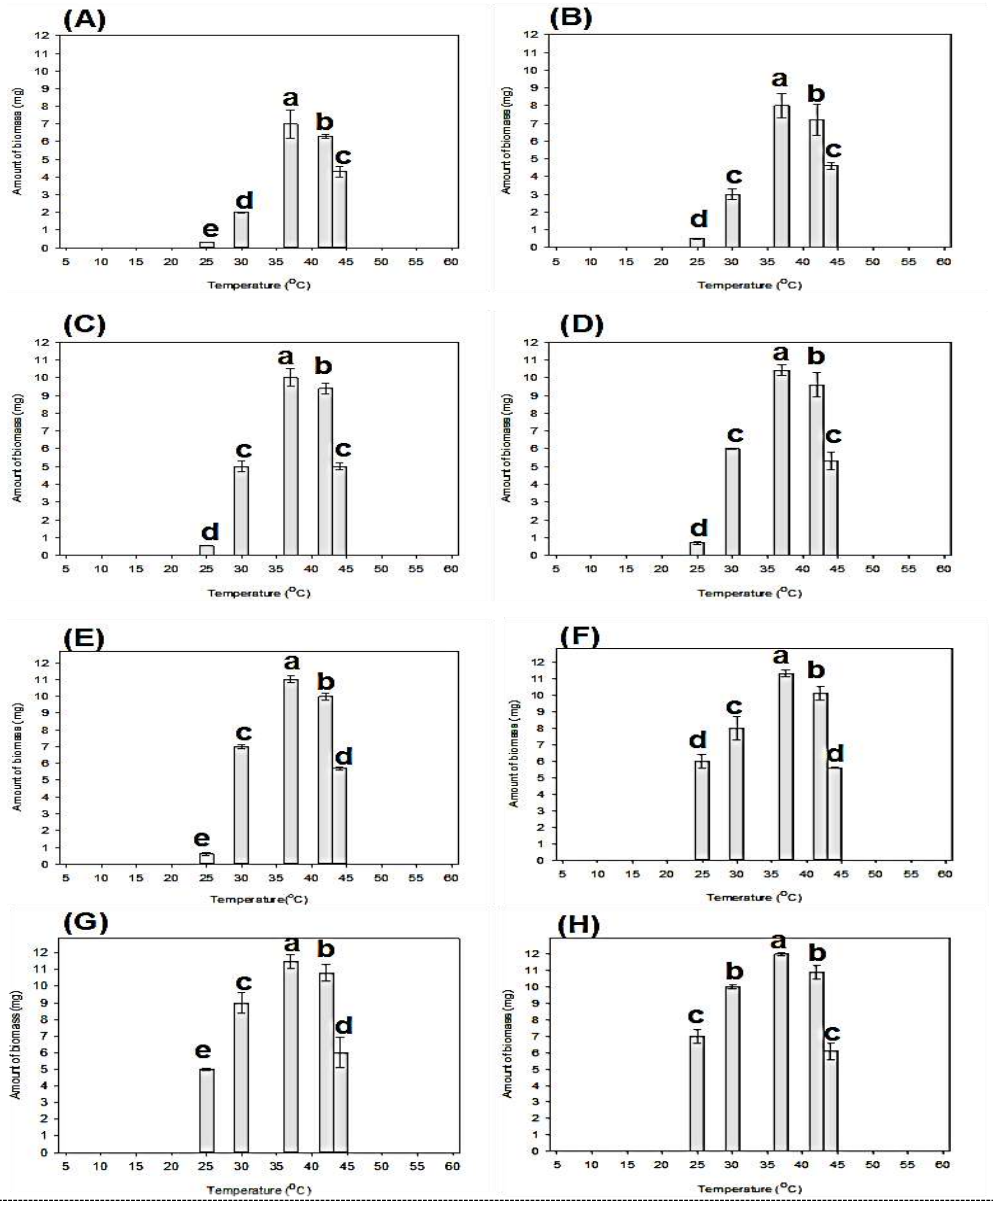

Figure 1. Determination of suitable temperature for the growth of eight Cd-resistant isolates. (A) Isolate C10-1, (B) isolate C10-2, (C) isolate C10-3, (D) isolate C10-4, (E) isolate C15-1, (F) isolate C15-2, (G) isolate C15-3, and (H) isolate C10-4. These isolates were grown in the EBS/D-fructose, incubated for 48 h at 37 °C and shaken at 100 rpm. The error bars represent the standard errors of the mean (n = 3, batch experiments) and a different letter on the bars indicates a significant difference among temperatures within isolates.

The determination of a suitable carbon source was identified by measuring the growth of each isolate in batch cultures, supplemented with glucose or fructose (10 mM), acetate, sucrose, or pyruvate (20 mM). The suitable carbon source for the growth of eight isolates demonstrated that the isolates C10-1, C10-2, C10-3, C10-4, and C15-4 had the highest biomass when growing with 10 mM of fructose (Figure 2, A, B, C, D and H, $^{a}P<0.05$) compared to other isolates, C15-1 (Figure 2, E $^{c}P<0.05$), C15-2 (Figure 9, F $^{b}P<0.05$) and C15-3 (Figure 2, G $^{c}P<0.05$). At the same time, the isolates; C15-1, C15-2, and C15-3, as outlined in the Figures 2E 2F 2G, respectively. Figure (2) showed the highest biomass ($^{a}P<0.05$) in growing within 20 mM pyruvate compared to their growth within other carbon sources.

The suitable nitrogen sources for growing the eight isolates were optimised under different nitrogen sources at an optimised temperature (37°C), and carbon sources, either with fructose (10 mM) for isolates C10-1, C10-2, C10-3, C10-4, and C15-4 or pyruvate (20 mM) for isolates C15-1, C15-2, and C15-3. All isolates illustrated the highest growth when grown with ammonia (Figure 3, $^{a}P<0.05$) that was initially used in the composition of EBS medium, compared to other nitrogen sources. Based on the MTC abilities of the eight Cd-resistant isolates, four isolates i.e. C15-1, C15-2, C15-3, and C15-4 demonstrated the highest MTC abilities, and were then chosen for further study.

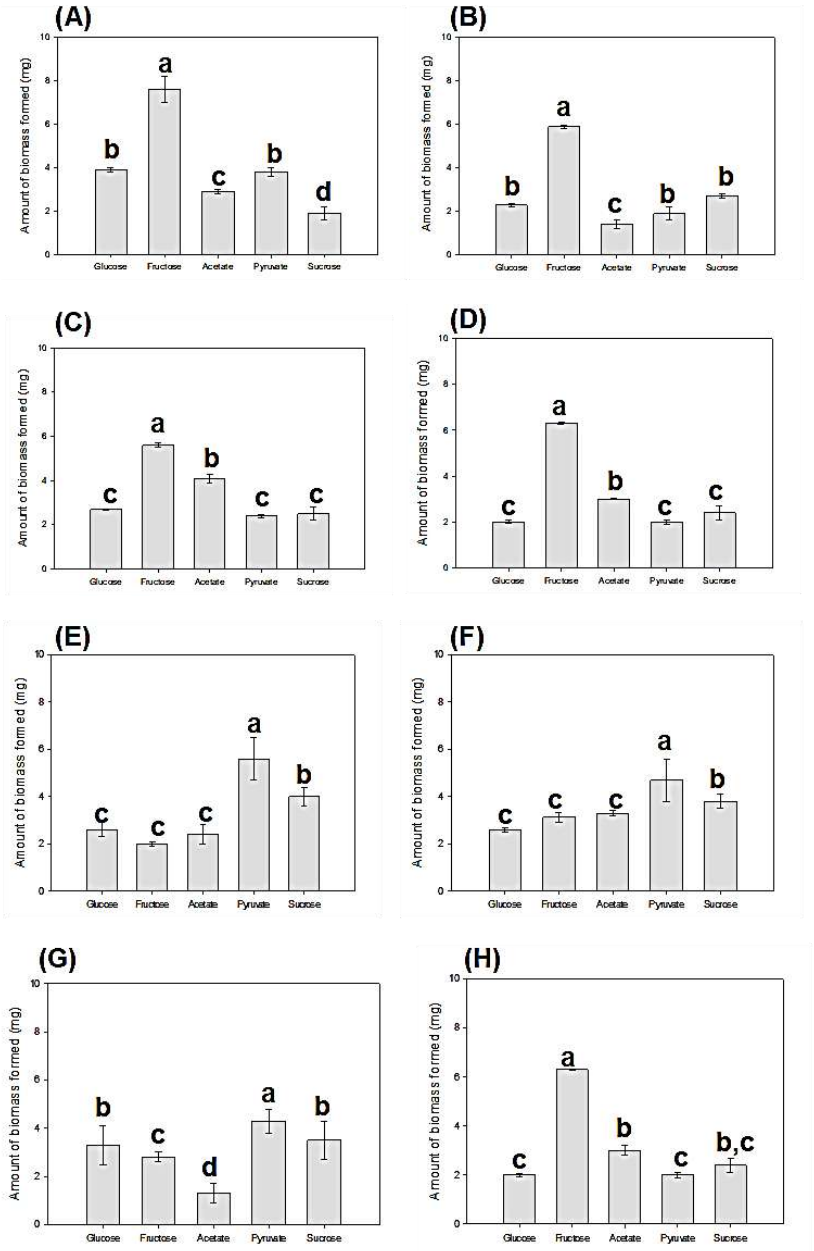

Figure 2. Determination of suitable carbon sources for the growth of eight Cd-resistant isolates. (A) Isolate C10-1, (B) isolate C10-2, (C) isolate C10-3, (D) isolate C10-4, (E) isolate C15-1, (F) isolate C15-2, (G) isolate C15-3, and (H) isolate C10-4. The isolates were grown in EBS supplemented with different carbon sources, incubated for seven days at 37°C and shaken at 100 rpm. The error bars represent the standard errors of the mean (n = 3, batch experiments) and a different letter on the bars indicates a significant difference among carbon sources within isolates.

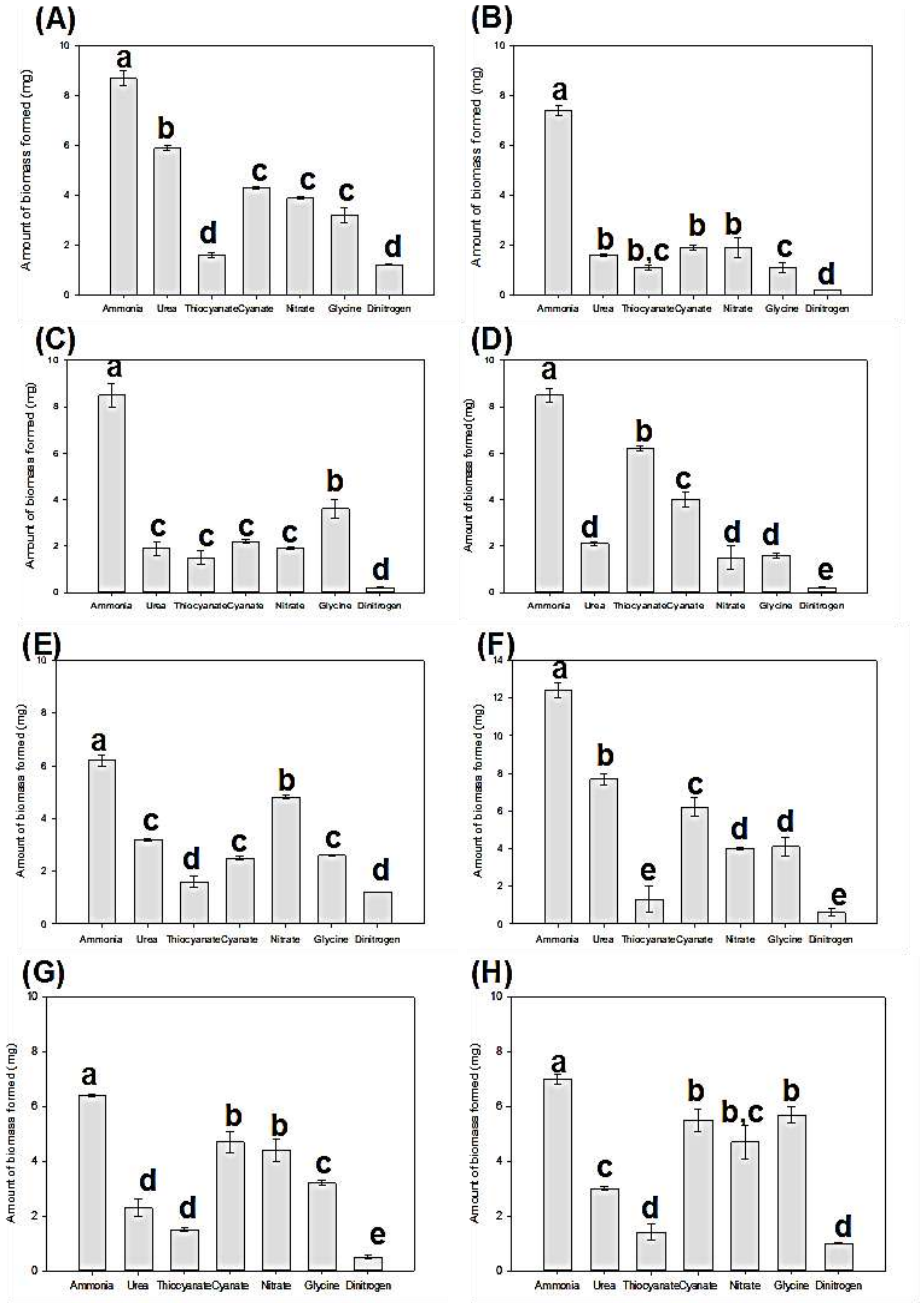

Figure 3. Determination of nitrogen sources for the growth of eight Cd-resistant isolates. (A) Isolate C10-1, (B) isolate C10-2, (C) isolate C10-3, (D) isolate C10-4; (E) isolate C15-1, (F) isolate C15-2, (G) isolate C15-3, and (H) isolate C10-4. The isolates were grown in EBS supplemented with fructose (10 mM) for isolates C10-1, C10-2, C10-3, C10-4, and C15-4 or with pyruvate (20 mM) for isolates C15-1, C15-2, and C15-3, incubated for seven days at 37°C and shaken at 100 rpm. The error bars represent the standard errors of the mean (n = 3, batch experiments) and a different letter on the bars indicates a significant difference among nitrogen sources within isolates.

3.3. Estimation of the specific growth rate and selection of one isolate

The selection of the potential isolate was based on its specific growth rate in addition to its MTC ability. The dry biomass of isolates C15-1, C15-2, C15-3, and C15-4 were determined, and their growth curves were plotted to identify a specific growth rate (Figure 4). The values of the specific growth rate ranged from 0.09 to 0.12 h^{-1}. Among the four isolates, C15-1 and C15-2 significantly showed (Figure 4A, B, $^{c}P<0.05$) the lowest specific growth rate (0.09 ± 0.004 h^{-1} and 0.09 ± 0.005 h^{-1}, respectively). The isolate C15-3 displayed the highest specific growth rate (0.12 ± 0.007 h^{-1}) , as summarised in the Figure 4C, $^{a}P<0.05$, followed by the isolate C15-4 (0.11 ± 0.02 h^{-1}), as outlined in the Figure 4D, $^{b}P<0.05$. Therefore, the isolate C15-3 was re-coded as 'C15' and chosen for further experiments.

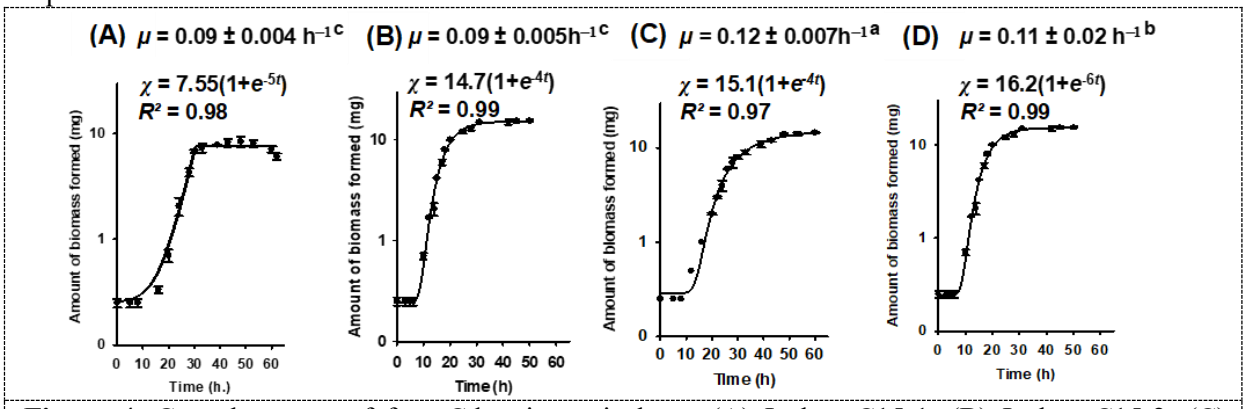

Figure 4. Growth curves of four Cd-resistant isolates. (A) Isolate C15-1, (B) Isolate C15-2, (C) Isolate C15-3, and (D) Isolate C15-4. The isolates were grown in EBS supplemented with D-fructose (10 mM) for isolate C15-4 or with pyruvate (20 mM) for isolates C15-1, C15-2, and C15-3, incubated at 37°C and shaken at 100 rpm for 72 h. The error bars represent the standard errors of the mean (n = 3, batch experiments). The specific growth rate (♣) is shown and a different letter on the ♣ indicates a significant difference among isolates.

3.4. Morphological, biochemical, and 16S rRNA sequence analysis

Morphological observation of isolate C15 showed Gram-stain-positive bacilli (Figure 5A). The biochemical characterisation (IMVIC test) of the isolate C15 was performed. The isolate was negative and did not produce indole from tryptophan; the acid formed from glucose but produced acetone from the glucose and did not use the citrate as a carbon source. The 16S rRNA (rrs) gene sequence of the isolate C15 identified that the isolate belongs to the genus of *Brevibacillus*, closely related to *B. agri* DSM 6348T (AB112716) with 100% identification. The isolate C15 was named *B.agri* C15, as outlined in the Figure 5E.

3.5. Assessment of the inhibition effects of cadmium on B. agri C15

The inhibition effects of Cd on *B. agri* C15 under 2.5, 5, 10, and 15 mM Cd were studied. An increase in the Cd concentration led to an increase in the amounts of unconsumed pyruvate. The exposure to 2.5 mM Cd decreased the utilised pyruvate (mM) from 14.1 (Figure 6A) to 12.3 (Figure 6B). The amounts of unconsumed pyruvate were inhibited with the nominal concentrations of 5 mM Cd (Figure 6C) and 10 mM Cd (Figure 6D). In contrast, the amount of unconsumed pyruvate under 15 mM Cd was reduced to 9.76 mM (Figure 6E). Nevertheless, the amounts of the biomass under the inhibited effect of Cd were recorded as small differences, and the specific growth rates under these toxic concentrations were significantly inhibited at the nominal concentration of 15 mM Cd (Figure 6E, $^{a}P<0.05$). All of these results indicated that the toxic effect of Cd controlled the consumed amounts of pyruvate.

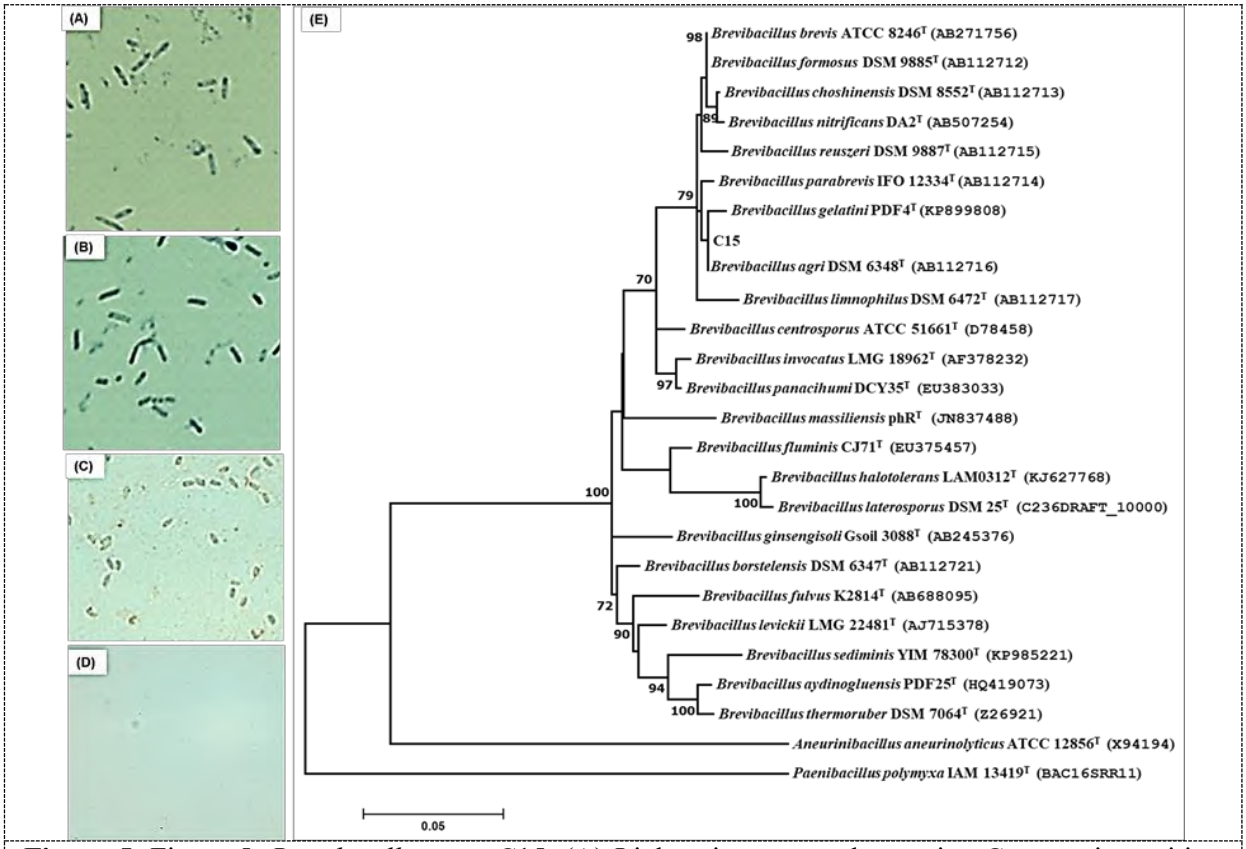

Figure 5. Figure 5. *Brevibacillus agri* C15. (A) Light microscopy observation Gram-stain-positive. The stains were analysed simultaneously in triplicates of three separately grown on nutrient agar plates. Control strains (B) *Bacillus subtilis*, showing Gram-stain-positive, (C) *Cupriavidus metallidurans* DSM 2839T, showing Gram-stain-negative and (D) uninoculated slides. (E) Phylogenetic analysis. The maximum likelihood tree produced based on the 16S rRNA (rrs) gene showing the positions of isolates C15 versus *Brevibacillus* species with validly published names. The tree shown is the optimal tree with the lowest log-likelihood (-4773.56), with numbers at nodes indicating the percentage of 5,000 bootstrap replications in which the topology was preserved (values <70 % omitted for clarity). All of the positions at which there was less than 95 % coverage were omitted from the final analysis, in which 1,342 nucleotides were used. The branch lengths are to scale, and they indicate the number of substitutions per site, and the bar represents 0.05 substitutions per site. The outgroup is the same gene from *Paenibacillus polymyxa* IAM 13419T, type genus of the Paenibacillaceae, in which all members of the in-group are circumscribed. The accession numbers are given in parentheses and refer to the GenBank or Integrated Microbial Genomes (IMG) databases (the latter contain an underscore " _").

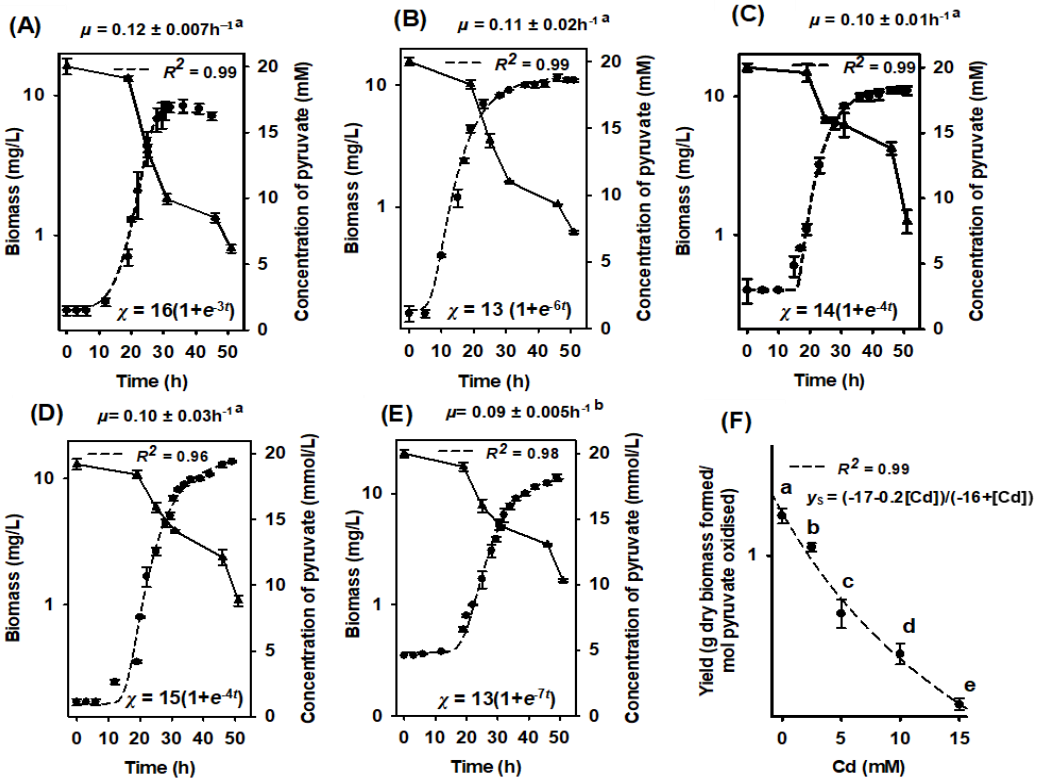

Figure 6. The effects of Cd on the concentration of biomass (●) and pyruvate utilisation (▼) of *B. agri* C15. The strain was grown in EBS/ pyruvate, (A) control and with nominal concentrations of Cd (B) 2.5 mM, (C) 5 mM, (D) 10 mM, and (E) 15 mM. The specific growth rate ( ) is shown. Inhibition effects of Cd on (F) their respective values of the Y_S formed. The error bars represent the standard errors of the mean of three independent cultures at each Cd concentration. b, c, d, and e are significantly different compared to the value of control without Cd.

The results observed that the specific growth produces were intensely inhibited under the Cd concentrations (Figure 6F); the highest yield was obtained in grown without Cd; this showed statistical differences (Figure 6F, $^{a}p\leq0.05$) compared to growth under other Cd exposures (2.5 mM, $^{b}p\leq0.05$), (5 mM, $^{c}p\leq0.05$), (10 mM, $^{d}p\leq0.05$), and (15 mM, $^{e}p\leq0.05$).

4.Discussion

In the current study, soil from Hay Tor quarry was chosen for the isolation of Cd-resistant bacteria, due to its history of mining, where metal ores have been observed in the soil. This soil is known to be contaminated with Cd (this study), and with other metals [10]. Therefore, it was assumed that it could be possible to isolate Cd-resistant bacteria from it. The isolation of Cd-resistant bacteria was screened sequentially by increasing the Cd concentration in the cultures. Moreover, the isolates were obtained from the highest concentrations that permitted culture survival. [18] reported that increases in Cd concentrations affect the properties of bacterial cells, such as protein activity and DNA stability, leading to evolutionary adaptations in phenotype (adaptation) and acclimatisation (changes in gene expression). Also, eight Cd-resistant isolates observed Cd-tolerant abilities, and their growth was optimised under different conditions. The best incubation temperature was established at 37°C. It is common to assume that different bacteria will prefer different carbon sources for the enrichment and that structurally similar carbon sources, which are metabolised by relevant biochemical pathways, are selected by the same microbial strains. About 55% of the carbon taken by the bacteria serve as

substrates of the metabolic network after being broken down to supply pools of amino acids and other components of a cell [19]. The isolated bacteria in the present study were enriched in EBS medium on five different carbon sources. The biomass of the isolates generated from enrichment cultures containing different carbon sources showed that pyruvate or fructose were the preferred sources of different strains. Fructose was added as the carbon source in the first steps of the enrichment culture of the soil sample; therefore, some isolates choose this source. Other strains preferred pyruvate as a carbon source. This could be as a result of using more than one carbon source for the enriched isolates and the changes in the composition of the growth medium over time will be reflected by changes in the behaviour of the isolates[20]. As well as, [21] observed that bacteria chose fructose as the sole carbon source and did not use glucose at all. Ammonia, which was used in the original EBS medium, was preferred among the nitrogen sources added. The specific growth rate of the selected four isolates (C15-1, C15-2, C15-3 and C15-4) from the eight isolates showed that isolate C15-3 grew faster than other isolates. So it was chosen for further experiments and re-coded as 'C15'. Isolate C15 was tolerant to 15 mM of Cd (supplied as Cd $(NO_3)_2 \oplus 4H_2O$); it was considered as a potential isolate. Isolate C15 was identified as *Brevibacillus* agri C15 that used pyruvate as a carbon source, showing a new characteristic compared to other *Brevibacillus* species, which was reported by [15]. It has been published in a recent study that several species of *Brevibacillus* have been isolated from diverse habitats and geographical locations. *Brevibacillus* sp. has been previously demonstrated to have the ability to grow in the presence of Cd (85 mg/kg or ~760 μmolal) [22]. The mechanisms of resistant bacteria to resist Cd have been described and involve an efflux pump, adsorption, precipitation, and intracellular accumulation processes [23]. The bioaccumulation process consists of the accumulation and localisation of Cd in specific organelles; Cd-resistant bacteria can resist Cd through other mechanisms as well. The proposed Cd resistance of *B. agri* C15 may be due to a mechanism as mentioned above. The isolate *B. agri* C15, which had a natural resistance in Cd-contaminated soil, may harbour one or several ATP, RND, or CDF transporter responsible for the efflux system [24]. In addition, [25] mentioned that a PIB-type ATPase gene in a uranium-resistant bacterium isolated from uranium-contaminated soil. Similar efflux systems were reported with Cd resistance in *Acidithiobacillus ferrooxidans* [26]. Another mechanism of effective resistance is the precipitation or the adsorption of Cd on the cell surface. The extracellular polymeric substance (EPS) produced by *B. agri* C15 could allow the binding of Cd to anionic carboxyl groups (COO-) on the EPS. When exposed to Cd, the growth of *B. agri* C15 was adversely affected. The efflux of Cd outside the cells was likely responsible for the higher concentrations of Cd in the growth medium that changed the efflux process, increasing the intracellular uptake of Cd. [27] reported that Cd might cause damage to the cells through the accumulation of reactive oxygen species (ROS). The cell numbers of *Acidithiobacillus ferrooxidans* were reduced when exposed to CdSO4 [26]. It has also been reported that the growth of *Pseudomonas fluorescens* H_2 was affected by Cd exposure [28]. The results in the current study agreed with results as found [29], and [30], and reporting that Cd damages bacteria and leads to growth inhibition. The inhibition effect of Cd on the specific growth yield of *B. agri* C15 could also be due to the presence of other cations in the EBS growth medium. [28] found that Cd toxicity in cells decreased with the presence of Zn in the medium, a result of the inhibition of Cd uptake due to competing effects. In the present study, the EBS growth medium was used, and the possible competing effects were EDTA and Zn, both with lower concentrations compared to the Cd concentrations used in the exposure test. The high concentration of Cd suggests that the Cd were the cause of inhibited bacterial growth.

5. Conclusion

The *B. agri* C15 was isolated from a contaminated soil based on the MTC, and this strain showed tolerance to Cd and had a MTC value of 15 mM to Cd, which is considered as Cd-resistant bacteria. Thus, it is concluded that this strain could be suitable for a new Cd-bioremediation process; therefore, further studies are needed to investigate this possibility..

Abstract. Cellulase is an enzyme produced by fungi and bacteria that hydrolyzes cellulose by breaking down the glycosidic bond, β-1,4 that binds sugar glucose units. Bioethanol and cellulase enzyme were produced by ethanol-tolerant of *Bacillus cereus* co-culture. So the production of filamentous solani were using the wastes of *Cynodon dactylon* L. The highest activity of enzyme was at 96 hour/30°C of incubation. The optimal pH value was 7.5, while the carbon concentration was 3%. On the other hand, the best inoculum ratio was 0.5/100 mL (52 × 10^8 cell/mL bacterial cells and 10^5 conidia/mL of the fungus). In order to test the efficiency of ethanol production by the co-culture by using different concentrations of pure ethanol was measured in the solid medium. Both *Bacillus* sp. and *F. solani* tolerated incubation with 5% ethanol. The best treatment when using 0.5% sulfuric acid which gave the best concentration of reduced sugars and the results showed a difference in the concentration of sugars produced by the fermentation process, it was 3.9 mg/mL in the first day, whereas it was 2.51 mg/mL after 120 hours of fermentation, the concentration of bioethanol produced after fermentation was 195 g/L. In conclusion *Cynodon dactylon* L. wastes were treated by sulfuric acid, cellulase digestion, and autoclave treatment to be a good source of reducing sugars.

Keywords. Ethanol, Cellulase enzyme, *Fusarium*, *Bacillus*.

1. Introduction

Cellulose is the main component of the plant cell wall, while the massive of cellulosic sources containing raw materials that not exploited or can be used more efficiently [1]. Lignocellulosic biomass in plants consists of about 10-25% lignin, 20- 30% hemicellulose and 40-50% cellulose [2]. Cellulase is an enzyme produced by fungi and bacteria that hydrolyzes cellulose by breaking down the glycosidic bond, β-1,4 that binds sugar glucose units. This enzyme has the ability to hydrolyze cellulose into its essential components, glucose-β or oligosaccharides [3]. Cellulose biomass is an important source of energy. Through this mass, carbon is recycled by microorganisms that secrete the cellulase enzyme, which catalyzes the process of cellulose hydrolysis into cellobiose and then converts it into glucose that can be converted to biofuel such as ethanol [4]. The world faces major economic and environmental problems due to higher fuel prices and increased gas emissions, contributing to global warming. As the sources of these conventional fuels have been depleted, it becomes imperative that alternative energy sources such as bio-ethanol, which has been widely produced in the world by

fermentation processes be explored [5]. Ethanol is the most important alternative source of fuel. Its production has increased in recent years, and its production reached about 11% of the fuel used due to the rapid depletion of the global extra oil until global production reached 100 billion liters in 2015 [6]. The present study is aimed to produce the cellulase enzyme and ethanol by using of the co-culture of local isolates of *Bacillus cereus* and *F. solani* by culturing of the *Cynodon dactylon* plant as a production medium. The study also identified the optimum conditions for the production of the enzyme and ethanol using the liquid state fermentation.

2. Materials and Methods

2.1. Preparation of Cynodon dactylon wastes

Cynodon dactylon L. was collected from the gardens of the University of Sulaimani and was washed, cut into pieces and then dried using an electric oven at 65 °C for 24 hours. The wastes were then grinded using an electric mill and passed through a 2 mm sieve and stored in sterile polyethylene bags until use.

2.2. Cellulase production

The media for the enzyme production was prepared by dissolving 2 g ($(NH_4)2NO_3$, 2 g (KH_2PO_4), 5 g ($MgSO_4.7H_2O$), 0.2 g ($CaCl_3.H_2O$), 0.2 g ($MnSO_4.7H_2O$), 0.2 g ($FeSO_4.7H_2O$), 0.2 g (Yeast extract), 0.2 g (Peptone), 40 g (*Cynodon dactylon* wastes) in one liter of distilled water, and adjusting the pH to 7.5. The 1 liter of media was prepared in a 2000 mL flask and sterilized using the autoclave. The media was then allowed to cool, after which it was used to inoculate the selected isolates *F. solani* and *Bacillus* sp. 0.5 ml / 100 ml of media was used to inoculate the bacteria and fungi and incubated in shaking incubator at 30°C with 150 cycle/min for 96 hours [7]. The raw enzyme was extracted by separating the supernatant from the residual media by using the centrifuge at 5000 rpm for 30 min at 4°C and enzyme activity in supernatant estimated according to the protocol by Miller [8], using a microtiter plate reader with wavelength of 450 nanometres.

2.3. Determination of the cellulase activity in the liquid media and the use of carboxymethyl cellulose (CMC)

The enzyme activity was estimated in the liquid media based on the standard glucose curve prepared according to the method described in [8].

2.4. Determination of optimal conditions for the production of cellulase enzyme in the liquid cellulose media

Different standards were used to determine the optimal conditions of the production of the enzyme, including the volume of the inoculum, specifically, 0.5, 1.0, 1.5, 2.0, and 2.5 ml / 100 ml media. Each aliquot of the fungi and bacteria isolate was used to inoculate the liquid media in order to detect the effect of amount of inoculum on enzyme activity and production while the pH of the growth media was adjusted to 5.5, 6.5, 7.5, 8.5 to determine the optimal pH for the production of the enzyme in the liquid media. Several concentrations (1%, 2%, 3%, 4%) of the carbon source were used to determine the best concentration of carbon source for the production of enzyme cellulose. The fungal and bacterial isolates tested on liquid media contain ground *Cynodon dactylon* as sole carbon source at different incubation periods (48, 96, 144, and 192 hours). The media was inoculated with both isolates and the activity of enzyme was estimated at each incubation period.

2.5. Pre - treatment for biomass of Cynodon dactylon wastes plant

The process of production of ethanol using the wastes of *Cynodon dactylon*, which was the first pretreatment done for the purpose of increasing the efficiency of both bacteria and fungi for digestion and consumption of cellulose, were done by adding 0.5% diluted sulfuric acid to the crude enzyme and autoclaving.

2.6. Determination of the capacity of isolates to Ethanol Stress Tolerance

F. solani and *B. cereus* were tested for different concentrations of ethanol (2.5%, 5%, 7.5% and 10%) and for different incubation periods (24, 48, 72 hours). After inoculation of the PDA media, pure ethanol, with concentrations suggested by the method of spot assay, was added in order to give an idea of the tolerance of these isolates in the production experiment. The fungal inoculum was prepared and the number of conidia was 10^4 conidia / ml, and the density of bacteria being 52 × 108 cells / ml. The samples were diluted ten to ten thousand folds after which 5 µl of each dilution was taken and cultured on the surface of the petri dish containing the culture media with ethanol [7].

2.7. Production of ethanol

The wastes of the *Cynodon dactylon* plant treated with fungus *F. solani* (0.5 ml inoculums), as mentioned above, and containing 104 conidia /ml and 0.5 ml of bacteria (52 × 108 cells / mL) were placed in a shaking incubator at a speed of 100 rpm at 30 °C and at different incubation periods (24, 48,72, 96 hours). Glucose concentration was measured after each incubation period in the supernatant after removal of liquid media by using centrifuge at 5000 rpm for 15 minutes at 5°C and separating the supernatant from the precipitate. The reduced sugars present in the supernatant were estimated by taking 0.5 ml of supernatant in each test tube followed by the addition of 1 ml 3,5 DNS reagent to each tube. The tubes were then placed in water bath at 100 °C for 5 minutes, after which then the tubes were cooled down to RT. 10 ml of distilled water was added to each tube and mixed well. Absorbance measurements were taken at a wavelength of 540 nm using a Microtiter plate reader. The concentration of the reduced sugars were determined by extrapolating the corresponding absorbance measurements from the standard curve of glucose as described by [8].

2.8. Determination of Ethanol

The process of bioethanol production involved addition of the *Cynodon dactylon* plant waste treated with sulfuric acid into the conical flasks containing fungus and bacteria, and inoculating with the fungus inoculum (10^4 conidium /ml) and bacteria (52 × 10^8 cell / ml). Samples were placed on the shaking incubator, then the amount of glucose were measured by using a microtiter-plate reader, before and during the fermentation process. After the 120 hours fermentation process, the supernatant was separated from the precipitate, distilled at 80°C and the ethanol collected from the distillation process. The ethanol concentration was estimated using gas chromatography (GC).

3. Results and Discussion

The co-culture system has been used in many food biotechnologies, but it is important that the mixed isolates be commensals with each other and not to compete or antagonize with each other [9]. Figure 1 illustrates that there is a synergistic relationship between the two isolates with their growth on the same media and close to each other. This indicates that there is no antagonism between the two

isolates and thus the possibility of using the two isolates together to enhance the production capacity and thereby increase the production of the enzyme and bioethanol

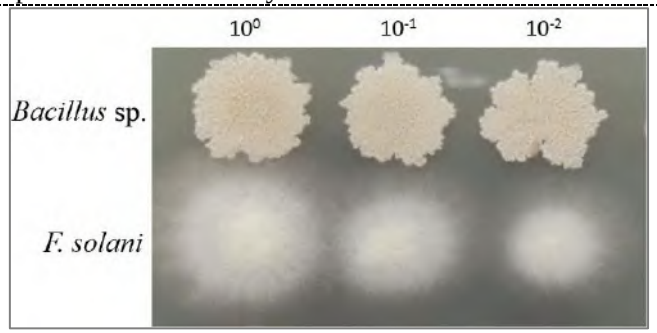

Figure 1. The relationship between *Bacillus* sp. and *F. Solani* (F7), cultured on Luria-Bertani media using the Spot dilution plate assay at 30 ° C for 96 hours; number of fungi / ml (10^5conidium/ ml), number of bacteria / ml (52 x 10^8 cell /ml).

3.1. Determination of Ethanol

The process of bioethanol production involved addition of the *Cynodon dactylon* plant waste treated with sulfuric acid into the conical flasks containing fungus and bacteria, and inoculating with the fungus inoculum (10^4 conidium / ml) and bacteria (52 × 10^8 cell / ml). The samples were then placed in the shaking incubator, and the amount of glucose measured, using a microtiter-plate reader, before and during the fermentation process. After the 120 hours fermentation process, the supernatant was separated from the precipitate, distilled at 80°C and the ethanol collected from the distillation process. The ethanol concentration was estimated using gas chromatography (GC).

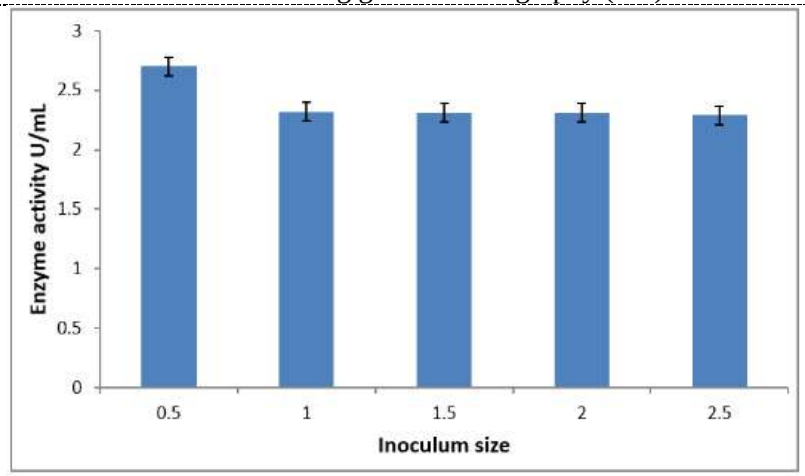

Figure 2. Effect of inoculum size on the activity of the enzyme.

The decrease in enzymatic activity when using an inoculum size greater than 0.5 ml / 100 ml was due to competition between bacteria and fungi for nutrient utilization in the culture media [10]. The statistical analysis showed no significant difference between the inoculum sizes used in this study except the size of the inoculum (0.5 and 1 ml) and at a significant level $P < 0.05$. The effect of the change in pH of liquid media on the production of the cellulase enzyme were also studied. Figure 3 shows that the best enzyme activity was at pH 7.5 with mean value of 2.70 unit / ml.

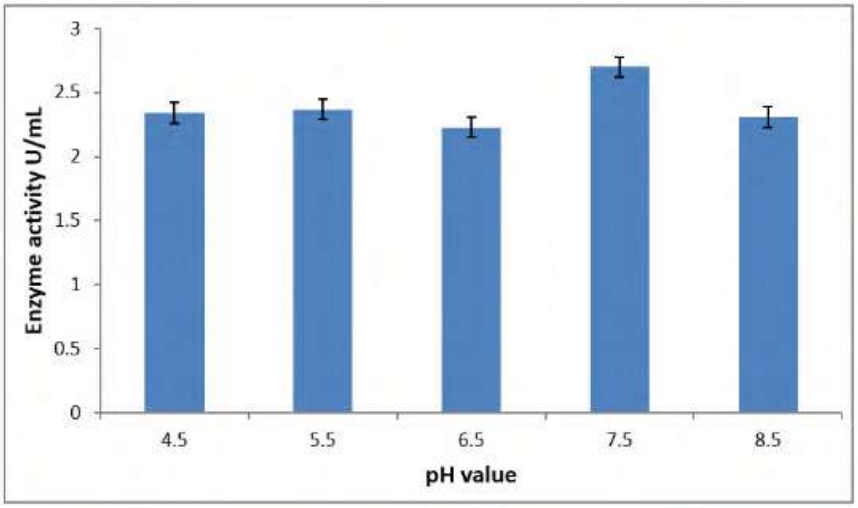

Figure 3. Effect of pH on the activity of cellulase enzyme.

These results were agreement with a previous study [11], which found that the best enzyme activity was at pH 7.5, and to some extent with the findings of [12], which found that pH 7.0 is the best in the production of cellulase enzyme and using *Bacillus* sp. isolate. The presence of more than one or more enzymatic profiles of the enzyme complexes produced by microorganisms may cause fluctuation in pH values, which may lead to reduced enzyme production during fermentation. It has also been reported that the optimal pH for the production of the cellulase enzyme may vary depending on the type of micro-organism used in the production [13]. The statistical analysis showed a significant difference in the values obtain at pH between 6.5 and 7.5 as well as 7.5 and 8.5. There was no significant difference, however, for values obtained at pH between 4.5 and 5.5; 5.5 and 6.5 at $P < 0.05$. Figure 4 shows the effect of the concentration of carbon source on the production of the cellulase enzyme, and from the observation of the results, the best concentration of the carbon source in which the best production of the enzyme was found is 3%, with enzyme activity of 2.75 unit / ml. Next was the concentration of 4% , showing enzyme activity of 2.73 unit / ml while the enzyme activity at 1% and 2%, concentrations were 2.70 and 2.49 respectively.

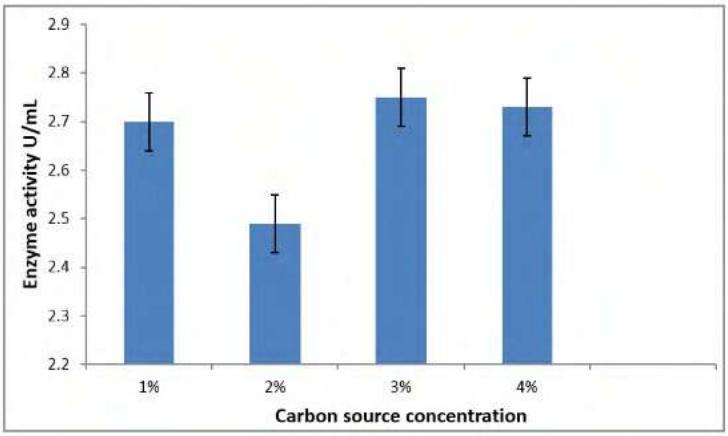

Figure 4. Effect of carbon source on the production of the cellulase enzyme.

These results differed from those obtained previously [14], in which the highest enzymatic activity was obtained at a concentration of 1% carbon source by the culture of *Bacillus* on corn husks and using liquid state ferments. The statistical analysis confirmed a significant difference in the enzymatic activity of the cellulase enzyme among all concentrations of carbon source and at the probability level $P < 0.05$.

Figure (5) shows the effect of incubation period on the production of the cellulase enzyme using the fungus *F. solani* and *Bacillus*. It was observed that the best enzyme activity was after 4 days of incubation at 30 °C, which yielded an enzyme activity of 2.83 unit / ml. The enzymatic activity decreased to 2.7 unit / ml after a 6-day incubation period and continued to decline to 2.59 unit / ml after 8 days of incubation.

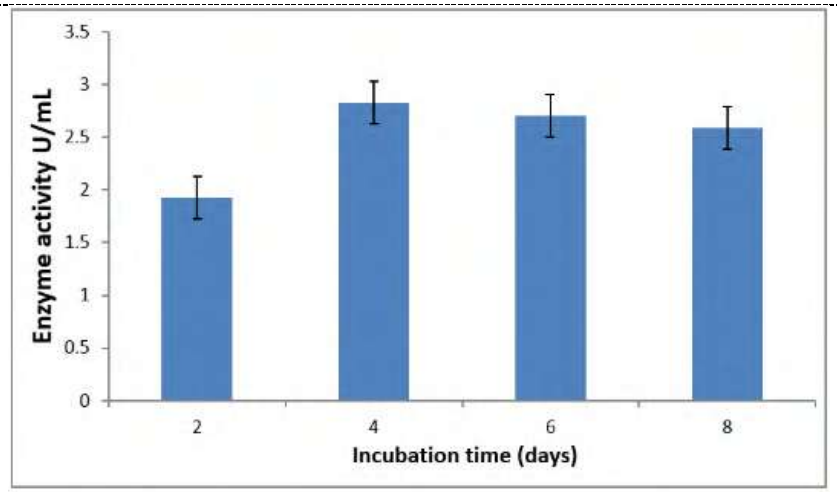

Figure 5. Effect of incubation period on the production of the cellulase enzyme.

The decrease in enzyme activity with increased incubation duration may be attributed to cell autolysis, release of metabolic substances affecting enzyme productivity, and the possibility of altering the structural composition of the enzyme over time, as well as environmental changes in the production media [15]. [16] reported that most isolates of *Bacillus* sp. begins the production of cellulase enzyme after 3-12 hours of growth. The difference in production depends on the quality of the nutrients in the media and the stage in which the microorganism passes. The results obtained in this study agreed with previous work [17], which showed that the best production of the cellulase enzyme is achieved after 96 hours. The results of the statistical analysis showed a significant difference at $P < 0.05$ between the incubation period of 2 days and 4 days, while there were no significant differences between the other incubation periods.

3.2. Ethanol Production

Figure (6) shows the ability of the isolates *F. solani* and *Bacillus* sp. to tolerate different concentrations of ethanol (2.5, 5, 7.5, 10%). It is observed that the isolates have a strong ability to tolerate 5% of the ethanol, while there is no growth of the two isolates at the concentrations higher than 5%. These results are consistent with those of [18], who concluded that *B. cereus* is excellent for bioethanol production due to its ability to tolerate ethanol concentration at 6%. [19] reported that *F. oxysporum* had the ability to produce bioethanol from the fermentation of hexoses and pentoses, but there was no growth at 3.5% ethanol level. The increase in concentrations of ethanol and the inability of cells to tolerate high concentrations affect the formation of mycelium and the permeability of the wall of fungi and low net weight of the biomass. The presence of ethanol of about 0.5 - 2% inhibits the secretion of the cellulase enzyme by the fungus *Trichoderma reesei* [20]. Aldehyde Dehydrogenases enzyme is reported to play an important role in the tolerance of ethanol by fungus [21].

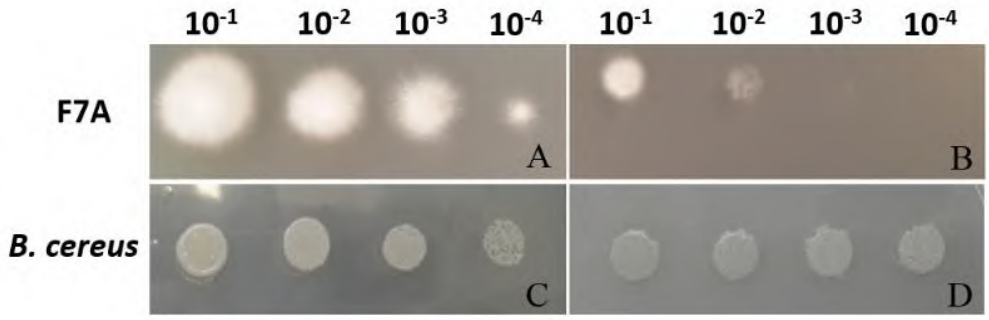

Figure 6. Ethanol tolerance using the Spot dilution plate assay: (A) Isolation (F7A) *F. solani* without ethanol. (B) The fungus sample treated with 5% ethanol. (C) *Bacillus* isolate without ethanol. (D) Sample of bacteria treated with 5% ethanol..

3.3. Bioethanol production

The results of the treatments for the *Cynodon dactylon* wastes shown in Figure 7, based on the concentration of sugars produced after treatment, were higher than the 0.5% H_2SO_4 treatment on the rest of the treatments. The concentration of reduced sugars was 3.5 mg / ml while the concentration of sugars of the *Cynodon dactylon* waste treated cellulase enzyme was 2.51 mg / ml. The *Cynodon dactylon* waste treated with distilled water and autoclave recorded the lowest concentration of produced sugars at 2.0 mg / ml. Pre-treatment is essential for obtaining the best degradation of plant wastes by the use of thermal chemical reactions involving the breakdown of solids from the mass of lignocellulose. These factors increase the readiness of the substrate and the redistribution of the lignin so that it can achieve the minimum energy consumption and obtain high percentages of sugars [22, 23]. The results of this study were in agreement with the results obtained by [24] in which H_2SO_4 was used for pre-treatment and high percentage of reducing sugars obtained. Removal of more than 65% of the lignin were observed when *Saccharum* plant was used. The results of the statistical analysis showed a significant difference between all the treatments used in this study at probability level $P < 0.05$.

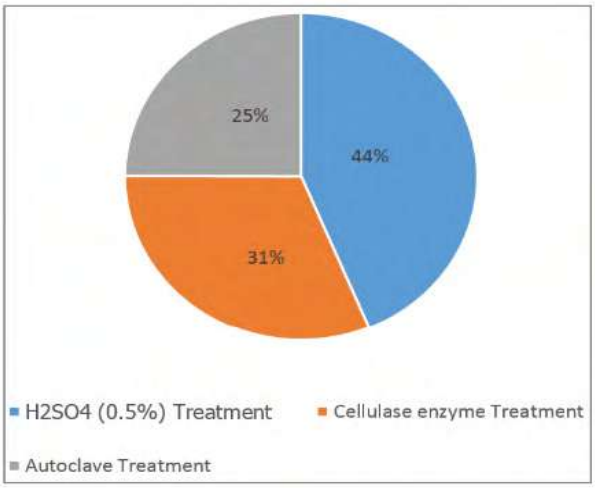

Figure 7. Concentration of glucose sugar after pre-treatment of *Cynodon dactylon* wastes.

Figure (8) shows the concentration of glucose produced by the treatment of *Cynodon dactylon* wastes with 0.5% sulfuric acid, on which the *F. solani* and *Bacillus* were cultured. , The daily glucose concentration were then calculated for the 5 days of incubation. The figure clearly suggests that there is a decrease in the concentration of sugars with an increase in fermentation time. Concentration of

glucose after 24 hours of fermentation time was 3.9 mg / ml and then the concentration decreased after 48 hours to 2.62 mg/ ml with a decrease in pH from 6.8 to 6.3. We noticed increments in sugar concentration after 72 hours of fermentation. The concentration reached 3.2 mg/ ml while the pH dropped to 6.1. The increase in glucose concentration after 72 hours of fermentation time may be due to fungal activity, which increased on the third day. Concentration of glucose started to decrease to 2.89 and 2.51 mg/ ml respectively, after 96 and 120 hours of fermentation time, while glucose concentration for control sample was 3.14 mg / ml, and there was an increase in pH value to 7.7 after 120 hours fermentation.

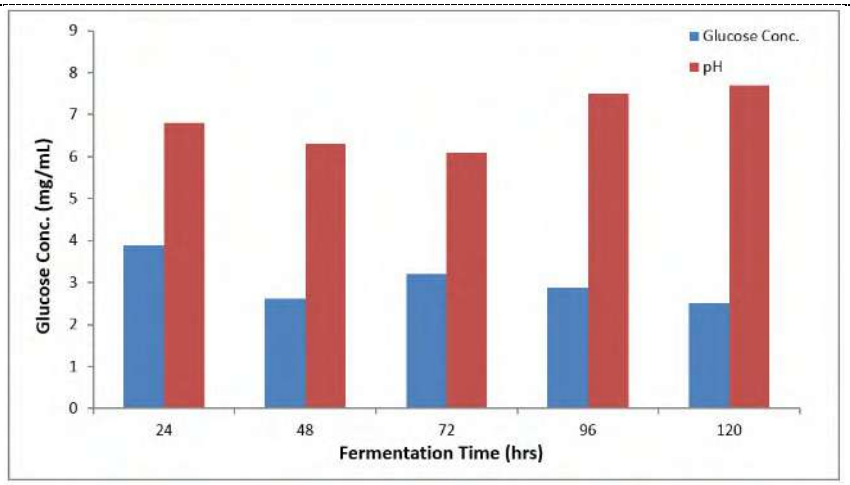

Figure 8. Concentration of glucose resulting from the fermentation process using a mixed fungal *F. solani* culture and *Bacillus*.

The growth of isolates in cellulose-containing culture media has been shown to be characterized by the length of the lag phase [25]. Growth depends on the adhesion of microorganisms to the cellulosic fibers found in the culture media and stimulates the secretion of cellulolytic enzymes, in contrast to the culture media containing dissolved substances as the lag phase is short in length. The concentration of reduced sugars in the culture media depends on the enzyme activity in the growth media and on the type of cellulosic material and its capacity of enzymatic degradation, and also depends on the growth phase of the bacteria. The passage of the bacteria in the stationary phase indicates that more sugars are consumed by the bacteria to sustain their activity. This study was conducted to produce bioethanol from the wastes of *Cynodon dactylon* with *Bacillus* isolate and *F. solani*. The important factor in making ethanol production more economical is the use of large quantities of cellulose available in the environment and containing large amounts of cellulose that can be converted into ethanol [26]. Table (1) and Figures (9) and (10) show the concentration of bioethanol produced from the fermentation process after 120 hours of fermentation and saccharification using co-cultures, as well as the results of the analysis of the correlation curve for the produced ethanol and standard ethanol. Table (1) shows that the ethanol concentration was 195 g/liter. This concentration increases with the availability of extra fermented sugars in the media so it is necessary to increase the concentration of sugars in the media to produce ethanol in large quantities and the efficiency of fermentation depends on the speed of sugar consumption by the cell [27]. The concentration of ethanol produced in this study was higher than those obtained by several other researchers who used single isolates. For example, [28], produced bio-ethanol from *Saccharum* plant and cassava husks using *B. cereus* bacteria and obtained a concentration of 18.4 g / L of Saccharum wastes sugar and 17.80 g / l of cassava husks Our results also show significant improvement over the works of [29], who reported concentration of bio-ethanol obtained to be 8.3 g / L using *B. subtilis* and potato wastes. Our work remains supreme when we further compare our results to that of [30] who used rice bran with *B. cereus* and obtained bio-ethanol concentration of 10.2% at 37 °C and pH 5, after 120 hours of fermentation.

Table 1. Ethanol concentration (g / L) resulting from the fermentation process Using a co-culture of fungus *F. solani* and *Bacillus* species.

Concentration of Ethanol g/l	Area	R. Time	No. Peak

Investigation of fungal contamination in some types of chips in the market in Karbala

Investigation of fungal contamination in some types of chips in the market in Karbala

Ihsan Ali Al-Zamily[1*]

[1]General Directorate of Education in Karbala.

*E-mail: ihsanalzamily@gmail.com

Abstract. Different types of chips samples sell were collected from some markets in Karbala city, which its made in Jordan (Chipsico and Alsaada), Saudia (Liz, Gillts, Doritos), Iran (Bovac, G Toz and Macho) and Iraq (Hala, Dalia, Al-Aseel). The Iranian Chips were the most contaminated, where Iraqi and Jordanian Chips comes in the second. The results of isolating fungi study in chips types, showed diversity in numbers and kinds of fungi .The genus *Aspergillus* is a fungus predominate on all isolates and followed by *Penicillium*. Also different genera including *Fusarium, Alternaria, Curvularia* and *Rhizopus* have been isolated. It is mentioned that these fungi are dangerous because they produce myctoxins, especially aflatoxin and ochratoxin. It was noted that, the Saudi products are free from contamination. Ammonia test and Fluorescence was used to identify the aflatoxin-producing isolates and it appeared that isolates of *Aspergillus* had great potential to produce these toxins.

Keywords. Chips, *aflatoxin, Aspergillus*, *Penicillium*.

1. Introduction

Fungi are eukaryotic organisms that present in all parts of the earth and are characterized by their great variability in terms of color, size and shape. Fungi it's very important in our daily life as they are a source of food, antibiotics and some important compounds such as proteins, vitamins, organic acids and others [1].But it may be harmful, as it spoilage foodstuffs, especially those stored and contaminates them with their lethal toxins. Mycotoxins are among the most dangerous known contaminants at the present time, especially aflatoxins, ochratoxin, ergot, and others [2]. Fungi can reach to foodstuffs in a variety of ways. For example, the foodstuff from which these products are made may be originally contaminated and contamination is transmitted to the manufacturing factory. It has not been sterilized, or contamination comes from the environment. Polluted air and water are an important source of contamination, or it may come from hands workers in these factories, especially if they did not observe the health conditions, such as wearing special clothes , wearing gloves and masks, or the pollution may arise from the materials used in the packaging [4]. What exacerbates and increases the problem is the incorrect storage and transportation conditions. Storage for a long time with suitable humidity helps the growth and prosperity of fungi. These fungi begin to secrete their toxins on the food. among the fungi and yeasts known to be a cause of food spoilage, such as *Aspergillus* and *Penicillium*, which were considered the source of toxins and organic acids. *Rhizopus*

is considered a widespread fungus and is a likely pollutant of foodstuffs, whether it open or packed, as it is characterized by fast growth and resistance to difficult conditions. One of the contaminated yeasts of foodstuffs is *Candida albicans*, a widespread yeast that has been isolated from various sources such as milk, fruits, vegetables and others. Food products are considered very suitable medium for growth of fungi because they contain sugars, proteins and salts supporting the requirements of growth, they are either made from grains such as wheat and barley grains as in nestles or from agricultural crops such as potatoes, peppers and strawberries as in chips, ice cream add to it other additives, flavors, preservatives, salts , spices and other substances that add desired taste to the food product [5]. Chips are among the most famous and most popular food demand for it by children and even adults as they are a fast and light meal and do not need preparation and cheap price and there are different forms, types and flavors, some of which are made from potatoes, grains , crops and fruits, and there is no house is almost empty without this food product. Therefore, it is necessary to avoid contaminated types and not consume them, as they may be the cause of many health problems, including toxins, fungal spores, yeast cells and bacteria [6]. The local markets in Karbala city are filled with various local and imported food products and the demand for which has increased recently, these include canned food, chips, juices and other. There has been a great openness in the field of manufacturing and importing these foodstuffs and in some cases the absence of control and follow-up on these products which causes their entry into the markets causing contaminated it with fungi [3]. The aim of the study was to investigate the fungi transmitted by chips and to know which companies and brands are best regarding fungi contamination and comparing local origin with imported ones.

2. Materials and Methods

2.1. Sample collection

The current study included the collection of different samples of chips that existing in the markets of Karbala city randomly, which included all the prevailing brands in the markets from local and imported origins, which are Jordanian (Chipsico and Alsaada), Saudian (Liz, Gillts, Doritos), Iranian (Bovac, G Toz and Macho) and Iraqi (Hala, Dalia, Al-Aseel), samples were transported as quickly as possible to the laboratory for cultivation on the prepared culture medium.

2.2. Culture media

Three culture media were used as the following:

2.2.1. Potato Dextrose Agar (PDA)

Use for growth of sample in food and dairy samples [7].

2.2.2. Cocconut Extract Agar (CEA)

Use the medium for Detection of aflatoxins [8].

2.2.3. Yeast Extract Agar

It is highly nutritive medium recommended for plate count of microorganisms [9].

2.3. Fungi isolation

Small pieces of each brand of sample were taken with forceps and placed in Petri dishes, and with three replicates per sample, the dishes were transferred to the incubator at 28 degrees while group of

control, and all dishes were incubated for 7 days with daily examination until appearance of growth [9].

2.4. Purification and Diagnosis

The growing cultures were purified by re-cultivation them on (PDA) medium until obtaining pure cultures. The cultures were examined for the purpose of diagnosis. The diagnosis was according to the shapes, color, nature of the cultures growth, edges and height, as well as examining the cultures under a microscope to observe the hyphae and the structural and reproductive structures of the fungi under study and were compared with the classification keys of fungi to determine fungal species [9].

2.5. Detection of aflatoxins

To detect the ability of isolated fungi to produce mycotoxins, the following two methods were used:

2.5.1. Ammonia solution

For this method a single colony is grown in the middle of a petri dish containing a medium like PDA. Turn over the plate and one or two drop of concentrated ammonium hydroxide solution is placed inside lid. The undersides colonies that produce aflatoxin quickly turn plum to red after the bottom of the Petri dish are inverted over the lid containing ammonium -hydroxide. Basically, if there is no change in color of colonies that's means do not produce of aflatoxin. note the greatest color change in the colonies grown on the yeast extract - sucrose and coconut media, a less intense color change in PDA , and the slightest change in color in the media of glucose salts - minerals, all of which prefer the production of aflatoxin [10].

2.5.2. Fluorescence

The isolates of fungi were grown on PDA medium by placing 3(replicates) for each fungal isolate after which it was incubated at a temperature of 25 °C ± 2 °C for a period a week later, a dish was selected for each isolation, and the cultured medium was cut on it by isolating the fungus with a sterile knife in the form of small pieces. Then the pieces were transferred with a sterile needle to an electric mixer containing 50 ml of chloroform and the mixture was mixed for 3 minutes and the mixture was filtered by filter paper. The filtrate sample was taken and put in a clean and sterile beaker and placed in an electric oven at a temperature of 60 ° C, where the amount was concentrated to approximately (1) ml only. The presence of aflatoxin B1 was detected, then it was examined under ultraviolet rays with a wavelength of 360 nanometers. The presence of aflatoxin B1 was detected by matching transfer coefficient (Rf) and fluorescence color of the extracts content of aflatoxins with Standard Substance Dorner and AFB1 [11].

3. Results and Discussion

The results of isolations in Table (1) existence variations in the numbers and genera of isolated fungi. The isolated fungi predominate the fungus *Aspergillus*, followed by *Penicillium* fungus. Also *Fusarium*, *Alternaria*, *Curvularia* and *Monillia* fungi have been isolated. It is mentioned that these fungi are dangerous because they are producing toxins, especially the Aflatoxins and ochratoxins [12]. *Aspergillus* is one of the moulds found all over the world. Its ability to contaminate food and animal feed is widespread under favourable environmental conditions. It is a large proportion of all molds found in industrial foods. It has a special importance as spoilage organisms of food. The changes due to spoilage caused by the *Aspergillus* species can be sensorial, nutritional and qualitative nature such as discolouration, pigmentation and moldy development of odors and destinations. Many species grow in very low water activity and are found attacking different foods and producing mycotoxins

[13]. *Aspergillus niger* is distributed worldwide on a large variety of substrates, which are the most common types of *Aspergillus* responsible for post-harvest decay [14]. *Penicillium* is another group of molds with a high appearance. The occurrence of *Penicillium* in some samples during this investigation is consistent with the. He reported that there is a high percentage of *Penicillium* types of fodder obtained from the farm with the *Penicillium citrinum* with the highest incidence. Many types of *Penicillium* can also produce a wide range of toxic compounds such as Citrine and Citroveridin [15]. [16] noted that the presence in food products of some of these molds, especially *Aspergillus flavus* and *Aspergillus niger*, is highly undesirable. Some of it reported to have public health significance because of the production of mycotoxins, which have implication on consumers' health and food shelf-life decreasing. This is especially prevalent in developing countries, *Aspergillus flavus* and *Aspergillus parasiticus* are mainly responsible for mycotoxin production [17].

Table 1. Isolated fungi from Some type of chips.

Origin	brand	fungi	percentage of appearance	Total
Iranian	Bovac	*Penicillium digitatum*	9	17
		Aspergillus flavus	7	
		Curvularia platzii	1	
	G Toze	*Rhizopus stolonifer*	1	1
	Masho	*Aspergillus flavus*	6	12
		Penicillium digitatum	3	
		Fusarium sp.	1	
		Alternaria alternata	2	
Jordanian	Chipsico	*Asprgillus niger*	3	4
	Alsaada	*Penicillium digitatum*	1	
Saudian	Liz	-	0	0
	Gillts	-	0	
	Doritos	-	0	
Iraqian	Hala	*Aspergillus flavus*	2	12
		Penicillium sp.	1	
	Dalia	*Fusarium sp.*	1	
		Penicillium sp.	2	
	Al-Aseel	*Aspergillus niger*	6	

The Iranian chips types were find the most contaminated samples and Iraqian chips types came second followed by Jordanian chips and finally Saudian chips without any fungal contamination. This may be due to the fact that the Iranian chips remain in the stores for long periods, not to mention the time needed to reach Iraq, as well as the machines used in production from the old generations due to the blockade imposed on the Islamic Republic, while notes that Saudi products are free from contamination. The reason for this may be due to adopting modern methods of production and marketing and benefiting from foreign expertise.

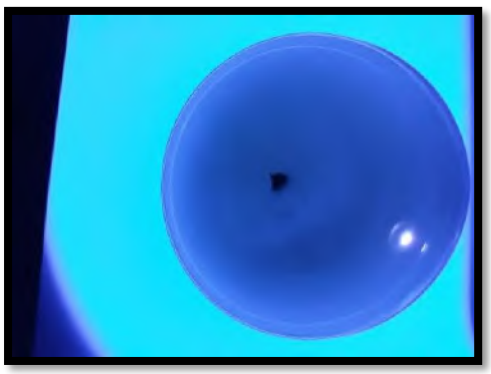

Figure 8. Aflatoxin detection under (UV).

Table 2. Aflatoxin production by fungal isolates on different media.

Chips samples	Fungal isolates	Fungal toxins secreted on three media		
		PDA	CEA	Yeast
Bovac	*Penicillium digitatum*	-	++	++
	Aspergillus flavus	+	++	++
	Curvularia lunata	+++	+	+++
G Toze	*Rhizopus stolonifer*	++	+	+
Masho	*Aspergillus flavus*	++	+++	+++
	Penicillium digitatum	-	++	++
	Fusarium sp.	+	+	-
	Alternaria alternata	+	+++	++
Chipsico	*Asprgillus niger*	-	+++	+++
Alsaada	*Penicillium digitatum*	-	+	+
Hala	*Aspergillus flavus*	+	+++	+++
	Penicillium sp.	-	++	+
Dalia	*Fusarium sp* .	+	+	++
	Penicillium sp.	-	+	++
Al-Aseel	*Aspergillus niger*	-	++	+++

+++ fungal production of aftoxin (very sparkling)
++ fungal production of aftoxin (medium sparkling)
+ fungal production of aftoxin (weak sparkling)
- Non-toxic

The Table (3) showed the ability of fungal isolates to produce toxins on three different media (PDA,CEA and Yeast) as the results showed great susceptibility of both *Aspergillus* and *Penicillium* to produce aflatoxin followed by other fungal species, the culture medium yeast was the suitable medium that stimulate fungi to produce toxins followed by CEA medium and finally PDA medium.

4. Conclusion

According to this study we conclude that these different types of chips are the same as the foodstuffs be exposed to contamination with various contaminants and therefore have a great impact on the health of human who deals with these foods tuffs, and the possibility of producing various types of toxins, therefore we recommend the need to use modern technologies in the production of foodstuffs such as chips and not to import them from poor and cheap sources.

Biological control of *Azotobacter chroococcum* on *Fusarium solani* in tomato plant

Biological control of *Azotobacter chroococcum* on *Fusarium solani* in tomato plant

Sraa Nsayef Muslim[1], Rawa Abdul Redha Aziz[1] and Asmaa Mansour Al-Hakeem[1*]

[1]Department of Microbiology, College of Science, Al-Karkh University of Science, Baghdad, Iraq.

*E-mail: asmaa.mansoor@kus.edu.iq

Abstract. this experiment aimed to study the effect of *Azotobacter chroococcum* in reducing infection of the tomato plant by *Fusarium solani* under the greenhouse condition. The results show that *Fusarium solani* isolates proved high pathogenicity and chosen isolate (Fs4) for being given a lower percentage of germination of cabbage seeds and the highest disease severity to tomato seedling. Also, the results were indicated that T6 (Biofertilizer at concentrations (25 ml\2Kg soil) with *F. solani* (F.s4) was the past this treatment reduced significantly the disease severity (73.10%) which also recorded a positive effect on the growth parameter of tomato plant compare to T1 (pathogen only).

Keywords. Biocontrol, Tomato, Root rot, *Azotobacter*, *Fusarium*.

1. Introduction

Lycopersicon esculentum is one of the important vegetable crops in most agricultural areas in Iraq and used for food and industrial purpose [1]. Tomato plants are infected by several fungal pathogens such as Fusarium spp., which cause several diseases as wilt and root rots and finally reduced crop yield [2, 3]. Several strategies are used to control and reduce the risk of diseases; especially fungicides [4, 5]. However, increase the application of fungicides would affect the environment and human health negativly but is not always satisfactory, as well as the emergence of resistant strains of fungi towards these pesticides [6] (Cooper and Dobson,2007). Therefore, studies have tended to find alternatives methods to control plant diseases by using biological control agents [7] (Lee, et al., 2008). The success of some biological resistance factors has been a major role in pushing some researchers to find other organisms such as bacteria and fungi that can be hosted as successful biological resistance agents in showing the best performance to combat pathogens and to enhance plant growth. *Azotobacter chroococcum* is one of the organisms that were used in the biocontrol and also plays a large role against many pathogens, as it works directly or indirectly as a biological resistance agent for a visit to plant growth and the prevention of harmful effects of pathogens as well as play another important role, such as producing inhibitory antibiotics that stop fungi growth, including Agrocin 84, Agrocin434, 2-4-diacetyl phorogluinol, Herbicolin, Phenazin, Phenazin, Oomycin, Pyoluteorin, as these antibiotics act as inhibitors of pathogenic fungi, including *Fusarium* [8, 9]. In our research, the biofertilizers and

biological control with Azotobacter chroococcum will be studied in terms of controlling root rot disease which is usually caused by the fungus (*Fusarium solani*). Also, its effect on the growth parameter of the tomato plant and the resistance of the *Fusarium solani* under greenhouse condition.

2. Materials and Methods

2.1. Isolation and diagnosis of Fusarium from tomato plants

2.1.1. Sample collection

Samples were collected from the roots of tomato plants grown in greenhouses from some farms in Baghdad city, which showed symptoms of infection. The samples were placed in polyethylene bags, transferred to the laboratory, and then kept in the refrigerator until the isolation process was performed.

2.1.2. Isolation from infected tomato plants

The roots of tomato plants were rinsed under tap water for 30 minutes to remove the suspended soil, chopped the roots into small pieces, and disinfected with sodium hypochlorite solution (1%) for 3 minutes and rinsed with sterile distilled water for 2-3 minutes and then dried using sterile filter papers. The pieces were placed on Potato Dextrose Agar (PDA) plates. The plates were then incubated at (25± 2 °C)/ 5 days. Microscope examinations were then carried out of the growing fungi colonies. The colonies of the *Fusarium* appeared which were transferred to fresh PDA medium.

2.1.3. Diagnosis of Fusarium

Fusarium solani has been diagnosed based on certified classification keys [10, 11].

2.2. Pathogenicity test

Four isolates of *F. solani* were taken from roots of tomato plants and tested based on [12] process. PDA disk of 0.5 cm/ 7days old Fungus colonies were put in the center of water agar medium petri dishes. Other petri dishes used as a control treatment, and containing the same medium but not inoculated with fungus. All petri dishes (inoculated and non-inoculated) were incubated at 25±2°C for 72 hours. After that, the local cabbage seeds were sterilized using 1% solution sodium hypochlorite for 2 min and then washed with distilled water 3 times and then twenty five seeds were cultured circularly edge of inoculated and non-inoculated petri dishes. This culture was done twice so end up with 3 treatments for each. Then they were incubated at 25 ± 2°C. Seven days later, the percentage of seed germination calculated using:

$$\text{The Percentage of germination} = \frac{The\ number\ of\ seeds\ \ germinated}{The\ total\ number\ of\ seeds} \times 100$$

2.3. The pathogenicity of Fusarium solani on tomato plants under greenhouse conditions

This experiment was conducted in greenhouse of Agriculture College / Baghdad University in 20/12/2019 and it was done in three randomizelly replicate. This experiment was included in fungal treatment and control treatment without fungal inoculum. The plastic pots were filled with sterile soil, tomato seedlings were transplanted in each pot at 35 days after sowing. Previously, the fungal inoculum was prepared according to the [13], the inoculum was added after 3 days from seedling transplant to pots. The percentage of disease severity was calculated after 30 days based on [14] equation by the following.

$$\text{Disease severity}(\%)=\frac{(\sum scale \times number\ of\ plants\ infected) \times 100}{Highest\ scale \times total\ number\ of\ plant}$$

0 refers to healthy plants

1 = 1- less than 25% of the plant root are slightly brown color.

2 = 25- less than 50% of plant roots are a dark brown color.

3 = 50- less than 75% of plant roots are a dark brown color.

4 = 75- less than 100% of plant roots are a dark brown color.

2.4 Isolate and diagnose of Azotobacter chroococcum

Soil samples were collected from rhizospheric soil from the rhizosphere of the different crops (tomato, wheat, cotton). About 10 g of dry soil sample was put in 90 ml of D.W in a conical flask. Basic dilution was prepared to 10-6. Bacterial isolation was performed based on [15] manner. *Azotobacter chroococcum* were identified phenotypically based on their appearance under the microscope and biochemical test. Later on, *Azotobacter chroococcum* strain (A.ch1) was used in a greenhouse experiment due to its high ability against the pathogenic fungal.

2.5. Antagonistic effect of A. chroococcum against F. solani (F.s4)

For studying the antagonistic effect of *A. chroococcum* bacteria against *F. solani* (F.s4)., PDF plates were inoculated with two days old bacterial colony by streaking with needle on opposite sides of periphery plates. Each plates then were inoculated in the center with *F. solani* (F.s4) disk as control and incubated at (28)°C. Antagonistic effect of pathogen fungal growth on control petri dishes surface was calculated by [16].

$$\text{Inhibition percentage } \% =\frac{A_1 - A_2}{A_1} \times 100$$

Where the A_1 refers to the fungus growth area on the control surface.

A_2= refers to the fungus area in the dual culture.

2.6. The effect of A. chroococcum on rot disease under greenhouse condition

The experiment was carried at greenhouse during 2019 following a completely randomized design. There were 3 replication for each treatment. Antagonistic bacteria isolates was cultured on Nutrient agar plates (28°C/45 hours). Then, bacterial suspension of (108CFU/ ml) was prepared by using distil water and O.D of 0.1(600nm) [spectrophotometer model 6405UV/ VIS].The plastic pots (2 Kg capacity) were filled with a mixture of sterile soil and peat-moss 2:1,afterthat seedlings were transplanted to pots (30 days after sowing). The experiment was included in the following treatments (Table 1).

Table 1. Treatments of experiment.

Symbol treatment	Treatment
T1	*F. solani* (F.s4) only (pathogen only)
T2	Biofertilizer at concentrations (5ml\2Kg soil) with *F. solani* (F.s4).
T3	Biofertilizer at concentrations (10 ml\2Kg soil) with *F. solani* (F.s4).
T4	Biofertilizer at concentrations (15ml\2Kg soil) with *F. solani* (F.s4).
T5	Biofertilizer at concentrations (20ml\2Kg soil) with *F. solani* (F.s4).
T6	Biofertilizer at concentrations (25 ml\2Kg soil) with *F. solani* (F.s4).
T7	Chemical fertilizer only (Beltanol 1ml\L) with *F. solani* (F.s4).

The some pots were inoculated with the *A. chroococcum* (A.ch1) at concentrations (5, 10,15,20,25 ml\2Kg soil). It was applied 7 days before fungal inoculation millet seeds which contain on *F. solani* (F.s4) isolate. Some pots were treated with a chemical fungicide. The fungicide was applied one day before fungi inoculation. The plants were harvested and calculated the following:

- Disease severity.

- Height and weight of shoot (dry and fresh).

- Number of leaf and flower.

- Weight of one fruit per plant.

- Number of fruit per plant .

- Yield fruit.

2.7. Data analysis

ANOVA variance analyzer with the aid of GENSTAT computer software package were used to analyze the data and the means different between treatments were compared by using 0.05 probability level.

3. Results and Discussion

3.1. Isolation and diagnosis of Fusarium spp. from tomato plants

The colonies of 4 *Fusarium solani* isolates showed creamy pigmentations. The thin microconidia were oval to ellipsoid shaped. The macroconidia were subcylindrical, usually predominantly with three septate. The chlamydospores were single, in pairs, chains or clusters, arranging terminal or intercalary.

3.2. Pathogenicity tests

Table (2) showed that all isolates *Fusarium solani* were caused a significant reduction in the percentage of seed germination compared to control treatment. The results revealed that isolate *Fusarium solani* (F.s4) was more virulent than other isolates. These results may be attributed to that *Fusarium solani* are secreted many toxins such as (Fusarubin, Javanicin, Polypetide, Anhydrofusarubin, and Protenoneons) that is important in pathogenicity [17].

Table 2. Pathogenicity tests of *Fusarium solani* (F.s4) on cabbage seeds.

Isolates	Percentage of germination
***F. solani* (F.s1)**	11
***F. solani* (F.s2)**	9
***F. solani* (F.s3)**	14
***F. solani* (F.s4)**	7
Control	95
LSD=0.05	1.97

3.3. The pathogenicity of Fusarium solani on tomato plants under greenhouse conditions.

Disease severity was recorded after 30 days of transplantation. Disease severity of root tomato was found within the range of 48.10-73.10 %. The isolate *Fusarium solani* (F.s4) has maximum disease severity was further used in the experiment. As well as, three isolates (F.s1, F.s2, F.s3) were the least aggressive disease severity compared with isolate (F.s4) Table (3). [18] found that isolates have different abilities to the secretion of analyzing enzymes that play role in penetrating the plant roots.

Table 3. The pathogenicity of *Fusarium solani* on tomato plants under greenhouse conditions.

Isolates	Disease severity%
***F. solani* (F.s1)**	52
***F. solani* (F.s2)**	55.10
***F. solani* (F.s3)**	48.10
***F. solani* (F.s4)**	73.10
control	0
LSD=0.05	1.85

3.4. Isolate and digamous of the Azotobacter chroococcum and inoculum prepare.

Tables (4, 5, 6) shows the morphological, microscopic characteristics, and physiological test of bacterial isolates of rhizosphere of tomato, wheat, cotton crops. Colonies of bacteria exhibit viscous, brown-color, on pairs resampling *Azotobacter chroococcum* in its characteristics. Bacteria were gram-negative with rounded ends. These results were similar to as described by Bergey's manual of Determinative Bacteriology [19]. Table (7) reports the biochemical patterns of bacteria tested in this study. Three *A. chroococcum* isolates were positive in each test. Also, these bacterial shows cannot able to grow on Burk's medium and the same was used inoculation.

Table 4. Colonies morphology characteristics of *Azotobacter chroococcum*.

Morphological characters	*A. chroococcum* (A.ch1)	*A. chroococcum* (A.ch2)	*A. chroococcum* (A.ch3)

control	8.00	0.0

3.6. Evaluation of A. chroococcum against root rot disease some growth parameter of tomato plants in greenhouse environmental condition

Table 8 reported *A. chroococcum* and Beltanol treatments with pathogens were led to the lowest disease severity compared with pathogen treatment only. Also, *A. chroococcum* (25 ml/2Kg soil) with pathogen treatment was recorded highest disease severity (0.0%) compared with other treatments treated with the pathogen. Plant height records of growth parameters have been noticed in tomato inoculation with *A. chroococcum* (25ml/ 2Kg soil) with *F. solani* (F.s4). All treatment inoculation with *A. chroococcum* gave higher records of growth parameters in combination with control. Inoculation of *A. chroococcum* can increase plant growth through the ability of bacteria to synthesis IAA, fix nitrogen, provide P nutrients, and other elements [20]. The production of plant growth regulates by bacteria in the rhizosphere around roots was increased by the fixation of nitrogen [21]. The weight of one fruit recorded increase due to the application of *A. chroococcum* in combination with T1 (treated with pathogen only) (Table 9). The maximum weight of one fruit was recorded from the untreated plants. The fungicide application significantly increased the weight of one fruit. These results are in

agreement with [22] who found that inoculation with *A. chroococcum*, Alipoferum+ NPK resulted in earlier flowering, increasing fruits, and increased yields. *A. chroococcum* has many benefits like N2 fixing, antibacterial and antifungal production growth regulators, and siderophores. It is reported that the application biofertilizer such as *Azospirillum*, *Azobacter* and *Bacillus* sp. significantly increased tomato fruits and total yield/fed compared with control [23].

Abstract. This research included evaluating the efficacy of plant aqueous extracts for myrtle *Myrtus communis*, *Nerium oleander*, *Eucalyptus* spp. and *Bacillus thuringiensis* on adults of the house fly *Musca domestica* L. under laboratory conditions at a temperature of 2 ± 28 ° C and with a humidity of 50-70 %. it was found that the highest rate of laying eggs was in the extract of eucalyptus leaves, where the number of eggs laid was 60 eggs on average and at a concentration of 5%, while in the concentration of 10% the average egg was 55 eggs then In the extract of the leaves of the oleander was at a concentration of 10% at a rate of 50 eggs and in control treatments the number of eggs reached 80 eggs and the results showed the highest death rate for adults before laying eggs was in the extract of the eucalyptus leaves at a concentration of 15% where the death of 6 adults and the lowest percentage of death by 5% was recorded One adult death and the highest rate priest for eggs, with a concentration of 10%, reached 94%, and the highest percentage of larval mortality reached 68.12%, with a concentration of 10% in the transactions of extract of oleander leaves, and in it also the highest rate of exclusion is 31.93%. The third larval stage with a concentration of 5% with a ratio of 3.67 days and the highest incidence rate in the third larval stage with a concentration of 2.5% at a rate of 26.70% and the lowest incidence rate of 6.70% with a concentration of 2.5% and 5% and 7.5% in the first and second stages respectively and the lowest dawning rate was recorded in the larval phase the first with a concentration of 2.5% at 16.66% and the highest deformation rate in the third larval stage with a concentration of 7.5% at 66.66%. As for its effect on the number of eggs was a rate of zero% of all concentrations (2.5%, 5% and 7.5%) compared to 80 control egg either its effect on the longevity of the adult was the highest rate of longevity amounting to a concentration of 7.5% by 5.33 day..

Keywords. House fly, *Musca domestica*, Myrtle, Oleander, Eucalyptus, *Bacillus thuringiensis*.

1. Introduction

The The house fly (*Musca domestica*) is considered the most common among all other types of flies, accounting for 90% of all types of flies in human housing all over the world, as it is one of the most important insects spread widely around the world, especially in warm regions [1]. Where it lives in association with humans and poses a major threat to public health due to its ability to transmit intestinal parasites and other pathogenic microorganisms [2]. Adults can emergence from pupa in as

little as three and a half days at 35º C and five days under normal conditions, while there may be a need for several weeks under adverse conditions [3]. Despite the effectiveness of chemical control methods for flies, they have become resistant to many chemical groups, which prompted researchers to turn to modern control methods, like the use of microbes and plants control [4, 5]. The bacteria *Bacillus thuringiensis* is a widely used biocide against biological microbes in controlling harmful insects [6]. As it is natural, degradable and safe for pest control based on the insecticide activity of *Bacillus thuringiensis*, commercial biopesticides have been developed to control larvae of Diptera, Lepidoptera, and Coleoptera [7]. Several compounds and plant extracts were evaluated for their toxicity and effect and for reducing the density of different species of double winged flies, especially house flies, including petroleum-ether extracts of *Griffonia simplicifolia* and *Zanthoxylum xanthoxyloides* were evaluated as toxic to house flies [8] . The secondary metabolites in plants work with different mechanisms to affect the life of the insect. They may be contraindicated to nutrition, some of which affect the effectiveness of digestion, reduce the metabolism, or have a repellent effect for the feeding stages of the insect, or be toxic to the insect's tissues, or they may affect the biosynthesis process of chitin thus preventing the phases shedding. The larva and its development, or the nymph, and finally it may affect the productivity of the adult insect, such as preventing egg laying, leading to sterility of adults, or preventing the meeting of the sexes for the same species [9]. The study was conducted with the aim of determining the biological effect between plant extracts and bacteria on house flies *Musca domestica*.

2. Materials and Methods

2.1. Insects breeding

The larvae of house flies were collected from north of Baghdad city were transferred to the insect laboratory . They were divided and placed in 500 gm plastic containers containing larvae feeding and colony maintenance media consisting of 100 gm of floating fish meal consisting of phosphories 1.8%, Ash 10-15%, Crude Fiber 6-8%, Crude fat 8-10%, Crude protein 30 ± 2%) produced by company from Iran and obtained from the local market after being milled and sterilized with an Autoclave at a temperature of 121 degrees 1 centigrade and pressure 1 atmosphere for 25 minutes, 200 ml sterile distilled water and 10 g of dry yeast were added to it, and the center of the feeding was divided on plastic pots, which were transferred to wooden crates with dimensions (30*30*30 cm) made of wood and covered with muslin cloth (with Small porces prevent the exit of the insect.) After the larvae reached the third stage, sawdust were placed on the edges of the pots in order for the larva to dwell and transformed into a pupa, and after 6-7 days of excuses, the virgins began to emerge, and in order to feed the budding adolescents and maintain the group. A clove of a container containing 50 grams of sugar powder and powdered milk (1: 1) (weight: weight) to feed the whole grains and a bottle filled with water and the nozzle of it covered with cotton 12 light: 12 dark hours.

2.2. Preparing plant extracts

Collected plant leaves (myrtle, oleander, eucalyptus) the leaves were washed in running water well several times and left to dry completely in a dark place , at room temperature, taking into account constant stirring to prevent rotting, then these dried leaves were ground using an electric grinder sterilized using sterile alcohol, and after grinding them well, they were placed in sterile cans . The plant extracts were prepared according to the method of [10], where 25 g of each dried plant was weighed and dissolved with 250 ml of distilled water and placed in a Soxhlet extractor for 7 hours at a temperature of 45 ° C and then filtered. Using filter paper, then dry the raw extract produced by a Rotary Evaporator until it becomes in a powder form, and is well preserved until use in the transactions.

2.3. Study of the effect of plant extract concentrations on whole house flies

Prepared 12 wooden crates (30*30*30) cm , in each box, a plate containing 30 grams of whole milk, consisting of (15 grams of milk powder + 15 grams of sugar) was placed and added to it The three concentrations of each extract (myrtle, oleander, eucalyptus) (5,10,15%) for each one of them plus the comparison treatment In another vessel, water was placed for her to drink, where the mouth of the vessel was covered with cotton , a pair of camels, a male and a female, were entered into each cage, and the observation and examination were carried out, and for each repeat a pair of whole house flies (1 male: 1 female) was entered at the age of two days, and the daily monitoring and recording of the effect of the extract on the pair of adults and their survival time and its effect on the laying of eggs and hatched larvae and their duration of survival and the resulting distortions.

2.4. Study of the effect of bacteria on adults house flies

In the first group, three previously described wooden crates (representing 3 replicates) were prepared. In each duplicate, a plate consisting of 30 gm of adult food was placed (15g milk powder + 15g sugar) and 0.075g of the biocide *B.t.k.* was added to it. (It represents a concentration of 2.5%), the materials were mixed well for a minute with each other and in another container put drinking water and the mouth of the vessel was covered with cotton The second group included three cages representing three replicates, each one containing a food dish with 0.15 gm (5% concentration) added to a bacterial pesticide in addition to a bowl of water, while the third group included the same previous details with the addition of the bacterial pesticide at a concentration of 7.5% at 0.21 g per dish in addition to cages the comparison, which contained only food and water, included in each repeat a pair of whole house flies (1 male: 1 female) at the age of two days, and daily monitoring and recording of the effect of the biocide on the pair of adult and their survival time and its effect on laying eggs and hatched larvae and their duration of survival and deformities were carried out.

2.5. Statistical analysis

Completely Randomize Design (CRD) was followed in the implementation of the experiments, and the percentages of larval decay were corrected based on the [11] equation which states:

$$\text{Loss\%} = \frac{Perishing\ in\ comparison - Perishing\ in\ the\ treatment}{100 - Perdition\ in\ comparison} \times 100$$

3. Results and Discussion

3.1. Study of some biological aspects of the house fly by adding different concentrations of plant extracts to the diet of adults

It is evident from the results of the table(1) that the highest rate of egg laying was in the eucalyptus leaf extract, where the average number of eggs laid was 60 eggs at a concentration of 5%, where at a concentration of 10%, the rate of eggs laid was 55 eggs, where in the extract of the leaves of the oleander it was at a concentration of 10 An average of 50 eggs, and in the control factors, the number of eggs was 80 eggs , the results of the statistical analysis showed that there are high significant differences between plant extracts and the reason for the low female productivity is that the chemical compounds contained in the plant extracts inhibit the insect's nutrition while it is in the larval stage, which led to the inhibition of egg formation later because this process depends on the active substances that were stored during Larval feeding , whereas the toxic effect of myrtle plant is due to monoterpens. He confirmed that these compounds affect the female reproductive system of insects and

reduce the number of eggs produced from each ovary [12]. The results of the statistical analysis showed that there were significant differences between the death rates of adult females before laying eggs, as some of the adults did not lay eggs because of their infertility, no eggs were laid, and some adult deaths were recorded before laying eggs in eucalyptus extract at a concentration of 5%, and some adult deaths were recorded before laying eggs in eucalyptus and oleander extract at a concentration of 10%. In the control treatments, the adult mortality rate was 0% in the myrtle and babble treatments, the reason for the superiority of myrtle leaf extract over eucalyptus in reducing the life expectancy of male and female adults is due to the fact that myrtle leaf extract contains compounds that are more toxic than the compounds in eucalyptus leaf extract, which led to the death of adult females in a faster time compared to eucalyptus extract, whose effects were slow and not. Shows clear adult toxicity when food is treated.

Table 1. The biological aspects of the *Musca domestica* house fly by adding different concentrations of plant extracts to the adult death.

CON. / Extract	Number of eggs				Mortality				Longevity of females				Longevity of males			
	5%	10%	15%	control	5%	10%	15%	control	5%	10%	15%	control	5%	10%	15%	control

	0.577	0.577	0	0.577	0	0	0	0	0.58	0.33	0	0.33	0.33	0	0.33	0.58
LSD	*0.69				*				N.S				N.S			

NS means that there are no significant differences, and * means that there are significant differences between some treatments between the probability level ($0.05 \leq p$) according to the LSD test.

It is agreed with [13] that the extract of crude terpenes for leaves and fruits of *C.spinosa* had a significant effect on some life performance parameters of the house fly, as the productivity of females treated with leaf and fruit extract decreased from 1147 eggs / female in control factors to 498 and 555. Egg / female, respectively, at a concentration of 20 mg / ml.

3.2. Study the biological aspects of the house fly by adding different concentrations of plant extracts in the death of adults to the laid eggs

The results of Table (2) showed that the highest rate of laying eggs was in eucalyptus extract, where the number of eggs laid was 60 eggs on average with a concentration of 5%, but at a concentration of 10%, the rate of eggs laid was 55 eggs, and then in the extract of leaves of oleander, it was at a concentration of 10% at a rate of 50 eggs compared to the treatments. Control where the number of eggs reached 80 eggs. The reason for the difference in the rate may be due to the different nature of the active substances present in the plants used with food and their effect on the performance of the reproductive system. It has been found that limonene, which is one of the volatile compounds found in plant extracts, which inhibits growth and reproduction and has a toxic effect on the nervous system of insects in several types of insects. a number of researchers have confirmed its presence in the eucalyptus and myrtle plants. The results of the statistical analysis showed that there were significant differences between the rates of egg hatching, where the highest percentage of eggs hatching was recorded in the oleander leaf extract at a concentration of 10%, reaching 94%, followed by the

eucalyptus extract at a concentration of 5%, at 86.67%, compared with the control treatment for eucalyptus 93.75% and the guava 96.25%, respectively. The cause of egg decay may be attributed to the effect of toxic substances in the extracts on the biological systems of the embryo, or to impede the gas exchange inside the egg, which leads to its destruction. The failure to hatch eggs in general may be due to the fact that the secondary compounds present in myrtle and eucalyptus were Toxic to the embryos and led to failure of hatching eggs [14], the results showed that there were high significant differences between the mortality rates of larvae after hatching, as the highest percentage of mortality was 100% in eucalyptus leaf extract, followed by the oleander leaf extract at a concentration of 10%, reaching 68.12% compared to the control factor, where it reached 0%. and there were no significant differences between the exclusion ratios for the larvae, as the highest percentage of exclusion was reached in the extract of oleander, at 31.93%. The results showed significant differences between the rates of eruption failure, as the highest rate of eruption failure was 100% in all concentrations of ace and eucalyptus and in oleander at a concentration of 5% and 15%, and the lowest rate of emergence in oleander extract at a concentration of 10% at a concentration of 33.30% compared to control, where it was 0%. The results of the statistical analysis showed significant differences between the deformation rates of the buds, as the lowest deformation percentage reached 0% in all concentrations of myrtle and eucalyptus, respectively, and the highest deformation percentage in the oleander extract at a concentration of 10% by 30%. Organic extracts produce pupae with deformed shapes, and adults who have successfully exited often suffer from wing reduction.

Table 2. The biological aspects of the house fly by adding different concentrations of plant extracts in the adult death to the laid eggs.

Con. / Extract	The percentage of hatchability				The percentage of larvae mortality after hatching				Percentage pupa				Emerges failure				Distortion ratio

3.3. Study of the effect of adding concentrations of Bacillus thuringiensis to the whole food of house fly

The results of table (3) proved that no eggs were laid for adult domestic flies in all concentrations compared to the control factor, where the number of eggs was 80 eggs, as well as the results showed that there were no significant differences between the longevity of adult females, where the longest life span for adults was 5.33 days with a concentration of 7.5% and the lowest age for adults was 4.33 A day compared to the control was 5 days.

Table 3. Effect of addition of *Bacillus thuringiensis* bacteria to the death of *Musca domestica* whole flies.

Bacterial concentration	The number of eggs for the adult	Adult longevity
2.5%	0.00 b©	4.33 a
%5	0.00 b	4.67 a
%7.5	0.00 b	5.33 a
Control	80.00 a	5.00 a
LSD	-	N.S

Multiple comparisons cannot be calculated as its standard errors are zero

The cause of death of adult adults is that the microscopic crystals that they eat with food turn into toxic protein particles that destroy the stomach walls, so the insect stops feeding within hours after exposure to the bacteria and dies within 2 to 5 days [15]. This is in agreement with [16], who proved that females treated with *B.t.k* bacteria lay the lowest rate of eggs, ranging between 24 - 42 eggs as a maximum, compared to normal treatments that lay eggs at a rate of 33-59 eggs.

Abstract. The interface between the ions in groundwater affects the biogeochemical behaviour of metal, and metal bioremediate by bacteria. Therefore, this study was aimed to predict the influence of pH, calcium, phosphate and humic acid on cadmium availability in artificial groundwater (AGW). Speciation and the thermodynamic calculation (MINTEQ program) were used to predict this in AGW theoretically. In results, cadmium availability diminished with an increase in pH, increase of calcium concentration and the addition of phosphate and humic acid of AGW. According to MINTEQ program, cadmium binds to some cations leaving fewer free cadmium ions available in AGW such as $CdHCO_3^+$, $Cd(SO_4)_2^{2-}$, $CdCl^+$, $CdHPO_4$, HA1-Cd, FA1-Cd, FA2-Cd, and HA2-Cd. It is suggested though that pH in AGW is maintained at pH 4.00 for best availability of cadmium and bioremediate by bacteria.

Keywords. Availability, cadmium, calcium, groundwater, humic acid, pH, phosphate, speciation.

1. Introduction

The Metals speciation and availability in environments and their biogeochemical activities are the main area of research for biochemistry and ecotoxicology of metals [1]. This is important since chemical or mineral speciation is a crucial factor inducing; the solubility, mobility, bioavailability, bioaccumulation, biodegradability, persistence and toxicity [2]. Metals can occur in environments as free metal ions and/or complexed with inorganic components or organic ligands. Is typically, the dissolved and transferrable forms of metals are well-known as bioavailable. Comparably, the fraction of a metal that forms as a portion of the solid-phase minerals may not be bioavailable [3]. Therefore, it is impossible to measure the total metal concentration as its concentration is often insufficient to clarify its ions. Expecting metal speciation has increasingly gained inclusive application as an active constituent of environmental chemistry in enhancing our knowledge of studies such as agriculture, pollution risk assessment or remediation. Cadmium is considered as a serious environmental issue because of its toxicity, non-biodegradability and bioaccumulation [4]. The contamination of

groundwater with cadmium has become a global challenge, and more effective methods for removing cadmium are required. The bioavailability and toxicity of cadmium in water are strongly affected by the cadmium forms. Predication of metal speciation aids our understand of metal performance in water and few analytical techniques are used to estimate metal speciation in water such as sorption onto C18 columns, anodic stripping voltammetry, ion-selective electrodes and competitive ligand equilibration/adsorptive stripping cathodic voltammetry [5]. Nevertheless, these methods are acknowledged as very time consuming in sample preparation. Alternatively, the use of geochemical speciation software programs offers a rapid method to establish metal speciation such as Visual PHREEQC, CHEAQS, ORCHESTRA, ECOSAT, CHESS and MINTEQ. These geochemical speciation software programs can predict metal speciation theoretically. This study, aimed to predict the cadmium speciation in typical groundwater without any contamination; AGW was prepared in the laboratory, and cadmium speciation was then predicated under the contamination of a change in pH, an increase of calcium concentration and the addition of phosphate and humic acid.

2. Materials and Methods

2.1. Cadmium precipitation and speciation

2.1.1. Uncontaminated AGW

The component of AGW is specified in Table 1 (first column, Cd-AGW), according to [6]. To theoretically assess the experimental conditions of Cd-AGW, the inorganic chemical speciation at 22°C was calculated using the geochemical speciation software Visual MINTEQ, version 3.1 [7]. The input file contained the components and concentrations of AGW, with a nominated concentration of 10 µM Cd at pH 7.00; (Table 1), oversaturated solids were allowed to precipitate, ionic strength was calculated, and activity corrections were performed after Davies. Redox calculations were not performed.

2.1.2. Contaminated AGW: Chang the pH, increase of calcium concentration and the addition of phosphate and humic acid

The inorganic Cd speciation at different pH values (fixed at pH 4.00, 7.00, 7.50, and 8.50, respectively) was calculated. At pH 8.50, calcium carbonate species (e.g., calcite) and Cd carbonate (otavite) were predicted to precipitate, and the proportion remaining in the AGW was 84.9% of Ca2+, 4.8% of Cd2+, and 76.5% of CO32-. The otavite precipitation predicts that only 0.48 µM remained in AGW as Cd2+. Consequently, the experiment was not run at pH 8.50. The concentration of calcium in AGW was increased from 1.75 to 17.5 mM, applied as CaCl2. Similarly, the effects of the higher concentration of the anion on the cadmium speciation were studied by adding phosphate (10 mM), which does not consist of AGW. Phosphate (10 mM) consisted of two components of 6.15 mL of K2HPO4 (1 M) and 3.85 mL of KH2PO4 (1 M) in a litre. Humic acid constitutes the significant fractions of OM in natural water, which consists of 90% of the total dissolved organic carbon (DOC) [8]. Thus, humic acid (Sigma-Aldrich) was added at the concentration of 10 mg/L to Cd-AGW. This concentration of humic acid was chosen as the average concentration is presented in natural water [9]. With the addition of humic acid (10 mg/L), the NICA-Donnan model in Visual MINTEQ was used. It was found that the parameters and constants for a ‘generic’ fulvic acid were assumed to be 82.5% of the input; dissolved organic carbon (DOC) consists of fulvic acid with a carbon content of 50% (the portion designated ‘active’ concerning metal complexation because humic acid is assumed not to be dissolved in solution), as described by [10]. Fifty percent was in a DOC: DOC ratio of 1.65, which is an average based on stream and lake sediments from the Swedish environmental monitoring network. However, default parameters were used for VMINTEQ for humic acid: 1.4. The total molar

concentration of DOC was10 mg/L (gave 551% C in HA), which is equal to 459 µM. Therefore, the input parameter for humic acid is 459 µM (Table 1).

Table 1. The input file of software Visual MINTEQ contained the components and their concentrations in AGW with a concentration of 10 µM Cd at pH 7.00 under the increase of calcium concentration (17.5 mM) and the addition of a phosphate (10 mM) and humic acid (10 mg/L).

Component	Concentration (µM)			
	Cd-AGW	Increase of $CaCl_2$	Addition of phosphate	Addition of humic acid
Ca^{2+}	1750	17500	1750	1750
Cd^{2+}	10	10	10	10
Cl^-	1750	17500	1750	1750
CO_3^{2-}	1162	1162	1162	1162
K^+	103	103	103	103
Mg^{2+}	448	448	448	448
Na^+	1144	1144	1144	1144
NO_3^-	44	44	44	44
PO_4^{3-}	*	*	10000	*
SO_4^{2-}	448	448	448	448
Humic acid	*	*	*	459

*No component added.

2.2. Statistical analysis

ANOVA followed by Tukey post hoc was performed on the data of Cd species distribution of AGW with a concentration of 10 µM Cd, which predicted using Visual MINTEQ to find the differences under the effect of different factors on the percentages of Cd species.

3. Results and Discussion

3.1. Cadmium precipitation

At pH 7.50, the calculations revealed the precipitation of otavite (80% of the added Cd concentration), as shown in Table 2, leaving a dissolved concentration of 2 µM in AGW. At pH 7.00, the calculations indicated that the precipitation of otavite (57.7% of the added Cd concentration), leaving a dissolved concentration of 4.22 µM in AGW. It has been recently reported by [11] that cadmium could be precipitated at alkaline pH (>8.00). The calculations revealed the potential loss of Cd from the solution, as the initial concentration in the AGW was 10 µM Cd. At pH 4.00, the calculated saturation index for all species was negative, and Cd was not predicted to precipitate.

Table 2. Effect of pH on the percentages of dissolved and precipitated components in AGW with a concentration of 10 µM Cd. The percentages of values were predicted using Visual MINTEQ.

Component	pH 4.00		pH 7.00		pH 7.50	
	Dissolved (%)	Precipitated (%)	Dissolved (%)	Precipitated (%)	Dissolved (%)	Precipitated (%)
Ca^{2+}	100	0.00	100	0.00	100	0.00
Cd^{2+}	100	0.00	42	57.7	19.5	80
Cl^-	100	0.00	100	0.00	100	0.00
CO_3^{2-}	100	0.00	99	0.40	99	0.40
K^+	100	0.00	100	0.00	100	0.00
Mg^{2+}	100	0.00	100	0.00	100	0.00

Na^+	100	0.00	100	0.00	100	0.00
NO_3^-	100	0.00	100	0.00	100	0.00
SO_4^{2-}	100	0.00	100	0.00	100	0.00

However, when CaCl2 was increased from 1.75 mM to 17.5 mM (for the removal process under cation competition), the calculated saturation index for all species was negative, and no precipitation was predicted (Table 3). The dissolved Cd concentration at the beginning of the experiment can be assumed as 10 µM, and the initial measured concentration was approximately 10 µM. Also, the addition of a phosphate (10 mM) showed no potential precipitation of Cd in AGW (Table 3). The NICA-Donnan model indicated that there was no Cd precipitated (Table 3), leaving a dissolved concentration of 10 µM in the test AGW. The measured and predicted dissolved Cd concentrations were the same, due to the low concentration of humic acid, which explains the lack of Cd complexation with the humic acid. [12] used 200 mg/L of humic acid, which is higher than the concentration in this study, and they found that the log activities of binding of $Cd(OH)_2$ and $CdOH^+$ with humic acid were -9.5 and -8.4 mol/L, respectively. While, in this study, the log activities for the same species of Cd were low -11.5 and -8.5 mol/L, respectively.

Table 3. Effect of increased calcium (17.5 mM), additional phosphate (10 mM), and humic acid (10 mg/L) on the percentages of dissolved and precipitated components in AGW with a concentration of 10 µM Cd. The percentages were predicted using Visual MINTEQ.

Component	Calcium (17.5 mM)		Phosphate (10 mM)		Humic acid (10 mg/L)	
	Dissolved (%)	Precipitated (%)	Dissolved (%)	Precipitated (%)	Dissolved (%)	Precipitated (%)
Ca^{2+}	100	0.00	0.59	99.4	100	0.00
Cd^{2+}	100	0.00	100	0.00	100	0.00
Cl^{1-}	100	0.00	100	0.00	100	0.00

HA2					100	0.00

* No component added.

3.2. Cadmium speciation

Predicting Cd speciation in AGW versus pH showed that Cd^{2+} was the dominant type in AGW with a concentration of 10 µM Cd at a different pH (**Error! Reference source not found.**A, $^a p<0.05$), compared to other dissolved Cd species. Similarly, $CdCl^+$ recorded no differences at different pH values (**Error! Reference source not found.**A). The appearance of $Cd(SO_4)_2^{2-}$ at pH 4.00 and 7.00, which disappeared at pH 7.50, showed no significant differences between pH 4.00 and 7.00. The occurrence of $CdHCO_3^+$ was the unique species predicted at pH 7.00 and 7.50 (**Error! Reference source not found.**A, $^c p<0.05$). The effect of increased Ca concentration (17.5 mM) of Cd speciation in AGW at pH 7.00 showed Cd^{2+} was lower than the value recorded at a natural concentration of Ca (1.75 mM). However, Cd^{2+} was the dominant species and showed significant differences (**Error!**

Reference source not found.B, [a]p<0.05) compared to other Cd species. However, $CaCl^+$ was predicted to be 41%, which was higher than the percentage recorded at the initial concentration of $CaCl_2$ (1.75 mM). Moreover, both species of $CdHCO_3^+$ and $Cd(SO_4)_2^{2-}$ were predicated at an increase of Ca as a natural concentration of Ca (1.75 mM), without any differences between them (**Error! Reference source not found.**B, [c]p<0.05). While the addition of a phosphate (10 mM) showed that the domain of Cd species was $CdHPO_4$ (89%), the presence of other Cd-species was rare. Fraction Cd^{2+} was the highest predicted percentages (9.2%) among $CdCl^+$, $Cd(SO_4)_2^{2-}$, $CdHCO_3^+$, and $CdCO_3^+$ (**Error! Reference source not found.**C). Similarly, as Cd^{2+} was the dominant species in AGW at pH 7.00, with the addition of humic acid (10 mg/L) into the AGW, Cd^{2+} was the dominant species (84%), followed by $CdCl^+$ (10%, Figure 1D).

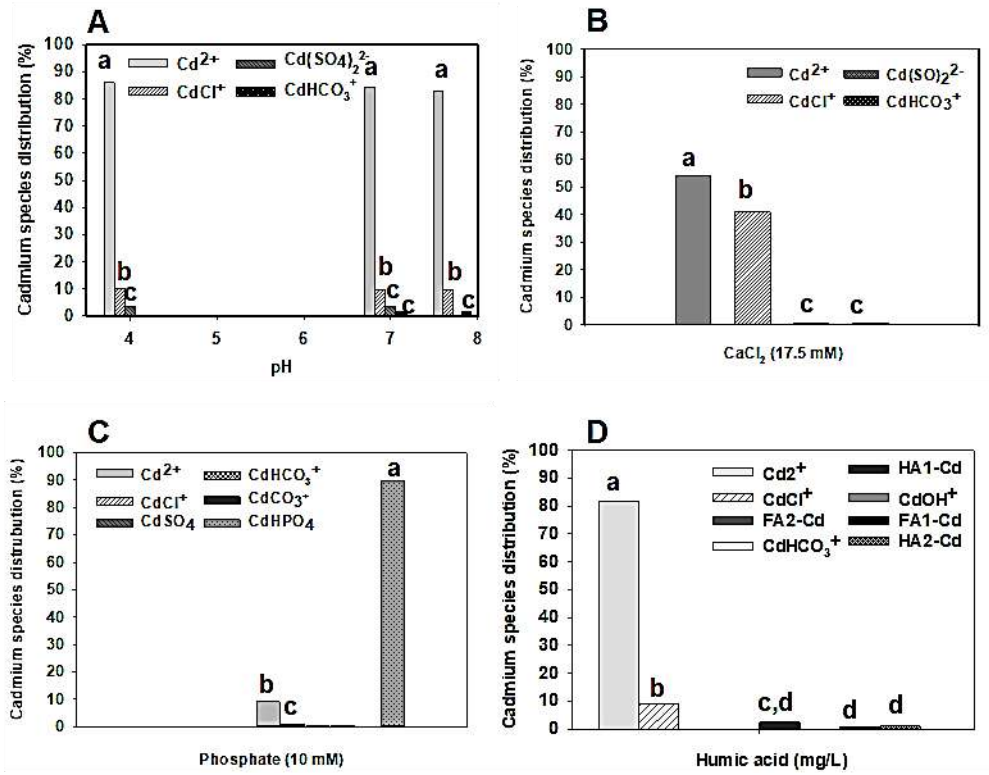

Figure 1. The effect of different factors on the percentages of Cd species distribution of AGW with a concentration of 10 µM Cd, predicted using Visual MINTEQ. (A) At pH 4.00, 7.00, and 7.50, (B) increase of calcium (17.5 mM), additions, (C) phosphate (10 mM), and (D) humic acid (10 mg/L) on Cd speciation in AGW. The Cd species were subjected to two-way ANOVA, Tukey *post hoc* test, and a different letter indicates a significant difference between Cd species under different factors.

With the use of two types of Cd-binding with fulvic and humic acids in the NICA-Donnan model, complex HA1-Cd occurred in addition to other complexes in rare percentages (FA1-Cd, FA2-Cd, and HA2-Cd) as well as the occurrence of fractions $CdHCO_3^+$ and $CdOH^+$. The complexation of Cd with humic acid (Cd-HA) was predicted as this complex is the most formed complex with Cd [13].

4. Conclusion

The ions of cadmium diminished with increase in pH of AGW, in which cadmium binds to cations present in water, leaving less availability of cadmium ions. Increase of calcium concentration and the addition of phosphate and humic acid formed of insoluble cadmium species that appeared in the water. It is recommended though that free cadmium ions were available at a pH of 4.00, which would make cadmium soluble, available and toxic.

Abstract. Garlic is rich in nutritional and medicinal value as it has been found that the water extract of garlic plant contains 31% carbohydrates and rich in elements calcium, phosphorus, magnesium, potassium, sodium, iron, zinc, manganese, vitamin C, thiamine, riboflavin, niacin and pyridoxine. The aim of this study was to investigate the effect of garlic extract (*Allium sativum* L.) on tomatoes (*Solanum lycopersicum* L.) plant. The trend is to use plant extracts in foliar and ground fertilization. Three levels of foliar application (4, 6, 8%), three levels of ground application (10, 20, 40%), one treatment 6% of foliar and 20% ground application together and the treatment of control (0) were used. The results showed that the usage of garlic extract led to a significant increase in the height of the plant 98.00 cm, chlorophyll content 46.33 spadm, increase the Carbohydrates 7.95%, the number of branches, the number of leaves, the foliar area, the dry weight of vegetative group, the number of flowers, the leaves content of nitrogen, protein and carbohydrates, fruit weight, fruit size, measurement T.S.S. and solidity of treated plant compared to control plants.

Keywords. Fruit quality, Garlic, Plant extracts, Tomato.

1. Introduction

Tomatoes esculentum belonged to Solanaceae family, its native habitat is South America and is one of the most consumed vegetables in the world with more than 120 million metric tons of global production [1], and is the second most important vegetable after potatoes in many countries of the world [2]. In Iraq, according to Food and Agriculture Organization (FAO) statistics for 2011 reported, the area under cultivation was 61,042 hectares and the production rate was 17.36 tonne. h-1. It is represent an important source of minerals, vitamins and antioxidants [3], so is grown either in open field or in covered farming systems. Statistics indicate high annual consumption rates, due to the high nutritional value, as its fruits contain ascorbic, citric and malic acid, some minerals, vitamins and pigments such as carotene and lycopene, which are a major source of antioxidants [4]. The researchers adopted the foliar application method of nutrients in supplying plants with the necessary elements to sustain their continued improvement in their growth and to achieve qualitative and quantitative improvement in the outcome [5]. Plant extracts are the products of the newly used substances to

stimulate and encourage the vegetative and flowering growth. While, the yield are consider as a source of nutrients and natural growth regulations as well as they are easy to absorb and contain effective and effective substances and natural chemical compounds that vary by different species and plant parts and may be stimulating or inhibitory to growth [6]. *Allium sativum* L. was known by many civilizations it is mentioned in many Egyptian, Greek, Indian and Chinese authors. It is a vegetable annually herbaceous crop belong to Liliaceae family [7] regenerated annually and reproductive with bulb and seeds characterized by a special scent containing active substances as: Allicin and Alliin, an effective antibiotic that contains yeasts and vitamins [8, 9]. Garlic is rich in nutritional and medicinal value as it has been found that the water extract of garlic plant contains 31% carbohydrates and rich in elements calcium, phosphorus, magnesium, potassium, sodium, iron, zinc, manganese, vitamin C, thiamine, riboflavin, niacin and pyridoxine [10]. The study aim to investigate the effect of using garlic extract in the methods of foliar and ground application growth, yield and fruit quality of tomatoes.

2. Materials and Methods

The experiment was conducted using Plastic pots 5 kg soil and 30 cm diameter in the botanical garden of Biology Department in College of Education for Pure Sciences (Ibn Al-Haitham) for the growth season 2017-2018. The seeds of the hybrid tomatoes called Jinan were obtained from agricultural equipment in the local markets planted seeds in the pots by 10 seeds in each pots on 15 January 2018, took 10 gm. of fresh garlic cloves and added 100 ml of distilled water and was mashed in an electric mixer and filtered with a soft cloth and considered the stock solution according to [11], method and the concentrations used in the experiment was prepared as follow:

Treatment (0) without treatment (control)

Treatment (1) foliar application at a concentration of 4%

Treatment (2) foliar application at a concentration of 6%

Treatment (3) foliar application at a concentration of 8%

Treatment (4) ground application at a concentration of 10%

Treatment (5) ground application at a concentration of 20%

Treatment (6) ground application at a concentration of 40%

Treatment (7) foliar application at a concentration of 6% and ground application at a concentration of 20% together.

The plants were sprayed in the early morning until the total wetness when the plant became phase 4-5 real leaves on two periods. The first date is 20/3/2018 and the second date is 20/4/2018 then took measurements on 20/5/2018. The following parameters were studied:

2.1. Vegetative growth parameters

2.1.1. Measuring chlorophyll content in leaf by Spad

Spad it's calculated with a device Chlorophyll meter equipped by a Minolta company by taking mean of three readings of three plants randomly selected from each treatment. This was done by placing the most exposed part of the leaf under the arm of the device and pressing it then taking the reading.

2.1.2. The height of the plant (cm)

Measured by a measuring tape from the area of contact the plant with the soil to the highest point in the main branch of the stem at the end of the growth season.

2.1.3. Number of total branches per plant at the end of the growing season.

2.1.4. Number of leaves (leaf.plant^{-1}) end of growing season.

2.1.5. Leaf area (dcm^2.plant^{-1})

The leaf area was designed on the basis of dry weight as it took 30 foliar disks known area and dried until the weight in an electric oven stabilized at a temperature of 70 °C and from the total dry weight of the plants leaves calculated the foliar area in the following equation: Foliar area (dcm^2)= foliar area of discs × total dry weight of plant leaves / dry weight of discs [12].

2.1.6. Dry weight (gm) for the vegetative total

It was taken at the end of the season.

2.2. Specific qualities

Estimate the percentage of nitrogen in the leaves according to their component content based on dry weight using a Microkjeldahal device [13]. Calculating the percentage of protein in the leaves according to the following equation: Protein ratio = nitrogen × 6.25% [14] Estimating the percentage of carbohydrates in the leaves was done using a Spectrophotometer device [15].

2.3. Flowering parameters

Number of flowers in inflorescence (flowering. inflorescence^{-1}).

2.4. Fruit parameters

2.4.1. Number of fruits (fruit.plant^{-1})

2.4.2. Weight of fruit (gm.fruit^{-1})

2.4.3. The size of the fruit (cm^3)

The size of the fruit were measured by a method of the graduated cylinder and displaced distilled water. A known volume of water was placed in the graduated cylinder and the fruits were flooded at the rate of six fruits of regular growth inside the cylinder and the size was measured by finding the difference between the water level in the two cases then extracting the rate of the fruit size by dividing the difference of size by dividing the difference of size by the number of fruits and calculated in a unit of cm^3.

2.5. Fruit quality parameters

2.5.1. The proportion of total soluble solids in the fruits

It was estimated by Hand Refractometer and the reading was corrected by laboratory temperature at the measurement [16] (Ibrahim, 2010).

2.5.2. Measuring fruit hardness (kg.cm^{-2})

Hardness measured by a Pentrometer device [17].

2.6. Statistical analysis

The statistical analysis was carried out according to Randomized Complete Block Design (RCBD) by triplicates sample per treatments, examined the results according to the analysis of variance then compared the means using the test of the least significant difference (LSD) at the probability level of 5% [18].

3. Results and Discussion

The results indicated that the foliar ground application with fresh garlic extract have a significant effect on the content of the chlorophyll in the leaves of Table (1). while it is noted that the treatment of 6 and 7 gave the highest content of chlorophyll in the leaves which was 45.33 and 46.33 respectively. While the comparison treatment (0) gave the lowest chlorophyll content in the leaves was 31.06. As for the height of the plant, it was a clear significant increase between treatments where the treatment 7 outperformed all treatments by giving the highest rate of height of the plant length reached 98.00 cm and did not differ significantly the treatments 3 and 5 from each other and gave 88.19 and 88.95 cm respectively while the treatment 0 gave the lowest rate of height of the plant length reached 54.45 cm. The treatments 6 and 7 did not differ from each other significantly in the number of plant branches and gave the highest rate of the number of plant branches reached 12.55 branches for both treatments and outperformed the rest of the treatments while the comparison treatment gave the lowest rate on the number of plant branches by giving it 5.55 branches, while the number of leaves did not recorded a significant differences between treatments 5, 6 and 7, where they gave the highest rate on the leaves number reached 12.88, 12.77 and 12.88 leaves respectively, while the treatment 0 gave the lowest rate on the leaf number reached 10.33 leaves, which did not differ significantly from treatment 1 which gave 10.55 leaves. As for the foliar area of the table results, it is clear that the treatments gave a clear significant difference where the treatment of application 7 outperformed by giving it the highest value reached 153.58 dcm2.plant-1, which did not differ significantly from the treatment 6 which gave 152.67 dcm2 compared to the measurement treatment that gave the lowest value with a foliar area of 120.29 dcm2.plant-1 and did not differ significantly from treatments 1 and 2, which gave 121.77 and 121.99 dcm2.plant-1 respectively.

Table 1. The effect of foliar and ground application with garlic extract on the content of the chlorophyll in the leaves, plant height, number of branches and leaves and foliar area of the tomatoes plant.

Treatments	Chlorophyll content in the leaf SPAD	Plant height (cm)	Number of branches. plant^{-1}	Number of leaves. plant^{-1}	Leaf area (dcm^2. Plant^{-1})
0	31.06	54.45	5.55	10.33	120.29
1	32.60	58.06	7.00	10.55	121.77
2	42.30	64.85	8.11	11.11	121.99
3	43.71	88.19	9.55	11.88	126.07
4	44.15	91.34	10.89	12.11	137.44
5	44.81	88.59	11.00	12.88	144.36
6	45.33	94.63	12.55	12.77	152.67
7	46.33	98.00	12.55	12.88	153.58

LSD5%	1.322	1.269	0.961	0.741	5.660

Table 2 shows the effect of foliar and ground application with garlic extract on the measured parameters where the treatment of application 7 exceeded significantly in giving the highest level of nitrogen in the leaves of the plant reached 2.843%, which did not differ significantly from treatment 6, which gave a ratio of 2.733 compared to the treatment of comparison 0 which gave the lowest nitrogen ratio of 1.430, which leads us to exceed the treatments 6 and 7 with the content of the protein in the leaves reached 17.08 and 17.77, which did not differ between them significantly compared to the measurement treatment which gave the lowest value 8.94. As for the percentage of carbohydrates in the leaves, the table showed that the treatment of application 6 and 7 gave a significant differences to the rest of the treatments by giving them the highest percentage of carbohydrates in leaves and reached 6.96 and 7.95 respectively while they did not differ significantly while the treatment of application 0 gave the lowest percentage of leaf carbohydrates, which reached 1.88, that did not differ significantly from the comparison treatment of 1.96, and the treatment of application 7 had a significant superiority over the rest of the treatments by giving it the highest rate of plant flowers where it reached 22.56 flowers, while the treatment compared with control gave the lowest rate of the number of flowers reached 11.56 flowers, which did not differ significantly from the treatment 1 which gave 12.11 flowers.

Table 2. The effect of foliar and ground application with garlic extract on the percentage of protein, nitrogen, carbohydrates in the leaves, number of flowers and dry weight of the tomatoes plant.

Treatment	N%	Percentage of protein in the leaves	Percentage of carbohydrates in the leaves	Number of flowers. Plant^{-1}	Dry weight of plant
0	1.430	8.94	1.96	11.56	55.81
1	1.623	10.15	1.88	12.11	66.74
2	1.653	10.33	3.58	13.22	75.47
3	1.767	11.04	4.05	15.11	77.70
4	2.180	13.62	4.74	17.62	80.44
5	2.597	16.23	6.11	19.26	88.92
6	2.733	17.08	6.96	21.11	90.38
7	2.843	17.77	7.95	22.56	93.97
LSD5%	0.172	1.076	1.649	1.456	4.601

As for the dry weight, the treatments 6 and 7 outperformed the rest of the treatments and gave the highest dry weight rate reached 90.38 and 93.97 gm respectively and did not differ significantly between them, while the lowest dry weight at the treatment 0 was 55.81 gm. and did not differ significantly at the treatment of application 1, which gave a dry weight rate of 66.74gm from the results of Table 3, which shows the effect of foliar and ground application with garlic extract on the number, weight and size of fruits and measurement of the Total Soluble Solids (TSS) and hardness of tomatoes fruits. The results showed the presence of a significant effect of application with garlic extract on the number of fruits where the treatment 7 gave the highest rate of fruit numbers and reached 11.62 fruits while the lowest rate of fruits when the measurement treatment 0 and reached 4.96. As for the weight of the fruit, the treatments 6 and 7 did not differ significantly from each other by giving them 78.10 and 84.07 gm respectively superior to the rest of the treatment while the treatment 0 gave the lowest weight of the fruits and reached 43.37 gm., which did not differ significantly from the treatment 1, which gave a weight rate of 45.32 gm. As shown by the table the effect of application on the size of the fruits where the treatments 6 and 7 showed significant superiority over the rest of the treatments and gave the highest rate of the fruit size reached 98.22 and 98.72 cm3 respectively, while they did not differ significantly, compared with the lowest rate of the fruit size reached 371.92 in the compared with control. As for the measurement of Total Soluble

Solids (TSS), the treatment of application 7 exceeded the rest of the treatments by giving the highest measure and reached 9.070 while the treatments 5 and 6 did not differ significantly, which gave 8.577 and 8.477 respectively, while the measurement treatment gave the lowest percentage measurement of Total Soluble Solids (TSS) reached 6.653. As evidenced by the results of the table the effect of the garlic extract application on the hardness of the fruits, where the measurement treatment gave the highest rate of solidity of the fruits reached 16.99 $kg.cm^{-2}$, while the treatment 7 gave the lowest rate of hardness reached 12.74kg.cm-2 which did not differ significantly with treatment 6 which gave a hardness rate of 12.96 kg.cm-2. The processes of application with garlic extract in both types of foliar and ground application treatments to improve the physiological, morphological and quality characteristics in the tomatoes plant where it gave clear significant differences compared to the control treatment of garlic effective role in it, that the garlic plant contain vitamins, mineral salts and elements such as sulfur, phosphorus, calcium, potassium and iron as well as 31% carbohydrates and organic acids such as citric, malic and amino acids such as valine, leucine and glutamine [10]. All these compounds contribute to the process of photosynthesis and increase the products of photosynthesis and the cycle of Krebs and all of this contribute to the construction of the main compounds in the plant and improve its physiological characteristics. Garlic extract contains an effective compound and has all the properties of garlic and turns into many compounds such as Allicin, Allylsufid included allyl methyltrisulfide and diallyl disulfides which a volatile substances and have many effects [19]. In a study on the cucumber plant, noted [20] that the foliar application with garlic extract by a concentration of 2.5 $ml.L^{-1}$ led to a significant increase in the length of the plant, the number of leaves and foliar area and the content of total chlorophyll in the leaves, the proportion of the nodes and Total Soluble Solids (TSS), which is due to the fact that the water extract of the garlic plant contains 30% carbohydrates and is rich in the elements of potassium, iron, magnesium, phosphorus, thiamine, riboflavin, niacin and ascorbic acid in addition to volatile oils. [21] stated that the inclusion of garlic extract on amino acids such as Cysteine and Methionin, which have an important role in the biological processes of the plant and led to a significant increase in the vegetable growth characteristics, the number of fruits, the yield of the one plant when application the tomatoes plant with garlic extract at a concentration of 40 $ml.L^{-1}$. [22] pointed that the use of foliar application with a 30% concentration on chickpeas led to a significant increase in the content of chlorophyll in the leaves and the proportion of carbohydrates and protein in the seeds. [23] confirmed that the application of cherry tomatoes with Agrosol at a concentration of 6 $gm.L^{-1}$. [24] pointed that the ground application of *Schefflera araboricola* plant by garlic extract at a concentration of 250 $ml.L^{-1}$ led to a significant increase in the number of leaves, foliar area, leaf content of chlorophyll, dry weight of the vegetative total and the percentage of carbohydrates in the leaves compared to the treatment of foliar application of the plant led to improve the most of the vegetative parameters, root and flower growth in open and covered agriculture. In a study on *Beta vulgaris* var. *cicla* plant stated [25] the use of peppermint leaf powder and celery at 5 and 10 gm per kg of soil alone or together work to improve the morphological and physiological characteristics of the plant through an increase in the height of the plant, the number of leaves, dry weight and the content of chlorophyll in the leaves, nitrogen, phosphorus and potassium compared to the treatment of control. The content of garlic extract from the elements of phosphorus, potassium, nitrogen and iron, which worked to increase the height of the plant, the number of leaves, their content of chlorophyll and dry weight helped to synthesize biological components such as proteins and carbohydrates, which worked to improve the physiological characteristics of the plant where these elements enter in the synthesis of cellular membranes and work to increase the number of cells and cellular divisions as well as being involved in the synthesis of chlorophyll such as nitrogen and iron, potassium acts to regulate the opening and closing of the stomata as well as the regulator of biological processes in the plant. The presence of elements a lot provide the requirements for the synthesis of biological ingredients in the plant as well as transmitted with water through the roots, which makes the cells in the plant in a state of fullness and therefore perform their normal functions better [26, 27].

Table 3. The effect of foliar and ground application with garlic extract on the number, weight, size of fruits, and measurement of TSS and hardness of fruits for the tomatoes plant.

Treatment	Number of fruits. plant^{-1}	Weight of fruits (gm)	Size of fruits (cm^3)	TSS (%)	Hardness of fruits kg.cm^{-1}
0	4.96	43.37	71.92	6.653	16.99
1	5.80	45.32	76.20	7.147	14.74
2	6.44	59.38	81.95	7.947	14.70
3	7.10	63.04	86.64	7.777	15.04
4	7.81	56.87	90.84	8.147	13.54
5	7.85	67.75	93.59	8.577	13.75
6	8.96	78.10	98.22	8.477	12.96
7	11.62	84.07	98.74	9.070	12.74
LSD5%	0.874	7.155	2.951	0.440	1.241

4. Conclusion

To conclude that, the usage of garlic extract in two methods of foliar and ground application, were led to a significant differences in the parameters of growth in the characteristics studied for all treatments. Moreover, the higher effect was a significantly usage of both methods and the concentration of 6% foliar application+ 20% ground application in all the characteristics studied for the tomatoes plant.

Abstract. The quantitative and qualitative structure of the Tigris River copepods communities, were identified to investigate the biological composition, especially near the outcome of Rasheed power plant (RPP). on its biodiversity at four sites those were chosen on the Tigris River in south part of Baghdad Governorate during the period January to December 2012. The sites S2 was located near Rasheed Power Plant to represent the ecological features of the plant site, whereas other sites, S1 was located at the upstream of the RPP as a control site to investigate the ecological characters of the Tigris River. Moreover, the two other sites S3 and S4 were located down to the impact of RPP to reflect the possible effects of the plant on the copepoda fauna biodiversity by comparison with the control site. Thirty-nine taxonomic units of copepoda fauna were identified in the present study, Including 17 taxonomic units of Cyclpoida, 13 taxonomic units of Calanoida, six taxonomic units of Harpacyicoida and three taxonomic units of Parasitic Copepoda. This study found that the highest copepod density was recorded during the winter period on site below RPP. While at sites near RPP during the summer period, Copepoda showed the lowest density. The results also showed that the sites below RPP included the most constant species, while the lowest were included at site near RPP. The results of the biodiversity indexes generally showed the negative actual impact of RPP on the copepoda commu nity..

Keywords. Biodiversity, Copepoda, Tigris River, Power plant.

1. Introduction

The Power plants drain hundreds of millions or billions of gallons of water each day from rivers , lakes or oceans [1]. According to the United States Geological Survey (USGS) [2]. Water use survey data, 346 billion gallons of freshwater per day (BGD) was used in the United States in 2000, Each kWh of thermoelectric generation requires approximately 25 gallons of water, primarily used for cooling purposes a 500MW power plant would use approximately 300 million gallons of water per day [3]. Power plants and all other cooling water users harm and kill large quantities of fish and other aquatic biota [1]. Through more processes: entrainment (passage through the cooling system of smaller, typically planktonic organisms with cooling-water flow) and impingement (trapping of larger aquatic organisms against intake screens). Both of these processes can cause organism mortality [4].

Rasheed power plant (RPP) in Al-Zafaraniya Region, south of Baghdad, polluted Tigris River water as a result of hot water effluents containing organic compounds, disposed of 430 $m3*h^{-1}$ per high water temperature unit that caused damage to aquatic species in the river environment. Black oil and hot water were used to operate the power plant also it prepared the main sources of air and water pollution in this area. While there are industrial water treatment units, such as acidic acid equation basins and good mixing. As well as the presence of control units for the purification of air from pollutants which resulting from the combustion of fuel to do it within the limits allowed by the environment. The impact on aquatic life of the Iraqi power plant is limited including: [5] led a study to demonstrate the impact of Al–Durah power plant effluents on physical, chemical and invertebrate biodiversity in the Tigris River, southern Baghdad. However, many researchers evaluate series professional studies that included the impact of RPP effluents on the food chain assemblage biodiversity, such as Rotifer [6]; Cladocera [7]; Benthos fauna [8] and Phytoplankton [9]. In addition, [10] and [11] reported the effect of the same power plant on Tigris River ecological characteristics, and water quality using the Canadian Water Quality Index (CCME WQI); respectively. Furthermore, [12, 13] assessment the ecological risk of ash toxicity from Doura power plant in the freshwater Crustacean Simocephalus vetulus Schϕdler; and the Induced of Ash Toxicity Effects from Doura power plant on the hematological and biochemical changes of *Cyprinus carpio* L. 1785. From the literature cited above, It's appear limited work were done on the effects of the power plant (heat waste effluent) discharged into this important groups of zooplankton, Thus, to see the impact of this power plant on its biodiversity, it is necessary to study the biological composition, especially copepoda fauna of the Tigris River near RPP. A current study was the first study after the 2003 war, thus the current study was designed to determine the effect of the RPP on the copepoda community's quantity and biodiversity.

2. Materials and Methods

2.1 Description of the Study Area

Rasheed power plant is designed on the principle of steam generation as a running design and consists of six units and a design capacity for each units 25 MW and the fourth unit 45 MW, it was built in 1963 on the eastern side of the Tigris River, which is considered a source of water for operation and cooling, and near the Al-Dora refinery for the purpose of obtaining crude oil fuel. RPP had withdrawn $500m3*hour^{-1}$ from the Tigris River for each unit. It is tested daily to be treated for relieving them from dissolved and suspended salts according to the permissible limits. So its use of generation steam which it used in the operation of the turbines for the production of electricity [14].

2.2 The Samples Collection

During the period from January to December 2012, the quantitative and qualitative composition of copepoda communities was studied at four sites selected at Baghdad Governorate on the Tigris River. One of the sites was S2 which located near RPP to represent the ecological features of the plant site, whereas other sites, S1 was located upstream RPP as a control site to investigate the ecological characters of the Tigris River. Moreover, the two other sites S3 and S4 were located down to the impact of RPP to reflect the possible effects of the plant on the copepoda fauna biodiversity by comparison with the control sites (Figure 1).

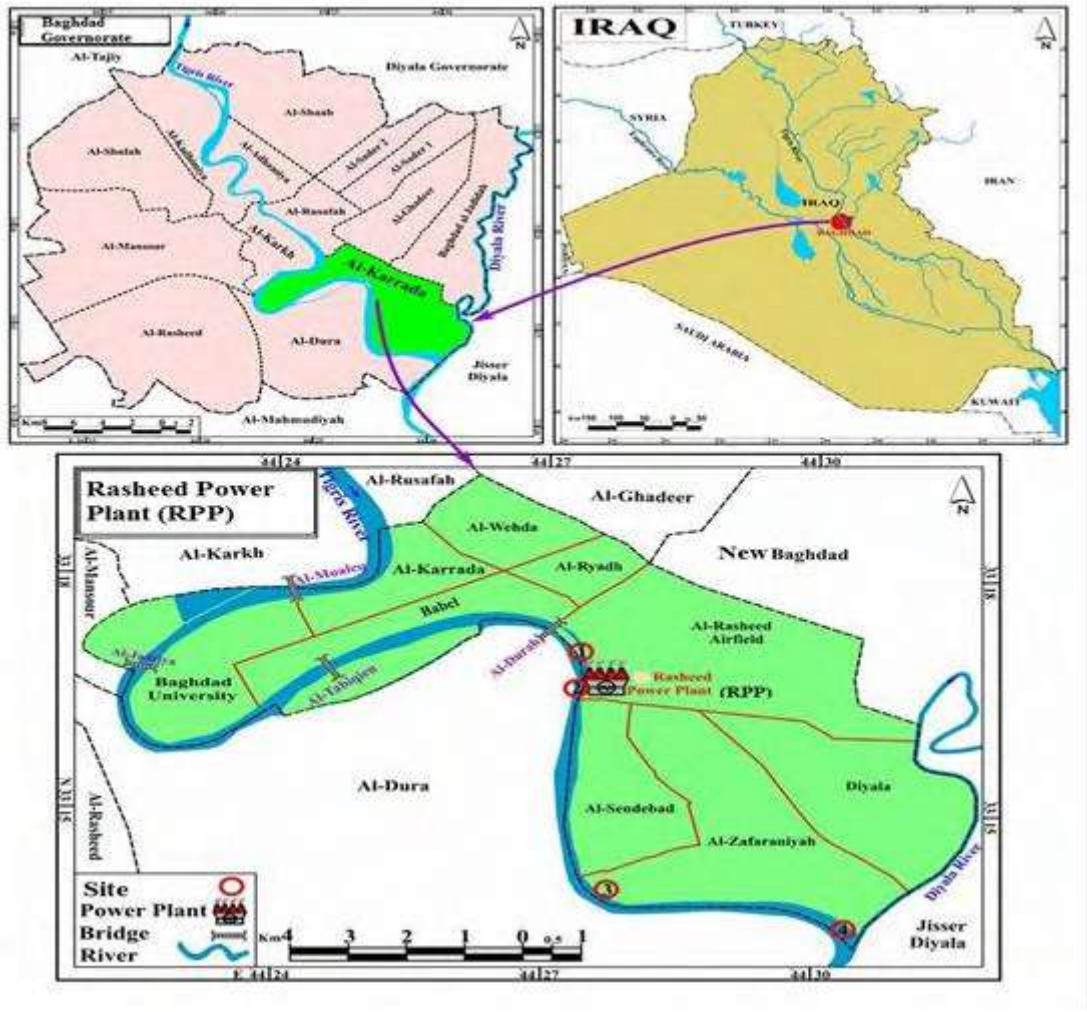

Figure 1. Map represents the study sites.

Monthly sampling was started from January until December 2012 from the four sites under from a depth of 0.5 to 1 m below the water surface, then 45 litre was passing through the zooplankton net with mesh size 55 microns and preserved samples by adding formalin 4%. The samples were examined under a compound microscope and the species was identified according to the diagnostic keys below [15, 16]. The results expressed for individual*m^{-3}. The following Ecological Indices were account:

Relative Abundance Index (Ra): The calculated by (Ra) was depending on the formula contained in [17]. Constancy Index (S): By the presence and frequency of each species, calculated according to the formula contained in [18]. The Species Richness Index (D): This indicator is calculated monthly according to the formula contained in [19]. Shannon - Weiner Diversity Index (H): Values of this indicator were calculated monthly for all groups of invertebrates by using the equation of Shannon and Weiner according in [20]. And the result expressed as the unit bit/Ind. as a bit equal one piece of information. Values < 1 bit * Ind^{-1}. is a little diverse while the values seem more than 3bit *$Ind.^{-1}$ is very diversified [21]. The Species Uniformity Index (E): The species uniformity index measured by the formula referenced in [22]. Values greater than 0.5 in appearance were considered equal or uniform.

3. Results and Discussion

The density of copepoda in the present study varied between great value reached 15577 Ind.* m^{-3} during of January at site 4 and does not appear in the site 2 during January (Figure 2).

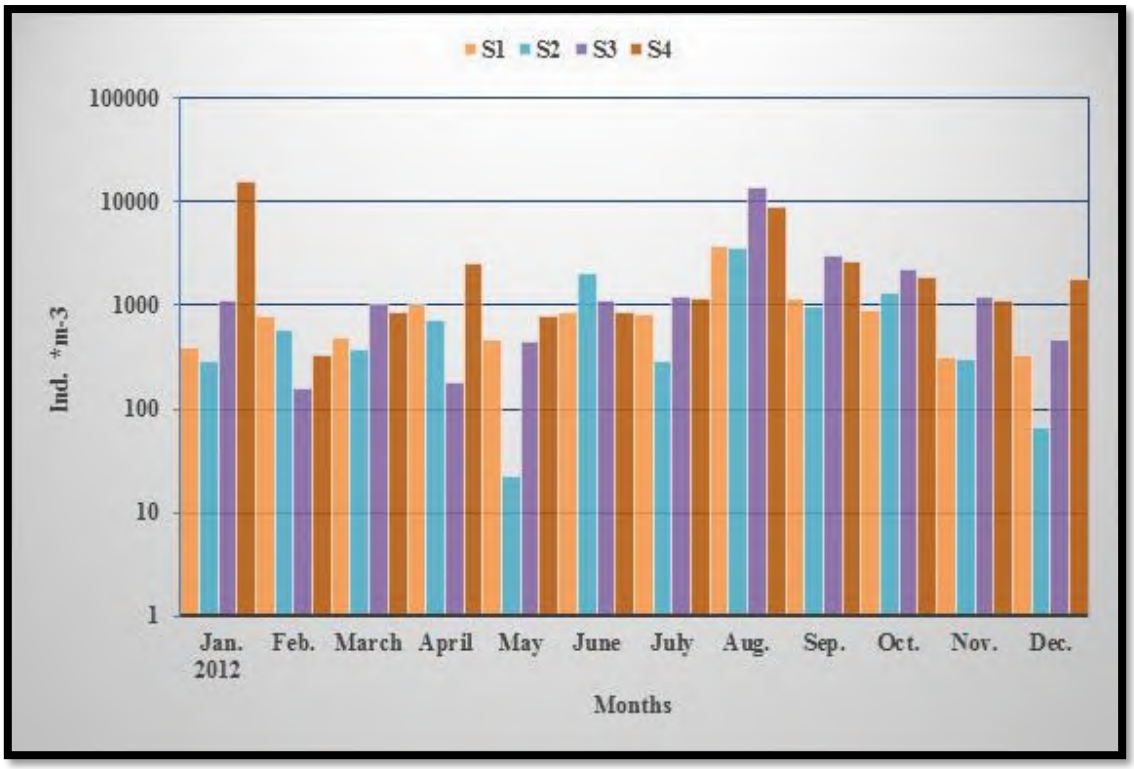

Figure 2. Monthly variations of the copepoda total density Ind.* m^{-3} during the period study.

At site 1 before RPP the density varied between great value reached to 3777 Ind.* m^{-3} during August and minimum 311 Ind.* m^{-3} in November, Whereas great value at site 2 near RPP was recorded 3577 Ind.* m^{-3} in August and minimum 22 Ind.* m-3 in May, while as great value at sites down of RPP reached to 15577 Ind.* m^{-3} in January at site 4 and the minimum value was 155 Ind.* m^{-3} in February at site 3. Throughout the winter season, 15577 Ind. * m^{-3} was observed at site 4 at the maximum copepod density at the site below RPP.. While, sites 2 showed the lowest zooplankton density with 22 Ind.*m^{-3} during summer season. Which may be due to affecting copepoda distribution with two stresses, summer season, and RPP thermal effluents that increase the temperature of the water. What's more, other considerations such as oil spill and sewage effluents that disposal from RPP itself, the same result was obtained by [5] on Al-Duara power plant. [6, 7, 8, 9, 23, 24] a decrease in aquatic group density was also recorded when the impact of other power plants on various groups of invertebrates and phytoplankton at the Euphrates River and Tigris River was studied. With regard to relative abundance index (Table 1, Figure 3), nuuplii recorded the highest percentage relative in compared with a total density of other species which it reached to 77%, 34%, 65% and 80% of sites 1, 2, 3 and 4, respectively. While other species such as immature Calanoid, *Halicyclops* sp., *Paracyclops fimbriatus* appeared in different percentages (Figure 3).

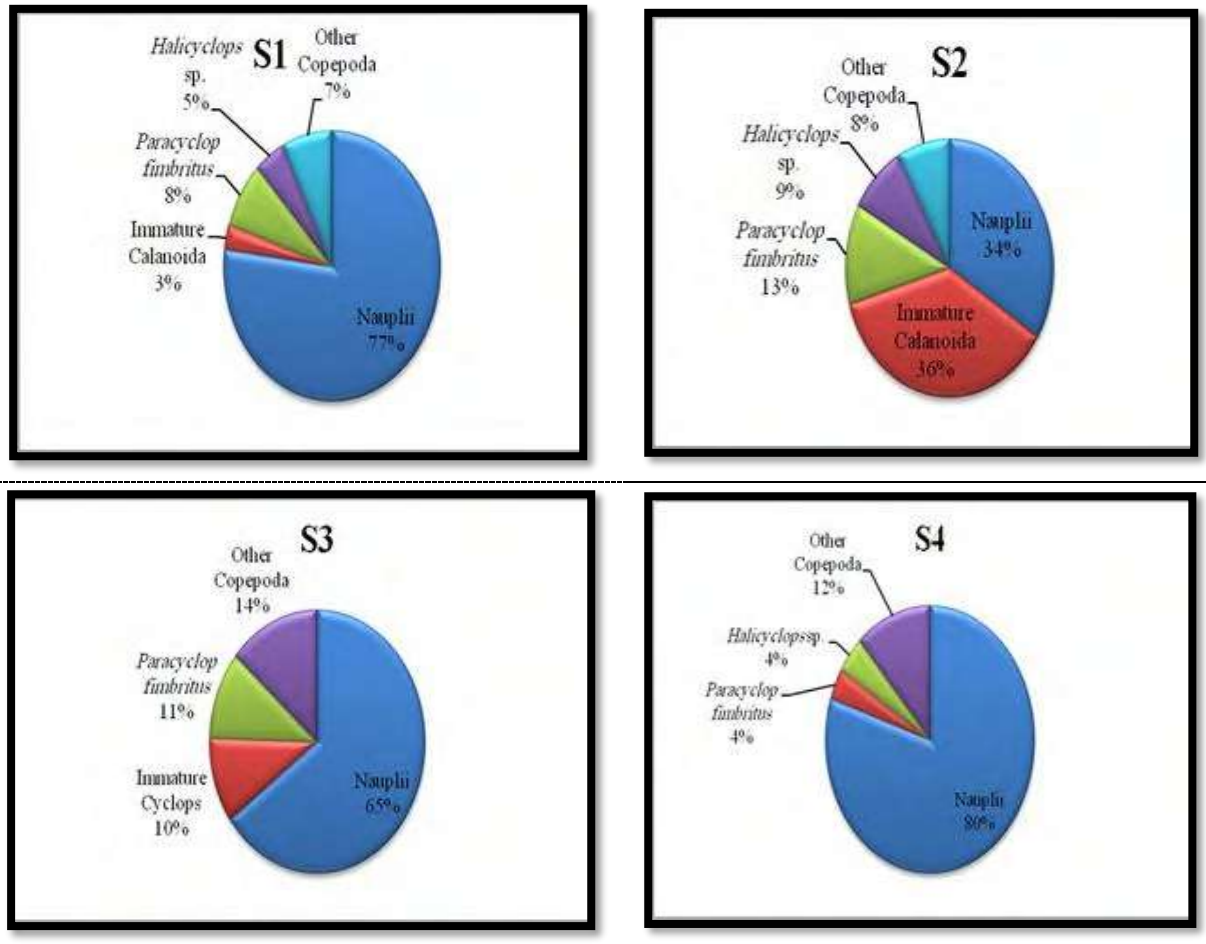

Figure 3. The relative abundance of dominating Copepoda species.

The difference in increased copepoda density may be associated with the nutrients appropriate and their individual is affected by concentrations of salts and organic matter in water [25]. In addition, they are affected by selective vertebrate and aquatic organisms that may be predation of certain sizes, also cyclopoida is the most susceptible to predation by fish larvae [26]. In population of copepoda the numerical predominance of young forms, especially nauplii is the most common pattern, as observed by [22, 27, 28] in different freshwater habitats and as also found in the present study. [29] refer that the dominant group among copepods on lake Lichenskie (with two power plants) were juvenile and harpacticoida found among aquatic plants, and were the most common, constituting nearly 60-80% of zooplankton communities. The low density of the Calanoid group compared to the other suborder may be due to the fact that most species are planktonic, rarely lateral and bloom in lakes and ponds which appropriate in a lentic available environment (Figure 4).

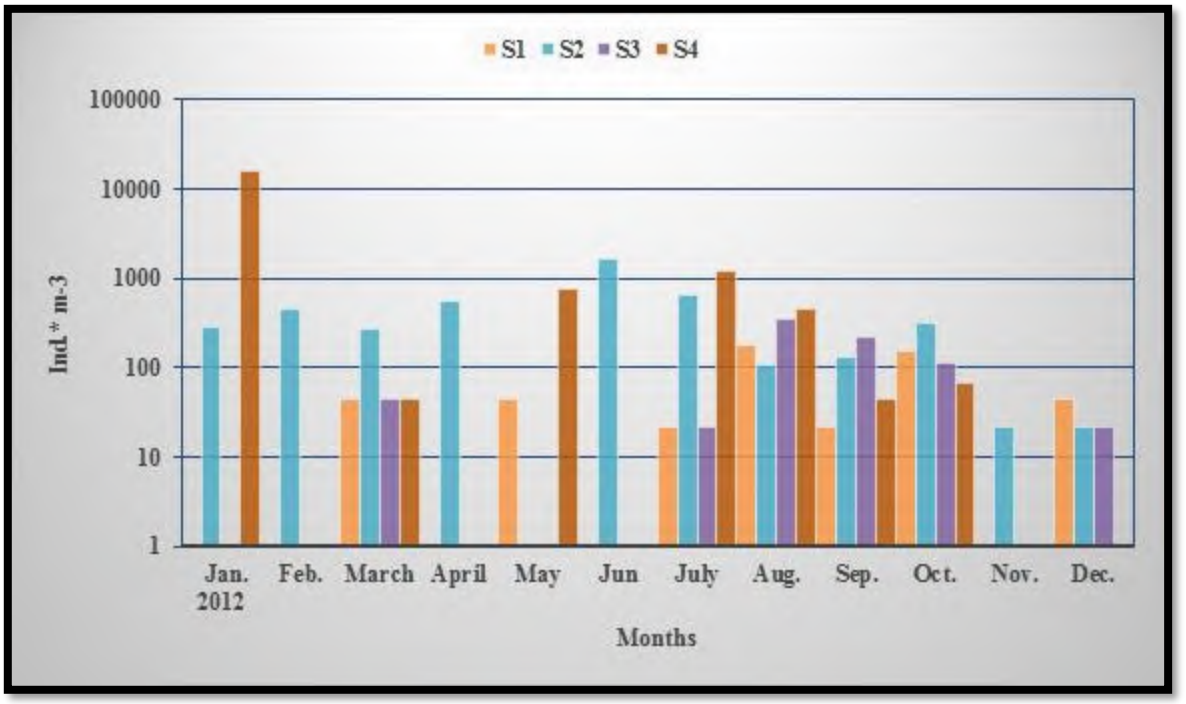

Figure 4. Monthly variations of the Calanoid group density Ind.* m^{-3}.

As for the other two suborders, Cyclopoida and Harpacticoida, they prefer the coasts of the water bodies, especially when there is a covered with vegetation [30] (Figures 5, 6).

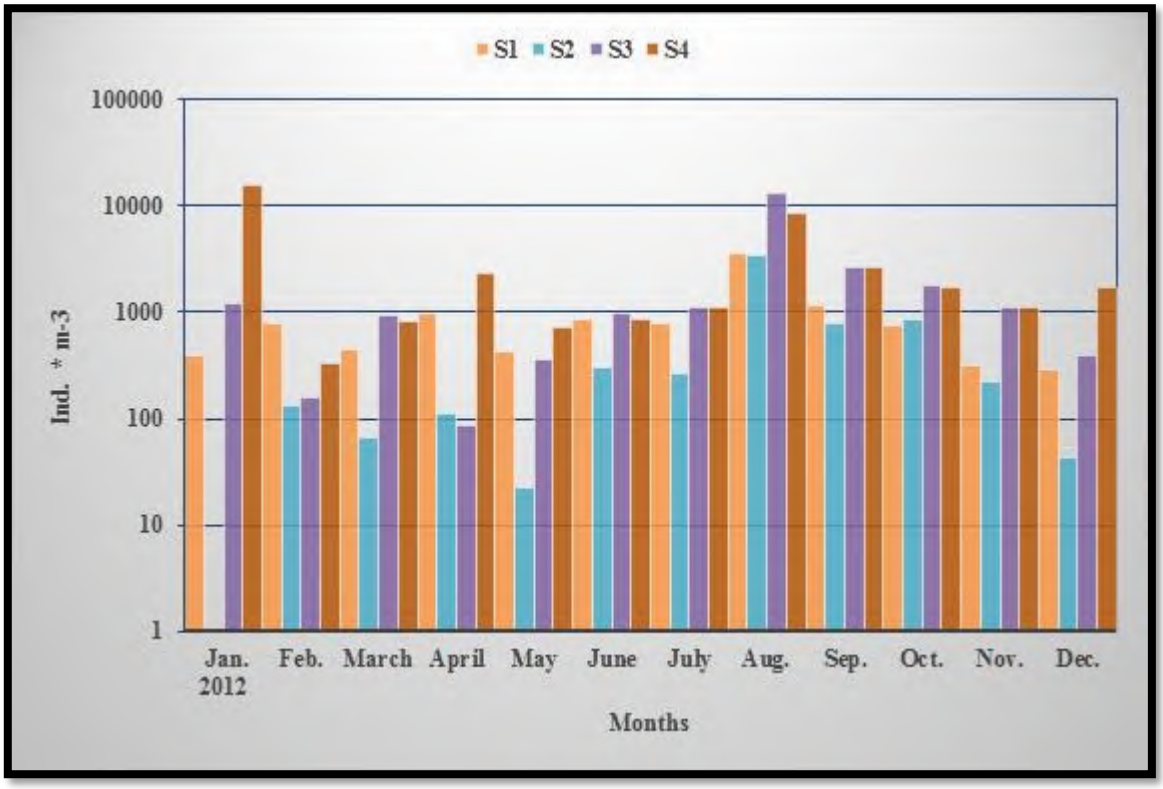

Figure 5. Monthly variations of the Cyclopoida group density Ind.* m^{-3}.

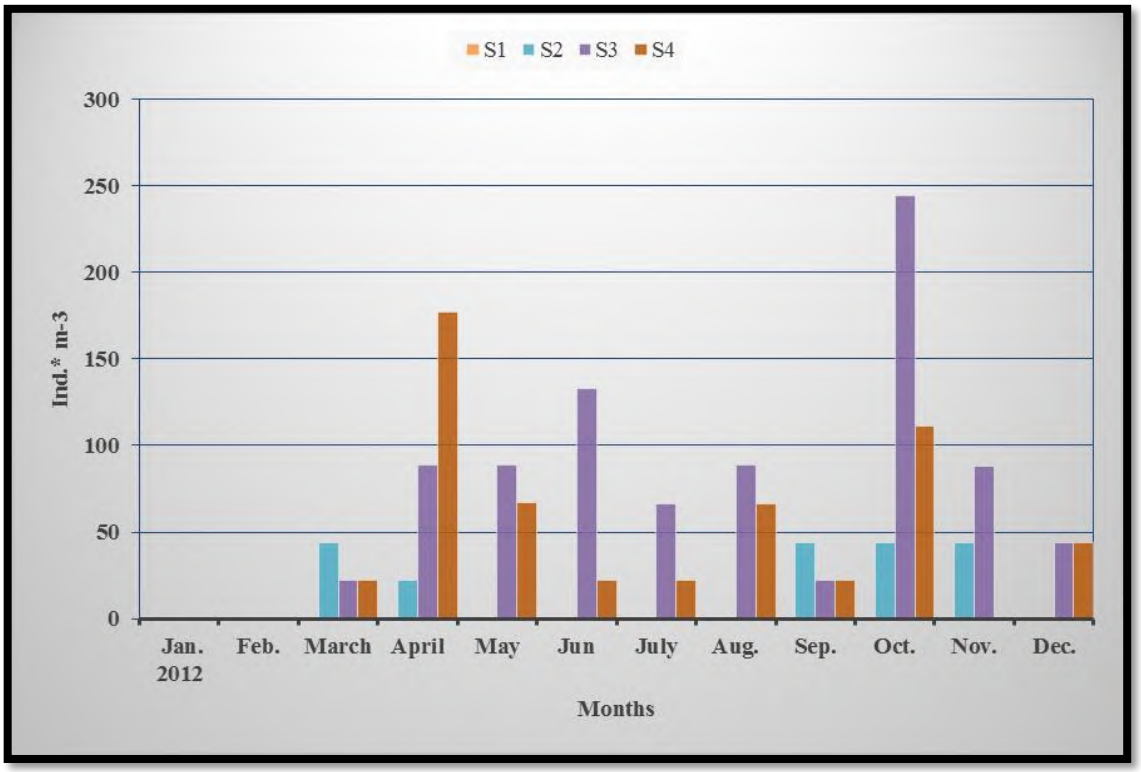

Figure 6. Monthly variations of the Harpacticoida group density Ind.* m^{-3}.

The high density of the copepoda group may be due to the increase of the nauplii, as this group has the ability to withstand the environmental conditions of the RPP more than the rest of the group may be of its small size with few appendixes and the hardness of the outer wall This case was recorded by other researchers [5, 28] (Figure 7).

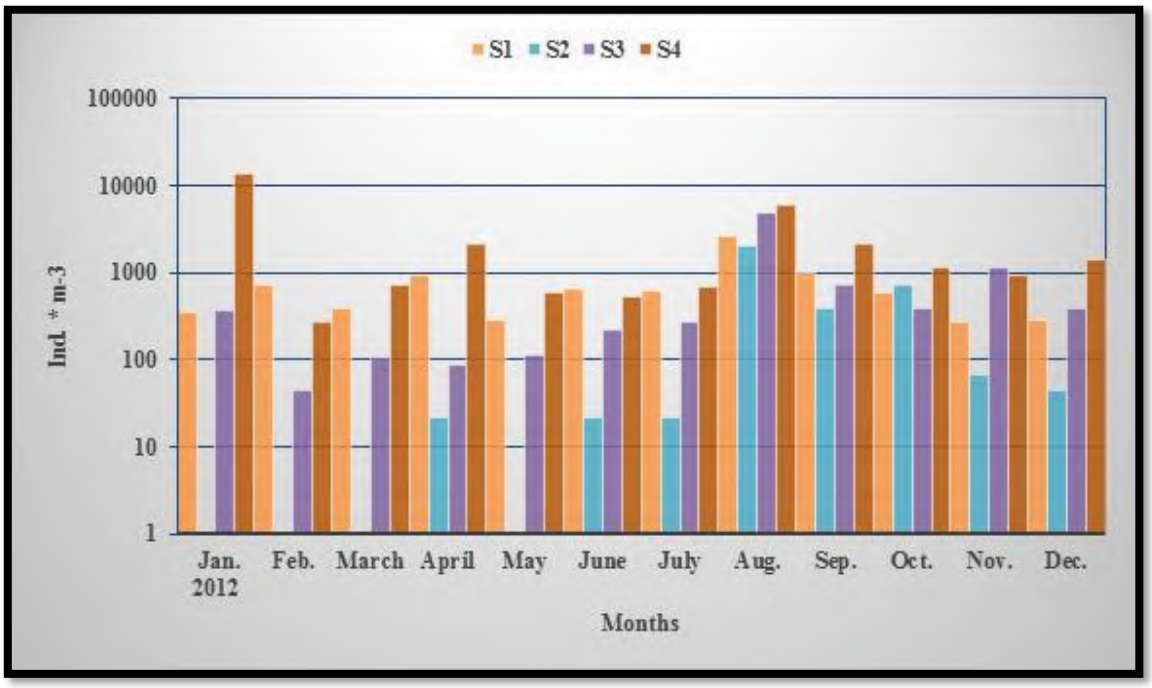

Figure 7. Monthly variations of the nuplii density Ind.* m^{-3}.

As for constancy index(S) Table (1) shows that species:- Cyclops♂, *Haicyclops* sp., Immature *Cyclop*, *Paracyclops fimbriatus*, *Nauplii*, Immature Calanoid, *Nitocra* sp., *Nitocra lacucetrus* were the most appeared and frequent. Therefore they are constancy species in the environment of the Tigris River, according to the constancy index, due to it was found in more than 50% of the total samples that taken in the current study. The results showed that sites 3 and 4 were included the most constancy species, while site 2 was included the lowest. However, the location of both sites 3 and 4 were below RPP and with more environmentally stable than other sites [28]. The presence of species belonging to zooplankton were under to a number of factors to be settled to the aquatic environment, including temperature, salinity, light, turbidity, and the presence or absence of predators, so the constant species in the environment is not an absolute issue, As it may turn out the taxonomic units from Accessory to constant species when conditions are favourable [30] especially after removals the effect of RPP effluents. The different in appearance frequency of taxonomic units was varying during the current study or along study sites in both up and below RPP, so some of which were wide-ranging and abundance species, may be due of the widespread tolerance to environmental variability, especially the presence of RPP effluents, Including the temperature, the presence of more than one generation, the suitable environmental conditions and location of the presence and reproduction of some species, and the ability of some species to continuation along the river [31], such as *Cyclops* sp. and nauplii which appeared seasonally and locally in high density, this may be due to the fact that each of them contained more than one undiagnosed species so these taxonomic units formed for a high percentage or may be due to contains it a various strategies that it ability to resist the unsuitable conditions that imposed on it by the RPP, so some of its individuals enter the diapuse stage, horizontal migration, change their location or change the source of depends food as a result of changing environmental conditions [32]. On the other hand, it was found a clear presence of limited species at a specific location at sites 3 and 4 below the RPP this may be due to the adaptation of some species to situational conditions or to the narrow tolerance of some species to the environmental conditions or as a result of the process of predation and competition, or due to the drift of some species to the sites 3 and 4 and from surrounding areas and their inability to continuation for further distances. Few species exceeded 50% of occurrence frequency were noticed, and the result agreed with [5, 6, 7, 29]. In the current study, the presence of few high frequency species was incompatible with [21] description of clean environment; that this environment with many species and high frequency species especially those didn't tolerate pollution. As for Species Richness Index, Thirty-nine copepoda taxonomic units have been identified, 17 of which belong to Cyclopoda, 13 to Calanoid, 6 to Harpactecoida and 3 to Parasitic Copepoda (Table 1). To compare the species composition of this study with the investigated copepoda fauna near Al-Mussaib power site at the Euphrates River by [24] they identified 27 copepod taxa. While as at Al-Durah power plant on Tigris River [5] identified 44 taxa of copepod. On the other hand, [29] identified 18 taxa of copepod in the Lake Lichenskie with two power plants in Poland, Sometimes these differences can be related to the level of classification in the study and to the quantity of power plant discharge. The species richness index ranged from lowest value reached in 0 at site 2 in May and highest value reached to 5.1 at site 4 in August (Figure 8).

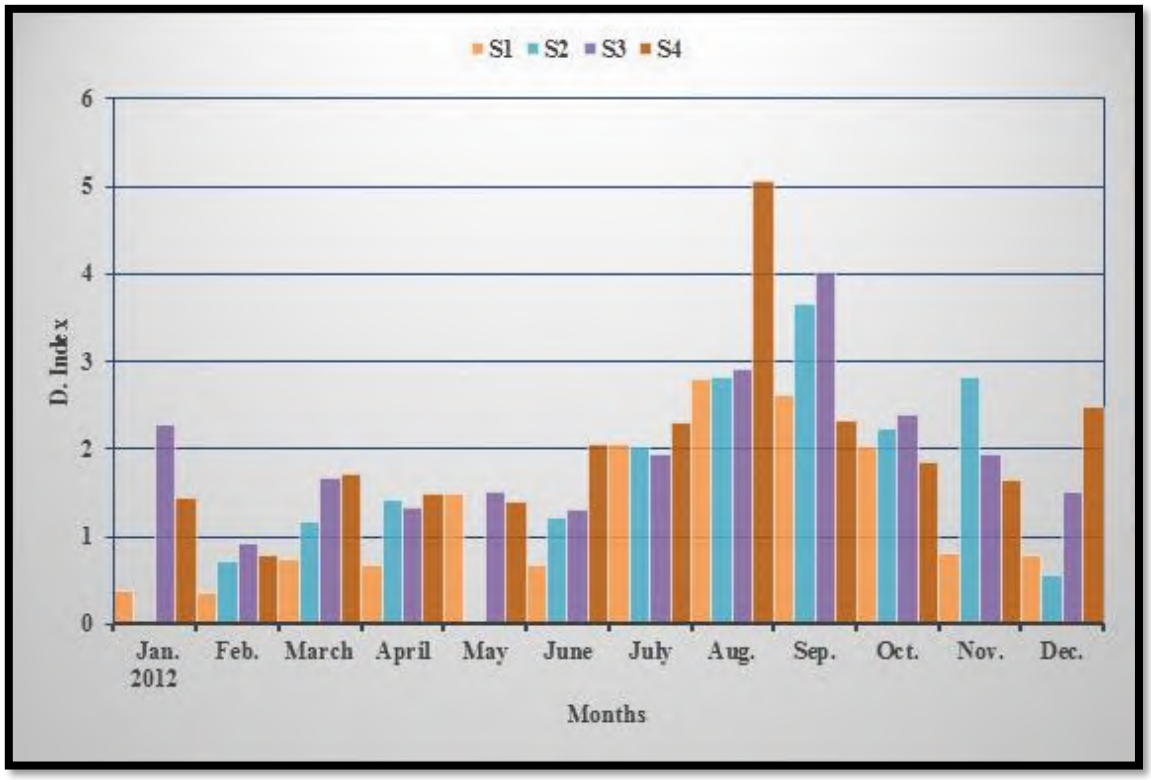

Figure 8. Monthly variation of the copepoda species richness index in the Tigris River during the period study.

The species richness index values varied in the site 1 from 0.34 – 2.79 was recorded in the February to August respectively, either at sites that located after RPP the values of this index was decreased, so at site 3 the value ranged from 0.91-4.02 in February to September respectively, finally at site 4 the ranged value of this index has increased from 0.79-5.06 in February to August respectively. On the other hand, at site 2 the values of this index show a decline in values throughout the period of the current study, which had an impact clearly on the sites that located close to the RPP. [29] showed that species richness varied significantly in particular months, and was the lowest in June and highest in September at Lake Lichenskie with two power sites in Poland. Our result agrees with [5, 6, 7] when they recorded the greatest species richness index at the site below Al-Durah and Rasheed power plant on the Tigris River. The results of the present study showed that the high values of the species richness index were recorded at the end of the summer and at the beginning of the autumn season, and this may be due to higher primary productivity through these seasons [33]. It was found in the current study some of the species showed with the highest number of species such as: *Cyclops* appeared in 6 species, *Diaptomus* with 9 species, one species for *Macrocyclops* and two species for each of *Mesocyclops* and *Paracyclops*. The genus *Diaptomus* belongs to the Calanoid group and is characterized by its large size compared with other groups. Several studies have confirmed it's as dominated species in the Iraqi water bodies [34; 35]. The Shannon-Weiner diversity index is one of the most widely indicators used for biodiversity. This indicator has a value from 0-5 and where the value of this indicator is exceeds 3 it indicates that the stricter of the ecological habitat is stable. When this indicator has a value of less than 1 it indicates that there is ecosystem defect caused by pollution [36]. The Shannon-Weiner indice values for the copepoda groups ranged from the lowest value of 0 bit.*Ind.$^{-1}$ was recorded at sites 2 in January and May, whereas the highest value 3.855 bit.*Ind.$^{-1}$ was recorded at site 2 in April (Figure 9).

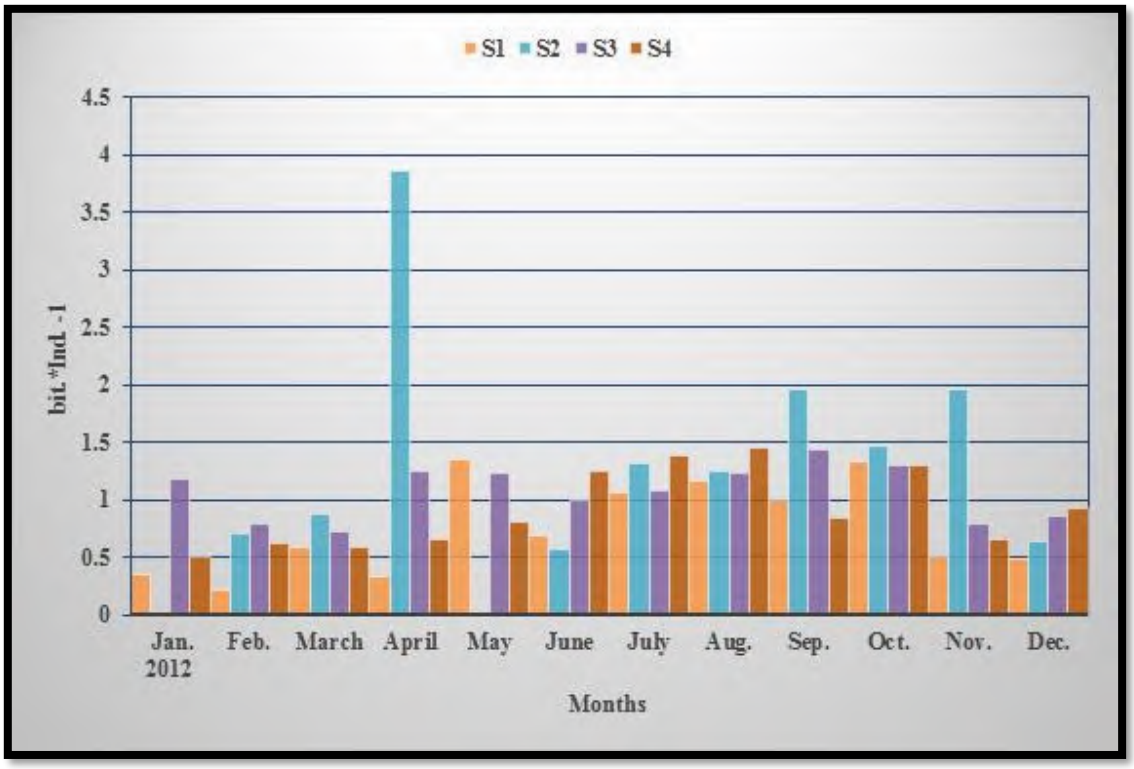

Figure 9. Monthly variation of the copepoda species Shannon-Weiner Index (H) in the Tigris River during the period study.

With regard to the copepoda species uniformity index, the lowest value ranged from 0 was recorded at site 2 in January and May to 2.39 was recorded at site 2 in April (Figure 10).

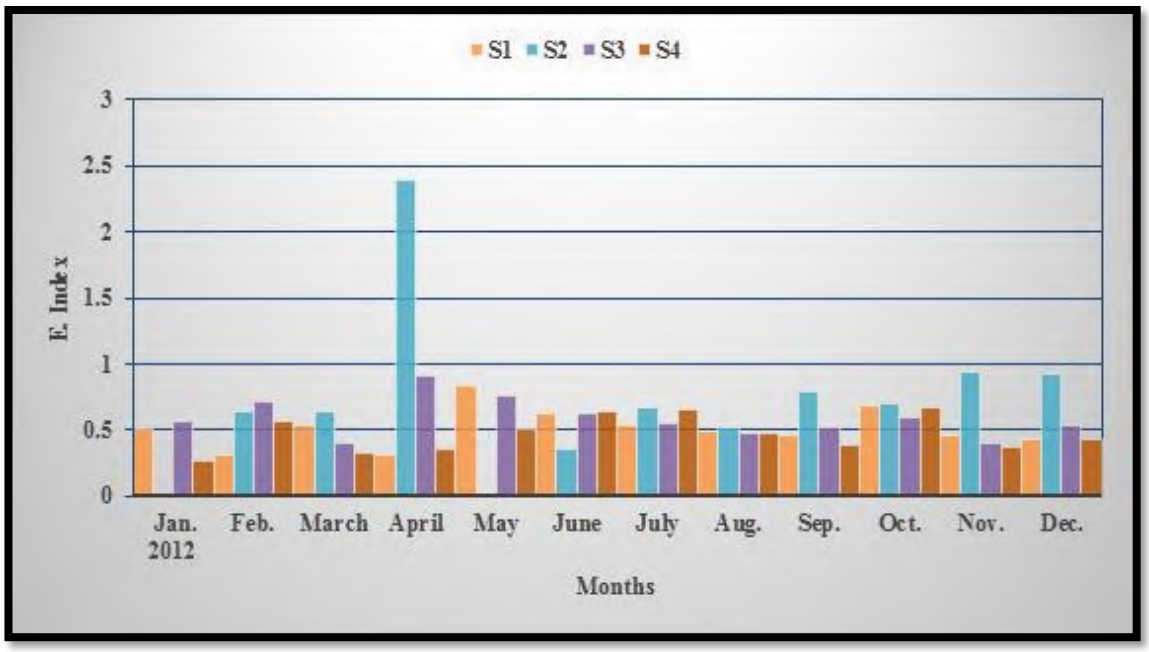

Figure 10. Monthly variation of the copepoda species uniformity index (E) in the Tigris River during the period study.

It was clear as for copepoda Shannon Weiner index at site 1 values did not lower than 0.21 bit *Ind^{-1}. during the period of study, whereas the values of this index decreased at all sites below RPP, especially at site 3 which as ranged from 0.7-1.43 bit * Ind.-1 Either at sites 2, it was a clear decline due to the effect of RPP effluents on the values of this index which reached to the highest value 1.97% in October except on April which it reached to 3.85 bit * $Ind.^{-1}$ that may be related with increased primary productivity in this season from phytoplankton bloom, because zooplankton is determined by the density and structure of phytoplankton [37] (Figure 6). According to [22] the environments in rich with organic matter characterized by having low diversity with a few dominated species. Our study agrees with [23] when they recorded the average values for the Shannon-Weiner index of the cladocera group of ranged from 1.5-2.9 bit /Ind. on in the Euphrates River near the Al-Musayib power plant and found that the hot effluents had a negative impact on the presence of individuals of different cladocera species. Our result also agrees with [5, 6, 7] when they recorded the greatest Shannon Weiner index at the site below Al-Durah and RPP on the Tigris River Presence of Aquatic Plant abundance leads to the formation of environmentally heterogeneous habitats that are stimulated to present different zooplankton communities [38]. Whereas low Shannon-Weiner index values were recorded at site 2, may be due to the impact of the direct effluents of RPP to the river as well as other human interventions [39]. Or may be the reason for the lower values of the Shannon-Weiner index at site 2 related with the increased turbidity and total suspended solids at this site which resulting from the RPP discharge effluent, where turbidity is the reason for the lack of biodiversity, [20] also showed that increased turbidity leads to an increase in the diversity of zooplankton. Regarding to species uniformity index, It was found that the highest value of copepoda uniformity index at site 1 was 0.8 in May, while these values decreased at the sites after RPP which reached to the minimum value of 0.67 in October at site 4, whereas repeated non-appearance of this value of for several time appeared at site 2 near RPP (Figure 9). Higher values of this index in the study sites indicate that the species was uniformity in appearance because of the absence of any environmental stress, which provides a favourable environment for the stability of the zooplankton community and allow to dominate of the larger species, and this is what happened at the site 1 where they exceeded the values of 0.5 throughout the study period, thus considered uniformity species in appearance. While indicating low values of this index to the dominated by a few species with a high density of it, which is a indicate of the presence of environmental stress, and this agrees with [28] when they referred that the decline in the value of uniformity species index indicates the presence of stress prevents the appearance of the dominated many species, which is what happened at the site 2, where that the decline the value of uniformity index of the species due to increasing organic matter, low of dissolved oxygen concentrations, high nutrient requirement of life and values to the degree of food abundance that allowed to dominated of few species with high densities of it. Our result was conflicted with the study of [5] when he recorded a value of the species uniformity index, ranged from 0.364 to 1.06 at sites up to Al-Duarah power plant while at sites below Al-Duarah power plant a values were ranged from 0.31- 1.05. But the results of the current study agree with [6, 7] when they studied the effect of RPP on rotifer and cladocera of this index was not affected by the effluents of RPP.

4. Conclusion

From a current study we can concluded that copepod assemblage especially near RPP affected on it density and constancy species index by it. Also the other biodiversity Indicators showed the negative RPP effect on the copepoda community.

5. Acknowledgement

Abstract. A novel Coronavirus disease (COVID-19) has being originated from animals and causing to running outbreak of viral pneumonia in human all over the world. The World Health Organization (WHO) has considered COVID-19 infection as Epidemic disease in March 2020. The high percentages of death rate among people lead the researchers and scientists in different fields of medicine in order to find solution for this threating problem. In this regard, an editing gene technique was employed in this study, in order to deter the viability of coronavirus genetically. The main objective in this paper first has been determined and obtained the essential proteins of COVID-19 coronavirus proliferation by using NCBI website which included *S, E, N, M, ORF3a, ORF6, ORF7a, ORF7b, ORF8, ORF10* proteins. The second objective is to use a very precise technique of editing gene called CRISPR-Cas9 to make changes to the virus's RNA, through designing single-guide RNA for the essential each protein of COVID-19, in order to inactivate an effective certain protein. These techniques will be provided for each patient and healthy person by injection of all genes components using the Gene-gun machine or spray aerosol to make ensure reach it to the target cell.

Keywords. CRIPR Cas9, Coronavirus, Gene Therapy, WHO.

1. Introduction

The A novel Coronavirus disease (COVID-19) has being originated from animals and causing to running outbreak of viral pneumonia in human all over the world [1, 2, 3]. Coronavirus (Covid-19) is a considerable aggressive comprehensive public health threat. It is a large family of enveloped RNA viruses [4]. There are four groups of coronaviruses, which originated from animals. Alpha and beta presence at bats, while Gamma and Delta are avian species reservoir. Coronaviruses are responsible for wide range diseases in many animals including the human. In human they cause mild self-limiting respiratory infections. Different kinds of animals had been recorded previously historically infected with coronavirus, like Avian, Murine, Ferret, Swine, Rat, Rabbit, Whale, Camel, Bat and Human [5]. All of these types of creatures have big issues problem for us and the possibility of the virus developing inside their cells and transmission it to each other easily. For instance, in terms of SARS-

CoV strain was conveyed from civet cat to human, while the MERS-CoV strain has been transmitted from camel to human. Usually, the virus access to the human body into the respiratory system reach lung cells through attachment by S proteins that covered the outside viral surface with the human receptor and then, an inject the ssRNA inside the intact human cell and start to replicate through many process [6]. In this study, ten important proteins have been virtualized by the stated NCBI website and then tag each protein from a precise RNA site by guide RNA in order to inactivation of protein using technique called CRISPR-Cas9, that prospective will aid for stop proliferation against specified coronavirus COVID-19 . These techniques will be provided for each patient and healthy person by injectable by gene gun machine or spray aerosol to make ensure reach it the target cell. In general, CRISPR-Cas9 is very accurate technique of editing gene, which allows the scientist to manipulate the DNA for repairing and cure the gene disorder. CRISPR-Cas9 system has only two compounds, a Cas9 endonuclease and a single-strand guide RNA (sgRNA) [7, 8]. It is adopted immunity system in the bacteria to detect and match virus's DNA or RNA and stop action. CRISPR-Cas9 is having a major effect on practical genomic carried out in experimental systems [9]. The scientific term of CRISPR is derived from Clustered Regularly Interspaced Short Palindromic Repeats that tied inside the genome of the bacteria with their associated nuclease enzyme called Cas9. This specific sequencing of gene allowed the bacteria to record over the time the virus's DNA that injected to the bacteria and protect itself. CRISPR-Cas9 considered as a genetic vaccination card in the bacteria that offer an opportunity to manipulate with the gene to edit or delete any desired gene. Overall, this complex is programmable, which is meaning we can program any specific fragment of the gene within the genome and cure it [10].

2. Materials and Methods

CRIPR-Cas9 system has designed to allow inducing cleave at target 10 gene sites for essential proteins for invasion and proliferation for Coronavirus. All ten genes sequences were obtained from the NCBI database, in order to complete the coding sequence of the open reading frame (*s, e, n, m, orf3a, orf6, orf7a, orf7b, orf8, orf10*) genes. The gene code (Gene ID) for all these proteins in NCBI website were as follow: Spike protein (S) is NC_030886.1, the Envelop protein (E) is 43740570, The Nuleocapsid phosphoprotein (N) is 43740575, the Membrane glycoprotein (M) is 43740571, the ORF3a protein is 43740569, the ORF6 protein is 43740572, the ORF7a and b proteins are 43740573, the ORF8 protein is 43740577 and the ORF10 is 43740576. This study, we have designed guide RNA for only S protein which is considered the most important part of the virus to cause infection (AGGGTCCACCAAACGTAATGCGG). Then, the interference leads to synthesis dsRNA, which will be formed of the guide RNA (sgRNA), thereby the sequence of each gene to be used accurately by the CRISPR-Cas9 technique inside the infected cell. The sgRNA directs the Cas9 endonuclease to cleave both DNA strands in a specific sequencing (Table 1 and 2). DNA cleavage happens at a sequence 3 base pairs upstream of an “NGG” proto-spacer adjacent motif (PAM). The CRISPR/Cas9 requires the co-expression of a Cas9 protein with a single guide RNA vector that will be expressed by the promoter [11]. Figure 1 refers to prospective cycle treatment of COVID-19 infection by using CRISPR-Cas9 technique as a novel treatment.

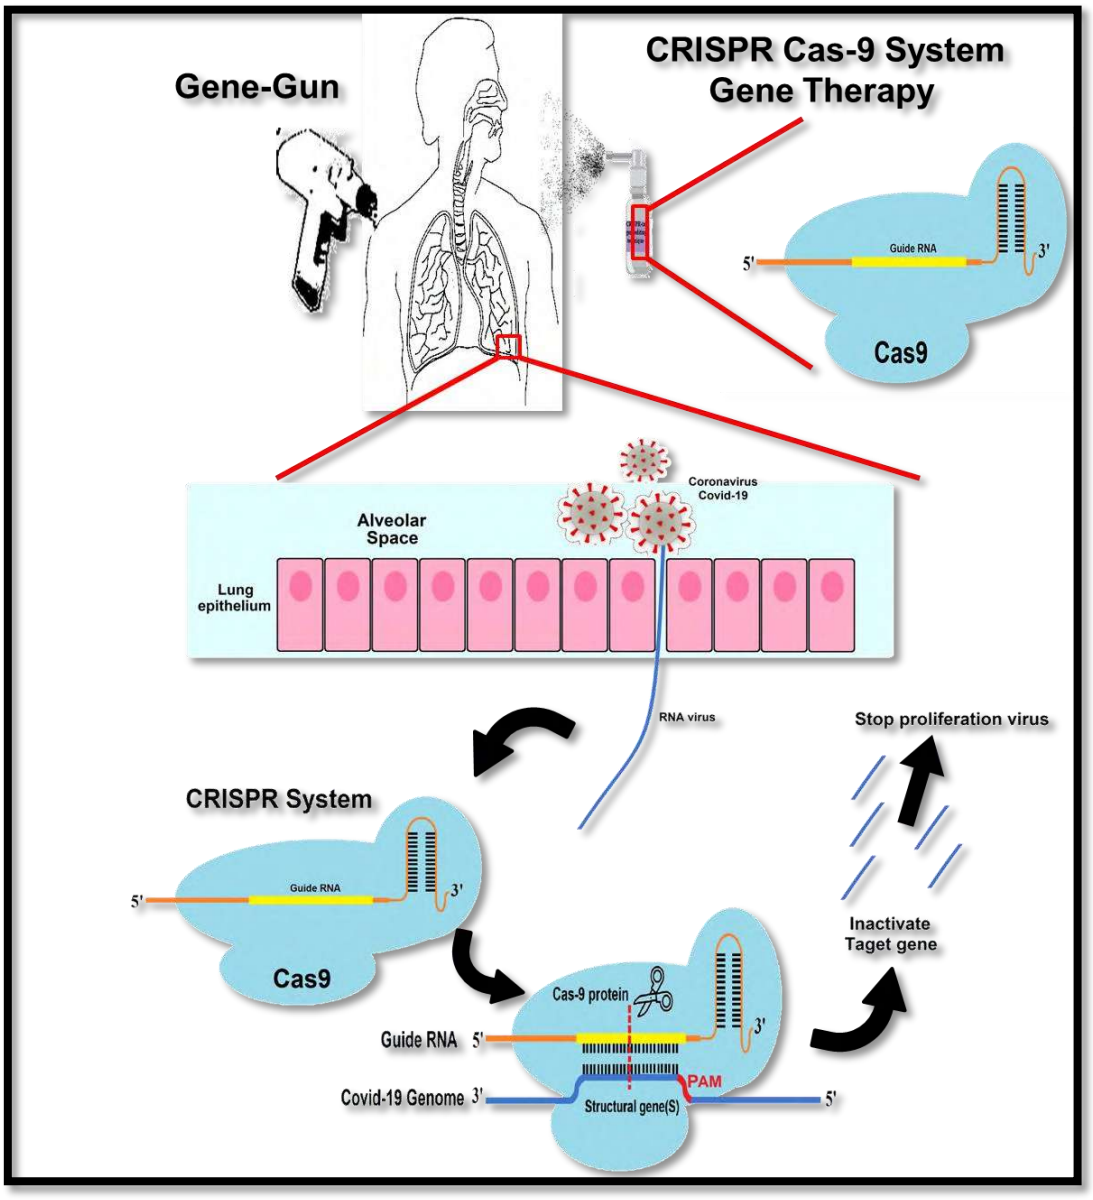

Figure 1. Overview of the stages for how to delivering gene therapy via CRISPR/Cas9 system with a specific guide-RNA for fighting Coronavirus Covid-19 by using a Gun-gene machine or spray aerosol. Also, how the CRISPR/Cas9 binds to the target gene site within sgRNA virus.

2. Results and Discussion

This Even though most of the researchers are considering finding a safe vaccine against Covid-19. However, in this study has suggested that CRISPR/Cas9 systems can accurately link certain gene with specific single guide-RNA in many essential sites into the Coronavirus genome (*s, e, n, m, orf3a, orf6, orf7a, orf7b, orf8, orf10*). Our study proposes to complete inactivation for each protein target, which has ability caused the infection by using bioinformatics analysis to do cleavage each gene through

binding with guide-RNA and stop expression. In addition, it has believed that the using design guidelines will induce decrease potential effects of proliferation coronavirus inside human cells and gives our body at least an initiate immunity. In this study, we just focus an example of one important protein (Spike -protein) out of ten proteins persist into the virus, which have capability inhibited for invasion and proliferation action inside the host cell. The idea has been developed throughout designed guide-RNA for S-gene sequences, in order to inactivate and impeding gene expression into the S-gene and ceases their action. Conservatively determining target gene sequences in order to avoid interfering with human genes contents, thereby make ensure to destroy the only target virus away from others. The limitation of facility and to save the time, the overall aim of our research is to bring together a serious detecting of genes and proteins sequencing of the essential proteins of COVID-19 coronavirus to make them as a target to inactivate the infection of virus by using CRISPR-Cas9 technique. The editing gene- CRISPR/Cas9- permits for precise genome destruction and replacement in a flexible way resulting in high activity and low cellular toxicity [10]. This will be a building block towards these potential proteins in the future studies that could then explore and exploit very applied method clinically to destroy this disease genetically and radically.

3. Acknowledgement

The authors are very grateful to the University of Mosul / College of Environmental science and Technologies for their provided facilities, which helped to improve the quality of this work.

Abstract. The study was conducted in Al-Youssoufia region which located in North West of Baghdad city during the growing season of 2018-2019. The experiment was aimed to demonstrate the optimum concentration of amino acid proline that reduce the effect of drought stress. By using three time for irrigation (4, 8, 12) day and four concentrations of proline (0, 20, 40, 60) mg. L-1 and their interaction on some growth characteristics: Root length, dry weight, nitrogen, phosphorous and potassium content , carbohydrate percentage and peroxidase activity in vegetative part. Data were statistically analysed to find out the least significant difference (LSD) between treatments at 0.05 level. The results indicated the increase of proline concentration from (0 to 60) mg.L-1 caused significant decrease in the average of growth characteristics and peroxidase activity unite.mg.proline-1 with increase in the average of irrigation periods under drought stress.

Keywords. Proline, Cowpea, drought stress.

1. Introduction

The Cowpea (*Vigna unguiculata* L.) is a specific type of small oval bean with black dot on it, and have different colors such as; red white, black and brown and although it is very popular for its flavor and delicious taste [1]. The cowpea contains all the essential vitamins and minerals including vitamins A, B and C, folic acid, iron, potassium, magnesium, calcium, selenium, sodium, zinc, copper and phosphorus [2]. People with diabetes can depend cowpea on their diet because it have magnesium in high levels which improve bone health and play a key role in carbohydrate metabolism [3], and can help the body to maintain balanced levels of blood sugar, and it essential for people with colitis because of its rich source of fiber and it can also improve the efficiency of digestion and help in eliminating urination problems [4] it used as a treatment for anemia and iron deficiency, and it is rich with antioxidants vitamin A and C which are benefit for the skin, and for hair, its solution prevent hair loss, and is very rich in vitamin B1 (Thiamine) there for play a role in preventing heart failure and controling ventricles of the heart [5]. The treatment with amino acid proline it play positive role correlation between proline accumulation and plant stress, it plays three major roles during stress like

as metal chelator, antioxidative defense molecule and a signaling molecule. Review of the literature indicates that a stressful environment results in an overproduction of proline in plants which in turn enhance stress tolerance by maintaining cell turgor or osmotic balance and stabilizing membranes, and minimize concentrations of reactive oxygen species (ROS) within normal ranges, thus preventing oxidative burst in plant [6]. Proline can enhanced stress tolerance when supplied exogenously at low concentration, but have a toxic effects when supplied exogenously at higher concentration. Plants are subjected to various types of environmental stresses, which include salinity, water deficit, temperature extremes, toxic metal ion concentration and UV radiation. The exogenous applied proline at seedling stage or at vegetative stage of *Zea mays* resulted in enhanced growth under water deficient environment [7]. The present study aimed to study the effect of increasing concentration of proline and irrigation times and their interaction on growth of cowpea plant and to determine the suitable concentration of proline acid that can avoid the decrease in water content in the plants.

2. Materials and Methods

The experiment was conducted in growth season at 2018-2019 in the Al-Youssoufia region which located in northwest of Baghdad city. The experiment designed at four levels of proline and three time of irrigation, (3x4x3) by using 30 plants in each treatment unit which was designed according to the Randomized Complete Block Design (R.C.B.D) with three replication.

2.1. Soil analysis

Top soil samples were taken from the (0-30) cm layers. Samples were air dried and sieved to a particle size (2 mm) for soil chemical analysis [8] the result of the chemical and physical properties of the soil used in the experiment.

Table 1. Some of the chemical and physical properties of the soil used in the experiment.

pH	EC $ds.m^{-1}$	N $mg.kg^{-1}$	P $mg.kg^{-1}$	Soil texture		
				Sand $g.Kg^{-1}$	Silt $g.Kg^{-1}$	Clay $g.Kg^{-1}$
7.08	2.6	0.132	23.10	200	240	390

2.2. Studied characteristics

2.2.1. Dry weight (g)

Shoot dry weight were calculaed by using sensitive balance after drying in an oven at temperature (60±0.2) C° until weight constant.

2.2.2. Root length

Root measurements were taken from the area associated with the stems to the furthest penetration from the soil and left in the water until the disposal of all clay.

2.2.3. Determination of the Nitrogen concentration (%)

To determine the nitrogen, known weight of plant samples, digested according to [9] method. Nitrogen was determined in the shoot by micro-Kjeldahl using the following equation:

$$\%N=\frac{V_1\times V_2\times N_1\times 14\times 100}{A\times B\times 1000}$$

In which:

V1= HCl volume from the burette.

V2= Total volume of digested plant sample in (50) ml.

N1= Used HCl normality (0.005 N).

14= Nitrogen atomic weight.

100= Conversion to the percentage rate.

A= Digested plant sample solution in the distillation unit.

B= The weight of the dried plant digested sample.

1000= To convert mg. to g. unit.

2.2.4. Determination of soluble carbohydrate percentage

The stock solution of glucose and fructose is prepared by solute (50) gm of glucose and (50) gm of fructose in one litter distiled water, then prepared many concentration of them like (0.0, 0.2, 0.4, 0.6, 0.8, and 1.0) $mg.L^{-1}$, (1) ml of each concentration and (1) ml of phenol indicator (5%) is added to each concentration, mixture is read by spectrophotometer at (488) mm wave length. From the relationship between the concentration curve is drawn [10].

2.2.5. Determination of total phosphorus content ($mg.plant^{-1}$)

Estimate phosphorus concentration in spectrophotometer digested samples and at length 882 nm according to [11], the concentration was multiplied by plant dry weight to estimate the total phosphorus content.

2.2.6. Determination of total potassium content ($mg.plant^{-1}$)

Potassium concentration in digested samples was first determined by the flame spectrophotometer according to [8] it was calculated by multiplying the potassium concentration by dry weight of plant to estimate total potassium content.

2.2.7. Determination of antioxidant enzyme (Super oxide dismutase) (SOD) $U.ml^{-1}$

Estimated by method [12] by used reagents:

- Nitro blue tetrazolioum.

- Ribovlavin

2.2.8. Prepare solution volume

Table 2. Preparation of solution.

Solution	2	2	3	4	Total volume
Component	Potassium phosphate buffer 82.4 ml.mol	Amino acid L. methionine 14 ml.mol.	Tritron-X 1%	14.4 ml.mol + 10 ml d.w	-

Volume ml	18.35	1.5	0.75	1	21.60

Prepare riboflavin in solution 47.7 micromole by dissolving 0.0018 gram with, distilled water and complete volume to 100 ml of distilled water

2.2.9. Method of work

Crush 1 gm of soft vegitative tissue from 90-day-old sample with 10 ml potassium phosphate buffer (0.1) molar and kept under the temperature of 3°C refrigeration for 24 hours and put it on centrifuge at 1000 rpm for quart of an hour, 1.5 ml from total volume above in the tubes and add 40 microliter of the solution filtration the transferred to spectrophotometer for absorbance reading at 560 wavelength and comparison with blank sample which did not contain plant tissue were added to then just distilled water, samples were then brought to light using two lamps (20 watt) in box for ten minutes then read the absorbance below the same wavelength the standard was drawn and the inhibitor ratio was calculated from the follow equation:

Enzyme activity=$\frac{\text{Sample inhibition ratio}}{\text{Highest inhibition ratio}} \times \frac{\text{Dilution coefficient(D.F)}}{\text{Volume of samples}} = \frac{60}{40}$

3. Results and Discussion

Effect of proline on some growth characteristics of cowpea plant exposed to water stress:

3.1. Dry weight

In Table (3) showed that there was significant increasing at (P= 0.05) in the dry weight with the increasing proline concentration without irrigation time and irrigation time without proline, the dry weight means increased with increasing in the proline levels from (0 to 40) gm.plant-1 this resulted significant in the average dry weight, an increase of (38.397%). The results also indicated a significant increase in the rate dry weight with increases the irrigation time from (4 to 8) day an increase of (7.710%). The effect of bilateral overlap of the study workers showed results, there was significant increase in this characteristic. The highest value for dry weight was at concentration 40 $mg.L^{-1}$ proline acid and (8) day irrigation time, where it reached (2.704 $gm.plant^{-1}$) compared with (0) $mg.L^{-1}$ proline and (4 day) where it reached to (1.995 $gm.plant^{-1}$) an increase of (35.538%). We conclude that the spacing of irrigation time affects dry weight as it leads to a decrease in photosynthesis rate as well as few absorption of important nutrient and consequently in metabolism, it is related reduced dry weight by low plant elongation rate and low leaf area rate, where dry matter is the net production of photosynthesis and depends on the balance between two processes photosynthesis and respiration, therefore spraying with proline acid increased that plant ability to build photosynthesis by controlling the opening and closing of stomata the ability of plant to build chlorophyll pigments and prevent them from decomposing and thus helped to balance taking CO_2 and water loss during transpiration [16]. It is believed that the effects of saturation mater deficit and the accumulation of ABA and pick up the leaves, close the stomata, decrease the CO_2 gas representation and increase the concentration of IAA-oxidase enzyme which oxidation of natural oxygen in the area of separation of the abscission zone which caused accumulation of ethylene hormone that causes the distraction of chlorophyll [17]. It is believed that the lack of water leads to an increase accumulation of hydrogen peroxide (H_2O_2) and inhibition of energy production by enzyme NADPH oxidase [18].

Table 3. Effect of different levels of amino acid proline on length of root (cm) of cowpea plant which exposure to drought stress.

Irrigation time	Concentrations of spraying proline ($mg.L^{-1}$)				Mean
	0	20	40	60	
Every 4 days	4.50	5.53	6.40	4.13	5.14
Every 8 days	4.30	5.03	6.17	6.07	5.39
Every 12 days	3.20	4.25	5.23	5.07	4.95
LSD (0.05)		1.25			0.62
Mean	3.00	4.94	5.93	5.29	
LSD (0.05)		0.72			

3.2. Root length

In Table (4) it can be observed that there was significant increasing in the root length with increasing in the proline without irrigation time in (40) mg.L-1 concentration which were (5.93) cm root length. In the irrigation time without proline we observed that there was significant increasing in the root length with increasing in the irrigation time at (8) day compared with other irrigation time which recorded (5.93) cm root length compared with other periods. The proline with irrigation time interaction showed that the increasing in the proline and irrigation time levels from (40 mg.L-1 and 8 day) led to significant increasing in the levels root length values at rat of (6.17) cm compared with another means. This may be due to increased dehydration causes to dysfunction of the internal hormonal system so down the gibberellic acid hormone, this leads accumulation of abscisic acid in the plant which reduces the division and size of cells in the apical areas [13]. The water stress is thought to be leads to increase the activity of free radicals of the effective oxygen and nitrogen group and inability for that the plant is inhibited and scavenged in chloroplasts and mitochondria stops the process CO2 stabilization and accumulation of dry matter [14], for that inhibits root growth, and water stress is thought to decrease in the oxygen content due to the activity of the IAA oxidase enzyme which prevents the descent oxygen and the factor of the leaves which causes weakness in growth of root [15].

Table 4. Effect of different levels of amino acid proline on dry weight (g) of cowpea plant which exposure to drought stress.

Irrigation time	Concentrations of spraying proline ($mg.L^{-1}$)				Mean
	0	20	40	60	
Every 4 days	1.995	2.317	2.571	1.780	2.166
Every 8 days	1.850	2.317	2.704	2.616	2.333
Every 12 days	1.545	1.805	2.186	2.432	1.992
LSD (0.05)		0.396			0.198
Mean	1.797	2.094	2.487	2.276	
LSD (0.05)		0.229			

3.3. Effect of different levels of amino acid proline on content of macro elements (NPK) of cowpea plant which exposure to drought stress

In Tables (5, 6, 7) showed that there was significant decrease in the means of nitrogen phosphor and potassium which affect by drought stress when irrigation intervals diverged from 4 days to 12 days the means decreased specials at 12 days an decreased of (8.070, 8.994, 20.717) % for N, P and K sequentially compared to 4 day treatment. The proline without irrigation time we observe through same Tables there was increased (NPK) means in concentration of proline at (40) mg.L-1 an increase of (38.372, 50.000, 57.418)% sequentially compared to control treatment without spraying proline (0) mg.L-1. The interaction between treatment was significant, an increase at (40 mg.L-1 and 8 day) for N

and P and (20 mg.L-1 and 4 day) for K (35.523, 51.445, 74.944) % compared with (0) proline and (4) day irrigation time. Metabolism disorder of nucleic acid, amine acid and protein where it is believed to affect straining dehydration in polyribosomes and low content in polyribosomes ATP levels and nitrogen content and effect on metabolism disorder due to the increase in effective oxygen compounds, this leads to an increase in the activity of nitrat-redutase and hydrolysis of nucleic acid that effect the absorption of mineral [19]. It is also believed that the cause of low protein content is an increase in activity enzymes such as lipoxygenase, protease and RNase are caused by drought stress and they act on reducing nucleic acid metabolism, as well the glutathione concentration to be increasing at extreme stress to release the accumulation of glutamate resulting from the decomposition of organelles and cell membranes [20], polyamines like glutathione and some amino acids such as proline ammonia modification to maintains the cell's osmotic pressures resulting from the effect of cell water loss due to dehydration which ultimately leads to increase cell osmosis and water absorption [21].

Table 5. Effect of different levels of amino acid proline on nitrogen percentage (%) in vegetative total of cowpea plant which exposure to drought stress.

Irrigation time	Concentrations of spraying proline ($mg.L^{-1}$)				Mean
	0	20	40	60	
Every 4 days	1.050	1.220	1.353	0.937	1.140
Every 8 days	0.973	1.137	1.423	1.377	1.228
Every 12 days	0.813	0.950	1.150	1.280	1.048
LSD (0.05)		0.209			0.104
Mean	0.946	1.102	1.309	1.198	
LSD (0.05)		0.121

Irrigation time	Concentrations of spraying proline ($mg.L^{-1}$)				Mean
	0	20	40	60	
Every 4 days	0.173	0.204	0.246	0.136	0.189
Every 8 days	0.162	0.189	0.262	0.229	0.210
Every 12 days	0.126	0.158	0.183	0.219	0.172
LSD (0.05)		0.049			0.024
Mean	0.154	0.184	0.231	0.192	
LSD (0.05)		0.028			

Table 7. Effect of different levels of amino acid proline on potassium percentage (%) in vegetative total of cowpea plant which exposure to drought stress.

Irrigation time	Concentrations of spraying proline ($mg.L^{-1}$)				Mean
	0	20	40	60	
Every 4 days	1.353	2.367	2.210	1.987	1.979
Every 8 days	1.270	1.640	2.113	1.763	1.696
Every 12 days	1.260	1.630	1.787	1.600	1.569
LSD (0.05)		0.282			0.141
Mean	1.294	1.879	2.037	1.783	
LSD (0.05)		0.163			

3.4. Carbohydrate concentration

In Table (8) showed that there was significant decrease in the means of carbohydrate under effect of irrigation time from (4 to 12) day the means decreased carbohydrate and decreased of (26.23%)

compared with (4) day. As for the effect of proline without irrigation periods, the effect was significant in increasing the percentage of carbohydrates at concentration (20 mg.L^{-1}) an increase rate estimated at (58.87%) compared with zero concentration. The interaction between proline and irrigation time was significant at (40 mg.L^{-1}) and (4 day) an estimated increase at (74.9%) carbohydrate compared with (0) proline and (4 day) irrigation time. The reduction of carbohydrates are due to the dehydration which effect in photosynthesis as the effect of water tension begins to close the stomata first accompanied by a shortage of the amount of carbon dioxide entering and installed in the leaves results in a significant drop in photosynthesis and this affects the amount of nutrients finally in the overall growth of plant [22].The increase in the percentage of carbohydrates due to effect of proline in increasing leaf area and number of leaves, as well as increasing leaf content of chlorophyll this will increase the efficiency of photosynthesis and then produce carbohydrates [23].

Table 8. Effect of different levels of amino acid proline on carbohydrate percentage (%) in vegetative total of cowpea plant which exposure to drought stress.

Irrigation time	Concentrations of sprying proline (mg.L^{-1})				Mean
	0	20	40	60	
Every 4 days	15.15	24.66	26.42	22.19	22.11
Every 8 days	14.09	23.61	18.32	19.73	18.94
Every 12 days	12.86	18.60	17.23	16.56	16.31
LSD (0.05)			2.78		1.39
Mean	14.03	22.29	20.66	19.49	
LSD (0.05)			1.60		

3.5. Peroxidase enzyme

In Table (9) showed that there was significant at all treatment, the means of peroxidase enzyme under effect of irrigation time increased by increasing the irrigation time, and the time of (12 day) highest value of the enzyme an increase of (88.46 unit. mg.$plant^{-1}$) compared with (4 day) irrigation treatment. As for the addition of increased concentration of proline we note decrease in the content of the peroxidase enzyme especially at concentration 60 unit.mg.plant-1 and a decreased as (36.36 unit.mg.$plant^{-1}$). The interaction between increased proline spraying and (8 day) irrigation time inhibited the activity content of peroxidase enzyme and decreased as (46.67%) compared with (0) proline unit (4) day irrigation time. Irrigation spacing led to an increase in the activity of the enzymatic oxidation system, which includes super enzymes SOD and peroxide resulting from the activity of oxidized enzymes and free radicals be mater stress and reduced scavenging [24]. Increasing the activity of the enzyme peroxidase by increasing the production of hydroxyl radical and single oxygen with water stress effect is also believed to increase concentration the activity of malonedihyde is vital guide for the plant to provoke antioxidant production [25].

Table 9. Effect of different levels of amino acid proline on plant content of peroxidase enzyme (Unit. mg $protein^{-1}$) in vegetative total of cowpea plant which exposure to drought stress.

Irrigation time	Concentrations of sprying proline (mg.L^{-1})				Mean
	0	20	40	60	
Every 4 days	0.03	0.028	0.022	0.026	0.026
Every 8 days	0.039	0.032	0.024	0.016	0.029
Every 12 days	0.059	0.050	0.048	0.042	0.049
LSD (0.05)			0.008		0.004
Mean	0.044	0.036	0.031	0.028	
LSD (0.05)			1.60

Abstract. Cocoon of larva *Larinus maculates* F. from Curculionidae family (*Echinops* species), locally in Iraq known as Tihan, is one of traditional folk medicine used in the treatment of diversity respiratory system and fever. This study was carried out to assess the bioactive component and the antioxidant capability of aqueous beetle cocoon extract (*Larinus maculates* F.) along with its possible cytotoxic activity against A549 lung cancer cell line. For phytochemical analysis gas chromatography-mass spectrometry (GC-MS) was used, and to detected free scavenging activity 2, 2-diphenyl-1 picrylhydrazyl (DPPH) was used. To determine the cytotoxicity in the cancer cell line 3-(4,5-dimethylthiazol-z-yl)-2,5-diphenyltetrazolium (MTT) was used; peripheral blood monolayer cells (PBMCs) was used as a normal cell. GC-MS analysis identified the presence of 9 phytochemical components. DPPH results suggested a promising antioxidant activity in a dose-dependent, the best antioxidant potential was at 600 µg.ml^{-1} concentration. Cytotoxic activity results showed that the increase in extract concentration decreases the cell viability, at 50 µg.ml^{-1} concentration the percentage of viability was (86.76±0.87) where at 200 µg.ml^{-1} the cell viability was (56.44±0.91) µg.ml^{-1}. Taken together, the results showed that larva cocoon of *Larinus maculates* F. extract has an important phyto-molecule with great potent antioxidant and cytotoxicity activity against lung cell line A549..

Keywords. *Larinus maculates* cocoon shell, GC-MS analysis, DPPH, A549 cell line.

1. Introduction

In many cultures, traditional medicine as an alternative medication is still important therapeutic source due to its adequate properties, heritage and popular belief along with the low cost [1]. Therefore, there is growing interest in the study of medicinal therapy in the field of biomedical research. Natural products such as plants, animals and marine organisms contain a large number of active compounds that reflect the potential treatment activity of these organism [2]. It has been suggested that some

alternative drugs might have a greater remedial capacity than those that are owned by manufactured drugs in the treatment of certain diseases with less side effects that accompany the use of chemical drugs [3]. One of the interested folk remedy use in Iraq is the cocoon shell produced by salivary glands of beetle larva of *Larinus maculates* F. from *Curculionidae* family commonly known as (Tihan). Also known in neighboring countries (Iran and Syria) *Trehala manna* (Shekar tighal). Commonly used in treatment from various diseases including respiratory system diseases, viral or bacterial infection, antitussive, anti-asthmatic and febrifuge [4]. In our *in vivo* previous study [5]. Tihan exhibited potential role in activated immune system where orally treated mice showed a significant increase in mitotic index and phagocytosis. Other study by [6] reported *in vitro* immunostimulatory effects on splenocytes and macrophages by increased PHA- and LPS-stimulated splenocytes proliferation and IFN-γ production. Additionally, Iranian researcher reported contains analysis of *Trehala manna* such as water-soluble polysaccharides (e.g. cellulose and trehalose), tannin, albuminoid matter, lipid, and mucilage [7, 8, 9]. As attributable the important role and their biological activities of *Trehala manna* due to its polysaccharides molecular weights [8]. It is well known that the unnecessary generation of reactive oxygen species (ROS) causing imbalance in oxidant/antioxidant status and leading to oxidative stress and consequently oxidative damage induced cell injured. The implication of ROS as one of the molecular mechanisms involved in carcinogenesis has been reported [10)] Therefore, antioxidants are proposed as possible applicant for prevention or/and treatment of cancer. Antioxidants play important role in determining the therapeutic effect of plants and other traditional agent and to make them a good remedy against acute and chronic diseases. These antioxidants usually found and taken in our dietary from the natural compounds. The current study aims to investigate the active compounds in comestible Iraqi aquatic cocoon shell of beetle larva of *Larinus maculates* and their anti-oxidant and cytotoxicity effects on A549 lung cell line. For our knowledge, this is the first study in this aspect in Iraq.

2. Materials and Methods

2.1. Chemical and reagent

Cell culture media and reagents were obtained from GIBCO (Rockville, MD, USA), all other chemicals and reagents were obtained from Sigma Aldrich (Louis, USA).

2.2. Beetle cocoon collection and extract preparation

Tihan cocoon shells were obtained from local shelf market (Iraq/Baghdad), identified by expert in Iraqi Natural History Museum Figure (1). Cocoons aquatic extract were prepared as the following (5) firstly emptied from inside insect, grounded using a laboratory electric grinder. 10 g from the powder dissolved in 100 ml of distal water using heating stirrer for two hour. Followed by centrifuging at 4000 rpm for 30 min and then the filtered supernatant dried using a rotary evaporator under reduced pressure and kept at 4°C until uses in the experiment.

Figure 1. Tihan cocoon shells produced by of *Larinus maculates* F from Curculionidae family.

2.3. Gas chromatography-mass spectrometry (GC-MS) analysis and identification of phytochemical components

The GC-MS analysis for aqueous beetle cocoon extract was performed as descripted previously [11] using a Clarus 500/580 Perkin Elmer GC (Connecticut, USA). The unknown components mass spectrum of the unknown components was compared with the spectrum of the components stored in the NIST library [12].

2.4. Anti-oxidant activity measurement

The antioxidant activity was determined according to [13] using 2, 2-diphenyl-1-picrylhydrazyl (DPPH). Briefly, 1 ml of the samples (different concentration 100, 200, 400 and 600 µg.ml^{-1} was mixed 1:1 with DPPH solution (60 ⌈M, 1 ml). After incubation in darkness at 37°C for 30 min, the absorbance was read at 517 nm spectrophoto-metrically (Perkin-Elmer Lambda 25, Germany). Vitamin C considers as a positive control, and measurements were carried out in triplicate. The IC50 value was calculated according to the absorbance and the inhibition percentage of was calculated using the following equation:

Scavenging activity(%) by DPPH = (Ac – As) / Ac * 100

Where, Ac = absorbance of control and As= absorbance of samples

2.5. A549 Cell line culture

The lung cell line A549 was provided by Center of Biotechnology at AL-Nahrain University. A549 cell line is usually used as a representative of type two alveolar pulmonary epithelial cell derived from pulmonary adenocarcinoma of 58-years old man [14] Dulbecco's Minimal Essential Medium (DMEM) was used for cell culture and maintenance and provided with 10% fetal bovine serum (FBS) and antibiotic penicillin & streptomycin (1%). Cells were incubated at 37°C in humidified 5% CO_2 and cultured at 2 ×10^5 cells ml^{-1} concentration.

2.6. Human Peripheral blood isolation and culture

In order to evaluate Tihan extraction effect on normal cells Human peripheral blood samples, blood samples were collected from healthy volunteers in heparinized tubes after taken their permission to participate. The peripheral blood mononuclear cells were isolated by using Ficoll-Paque after centrifuged in a falcon tube for 30 min at 3000 rpm. Cells were cultured in 96-well plates in RPMI medium and incubated for 4 h in 5% CO_2 at 37 °C. Concentration of 50, 100, 150 and 200 µg.ml^{-1}, the same concentration used with A549 cell, was add, lymphocytes in culture media without extract was considered as control and the cell viability calculated using MTT assay after 24 h incubation. Cisplatin was used a positive control (stock solution 1000µg/ml).

2.7. Measurement of cell viability

The 3-(4,5-dimethylthiazol-z-yl)-2,5-diphenyltetrazolium (MTT) assay was used as described by [15] for cell viability detection. Extract concentrations of 50, 100, 150 and 200 µg ml^{-1} was used. Cells were seeded at a concentration of 1 × 10^5 cell ml^{-1} and 100 µl of extracts was. After the incubation period, 10 µl of (5 mg ml^{-1}) MTT solution was added to each well and incubated 4 h at 37°C. Then 50 µl of dimethyl sulfoxide (DMSO) was added and left for 10 min. A549 cells without aqueous beetle cocoon extract represent control group. The absorbance was read at 570 nm using spectrophotometer

reader (VersaMaxTM, Molecular Devices, Sunnyvale, CA). Based on the inhibition concentration the IC_{50} value calculated using GraphPad Prism 6 software.

2.8. Statistical analysis

SPSS software version 16.0 was used for Statistical analysis. The results are accessible as means ± standard error. Analysis of variance (ANOVA) was used and Fisher Least Significant Difference (LSD) test.

3. Results and Discussion

3.1. GC-MS analysis

The GC-MS analysis of the cocoon extract showed the presence of 9 compounds (Table1). The major components were identified are benzoic acid, (19.89%); 2-butanol, (17.86%); followed by hexamethy l-3 (16.41%) and purin-6-1 (15.68%) as the major constituents cocoon extract. These elements have been reported for their biological and therapeutic properties including the antioxidant for example, Hydroxy benzoic acids and its derivatives showed antioxidant and anti-inflammatory properties against free radicals especially superoxide radical [16, 15, 17] where it decrease overproduction of reactive species. Also, it has been reported that antioxidant activity of butanol fraction was higher than α-tocopherol and butyrated hydroxyl toluene (BHT) [18].

Table 1. Phytochemical analysis of *Larinus maculates* F. cocoon extract by GC-MS.

NO.	RT	Phytochemical compound	Peak area %	CAS NO.
1	4.316	Performic acid, trimethysilyl derivative	7.92	1000368-52-2-25
2	4.536	Glyceraldehyde	2.93	000056-82-6
3	4.961	Cyclotrisiloxane, hexamethyl-	2.19	000541-05-9
4	5.136	Tricyclo [4, 3, 1, 1 (3, 8)] undecane-3-carboxylic acid, methyl ester	6.06	031061-61-7
5	5.477	Acetophenone, 4'-methoxy-, oxime	11.06	002475-92-5
6	5.675	6H-Purin-6-one, 2-amino-1, 7-dihydro-1-methyl-	15.675	000938-85-2
7	6.069	2-Butanol, 3-methyl-	17.86	000598-75-4
8	7.268	Benzoic acid, 3-methyl-2-trimethyl silyloxy-, trimethylsilyl ester	19.89	1000153-57-1
9	8.088	7, 7, 9, 9, 11, 11- Hexamethyl-3, 6, 8, 10, 12, 15-hexaoxa-7, 9, 11-trisilaheptadecane	16.41	1000375-89-1

3.2. Antioxidant activity

The aqueous extract was tested for its antioxidant activity with DPPH at 100,200, 400, and 600 $\mu g.ml^{-1}$ concentration. The results showed a significant higher radical scavenging activity as compared with the positive control (L-ascorbic acid) in a concentration-dependent inhibition. Higher activity ($P \leq 0.01$) was shown at 600 $\mu g.ml^{-1}$ concentration, while the lower one was with 100 $\mu g.ml^{-1}$ concentration ($P \leq 0.05$) compare with ascorbic acid control (Figure2). Many different compounds found in the extract of the present study can be contribute to free radical scavenging activity, such as the phenolic

compounds with its multiple hydroxyl groups showed higher ability to quench DPPH [19]. Moreover, [20] reported that the number of hydroxyl groups attached to the aromatic ring is associated with the phenolic acids anti-radical activity, though some other compounds may also be involved. Present study finding support this suggestion by which Butanoic acid, Oleic acid, Pimaric acid, Phenol and Benzoic acid found in the extracts might be responsible to the antioxidant activity. As a little-known of functional food sources of the cocoon extract, therefore, the isolation and purification of these phyto-compounds may be useful in the research of new treatment drug. The antioxidant activity performance in two levels, the first one at the cellular membrane level by breaking peroxyl radical chain reactions followed by the second level by reacting with intracellular ROS [21].

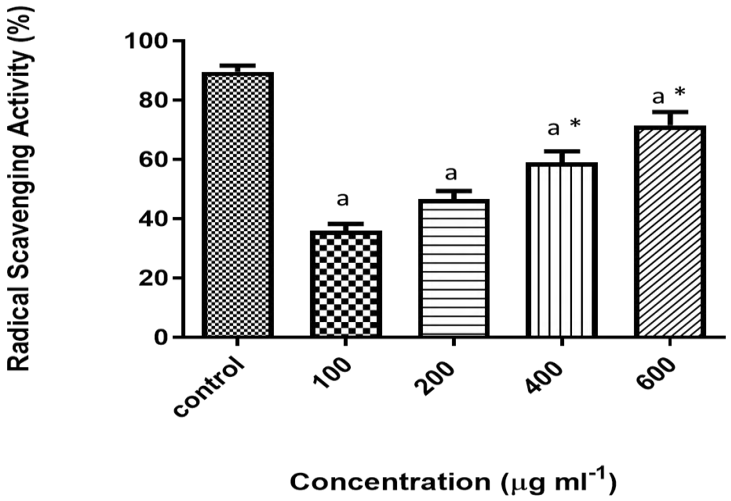

Figure 2. DPPH free radical scavenging activity. The inhibition percentage of different concentrations of extract observed at 517 nm. Data are means ± SE (n = 3). a significantly different at P≤ 0.05 as compared to L-ascorbic acid (positive control). * significantly different at P≤ 0.05 as compared to 100 μg.ml^{-1}.

3.3. Cell cytotoxicity

The cytotoxicity effect of different concentrations of the aqueous Tihan extract was evaluated using two Human cell line, A549 lung cancer cell line and PBMCs as a normal cell. The results showed significant cytotoxic effect in a dose dependent manner. The treatment of A549 cells with concentrations of (50, 100, 150 and 200 μg.ml^{-1} decreased significantly the % viability. Where the highest inhibition was at higher doses, however, a moderated inhibition (not significant) was found at the lower doses (Table 2). However, there was no potent cytotoxic effect on normal PBMCs cell (Table 2). Cisplatin effect on the percentage viability of PBMC cell was dose dependent by which the viability decreased significantly as the dose 8 and 12 μg.ml^{-1} compared to the control. However, at the dose 2 and 4 μg.ml^{-1} there was no significant difference.

Table 2. Cell percentage of viability on A549 and PBMCs cell line using MTT assay and treated with different concentrations of cocoon extract for 24 h. Data are means ± SE in triplicate. A significant at p≤0.05.

Cell Viability (%)	Concentration (μg. ml^{-1})				IC50
	50	100	150	200	
A549 cell line	86.76±0.87	71.52±0.79	63.14±0.64[a]	56.44±0.91[a]	139.01
PBMCs	96.34±0.56	100.30±0.89	118.59±0.72	126.73±0.88	43.7
CisP	2	4	8	12	
	89.96±2.24	74.08±2.48	66.14±1.56[a]	53.08±2.34[a]	0.27

This is because the cocoon extract of Tihan contains polysaccharide [22] and when the concentration of the extract is increased the ratio of polysaccharide increased that stimulate the production of IL-2, which plays a role in the activation of NK cells [23] as well as its role in T cell division. This demonstrates the role of polysaccharide in the development of immunity and its potential for use in therapeutic applications such as bacterial infections and cancer [24]. Study by [5] have indicated the role of these polysaccharide in increasing phagocytic index(PI). The reason for this increase is the effect of the active ingredient in the extract in stimulating phagocytosis by stimulating the release of certain cellular attractions specifically TNF And IL^{-1}, which stimulates macrophage cells, including neutrophils to leave the blood stream to the peritoneal cavity [25]. But the inhibition was decreased with reducing the concentration at 100 $\mu g.ml^{-1}$ concentration. The suppression of proliferation was concentration-dependant. Additionally, elevated ROS level has been associated with cancer, one of the causes is the abnormal mitochondrial oxidative metabolism which is responsible for the initiation and progression of cancer.

4. Conclusion

In conclusion, the finding of the present study identified that *Larinus maculates* F. cocoon aqueous extract has several phyto-molecule possessing anti-cytotoxicity and anti-oxidant therapeutic activities. The results of antioxidant activity suggested that ROS may be a potential mechanism involved in cancer cell death and the antioxidant capacity of the extract can decrease cell proliferation. For our knowledge this is the first study that recorded the *in vitro* toxicity for the cocoon extract. However, further research on cyto-toxicology still needed in order to insure the safety especially *in vivo*.

Abstract. This study included (75) samples of the males students at the Tikrit University, The samples were divided into three groups; the first group: (25) blood samples pulled from healthy no smoking students (males) as Control sample. The second group: (25 males) samples of diabetic mellitus (smoker students). Third group: (25 males) samples of hypertension (smoking students). The results of the study indicated a significant increase in the concentration of the levels Cholesterol, Triglyceride, Malondialdehyde (MDA), Lactate dehydrogenase (LDH) at level ($P < 0.005$) in the samples of smoker students when compared to the healthy group. And showed decrease in the concentration level of HDL, Glutathione Peroxidase (GPx) at level ($P < 0.005$) when compared to the healthy group (non-smokers).

Keywords. Biochemical variables, Blood serum, Smoking.

1. Introduction

The Antioxidants are a class of chemical substances naturally found in our food which can prevent or reduce the oxidative stress of the physiological system. The body is constantly producing free radicals due to regular use of oxygen. These free radicals are responsible for the cell damage in the body and contribute to various kinds of health problems, such as heart disease, diabetes, macular degeneration, and cancer. Antioxidants being fantastic free radical scavengers help in preventing and repairing the cell damage caused by these radicals [1] .Plants and animals are the abundant source of naturally producing antioxidants. Alternately, antioxidants can also be synthesized by chemical process as well as from the different kinds of agro-related wastes using biological process. Based on their solubility, antioxidants are broadly categorized into two groups: water soluble and lipid soluble. [2]In general, water-soluble antioxidants, such as ascorbic acid, glutathione, and uric acid, have functions in the cell cytosol and the blood plasma. Ascorbic acid is a redox catalyst which reduces and neutralizes the reactive oxygen species (ROS), glutathione has antioxidant properties as reducing agent and can be reversibly oxidized and reduced, while α-tocopherol, carotenoid, and ubiquinol are the examples of lipid-soluble antioxidants and protect the cell membranes from lipid peroxidation [3]. Enzymes are types of antioxidants that come from the protein and minerals we eat as part of our daily diets. These enzymes are synthesized in the human body, and include superoxide dismutase (SOD), glutathione

peroxidase, glutathione reductase, and catalases. The human body does not produce antioxidant vitamins naturally, so it is essential to include dietary sources of them in our daily intake of food, be it through foods or supplements. Common antioxidant vitamins include vitamins A, C, E, folic acid, and beta-carotene [4]. Free radicals are highly reactive and unstable molecules, usually oxygen molecules, but not always. Their unstable nature is caused by having an unpaired electron. As a result of this unpaired electron, free radicals seek out and take electrons from other molecules, which oftentimes causes damage to the second molecule. When a free radical molecule does this, it is called "oxidation." A molecule that has had its electron "stolen" from a free radical has been "oxidized." Molecules that have been oxidized are now transformed into free radicals themselves and will seek to interact with another healthy molecule, thereby creating a vicious chain reaction of electron stealing in the body. When the body has undergone excessive oxidation, or more oxidation than can be combatted, it is said be undergoing "oxidative stress."[5]. Like many things that occur in nature, free radicals are not only impossible to avoid, but necessary for life. Free radicals help us fight infection, begin the inflammation process that helps repair tissue injury, and short-term oxidative stress may inhibit aging. At the same time, excessive amounts are harmful to humans[6]. Free radicals can form in the body in a number of ways; Environmental exposure, Carcinogens like radiation from the sun, cigarette smoke, air and water pollution, pesticides and herbicides in the food we eat, asbestos and other nasties can cause free radical formation in our bodies. Exercise, while consistent moderate exercise has many positive benefits and can reduce the risk of breast cancer, excessive exercise or inconsistent but vigorous exercise uses a high amount of the body's oxygen store and as a result, generates excessive free radicals. Stress, the chemicals cortisone and catecholamines created by mental stress can create free radicals. Our bodies, Free radical molecules are a natural byproduct of cell metabolism. Alcohol, consumption of alcohol of any kind of any amount produces free radicals in the body. Fat polyunsaturated fat like that found in vegetables oils is easily oxidized in the body and can create free radicals. Substitute polyunsaturated fats with monounsaturated fat [7]. Some conditions caused by free radicals include; deterioration of the eye lens, which contributes to vision loss, inflammation of the joints (arthritis), damage to nerve cells in the brain, which contributes to conditions (such as Parkinson's or Alzheimer's disease), acceleration of the ageing process, increased risk of coronary heart disease, since free radicals encourage low-density lipoprotein (LDL) cholesterol to stick to artery walls, certain cancers triggered by damaged cell DNA [8]. Smoking considers being wide public health problem, which reached today to the level of global epidemical. It is a risk factor for variety of disease (cardiovascular disease, stroke, chronic pulmonary disease, Alzheimer's disease, Parkinson's disease) [9]. About more than 5 million people die from smoking related illnesses, as the report of World Health Organization [10], this number will be doubled by 2025. The main addictive component of smoke are Nicotine, Hydrogen cyanide, Methanol, Butan and about more than 400 other chemicals. These chemicals induced the rate of Reactive Oxygen Species (ROS), which is a part of free radicals. Free radicals are highly unstable and capable of undergoing complex interaction in biological system, make oxidative stress, which occur when there are not enough antioxidant molecules to counteract their side effects [11]. Antioxidant are natural molecules in the biological system that scavenging free radicals or protecting from its effects. They can be synthesized endogenously in the body or determined by food intake [12].Smoking is a rich source of oxidants. It has been considering the main cause of increase production of (ROS) which may exceed the capacity of antioxidants defense system [13].

2. Materials and Methods

This study has carried out in College of Science (November 2019) to (February2020) at Tikrit University. The study included (50) samples of the smoker students their ages (21-23) years old. As well as choosing randomly group included (30) sample of (non- smoker students) of age (21-23) years old.

2.1. The samples divided into three groups

First Group, included (25) non-smoker students. Second Group, included (25) diabetic mellitus (smoker students). Third Group, included (25) hypertension (smoker students).

2.2. Method Of Collection The Sample

The blood sample was collected from (75) samples of the students healthy (non-smoker) as well as smoker students of age (21-23) years old. The blood samples were taken from the vein.10 mL from each student, the blood was put in disposable test tubes. The tubes are empty of (EDTA) in order make Biochemical tests. After that, The blood was left at room temperature for 20 minutes, The blood was separated by using a centrifuge at speed of (3000) rpm for 10 minutes. The serum was extracted using Micropipette, in order to make Biochemical tests which included (Cholesterol, Malondialdehyde, Lactate dehydrogenase, HDL-Cholesterol, Alanine aminotransferase (ALT), Aspartate aminotransferase (AST), Glutathione Peroxidase, Triglyceride, Uric acid, Creatinine.

2.2.1. Measurement of Cholesterol concentration

To evaluate and estimate the Cholesterol in the blood serum, was dependent and using the (Kit) which its equipped (Biolabo) Company made in France with reference number 02160 [14].

2.2.2. Measurement of Triglycerides concentration

It have been used the (Kit) of Triglycerides equipped by (Biomaghreb) Company made in France with number 20133[15] to estimate and evaluate the Triglycerides enzyme in the blood serum.

2.2.3. Measurement of HDL-Cholesterol concentration

It have been used the (Kit) of HDL-Ch., equipped by (Biolabo) Company mad in France with number 02160 [14] to evaluate and estimate the HDL-Ch in the blood serum

2.2.4. Measurement of Lactate dehydrogenase

It have been measured (LDH) in the blood serum by the following the steps of attached with inspection (Kit) provided by(Biolabo) Company mad in France [16].

2.2.5. Measurement of Glutathione Peroxidase

It have been measured (GPx) in the blood serum by the following the steps of attached with inspection (Kit) provided by(Biolabo) Company mad in France [17].

2.2.6. Measurement of Malondialdehyde

It have been measured (MDA) in the blood serum by the following steps of attached with inspection (Kit) provided by(Biolabo) Company mad in France [18].

2.3. Statistical analysis

The data of the samples study were collected and analysed statistically by using program (SAOOS) of windows. Including (Mean ±S.D). The significant differences at level ($P < 0.005$)[19].

3. Results and Discussion

The results in (Figure 1) Showed significant increase in the Cholesterol concentration under levels of (P <0.005) in the smoker students as compared with in other groups, and this agree with results study of [20]. This increase of the Cholesterol concentration might be because high activity Cholesterol transferase responsible about Cholesterol absorption intestine and then induce as a result of oxidative stress which infect B-cell in pancreatic by the effect of reactive oxygen species [21]. On the hand, this results was revealed to the change in the concentration of the cholesterol is caused by the smoking which increase Cholesterol levels in the blood serum. The Smoking increases inflammation in the body when occurs chemicals in cigarette smoke injure cells, causing swelling and interfering with proper cell function. Also, the Smoking causes oxidative stress, a condition that occurs as chemicals from cigarette smoke combine with oxygen in the body [22] and all these reasons causes ledes to damage of cells. Evidence strongly suggests that both inflammation and oxidative stress may be related to an increased risk of diabetes. The Smoking causes rise both of Hypertension and glucose level in the body, so the Smoker people are less response for the insulin and subsequently the glucose rises in their blood causing Hypertension [23].

Table 1. Arithmetic average for studied croups according to the Disease kind and smoking kind (Heavy smokers).

The samples	NO.	Cholesterol mmol /L	Triglyceride mmol /L	HDL mmol /L
Control Group	25	4.2±2.3	1.7±0.3	1.51±0.01
group (diabetic mellitus)	25	6.8±3.5	5.6±3.2	1.02±0.03
group Hypertension	25	7.4±4.6	6.2±4.1	1.03±0.02

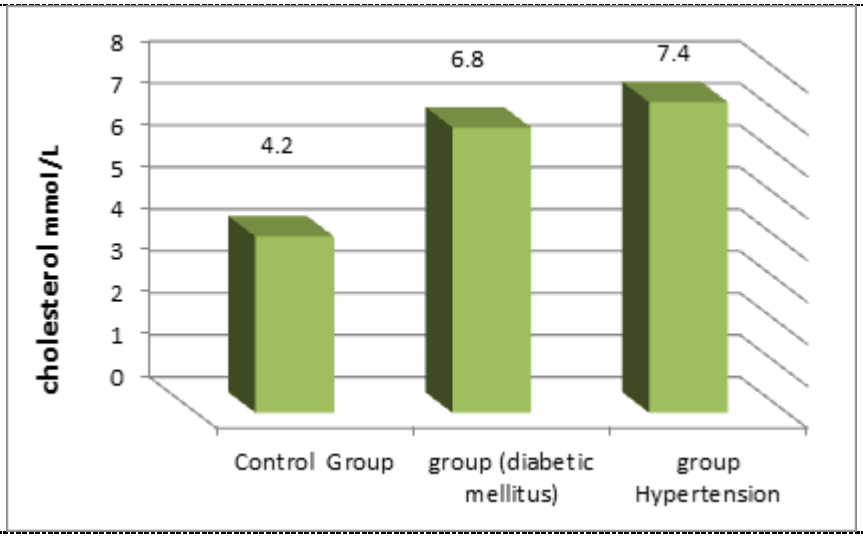

Figure 1. Illustrated the concentration of the cholesterol in the smoker students and compare with in other groups.

The results in (Figure 2) showed significant increase in the triglyceride concentration levels (P <0.005) in the smoker students as compared with in other groups, and this agree with results study of [24]. [25] , during his study on the association between the lipid profile and chronic smoking. Both research above also finded very low levels of HDL, with an increase in the levels of TC, in smokers and these

resulets were an agreement with the finding of our study. Previous studies have reported that smokers have higher serum triglyceride (TG) and blood glucose concentrations and lower high-density lipoprotein cholesterol (HDL-C) concentrations than non-smokers [26]

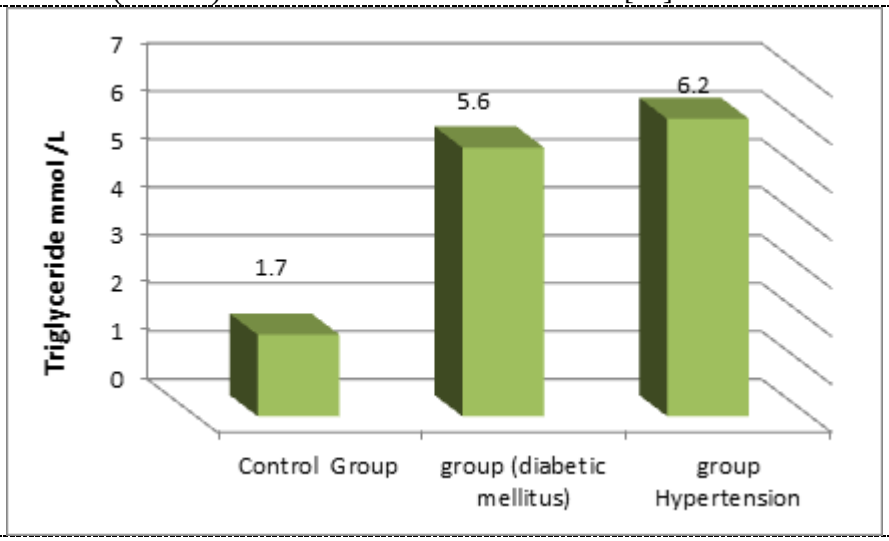

Figure 2. Illustrated the concentration of the triglycerides in the smoking students and compare with in other groups.

The results in (Figure 3) Showed significant decrease in the HDL-Cholesterol concentration levels (P <0.005) in the smoking students as compared with in other groups, smoking is associated with reduced HDL cholesterol levels. Cigarette smoking can alter the critical enzymes of lipid transport, lowering lecithin: cholesterol acyltransferase (LCAT) activity and altering cholesterol ester transfer protein (CETP) and hepatic lipase activity, which attributes to its impact on HDL metabolism and HDL subfractions distribution. In addition, HDL is susceptible to oxidative modifications by cigarette smoking, which makes HDL become dysfunctional and lose its anther protective properties in smokers. Therefore, cigarette smoking has a negative impact on both HDL quantity and function, which can explain, in part, the increased risk of cardiovascular disease in smokers [27, 28].

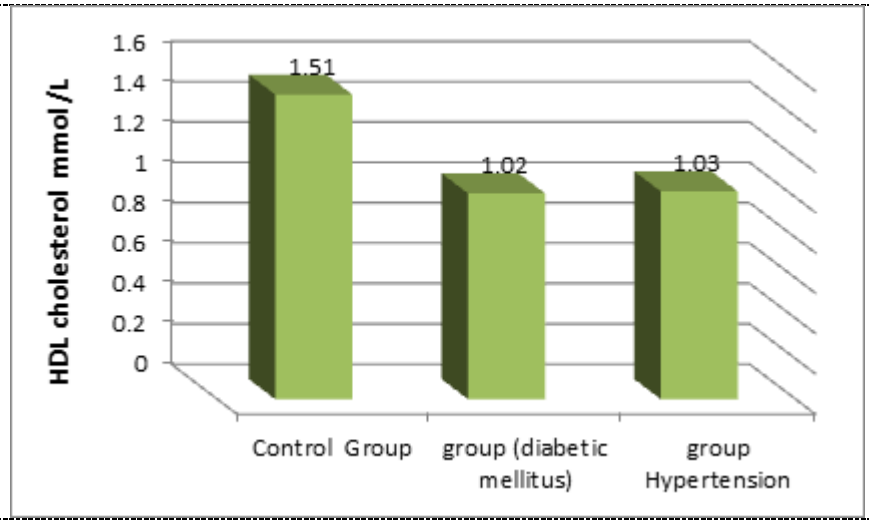

Figure 3. Illustrated the Concentration of the HDL-cholesterol in the smoker students and compare with in other groups.

Table 2. Arithmetic average for studied croups according to the disease kind and smoking kind (Heavy smokers).

The samples	NO.	Malondialdehyde (MDA) ug/l	Lactate dehydrogenase (LDH) u/l	Glutathione Peroxidase (GPx) u/l
Control Group	25	2.65±1.33	181.8±1.02	1.53±0.24
group (diabetic mellitus)	25	5.67±3.2	277.8±133.1	0.191±0.180
group Hypertension	25	6.4±4.1	302±214.2	0.195±0.183

The results in (Figure 4) In this study MDA levels were found to be significantly ($p<0.005$) raised in smokers. High serum levels of MDA in smokers could have amplified production of reactive oxygen species (ROS) which in turn might have accelerated lipid peroxidation manifested by increased levels of MDA, as well as the role of oxidative stress on glucose metabolism in a high-risk of diabetes. ROS can activate specific pathways whose products interfere with insulin signalling, the activation of the redox-sensitive nuclear factor-kappa beta (NF-kB) leads to the expression of cytokines such as temporal necrosis factor α (TNF-α), and interleukins (ILs) such as IL-1α and IL-6 and all these products have a quenching effect on insulin signalling [29, 30, 31].

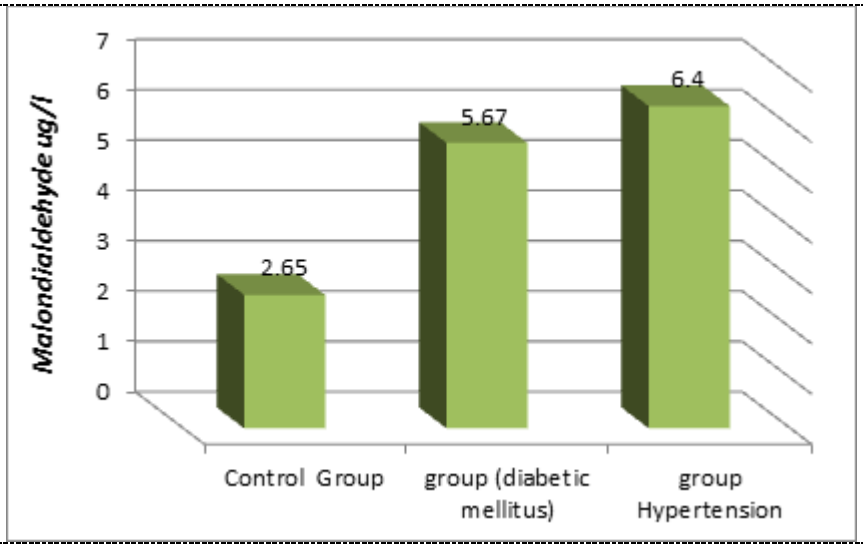

Figure 4. Illustrated the Concentration of the malondialdehyde in the smoker students and compare with in other groups.

While in the (Figure 5) findings showed significantly increasing in LDH level of smoker's group. Lactate dehydrogenase enzyme is found in almost every tissue in the body and its level increase in blood in many tissues damage pathological disorders. We think that the reasons for elevated of LDH significantly due to the smoke chemicals compounds may affect the respiratory tract as well as all of the cells in respiratory system [32]. The increased of LDH considered as indicator of cell necrosis or tissues damage or may be attributed on the smoking induced cell damage anywhere in the body, which may leak cellular contents along with LDH into serum [33]. Elevated of LDH levels is usually considered to reflect cell damage, and this is agree with the bad effect of smoking in generated free radicals and oxidative stress in cell which lead to release more of LDH to the blood stream by cell injury [34].

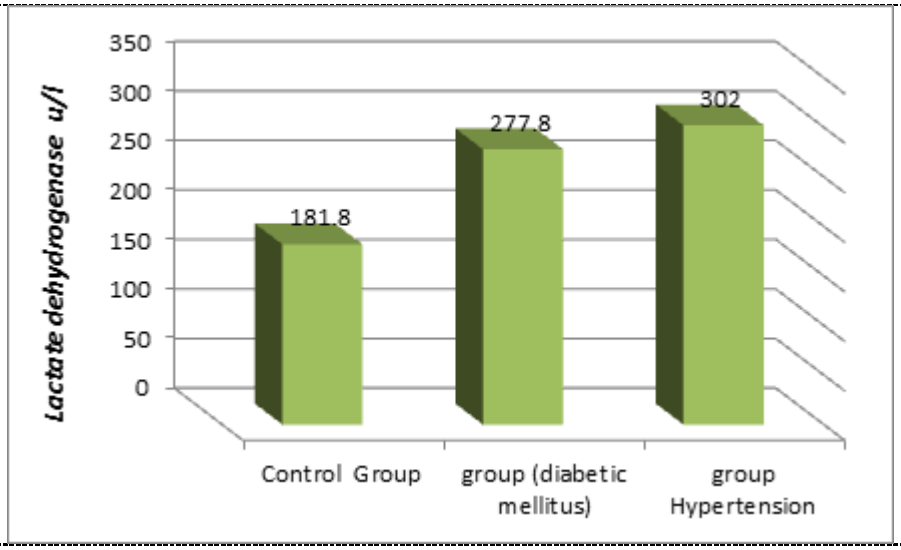

Figure 5. Illustrated the concentration of the lactate dehydrogenase in the smoker students and compare with in other groups.

The results in (Figure 6) showed Glutathione Peroxidase levels were found to be significantly ($p<0.005$) lowered in smokers than in non-smokers. The significantly differences of oxidative enzymes levels GPx may be due to nicotine increased generation of superoxide anion and hydrogen peroxide, which in turn results in generation of hydroxyl free radicals. Generation of these free radicals have been shown to participate in many toxic reaction and increased production of superoxide and hydrogen peroxide may cause deleterious injury to alveolar macrophages by causing release of proteolytic enzymes [35].

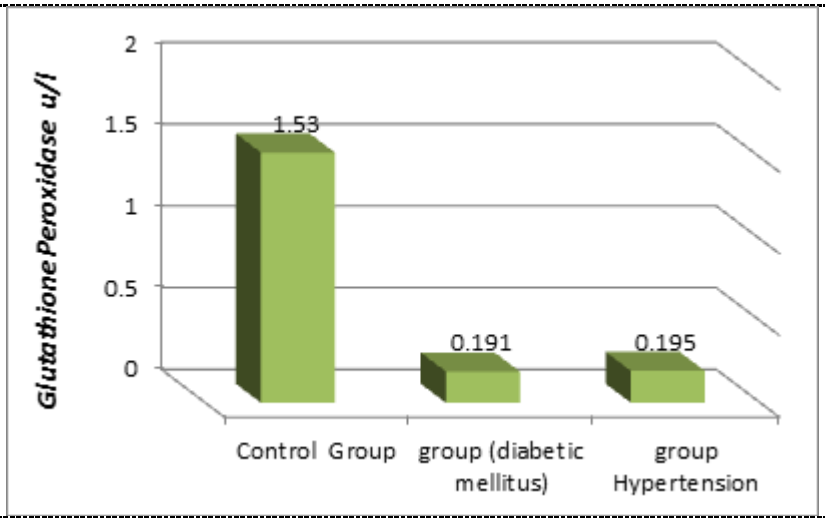

Figure 6. Illustrated the concentration of the glutathione peroxidase in the smoker students and compare with in other groups.

Table 3. Body Mass Index (Kg/m^2) sample of the study.

(BMI)	mean±S.D
Control Group	23.62± 0.52
smoking students	26.23±0.83

Figure (7) shows the relationship of Body Mass Index (BMI) among the studied samples, as there was a statistically significant ($p < 0.05$). The results rates increase between the BMI of smokers' students compared with the control group. Smoking and obesity are major public health challenges and the prevalence of both is increasing globally. Smoking increases the risk of cancer, respiratory and cardiovascular diseases, and is the leading preventable cause of death in developed countries [36]. Obesity is the fifth leading cause of death, globally, and accounts for 44% of cases of diabetes and 23% of ischaemic heart disease [37].

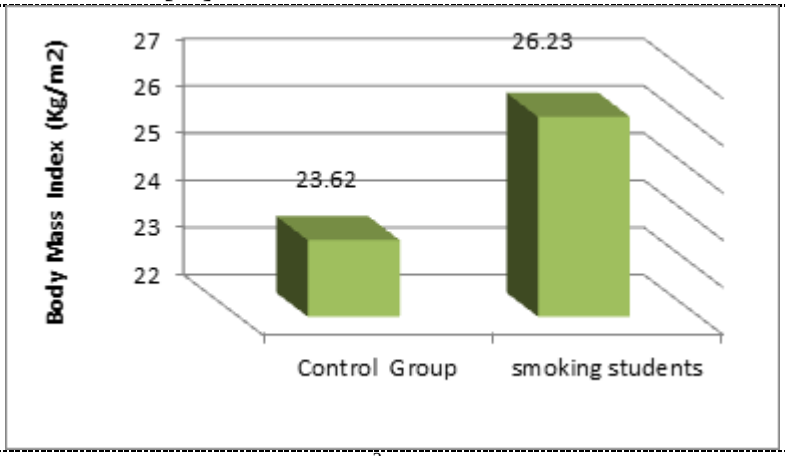

Figure 7. Illustrated the Body Mass Index (Kg/m^2) sample of the study.

4. Conclusion

The smoking effects on the levels of the Cholesterol, Triglyceride, Malondialdehyde (MDA), Lactate dehydrogenase (LDH) (increase) and decrease in the concentration level of (HDL-Cholesterol, Glutathione Peroxidase (GPx) in the smoker students, and smoking effect on the diabetic mellitus, hypertension and Body Mass Index.

New record of fresh water ciliates (Protozoa, Ciliophora) from Tigris river in Baghdad city, Iraq

New record of fresh water ciliates (Protozoa, Ciliophora) from Tigris river in Baghdad city, Iraq

Zahraa Y. Kadhim[1*]

[1]Department of Research & Development, Ministry of Higher Education & Scientific Research, Baghdad, Iraq.

*E-mail: zahraa.yahia76@gmail.com

Abstract. Documenting the biodiversity and biogeography of ciliates will help expand the overall knowledge within the field, as well as, shed new light on the dispersal and survival potential for other microorganisms, such as protists. As organisms at the base of food webs, ciliates are an essential part of the microbial loop and the ecosystems that they support. This study deals with ciliates community in freshwater of Tigris river within Baghdad city. Four sites were chosen at Al-Grea`t & Al-Adhamiya area at the riverbank. Total of 44 ciliophora taxa were detected, 22 taxa of which were identified to the species level and 22 taxa to the genus level. Among them, 11 taxa were new recording for Tigris river in Baghdad city: *Cyrtolophosis* sp., *Monochilum frontatum*, *Orborhabdostyla bromelicola*, *Ophrydium sessile*, *Scyphidia* sp., *Vortecilla convallaria*, *Vortecilla octava*, *Zoothamnium Bory*, *Tokophrya lemnarum*, *Urostyla* sp. and *Stentor fluiginosus*.

Keywords. Protists, Ciliates community, Tigris river, Ciliophora taxa.

1. Introduction

The Ciliates are unicellular microscopic eukaryotes moving with hair-like projections called cilia [1]; they have appropriate characteristics that being a large group found in all aquatic environments [2]; the short duration of their life cycle with high average of reproduction and authorized detection of environmental impacts in a short period [3]. Ciliates are the most prominent and major group of eukaryotic [4] which occur in alternative kind of environments, wherever there are moisture, sufficient nutrients and suitable microhabitats [5]. These organisms are found from the poles to the equator, in hot springs and in sea ice, in tropical forest litter and desert soils, in major oceans to the small temporary ponds and flooded regions of the inland waters [6, 7, 8, 9, 10, 11, 12, 13, 14]. Many studies showed that obviously ciliated protozoa are components of many microhabitats [15, 16]. The phylum Ciliophora is an ancient group, present on the earth for hundreds of millions of years [17]. Ciliates have an importance in total ecosystem function in some environments because they are the top predators in the microbial food webs [18, 19, 20], and they have a role in microbial loop [1, 9, 41]. Furthermore, ciliates are effective bioindicators of freshwater environments and they can be used in biomonitoring of streams, reservoirs and lakes under different scales of anthropogenic impact [21, 22, 23]. In addition, they are reducing conditions or indicative of oxidizing in the decomposition of

organic matter, share in phosphorus and nitrogen cycling, sensitive to different concentrations of pollutants and have high taxonomic density, providing responses to different levels of contamination [24]. In spite of their broad functionality, taxonomic diversity, and ability to gain large population densities in a short period of time [25], the structure and geographical distribution of ciliate communities is still uninvestigated in many regions of the world [26, 27] and poses an obstruction for studies of ciliate biogeography. Research into ciliates are differential biased to institutions of the researchers and their sampling areas mostly in Northern Europe [28]. There are over 1,100 ciliates genera and over 8,000 species included in these genera [29]; in spite of some argue that this diversity might represent only 10% of the actual diversity of species [28]. The mainly aim of this study was to document and record ciliates species which could be new recording in Tigris river at Baghdad city.

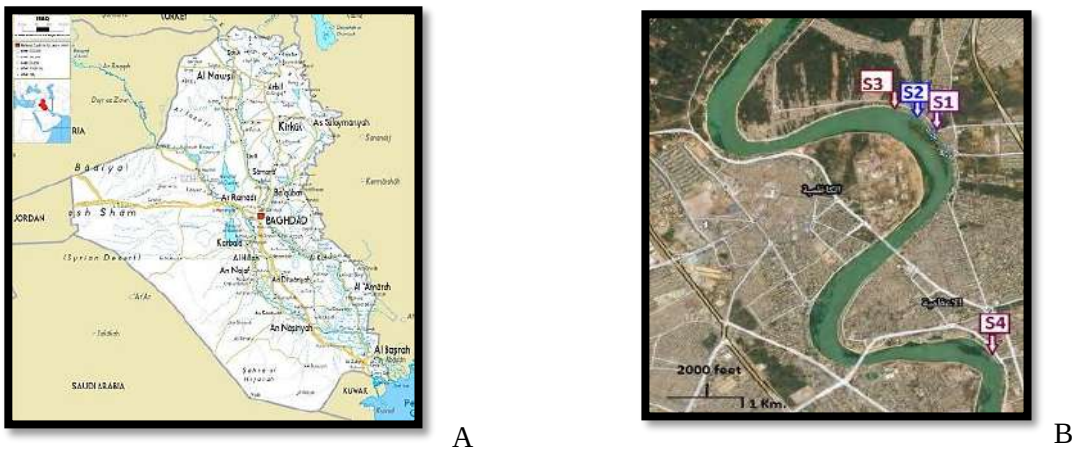
2. Materials and Methods

2.1. The study area and Methodology

This study deals with ciliates community in freshwater of Tigris river within Baghdad city that is located in the Mesopotamia alluvial plain between latitudes 33°14°- 33° 25° N and longitudes 44° 31°- 44° 17° E. Four sites were chosen at Al-Grea`t and Al-Adhamiya area at the riverbank (Figure 1). These sites are located close to the residential, agricultural and restaurants area within Baghdad city, thus, there is a lot of water utilization such as transportation purposes, household usage, agricultural usage and restaurant waste. Variable species of vegetation (reeds and wild grasses) were observed to grow at S4, while the remaining three sites was paved at the edges of the river. Monthly intervals, three samples were collected from each site of the riverbank over a period from June to September 2020, and each sample was 60 liters of water which was horizontally taken from the water surface with the aid of plankton net. This net made of bolting cloth with a fine mesh size (40 µm), with a small bottle container of 30 ml capacity attached to its narrow end [30].

2.2. Water samples

During the period of study (48), the fresh water samples were examined. One milliliter from each collecting water sample was investigated within 5-48 hours [31, 32, 33] by direct observation. All samples were examined alive [33] with the aid of compound microscope (Olympus, Japan) at a magnification of (X10- X40), and identification guides by [31, 34, 35, 36]. The classification of ciliates were followed [29]. Each species was photographed using camera (Casio). All of the photographs presented here are digitally processed (cropped, resized, contrast enhanced, white balance corrected, and background removed).



A B

Figure 1. The map of Iraq shows the sampling area at A. Ocular micrometer was used for specimens

measuring, B. Tigris river within Baghdad city.

3. Results and Discussion

Total of 44 ciliophora taxa were detected; 22 taxa of which were identified to the species level and 22 taxa to the genus level (table 1). Among them 11 taxa were new recording for Tigris river in Baghdad city, while the remaining previously recorded by [37]. Number of recording species in the present study was lower than [38], who recorded 208 ciliates species in Argentina; [39] recorded 84 cilites species from Southern Brazil and [40] recorded 63 cilites species from Tigris river in Baghdad city, while it was higher than [41] who recorded 7 ciliates species from Salim Ali Lake in Aurangabad. The lower number of ciliates were recorded in the present study could be refer to both limited of investigated area and limited duration of this work. Some taxa are rare in one environment could be abundant in others and the species which are rare under certain environment conditions could become abundant when the chemical, physical and biological inconsistent of their habitat are change. Despite it's not known if there are some species which are always rare in every suitable environment [42]. The new recording ciliophora taxa in Tigris river within Baghdad city are: *Cyrtolophosis* sp., *Monochilum frontatum*, *Orborhabdostyla bromelicola*, *Ophrydium sessile*, *Scyphidia* sp., *Vortecilla convallaria*, *Vortecilla octava*, *Zoothamnium bory*, *Tokophrya lemnarum*, *Urostyla* sp. and *Stentor fluiginosus*.

Table 1. The taxonomy of the species in phylum ciliophora (Doflein, 1901) were recorded from freshwater of Tigris river at four investigated sites during the study period from June to September 2020.

Note:* new recording species

3.1. Description and Photographs of the new recording species obtained during the study period (from June to September 2020)

3.1.1. Cyrtolophosis sp. Stokes, 1885

Small species, ovoid to pyriform in shape. Somatic ciliation uniform in longitudinal rows curving a little down the body and there is an anterior tuft of cilia in some species. The oral aperture within a shallow groove in the anterior third of the cell, and some species produce gelatinous tubes. Spherical macronucleus located centrally, and the contractile vacuole is in posterior third of body. Feeds on bacteria; Length of cell less than 40 μm as shown in Figure 2.

3.1.2. Monochilum frontatum Schewiakoff, 1892

Medium to large species (60-200 μm long), ellipsoid to elongate ovoid in shape. Oral aperture occurs in the anterior body half usually about a quarter of the cell length from the apical end, oval in outline and leads to a conical buccal cavity. There is an undulating membrane on the right and a prominent membranelle on its left of the oral aperture. In the posterior body half there is a contractile vacuole, usually near the equator. Ovoid macronucleus is locate centrally. Anterior end is broader, ventrally flattened, dorsally slightly convex, macronucleus is ellipsoid, feeds on algae. As shown in Figure 3.

3.1.3. Orborhabdostyla bromelicola nov. Spec

Narrowly conical, more or less asymmetrical. Size about (50–75 × 13–18) μm in vivo, with stalk-like narrowed usually less than 10 μm long and 2 μm wide. Cytoproct and Contractile vacuole on dorsal

wall of vestibulum slightly posterior of oral bulge. Peniculus 2 shortened posteriorly. Highly contractile. Fresh water cell. As shown in Figure-4.

3.1.4. Ophrydium sessile Ehrenberg, 1830

Cell body is long and contractile, in gelatinous matrix and posterior end rounded or pointed. As shown in Figure 5.

3.1.5. Scyphidia sp. Dujardin, 1841

Body drawn out, some species seem stalklike at rear, peristomal disc not stalked. There is no trochal band when mature, macronucleus often C-shaped and long. Cell body length about 60 μm. As shown in Figure 6.

3.1.6. Vortecilla convallaria Linnaeus

Body with bell-shaped; length (30-120) μm, width (35-70) μm, peristome width is (55-75) μm and stalk length is (100-500) μm. The animal never looks dark, but it is often yellow-tinted because there are (no) or (a few) darkishlooking refractile granules; the peristomal area is narrower than in V. campanula; the pellicle annulation is easily visible; contractile vacuole is one nearby the buccal cavity, food vacuole within oval contour as shown in Figure 7.

3.1.7. Vortecilla octava Stokes (V. striata Dujardin, 1841)

Vase-like shape, body length is 20-60 μm, width is 15-40 μm, peristome width is 13-40 μm and stalk length 20-300 μm. Vortecilla octava is similar to V. microstoma but smaller than it. The macronucleus lies transversal to the longitudinal axis, the peristome border shows much variation and it is thicker than in *V. microstoma*. Cytoplasm translucent or a little misty white, pellicle annulations pretty distinct, about 25-40 striae, surface of body a little ribbed, macronucleus sausage-like and thick, contractile vacuole is one nearby the buccal cavity as shown in Figure 8.

3.1.8. Zoothamnium Bory de St. Vincent, 1826

Resemble to *Carchesium*, but myonemes of all stalks of a colony are continuous together, so that the entire colony contracts or expands with each other, fresh or salt water, colonies some millimeters high. As shown in Figure 9.

3.1.9. Tokophrya lemnarum Bütschli

Pyramidal or pyriform, with no lorica, tentacles order in 1-4 fascicles on anterior surface, stalk not tough, endogenous budding is simple, fresh water. Tentacles emerge from distal, bullbous processes, about (70-260) μm as shown in Figure10.

3.1.10. Urostyla sp. Ehrenberg, 1830

Ellipsoid with 2 or more right marginal cirri (files). Pliable, posterior rounded, ventral surface is flatten with (4-10) rows of cirri, 2 marginal rows, (5-12) anals and 3 or more frontals as shown in Figure 11.

3.1.11. Stentor fluiginosus Forbes, 1891

Cylindrical or trumpet-shaped (when extended), contractile vacuole anterior-left; highly contractile; some with mucilaginous lorica; conspicuous peristomal field frontal, several micronuclei and a single macronucleus; cortical and cytoplasmic granules coloured with yellow-brown or red-orange. Body length is (200-300) μm when fully extended; freshwater cell as shown in Figure 12.

Abstract. The present study aimed to investigate the morphological description and histological structure of olfactory organ in rock dove (*Columba livia*).Results of the present study revealed that the nasal cavity of the species under investigation is anteriorly located, starting with a pair of external nares which located at the dorsal side of the base of upper beak . The external nares lead to two short nasal cavities. Each nasal cavity consist of three conchae or turbinates represented by anterior or vestibular concha, middle or respiratory concha and posterior or olfactory concha. The nasal cavity ended by a pair of internal nares which opened at mouth cavity. Results related with the histological structure of olfactory organ revealed that the vestibular concha lined by stratified squamous epithelium, the respiratory concha lined by ciliated pseudostratified columnar epithelium, and olfactory concha lined by ciliated pseudostratified columnar epithelium. The last concha showed three types of differentiated cell represented by basal cells, supporting cells, and receptor cells.

Keywords. Olfactory organ, Rock Dove, Morphology, Histology.

1. Introduction

The olfactory organs of vertebrates play an important role for feeding, reproduction, behavior and migration [1, 2, 3]. All vertebrates have olfactory regions which are represented by an internal invagination of the ectoderm to form the olfactory sacs in fish and the lining of nasal passages in tetrapoda [1, 2]. The avian olfactory organs are differ in different species of birds according to the differences of their position at the beak, feeding and behavior [4]. Generally the olfactory organs are located at the base of the beak or in some species of birds at the anterior end of beak [5], they are opened to outside via the external nares which leads to the nasal cavity, while they are opened in the mouth or oral cavity via the internal nares [1, 2, 5]. The ability of olfaction in birds is differ according to the structure of olfactory organs and the environment in which birds live [4, 7]. Review of the literature revealed that there are almost lack information related with olfactory organs of Iraqi birds with the exception of [7] on the morphology and histology of olfactory organ in local chicken, and the study of [8] who studied the cellular differentiation in the olfactory epithelium in chick embryo .This situation support our suggestion to investigate the olfactory organ in rock dove (*Columba livia*). This

study is a part of an extensive study conducted to investigate the olfactory organs in several Iraqi vertebrates in addition to the current study [7, 9, 10].

2. Materials and Methods

A total of 16 birds were collected from Al-Madhatia region /Babylon province. The olfactory organs removed after dissection the head of animals [11]. Paraffin wax methods were used for histological study according to the methods of [12].

3. Results and Discussion

3.1. Morphological description

Results of the present study revealed that the olfactory organ in bird under investigation started with two external nares which located at the dorsal surface of the upper beak base. The opening of external nares appear as a longitudinal slits with about (6 mm) length, they are covered by a keratinized flaps and the distance between them was (2.5-3.0 mm) (Figure 1 and 2).Each external naris lead to the nasal cavity. The nasal cavity was cone-like, with confined anterior part and wide posterior part, separated into left and right halves by incomplete cartilaginous septum. Each nasal cavity in the bird under investigation consist of three conchae or turbinates, which were respectively situated in the anterior, middle, and posterior parts of nasal cavity, their internal surface being covered with mucosa. The anterior concha represented the vestibular region of the nasal cavity, the middle concha represented the respiratory region of nasal cavity, and the posterior concha represented the olfactory region of the nasal cavity (Figure 3). The nasal cavity ended by a pair of internal nares, which are (5-6mm) in length and located in a V-shaped slit situated at the roof of the mouth cavity (Figure 4). The olfactory region attached to the olfactory bulb via the first cranial nerve (I-Olfactory nerve) (Figure 5). The olfactory bulb is triangular- shaped and situated at the anterior end of brain at eye level, which mean that the olfactory bulb of the studied bird is pedunculated bulb.

3.2. Histological Structure

Results of the present study revealed that the histological structure of the integument (the flap) that surrounded the external nares is keratinized stratified squamous epithelium (Figure 6). The vestibular

concha is lined by stratified squamous epithelium, which called vestibular epithelium (Figure 7), the respiratory concha lined by ciliated pseudostratified columnar epithelium rich with goblet cells that secret mucin to protect the epithelial surface (Figure 8), and the olfactory concha lined by ciliated pseudostratified columnar epithelium which consist of three types of cells represented by basal cells, supporting or sustentacular cells, and receptor cells (Figure 9 and 10). Results revealed that Bowman's glands are located beneath basement membrane in the lamina propria and the ducts of the glands pass through the basement membrane and the olfactory epithelium, their mucous secretion reach to the epithelial surface to protect it from drying (Figure 11).

4. Discussion

The external nares of vertebrates located at different sites of head region but mostly at the dorsal surface of anterior region of head [1, 2, 7]. In birds external nares located at different sites of head according to the type of food and feeding behaviour [13,14]. In penguin external nares located at the middle of beak [14], in kiwi the external nares located at the tip of the beak [16]. The external nares opening appear oval, elliptical, tubular and even spiral in different species of birds [13, 19]. In the species under investigation the external nares are slits-like located at the base of upper beak, which revealed poor olfaction due to this position [8]. The external nares in some species are protected by a keratinized flap [7, 17, 18]. Results of the present study revealed that the external nares in rock dove are covered by keratinized membranous layer. This results agree with [18, 20] foundation. The nasal septum showed clear variation in different species of birds, as it is appeared a complete septum and called naris impervia in ostrich [13], or the nasal cavities are fused and have a long narrow opening in the nasal septum, which is called naris pervia [20], in species under investigation the nasal cavities similar to Demirkan foundation[20] .The nasal cavity in rock dove located anteriorly started with the external nares which extend longitudinally at the upper part of the beak base, which is suitable with the shape of bird and the feeding habit [21]. Birds have in their nasal cavities three conchae or turbinates vary in their shapes in different species. They are represented by vestibular, respiratory, and olfactory conchae respectively [17, 21]. In sulida birds the vestibular concha is lost, while in palacoracida birds the middle concha is lost, and in collacoilia and jungle crow olfactory concha is lost [22, 23, 24]. Results of the present study revealed that in species of bird under investigation, there are three conchae which confirm the results reported by [17, 19]. The intensity of olfaction can determined through the correlation of the diameter of the olfactory bulb and the brain diameter of each species [25]. Generally the birds with large olfactory bulbs have high intensity of olfaction and vice versa [25, 26]. Results of the present study revealed that the olfactory bulb of the species under investigation is small and connected with the olfactory epithelium via relatively long olfactory nerve. These results agree with Allison [27]. Results of the present study showed that the tissue surrounded the external nares represented by keratinized stratified squamous epithelium, which agree with foundation of [28]. The wavy surface of the squamous epithelium in rock dove is agree with [2, 28, 29]. The degree of keratinization is high in the species under investigation perhaps due to the location of the external nares. The histological structure of respiratory epithelium is formed from ciliated pseudostratified columnar epithelium rich with goblet cells to prevent drying and give a chance to perform the function [29, 30]. Results of the present study agree with the above foundation due to the function need. The olfactory epithelium in vertebrates including birds is ciliated pseudostratified columnar epithelium with three types of cells represented by basal cells, supporting cells, and sensory receptor cells [28, 29].This result agree and confirm the present study results and the agreement probably related with the function need.

Abstract. Asteraceae (Compositae) famous as the aster, daisy or sunflower family is the biggest flowering family divided into thirteen subfamily that involve approximately two thousand genus, an important member of this family is *Silybum marianum* (Milk thistle). Management of hepatic diseases is the main use of milk thistle in traditional medicine also it has anticancer activity against different type of cancer in addition to antiviral, antioxidant, anti-inflammatory and anti-diabetic activity. This study was designed to investigate the pharmacognostical feature and the phytochemical ingredient of Iraqi *Silybum marianum*. The plant were examined macroscopically to investigate the morphological characters of plant and microscopically to determine the type of stomata and trachoma then flowers, leaves, stems and seeds of the plant were extracted by ethanol in a soxhlet apparatus individually and subjected to standard methods for active constituents identification and that total flaononid, total phenolic and total tannins content were determined using aluminum chloride colorimetric, folin-ciocaltue and acidified vanillin methods respectively. The results shows that *Silybum marianum* leave have a thick cell wall, anomocytic stomata, annual vessel, and unicellular unbranched trichomas. Also an important active constituents have been detected that terpenes, steroid and flavonoids were present in all plant parts, saponin appear only in the leaves and stems while alkaloids and coumarins are not detected in any part. Also the study referred to the seeds as the richest part of the plant with flavonoid and phenolic compounds followed by the flowers, leaves and stems which contain the less amount, while the higher content of tannin were observed in the leaves and stems..

Keywords. *Silybum marianum*, Milk thistle, Stomata, Trachoma, Flavonoid, Phenolic and tannin.

1. Introduction

The Asteraceae (Compositae) is famous as the aster, daisy or sunflower family; this biggest flowering family is divided into thirteen subfamily that involve approximately two thousand genus, *Silybum marianum* is an important member of this family [1]. The famous widespread name for S. marianum is

milk thistle, various other names are also used such as Pig leaves, Royal thistle, Marian thistle, Lady's thistle, Christ's crown, Snake milk,Venus thistle, Heal thistle, Variegated thistle , Sow thistle and Wild artichoke [2]. The plant is high biennial herb of about 5-10 feet, stiff, have a greenish shine leaves with barbed margins and a whitish lines along the veins. The flower is purple containing a small seed inside [3]. Its fruits have stiff skin achenes of about six to eight mm long; have a brown color with a white silk at the top which is collected after flowering in May [4]. Management of hepatic disease was the main use of milk thistle in traditional medicine that at early 19^{th} century it was advised and administered for the management of blood and liver problems as well as for intestinal cleansing [5], also it have anticancer activity against different type of cancer in addition to antiviral, antioxidant, anti-inflammatory and anti-diabetic activity [6]. This study was designed to investigate the phenotypic, anatomical and the phytochemical ingredients of Iraqi *Silybum marianum*, with the determination of the total flavonoid, tannin and phenolic content in the seeds, flowers, leaves and stems of the plant.

2. Materials and Methods

2.1. During Plant materials

All the parts of the plants were collected from the College of Pharmacy/ Al-Mustansiriyah University. The plant was authenticated by Dr. Sukaina Abbas/ College of Science/ Baghdad University/ Baghdad/ Iraq, and then it was identified microscopically in College of Pharmacy / Al-Mustansiriyah University. Leaves, flowers, stems and seeds of the plant were washed thoroughly by tap water, dried in shade, at room temperature from 2 weeks for flowers and seeds up to 1 month for leave and stems, then grinded to a powder and weight for further investigations.

2.2. Pharmacognostical (phenotypic and anatomical) study

2.2.1. Macroscopic examination

Fresh specimens of S. marianum were used to investigate the morphological characters of plant, such as shape, color, size, and margins of leaves, flowers, stems and seeds.

2.2.2. Microscopic examinations

Fresh and dried leaves powder is used for the microscopic examination, The type of stomata and trachoma were observed by taken the outer epidermal layer of fresh leaf on a slide and added few drops of chloral hydrate solution to obtain a clear section and observed under a microscope. Then the powder of the dried leaves were placed on slide and 2 drops of chloral hydrate were added and discarded (2 to 3 times) to bleach the color and clarify the picture then heated at a heater, finally examined under microscope after covering the slide [7], The photographers were obtained by using digital camera and diagnosis the different cell components.

2.3. Extraction method

Each part of the plant was put in a thimble and extracted by absolute ethanol using Soxhlet apparatus for 3 days and then the extract were completely evaporated by a rotary evaporator, the total dried extract of each part was weight to subsequently determine the amount of the contents in the dry weight and then labeled for further investigation [8].

2.4. Phytochemical study

2.4.1. Preliminary phytochemical screening

The plant extract was phytochemically screened for the qualitative investigation of major classes of secondary metabolites.

2.4.1.1. Flavonoids

A positive result is recorded when a yellow color is observed after the addition of 2ml ethanolic KOH to 1ml alcoholic extract of plant [9].

2.4.1.2. Tannins

Few drops of alcoholic extract were diluted to 10 times its volume, filtered and mixed with 1% aqueous ferric chloride, formation of dark green-blue color ensure tannin presence [10].

2.4.1.3. Saponin

Froth assay is used for saponin identification that by shaking distilled water vigorously with few ml of plant extract for fifteen minute. A persistent froth is an indication for saponins presence [11].

2.4.1.4. Terpenoids

4ml of the plant extract was treated with 1ml of equal quantity of acetic anhydride and chloroform. Then concerted solution of sulphuric acid was added gradually and red violet color was seen for terpenoids [12].

2.4.1.5. Sterols and steroids

Liebermann reaction was used to indicate the presence of steroids. Dried ethanolic extract was diluted with 0.5ml of hot acetic anhydride and filtered, then treated with *Libermann burrchardt*. The appearance of a blue-green ring at the interphase indicated sterol nucleus presence [13].

2.4.1.6. Coumarins

A few spot from a mixture of 0.5ml 10% NH4OH and 5ml of ethanolic extract was added on a filter paper and examined under U.V light. Coumarins give intense fluorescence under UV [14].

2.4.1.7. Alkaloids

Extracts were dissolved individually in 8ml of 1% hydrochloric acid and filtered. The filtrate was divided into two parts; the first one was reacted with Mayer's reagent, a positive result is indicated by white precipitate. The second part was reacted with Dragendroff's reagent. A red precipitate refers to alkaloid existence [15].

2.4.2. Estimation of total phenolic content

Total phenolic content was measured by adding 1ml of deionized water and 1ml of folin-ciocalteu reagent to 1ml of probably diluted extract sample, 5 minute later 1ml of 10% $NaCO_3$ was added and

the mixture was kept at room temperature for at least 90 min, the absorbance was measured at 760nm by UV spectrophotometer, the process was repeated three times for each sample and the average was recorded [16]. Calibration curve was done by measuring different concentration of gallic acid by the same procedure, and the result was expressed as mg gallic acid equivalent/g of dry plant material.

2.4.3. Estimation of total tannins content

0.05 ml of diluted alcoholic extract were reacted with 3ml of 4% methanolic vanillin solution and 1.5ml H2SO4, that condensed tannin will react with vanillin solution and form anthocyanidols in the presence of concentrated sulphuric acid, the absorbance was measured at 500nm after fifteen minute for three replicate of each sample, the result was expressed in mg equivalent of gallic acid/ g of dry plant material [17].

2.4.5. Estimation of total flavonoid content

0.5 ml of diluted extract was mixed with 0.15 ml of 7% $NaNO_2$ solution, after 7 minute 0.3 ml of 10% AlCl3 solution was added, later after 6 minute 1 ml of NaOH was added to the mixture and the volume was completed to5 ml by distilled water, the absorbance was measured at 510 nm and the result was recorded as mg quercetin equivalent /g of dry weight [18].

3. Results and Discussion

3.1. Macroscopic identification

Silybum marianum range from 25 cm to 2 m in height and from 5 cm to 1.5 m base diameter, the stem is green, grooved, branched, rigid and contain multiple leaves, large stem have a hollow in the middle. The leaves are lanceolate, lobate, and pinnate with spinny margin, they are hairless, greenish with milk-white veins, growing only on the base of the plants; they are small at December when they start growing and reach their maximum size at the end of March and April. Flowers are 4 to 13 cm long and wide, pale yellow to white at summer and purple at the end of winter and during spring; they are round, solitary at the apex of the stem or its branches, surrounded by needle like bracts, The seeds (fruits) are about 1 cm long, smooth, shiny with a simple long very fine pappus, surrounded by a yellow basal ring, it have a white color surrounded by a hard brownish to black achenes. Figure1. These morphologicl characteristic are identical to the plant characteristic prescribed at world health organization monograph [19], a guide of medicinal plants in Africa [20] and many papers around the worlds [21, 22, 23, 24].

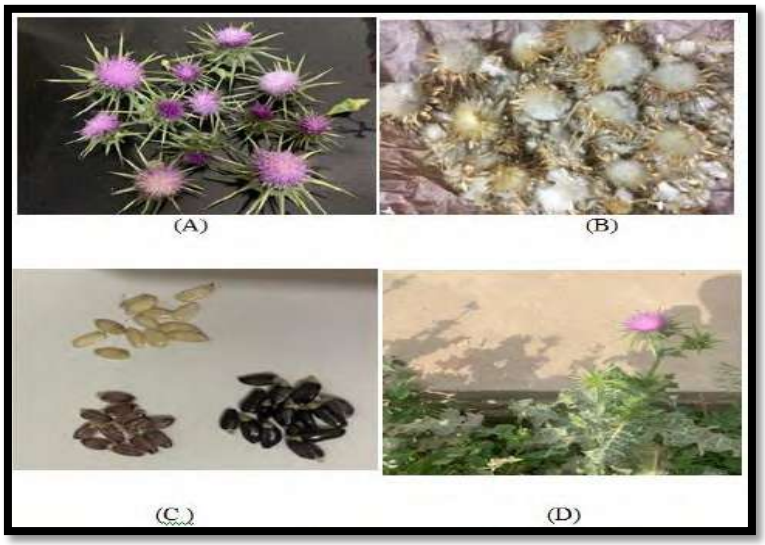

Figure 1. *Silybumm arianum* picture. A- purple flower, B- white flower, C- seed, D- whole plant.

3.2. Microscopic examination

Powdered leaves of *Silybum* were diagnosed under microscope by a thick cell wall, anomocytic stomata, annual vessel, and unicellular unbranched trichomes as shown in Figure 2.

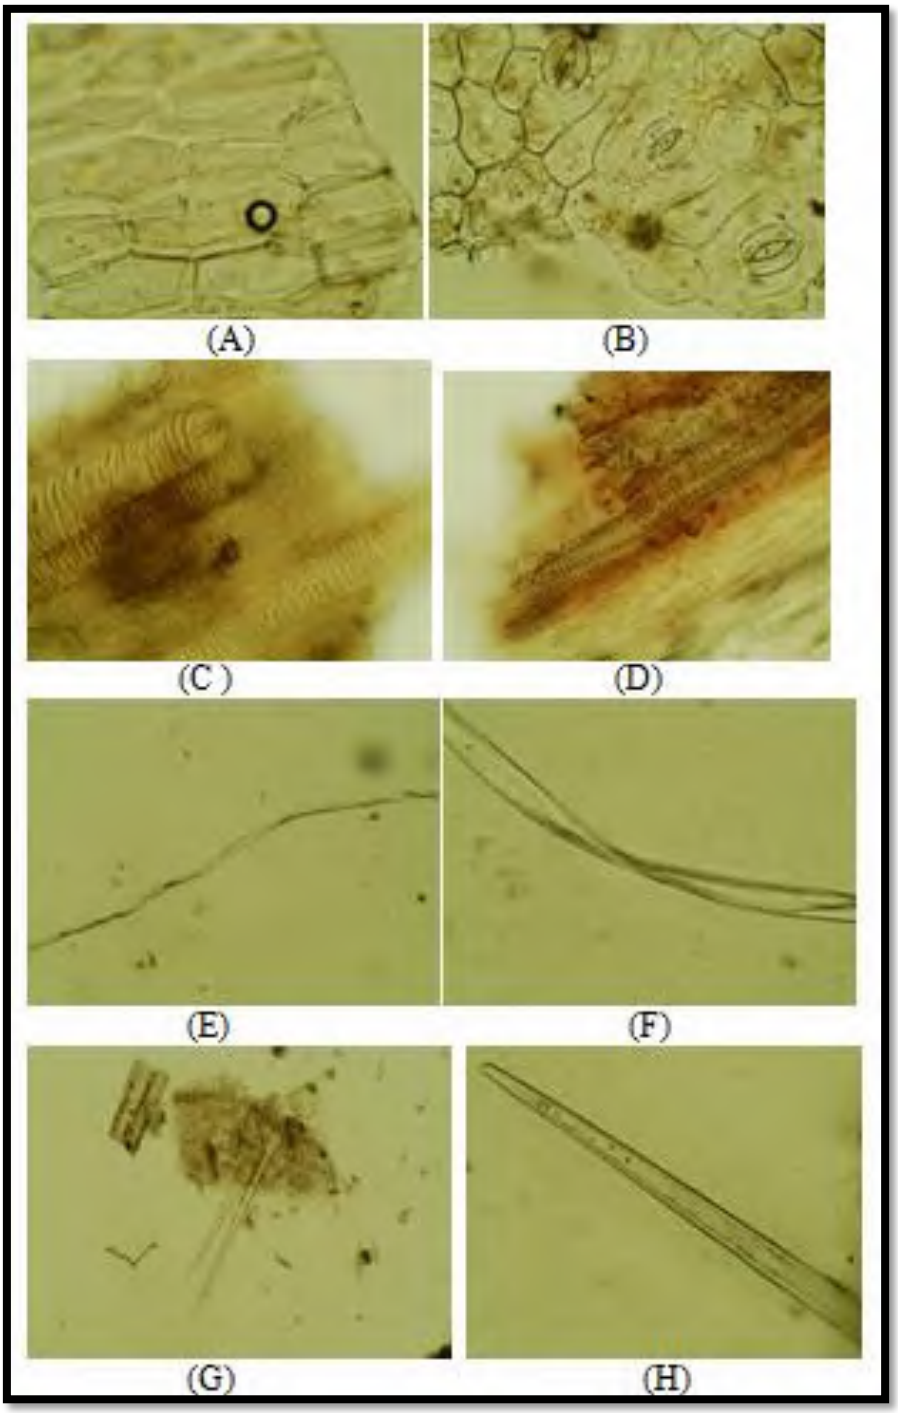

Figure 2. A-Thick cell wall, B- Anomocytic stomata, C- Annual vessle, D- Annual vessle 40X. E- fiber 10X, F- fiber 40X. G- Unicellular unbranched trichomas, H- Unicellular unbranched trichomas 40X.

3.3. Phytochemical results

3.3.1. Qualitative identification of Silybum marianum

Various qualitative phytochemical screening tests were done to establish the chemical composition of each extract; these tests provide important information regarding the type of secondary metabolites present in plant to establish a suitable procedure for isolation of these metabolites from different extracts. Primary chemical experiments for the extract of flowers, leaves, seeds and stems revealed the presence of terpenes, steroid and flavonoids while saponin appear only in the leaves and stems and the extract of flowers and seeds give a negative result, Alkaloids and coumarins are not detected in any part as shown in Table 1.

Table 1. Qualitative profile for phytochemicals found in S. marianum.

Part of the plant	Type of secondary metabolite					
	Alkaloid	Terpenoid	Steroid	Flavonoid	Saponin	Coumarin
Leave	-ve	+ve	+ve	+ve	+ve	-ve
Flower	-ve	+ve	+ve	+ve	-ve	-ve
Seed	-ve	+ve	+ve	+ve	-ve	-ve
Stem	-ve	+ve	+ve	+ve	+ve	-ve

3.4. Quantitative assessment of S. marianum

Different concentration of gallic acid, tannic acid and quercetin was used for calibration curve calculation of phenolic, tannins, and flavonoids respectively as shown in Figure 3, 4 and 5. different phytochemical ingredients vary considerably among different parts of the plant and affected by different biological stress and environmental conditions [25], therefore flavonoid, phenolic, and tannin content were determined in different parts of the plant and each measurement were repeated three times to reduce error and the results are documented in table 2.

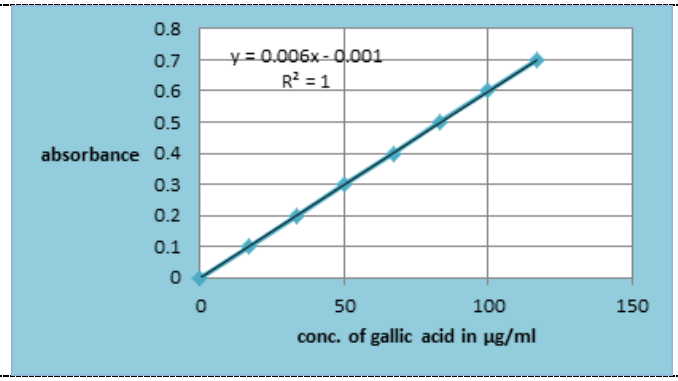

Figure 3. Standard curve for the determination of total phenolic content.

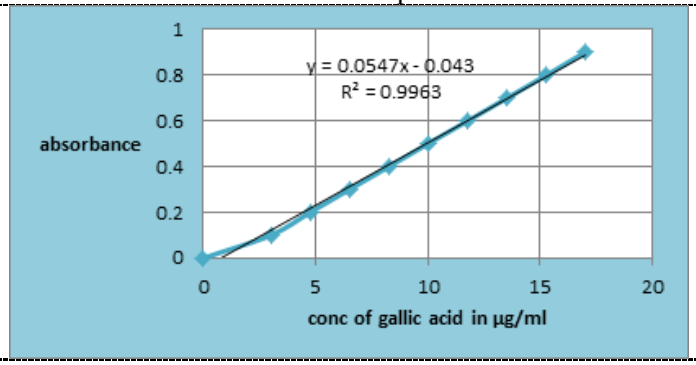

Figure 4. Standard curve for the determination of total tannin content.

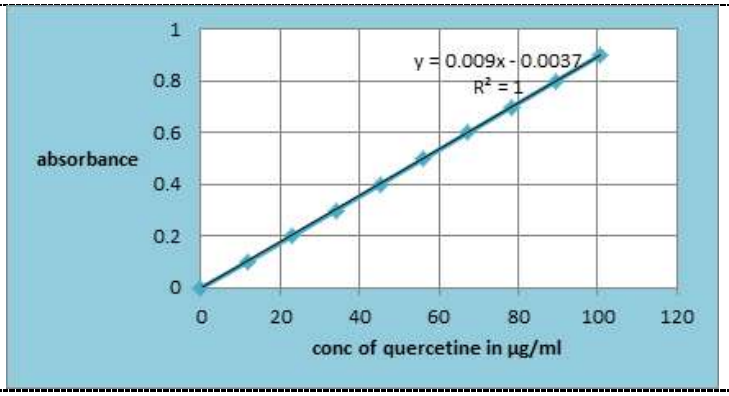

Figure 5. Standard curve for the determination of total flavonoid content.

Table 2. Total phenolic, flavonoid and tannin content in different parts of Iraqi *Silybum marianum*.

Part of the plant	Total phenolic content as µg gallic acid /mg dry plant	Total flavonoid content as µg quercetin /mg dry plant	Total tannin content as µg tannic acid /mg dry plant
Flowers	22.64±0.07	9.08±0.3	17.7±0.05
Seeds	67.03±0.56	12.32±0.45	15.6± 0.43
Leaves	12.6±0.5	10.02±0.09	74±0.63
Stems	11.03±0.45	7.5±0.2	66.34±0.35

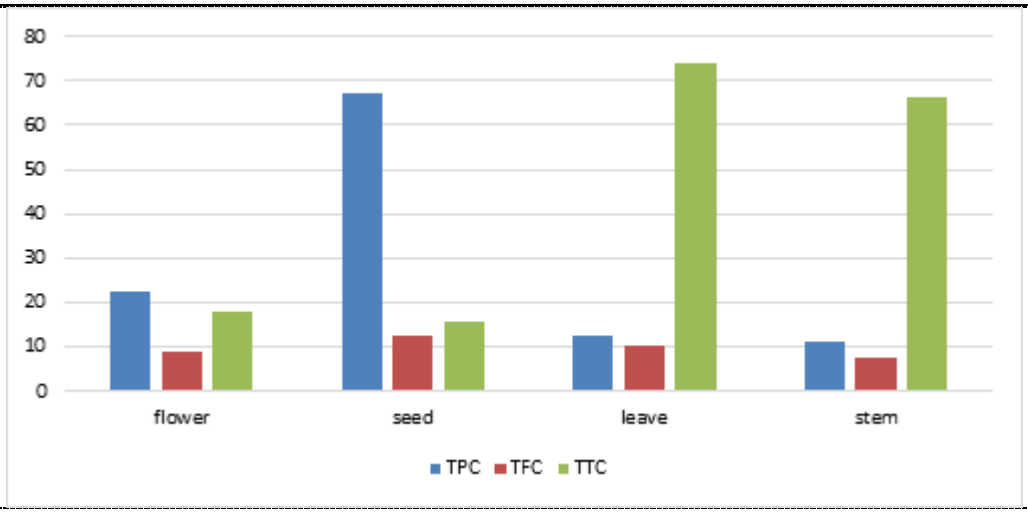

Figure 6. A comparison of total phenolic, flavonoid and tannin content in different parts of Iraqi *Silybum marianum*. TPC: total phenolic content, TFC: totat flavonoid content, TTC: total tannin content.

From the information above its obvious that the seeds are the richest part of the plant with flavonoid and phenolic compounds followed by the flowers then the leaves, the stems contain the less amount, while the higher content of tannin were observed in the leaves and stems.

4. Conclusion

Silybum marianum which is distributed widely in Iraq is an important medicinal plant and contain highly valuable active constituents in all the plant parts such as terpens, flavonoids, steroids and saponins, and this is the first study that describes the microscopic feature of Iraqi *Silybum* and

compare between the phytochemical components of the plants parts, further fractionation and isolation of this constituents are required.

Abstract. The aim of the present study is to examine the effect of (Chloroquine CQ) on the oxidative stress under water stress effect Recently , this compound is used to treat COVID-19 , Hydrogen peroxide H2O2 effect and Stimulate the enzymatic system through the exposure of the plant to water stress and interaction with Chloroquine , where the stress stimulate the production of these Oxidative Factors (Hydrogen Peroxide, Malondialdehyde(MDA), Protease increase the production of these oxidative factors increase activity through the effect of Chloroquine, This process was performed in the meristematic tissues of the cells of the permanent Mung bean (*Vigna radiata*) plants under experimental factors (water stress factor for 10 days with control period of 5 days) (Chloroquine factors and concentrations of 125 and 250 mg.L-1 with control treatment) were designed using a Factorial Randomized Block Design (R.B.C.D) with three replicates and 18 experimental units The experimental unit area was 2 m. The results have shown the following; The water stress period of 10 days led to the production of toxic hydrogen peroxide and increased concentration by stress. The effect of water stress was Stimulate the Production of hydrogen peroxide in Meristematic tissues. The effect of Chloroquine CQ with increased concentrations had a role in inhibiting the production of enzymatic antioxidants (Superoxide dismutase(SOD) and Catalase (CAT). The interaction between water stress and increased Chloroquine CQ concentrations has been instrumental in stimulating the production of oxidative Factors.

Keywords. Chloroquine (CQ), Antioxidants, Meristematic tissue, *Vigna radiata*, Water stress.

1. Introduction

Chloroquine (CQ) has been used extensively as an antimalarial agent with immunomodulatory effects. A derivative of CQ, Hydroxychloroquine sulfate (HCQ) was synthesized firstly in 1946 by addition of a hydroxyl group to CQ and is much is less toxic than CQ in animal studies [1, 2, 3]. CQ has been used in Severe acute respiratory syndrome (SARS) Coronavirus infection due to its antiviral properties. Recently CQ has also been found to have Anti-COVID-19 activity in vitro [4]. For these reasons, CQ and HCQ could be the potential drug for treating COVID-19 infection. To date, there is no clinical evidence to support the use of CQ or HCQ for treating SARS-CoV-2 infection though many clinical trials with these drugs are already underway [5]. This study aims to systematically review the available literature for the use of CQ or HCQ in treating COVID-19 infection [6]. Oxidative stress is produced by increasing the number of reactive oxygen species or free radicals,

which results in early aging, increased permeability, ions leakage from the cell membranes, and reduced photosynthesis in plants [7]. Free radicals result in cellular damage through lipid peroxidation (mainly cell membranes) and the blocking of natural antioxidants. By measuring the malondialdehyde (MDA), which is the result of lipid peroxidation, the level of oxidative stress in plant cells can be estimated [8]. Under oxidative stress conditions, by producing oxygen intermediates, which are relatively reduced or energy-intensive forms of atmospheric oxygen (O_2), the plant finds itself under stress conditions and activates a variety of defense systems such as antioxidants to protect against stress [9]. The goal for measuring the amount of stress created in the plant generally, is the measurement of the activity of the peroxidase enzymes, such as hydrogen peroxide (H_2O_2). In the case of the excessive accumulation of these activated oxygen's, a variety of cell damage such as DNA damage, membrane lipid peroxidation, RNA damage, protein oxidation, and enzymatic inhibition, occurs in the cell [10]. Free oxygen radicals or lipid peroxidation reactions in the plant membrane will selectively break up unsaturated fatty acids and accumulate hydrocarbons, aldehydes, and the like [11]. Therefore, frequently to determine the effect of environmental stresses on the membrane of plant cells, the amount of lipid peroxidation products, such as malondialdehyde (MDA) or hydrogen peroxide (H_2O_2), must be measured and their results suggest the involvement of free oxygen radicals in response to stress [12]. The antioxidant system stimulates, activates Enzymes activities or a group of antioxidants resulting from the oxidative stress effect. The mung bean (*Vigna radiata*) has been consumed as a common food in China for more than 2,000 years. It is well known for its detoxification activities and is used to refresh mentality, alleviate heat stroke, and reduce swelling in the summer it's contain balanced nutrients, including protein and dietary fiber, and significant amounts of bioactive phytochemicals. High levels of polyphenols ,antioxidant, antimicrobial, anti-inflammatory, and antitumor activities [13, 14].

2. Materials and Methods

The experiment was carried out in the gardens and laboratories of Al-Farahidi University for the 2018 season located at latitude 33.4o and longitude 44.4o and 23 meters above sea level. The experiment was designed according to Randomize Complete Blocks Design (3*3*2) and three replicates. The land was divided into 18 experimental units (2*1) m. The mung bean (*Vigna radiata*) seeds were planted on 1/7/2020 after sifting and testing the proportion of germination with the plant distance between another in field 25 cm and were taken samples on 1/8/2020 and frozen and stored in the (Deep Freezer) for the analysis and extraction of antioxidants.

2.1. Experimental factors

2.1.1. Irrigation and stress factors

The plants were irrigated every 5 days and treated with control. The stress factors were irrigated every 10 days. The water quantity (100%) of the field capacity (F.C) of the soil was controlled by the Soil Moisture Meter.

2.1.2. Chloroquine dose CQ concentrations

(125 and 250 $mg.L^{-1}$ and control treatment) Preparation of chloroquine doses(CQ) concentration: Standard chloroquine Phosphate (Bayshore Brand) solution was prepared with water by dissolving 125 mg in a liter of distilled water and then concentrated to 250 mg. Plants were sprayed with Chloroquine CQ concentrations before sunrise by manual sprayer after four plant leaf stage. The control treatment was sprayed with distilled water. The apical meristems (20-day age) were cut by Medical scalpel from the developing apex to the first leaf under the developing and were placed directly with Petri dishes and frozen at $-10^{o}C$.

2.2. Estimation of free radicals and oxidative factors

It was performed on the basis of:; Hydrogen peroxide level (µmol.gm^{-1}) according to the method of [15] was determined. Protease enzyme level (µmol.gm-1) Was determined according to the method of [16]. Free Radicals scavenging activity of antioxidants was evaluated from method of DPPH (2,2-diphenyl-1-picryl-hydrazyl-hydrate) assay [17].

- Lipid peroxidation indicator of Cell membrane Malondialdehyde (MDA) according to [18].

2.3. Antioxidants enzymes activities

They were performed on the basis of; Concentration of Catalase enzyme (CAT): (µmol.ml^{-1}): Estimated according to the method of [19]. Superoxide Dismutase enzyme (SOD) (µmol.ml-1). was estimated according to [20].

2.4. Statistical analysis

Results of the present study were statistically analyzed according to the statistical program (SAS) according to a global experience (3 × 2) with the design of the complete random sectors (RBCD) and the use of the least difference (LSD) to compare the arithmetic averages of the studied transactions at the probability level [0.05] [21].

3. Results

Regarding Hydrogen peroxide concentrations under concentrations of chloroquine CQ for the Vigna radiata Meristematic tissue affected by water stress (µg.g^{-1}) Table1 have shown that water stress had a significant increase in the hydrogen peroxide level at 10 days of water stress, with the increase in hydrogen peroxide level from 2.50 to 3.58 µg.g^{-1} with an increase of 72.00%, besides, spraying with Chloroquine CQ significantly increased the average hydrogen peroxide concentration and increased CQ concentration. At 125 mg.L^{-1} concentration of CQ , the average hydrogen peroxide level increased to 3.00 µg.g^{-1} when spraying at 125 mg.L^{-1} concentration and increased hydrogen peroxide level with CQ concentration of 4.50 µg.g^{-1} concentration at 250 mg.L^{-1} compared with the control treatment, which had a concentration rate of 1.63 mg.L^{-1} results of the interaction between the levels of water stress and spraying of Chloroquine CQ have shown significant in Hydrogen peroxide levels, where the highest level of hydrogen peroxide it was 5.08 µg.g^{-1} comparing with1.30 µg.g^{-1} under control level .

Table 1. Hydrogen peroxide level under different concentrations of Chloroquine CQ for the *Vigna radiata* meristematic tissue affected by water stress (µg.g^{-1}).

Stress levels	Chloroquine(CQ) con. (mg)			Stress level mean
	0	125	250	
days 5 (control)	1.30	2.30	3.91	2.50

Activities of Protease Enzyme under different concentrations of chloroquine CQ for the Vigna radiata meristematic tissue affected by water stress. The results in Table (2) have shown a significant increase in the activities of protease when the stress increased to 10 days, with the enzyme Activity

increasing to 27.49 µmol.ml^{-1} compared with the control treatment in which the Activity of the enzyme was 11.29 µmol.ml^{-1} and with the same effect, CQ effect increased the mean Activity of Protease with a concentration of 125 mg.L^{-1} The Activity of protease increased to 19.68 ìmol.ml^{-1}when spraying with a concentration of 125 mg.L^{-1} and the Activity of the enzyme increased by increasing CQ concentration, where it reached 27.06 µ.mol.ml^{-1} at 250 mg concentration compared with the control treatment, which was 11.43 mol.ml^{-1}. The results of the double interaction between the effect of stress and concentrations of CQ showed a significant increase, with the highest value of the increase in the activity of enzyme at the interaction between the 10 day stress period and the concentration of 250 mg.L^{-1} which reached 11.43 µmol.ml^{-1} compared to the lowest Activity of 5.77 µmol.ml^{-1} at the concentration of nill concentration of CQ and the absence of stress and an increase of 72.84%.

Table 2. Activities of Protease Enzyme under diffrent concentrations of chloroquine CQ for the *Vigna radiata* meristematic tissue affected by water stress(µmol.ml^{-1}).

Percentage of Free Radicals scavenging activity under concentrations of chloroquine CQ for the *Vigna radiata* meristematic tissue affected by water stress. The results of Table (3) Have shown a significant decrease in the concentration of Free Radicals scavenging activity during the 10-day stress period, with the Free Radicals scavenging activity decreasing to 72.35 (%) compared with the control treatment of which the Free Radicals scavenging activity was 21.65 (%) also and CQ doses decreased the average of the Free Radicals scavenging activity at 125 mg.L^{-1} reached to 76.01 (%) compared with 76.25 (%) under control dose. The mean of the Free Radicals scavenging activity a significant decreased by CQ concentration to 73.94 (%) at a concentration of 250 mg.L^{-1} compared with the control treatment of which the concentration of CQ was 76.25(%),The results showed a significant decrease in the Free Radicals scavenging activity, with the lowest value of Free Radicals scavenging activity at the interaction between the 10-day stress period and the concentration of 250 mg.L^{-1} reached to 71.88 (%) compared to the highest percentage of Free Radicals scavenging activity was 80.05 (%) at a concentration of 0 mg concentration of CQ and lack of stress.

Catalase activities under concentrations of chloroquine CQ for the Vigna radiata meristematic tissue affected by water stress (µmol.ml^{-1}). The results are have shown in Table 5 confirm that the effect of water stress has a significant effect on the activity of the catalase enzyme at 10 days of water stress. The activity of the catalase is 37.71 µmol.ml^{-1} when the control (5 days) to 18.35 µmol.ml^{-1}. The effect of CQ spraying significantly increased the level of catalase activity with the concentration of CQ. At the concentration of 125 mg.L^{-1} of the above CQ the activity of the catalase enzyme increased to 29.39 µmol.ml^{-1} concentration at 125 mg.L^{-1} of CQ and the activity of the enzyme increased by 33.81 µmol.ml^{-1} concentration at 250 mg.L^{-1} compared with the control treatment of 19.93 µmol.ml^{-1} and an increased rate of 61.29 %, the results in the interaction between stress and concentrations of CQ have shown a significant increase. The highest value of the increase in the enzyme activity at the interaction between the 10 days stress period at the concentration of 250 mg.L^{-1} of CQ with a concentration of 45.44 µmol.ml^{-1}, while the lowest activity of the enzyme was 19.91 µmol.ml^{-1} concentration at the duration of 5 days and 0 concentration of CQ (control treatment).

4. Discussion

The Free radicals concentrations under the stimulation of the antioxidant system of the Chloroquine (CQ) effect of the Oxidative factors. The effect of water stress increase the concentration of hydrogen peroxide and it is believed that the increase of oxidizing enzymes is produced when the plant is exposed to oxidative stress and the production of free radicals from the effective oxygen group. Hydrogen peroxide also has a common role with protease by analyzing proteins to release energy when exposed to stress [22]. The increase of the hydrogen peroxide root is due to the increase in the production of the single oxygen root of the photodynamic process in the process of photosynthesis where the accumulation of the oxygen root and the non-spasm leads to the transition from the activation phase of the free root to the more serious stage, the toxic hydrogen peroxide root [23], the increase in peroxide concentration is due to the primary activity of the superoxide root and the water stress results in the oxidation of NADPH NADPH by the enzyme NADPH Oxidase in Strom The plastids release hydrogen peroxide, increasing its concentration at stress [24]. The results were agreed with [25]. in its study on the Canola plant. Chloroquine (CQ) spraying also increasing of hydrogen peroxide and induce proton fluxes and free radicals leakage [26]. the levels of high MDA because of the water stress effect on lipid peroxidation of the cell membrane and loss of the flexibility of membranes functions [12]. Water stress has increased the effectiveness of the enzymatic oxidation system, which includes the enzymes SOD, CAT,. These enzymes are more effective as an anti-stress reaction resulting from the free radical activity and oxidative enzymes with stress effect and low inhibition Hydrogen peroxide that accumulates in the plastids, mitochondria, the endoplasmic reticulum, and peroxisomes, and their development into the activation stage to the interactions between the other free radicals, which stimulates the plant to activate the enzymatic these free radicals [27] this is due to the increased effectiveness of enzymatic antioxidants and increased oxidation of compounds. It is also believed that the lack of stabilization of CO2 resulting from increased effectiveness of photosynthesis and free radicals accumulation The increase in the effectiveness of the enzyme superoxide Dismutase result in response to increasing the production of superoxide radical in plastids and mitochondria, The effect of the catalytic enzyme (CAT) resulted from the increased activity and accumulation of the hydrogen peroxide and single oxygen oxides by the effect of water stress [28, 29]. The results were agreed with [30],the levels of antioxidant enzymes were reduced because the effect of chloroquine cannot balance between free radical production and the antioxidants enzymes inhibition activity and the CQ induce the toxic oxidative factors with the effect of free

radicals and Hydrogen peroxide protease Enzyme and damage in lipids metabolism and reduced the antioxidant system in cells [31].

5. Conclusion

The present study has reported that the exposure of water stress and chloroquine stimulates the production of Oxidative factors of the membranes permanent division and effectiveness as they mainly induce the production of hydrogen peroxide and protease enzyme and loss of membranous lipids metabolism with increasing the levels of Malondialdehyde compound and reduce the Free Radicals scavenging activity of antioxidants of SOD and CAT. .

Abstract. The aim of the present study was to investigate the histological structure of the tongue in Mongoose (*Herpestes javanicus*) and its related to the feeding pattern. Five adult animals were used in this study . The tongues were dissected and fixed in 10% formalin, then prepared by following stages (dehydration, clearing, and embedding).The serial section(5µ) were stained with(H&E) and some special stains.The histological examination showed that the tongue consists of three tunicae (mucosa, submucosa and musclaris) and the lining epithelium of the filiform papillae is composed of keratinized stratified squamous epithelial tissue. The cylindrical papillae are covered with a highly keratinized stratified squamous epithelial tissue, whereas the keratinized stratified squamous epithelium tissue is weakly keratinized at fungiform papillae, whilst circumvallate papillae are non-keratinized. The medullary of the papillae consists of a loose connective tissue which is considered as the lamina propria of the tongue, while the tunica submucosa consists of dense connective tissue. The muscularis is composed of skeletal muscle fibres arranged in three direction longitudinal, transverse and obliquate. The lingual glands(Von-Ebner and Weber) placed on both sides of the lingual root at the tunica submucosa and extend to the tunica muscularis .This study pointed out that the secretion of glands is mixed and the mucin is more neutral than acid.

Keywords. Mongoose , Histology, Tongue, Mucin histochemistry.

1. Introduction

The mongoose (*Herpestes javanicus*) is a mammal that belongs to the order carnivora from family of Herpstidae [1].The tongue as taste organ has important role in digestion and swallowing of food in all vertebrates [2, 3, 4]. Tongue's has been studied in different mammals, such as hedgehog (*Hemiechinus auritus*) [5] ,local mice (*Mus musculus*) [6],wild rabbit (*Oryctolagus cunculus*) [7], bat (*Pipistrillus kuhli*) [8] and Lesser hedgehog tenrec (*Echinops telfari*) [9]. The scarcity of studies in endangered wild Iraqi mammals have been a stimulant suggestion of the current study involving mongoose that no data investigated. There is no information on the structures of histological and histochemical features of the tongue in this species of wild animal in Iraq. The present study was designed to describe the microstructure of the tongue and histochemical structure of the lingual glands in mongoose and this results were compared with those of other mammals.

2. Materials and Methods

Five adult mongoose were used in this study .The animals were dissected and removed the tongues. The specimens were fixed in 10% formalin for 72 hours and processed routinely by following stages (dehydration, clearing and embedding).Serial sections(Transverse and Longitudinal) were obtained at 5µ thickness for a rotary microtome. The section were stained in haematoxylin and eosin for general histological examination and some special stains such as shiffs reaction periodic acid (PAS) for demonstrate neutral mucins, Alcian Blue (AB) (pH 2.5) for acidic mucins, PAS/AB to assess the neutral from acidic mucins and Masson's trichrome for detect collagenous fibers [10]. The slides (sections) were mounted and examined with light microscope and photomicrograph by (MEIJI TECHNO) microscope with Omax camera.

3. Results and Discussion

The histological study of the mongoose the subject of the current study showed that the tongue consists of the three tunicae ,the tunica mucosa, which consists of two layers (lining epithelium and lamina propria), tunica submucosa and tunica muscularis (Fig. 1) and this result agree with [11] while the current results contradict some studies [7, 12, 13] because their study described connective tissue as a single layer placed within the tunica submucosa- lamina propria. This difference seems to be related to the structural composition based on functional requirements. The lining epithelium consists of keratinized stratified squamous epithelial tissue and contains lingual papillae and unlike the ventral surface which is non- keratinized and free of papillae (Fig. 2) and this result corresponds to previous studies [13, 14].

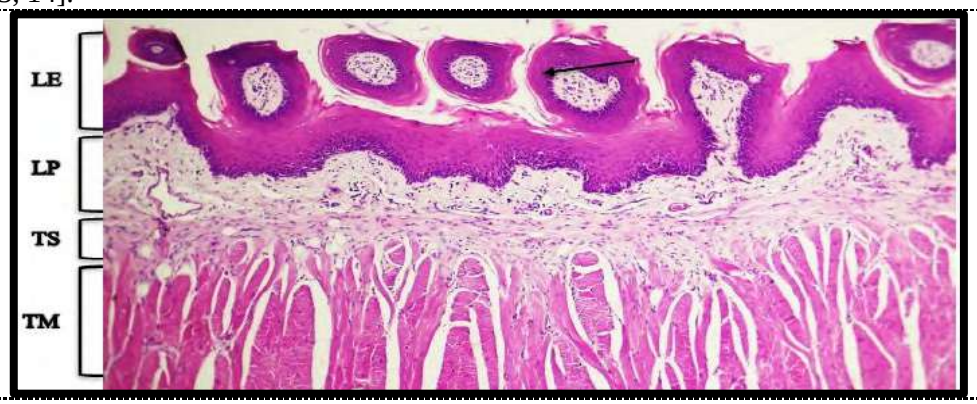

Figure 1. Cross section of lingual root in mongoose showing their components, lining epithelium (LE), lamina propria (LP), tunica submucosa (TS), tunica muscularis (TM). (H&E, 10x).

Figure 2. Cross section of lingual body in mongoose showing keratinized layer (KL). (H&E, 10x).

While lamina propria consists of loose connective tissue (Fig. 1) and this result corresponds to some studies [7] and contradict other studies which have shown that the lamina propria is composed of dense connective tissue [12, 15]. This variation is due to the pattern in the histological composition that based on function. The submucosa consists of dense connective tissue (Fig. 1) and this result is consistent with some studies [11, 16]. The presence of lingual glands in this tunica, which extends to the tunica muscularis (Fig. 3) was noted and this result is contrary to the study conducted on two species of wild rats (*Rattus wistar* and *Rattus norvegicus*) [11] because this result showed the position of the lingual glands in the lamina propria and perhaps the reason for the discrepancy is due to the fact that the animal in current study belong to carnivora order, while the mentioned study belongs to the rodents order, which vary in the pattern of nutrition. The tunica muscularis consists of skeletal muscle fibers arranged in three direction longitudinal, transvers and obliquate (Fig. 4) and this result corresponds to previous studies [5, 6, 17, 18]. This may be due to increased efficiency of the tongue in flipping and chewing food. The current study showed that the arrangement of muscle fibers varies between the three areas of the tongue, at the apex the arrangement of fiber takes an occasional direction at the medullary of the tongue and it is surrounded entirely by muscle fibers that take a longitudinal and transverse arrangement alternately (Fig. 5).

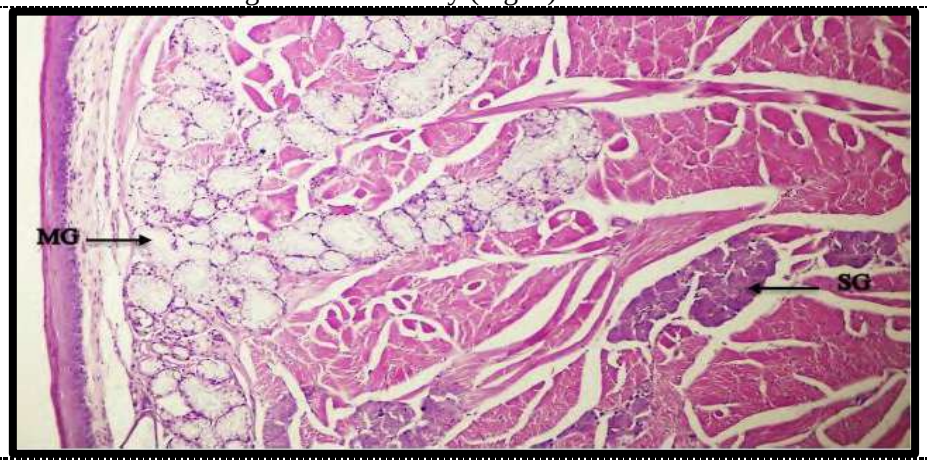

Figure 3. Lateral-cross section of lingual root in mongoose showing located of lingual glands within tunica submucosa and extened into tunica muscularis, mucous glands (MG), serous glands (SG). (H&E, 10x).

Figure 4. Cross section of lingual root in mongoose showing the tunica muscularis components and arrangement of longitudinal fibers (LF), transverse fibers (TF), obliquate fibers (OF). (H&E, 4x).

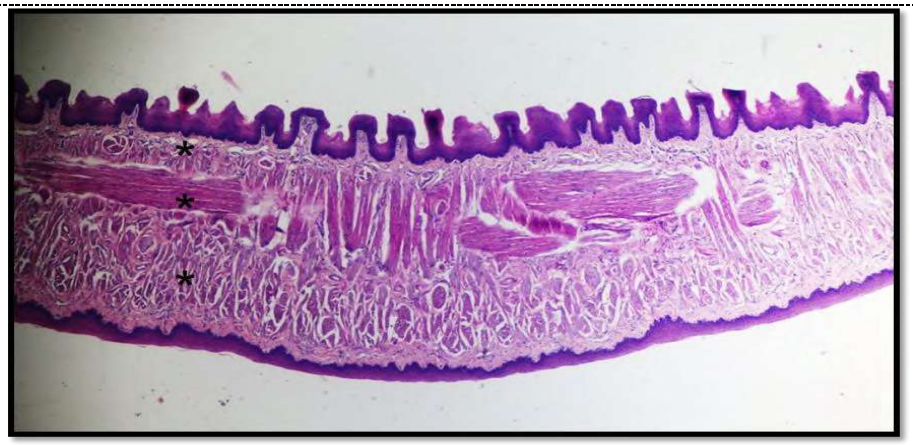

Figure 5. Cross section of lingual apex in mongoose showing the arrangement of muscle fibers (*) (H&E, 4x).

It was also noted that the surface layer of tunica muscularis at the dorsal and lateral surface in each body and root of the tongue is the arrangement of the fiber with a longitudinal and transverse exchange, while the muscular fibers at the core of the tongue are transverse as they take a radial form adjacent to the both sides the transverse fiber arrangement form in the shape of V letter (Fig. 6). While surface layer's fiber of tunica muscularis in the ventral side of tongue takes a longitudinal arrangement and there are blood vessels and nerves (Fig. 7). These results are in line with the results of [17] and this complexity in the arrangement of fiber is due to this animal depends on tongue largely during feeding as well as the fact that the muscle fibers form a basic mechanics to achieve different and precise movements of the tongue during chewing.

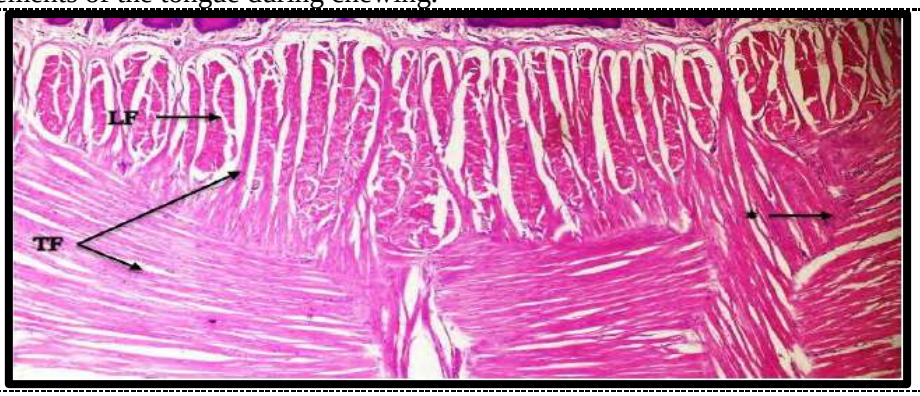

Figure 6. Cross section of lingual body in mongoose showing longitudinal fibers (LF), transverse fibers (TF) alternately, muscle fibers in form of V letter (*). (H&E, 10x).

Figure 7. Cross section of lingual body in mongoose showing keratinized layer (KL). (H&E, 10x).

This study showed that the lingual glands are positioned on both sides of the lingual root in the tunica submucosa and extend to the tunica muscularis (Fig. 3) and this result is contrary to the result of Lesser hedgehog tenrec (*Echinops telfairi*) [9] because the lingual glands are placed between the skeletal muscle fibers of tunica muscularis. The current study showed the presence of two types of glands first is the serous glands (von-Ebners) that fall forward (Fig. 8), the other type is mucous gland and seromucous gland (Weber's) which are positioned backwards (Fig 9), and this result is in line with many studies [5, 13, 18, 20]. Moreover, at the current study used some special stains to detect the type of secretions resulting from these glands. It was noted that the mucous glands give a positive result when stained with PAS, as they appear in a reddish purple color and this indicates that neutral mucin (Fig.10) and also give a positive result when stained with AB, pH: 2.5 and appear in a blue color, this indicated that the resulting secretion is acidic mucin material (Fig. 11) and these results correspond to some studies [13, 20]. But when stained in (PAS/AB, pH: 2.5) it is noted that many cells appear in a reddish purple color (implying that the secreted mucins are neutral) with a small number of cells in blue color (evidence of acidic mucins). We can conclude that the secretion of the glands is mixed mucins that are more neutral than acidic (Fig. 12) and these results are relatively consistent with the result of [13] and that this variation in the type of glandular secretions depends on the nature of the food eaten by the animal as mucous secretions of Weber's glands help to swallow food as well as facilitate the movement of the tongue, but the serous secretions of von-Ebners glands are centered in the partial digestion of food because it contains digestive enzymes.

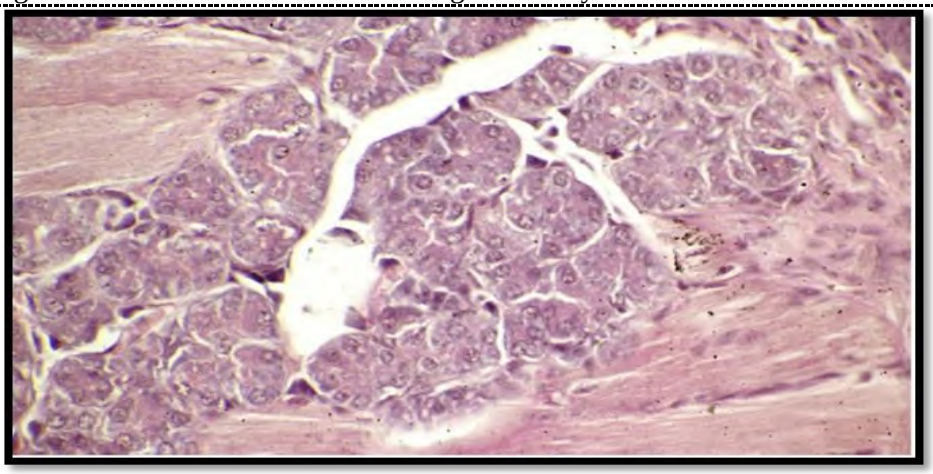

Figure 8. Cross section of lingual root in mongoose showing serous glands (von-Ebners). (H&E, 40x).

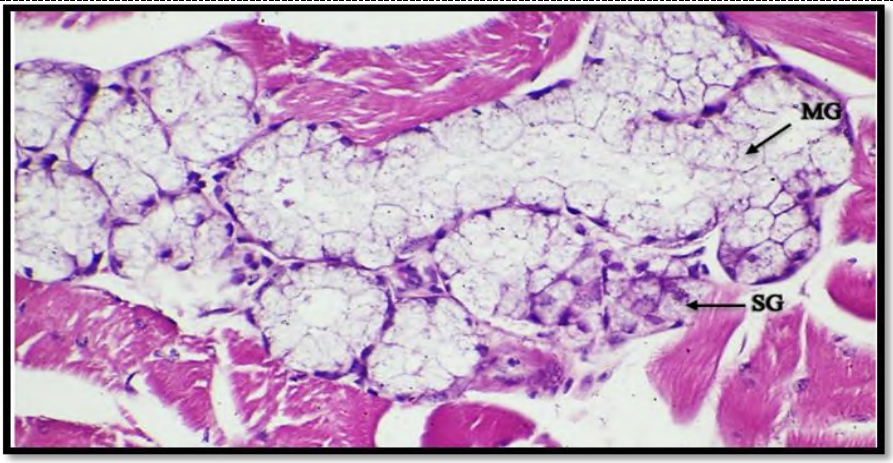

Figure 9. Cross section of lingual root in mongoose showing mucous glands (MG), serous glands (SG) (H&E, 40x).

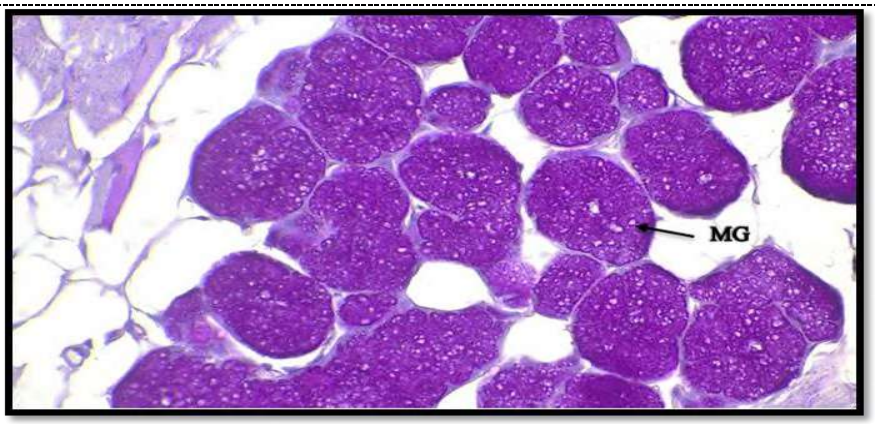

Figure 10. Cross section of lingual root in mongoose showing the positive reaction of mucin with PAS stain, mucous glands (MG). (PAS stain, 40x).

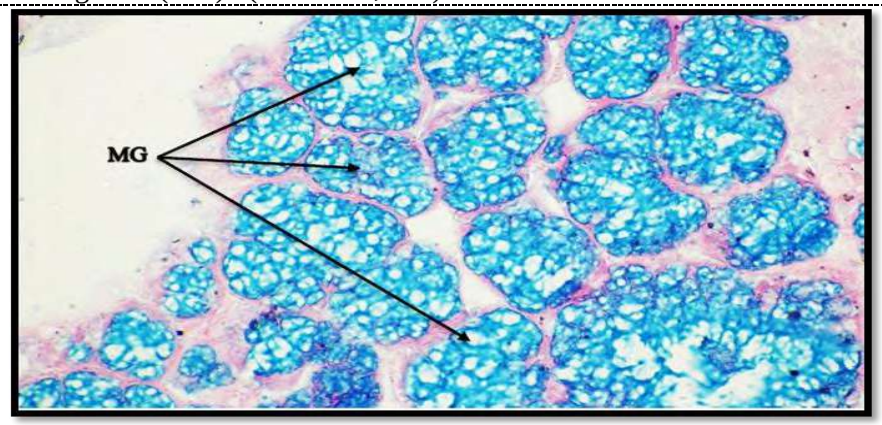

Figure 11. Cross section of lingual root in mongoose showing the positive reaction with AB stain, mucous glands (MG). (AB stain, 40x).

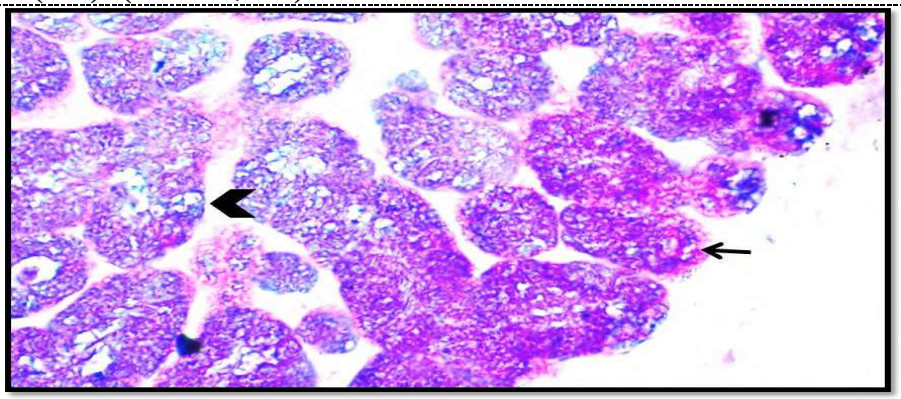

Figure 12. Cross section of lingual root in mongooe showing mucous glands and the positive reaction with PAS/AB stain, the purple color is dominant (arrow) while a little blue color (arrow head) is observed which means that the mucin is a mixed type (PAS/AB stain, 40x).

The dorsal surface of tongue's mongoose differs from the ventral surface as it contains lingual papillae, while the ventral surface is devoid of papillae, but it is characterized by the presence of rod like structure a called Lyssa [21] that consisting of skeletal muscle fibers penetrating between them the connective tissue to form bundles (Fig. 13) and this result is consistent with some studies that indicated the presence of this structure in their study animals [18, 22, 23]. While some studies are contrary in terms of the histological composition of Lyssa, the study of [24] showed that the

composition of Lyssa in the tongue of both the cat and the dog consists of a dense connective tissue, while the study of [18] stated that this composition in persian leopard consists of hyaline cartilage surrounded by connective tissue, and Lyssa's function may be that increases the efficiency of tongue movement, making it easier to flip and swallow the bite. The dorsal surface of tongue's mongoose is characterized by presence of lingual papillae that divided into mechanical papillae (filiform, cylindrical) and gustatory (fungiform, circumvallate) [21],who described the morphology of the tongue in general and , in addition, that shape, situated and distribution of papillae. The histological examination showed that the filiform papillae are covered with keratinized stratified squamous epithelial tissue and medullary of papillae composed of a loose connective tissue (Fig. 14). This result is consistent with other studies [12, 18, 20]. But it was noted that cylindrical papillae is covered with highly keratinized stratified squamous epithelial tissue and papillae's medulary composed of loose connective tissue (Fig. 15) and this result is consistent with previous references [2, 4, 18] and the role of these two types of lingual papillae (filiform and cylindrical) revolves around their mechanical function that represented by holding food and preventing it from slipping because the food of the mongoose is soft. Where the fungiform papillae is covered with a narrowly keratinized stratified squamous epithelial tissue and the dorsal surface of the papilla contains taste buds, while the medullary of papillae consists of a loose connective tissue (Fig. 14). This result is consistent with other studies [9, 12, 13, 25], while disagreement with the study of local mouse (*Mus musculus*) [6] because of their fungiform papillae lacks taste buds.

Figure 13. Cross section of lingual body in mongoose from ventral side showing: Lyssa (Ly), ventral side (V) ,Connective Tissue(CT). (Masson's trichrome, 4x).

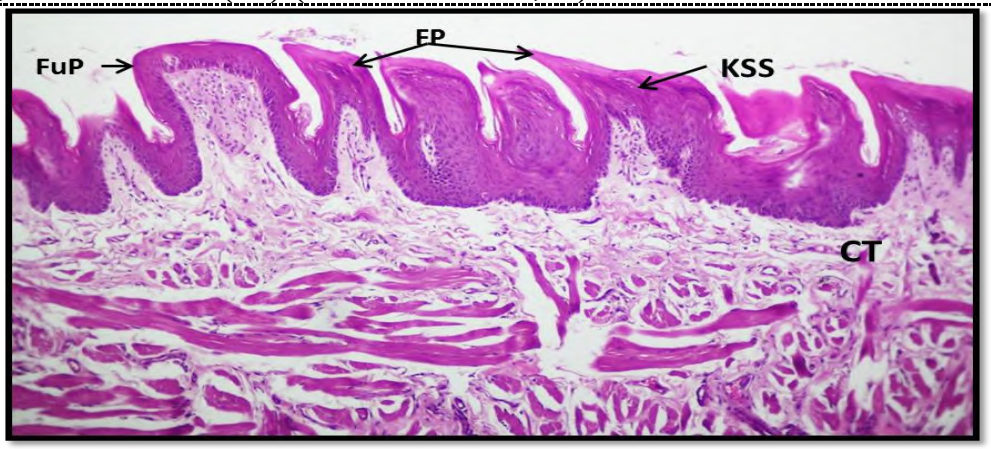

Figure 14. Cross section in tongue of mongoose showing: filiform papillae (FP), fungiform papillae (FuP), Keratinized Stratifed Squamous (KSS), Connective Tissue(CT) (H&E 10x).

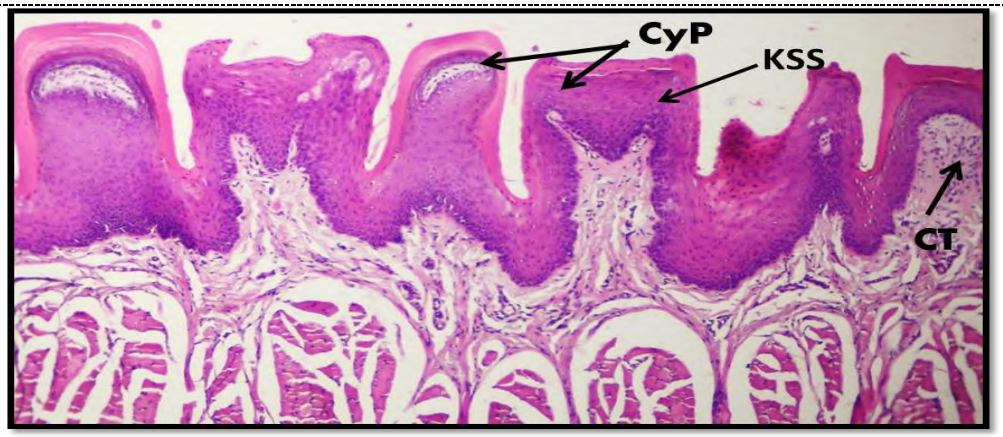

Figure 15. Cross section of lingual body in mongoose showing: cylindrical papillae (CyP) , Keratinized Stratifed Squamous (KSS), Connective Tissue(CT) (H&E, 10x).

The circumvallate papillae are covered with non-keratinized stratified squamous epithelium tissue and contain taste buds on the dorsal and lateral surface of the papillae, the medullary consisting of loose connective tissue, and surrounded by a groove and pad (Fig. 16) and this result corresponds to other studies [6, 18, 26, 27] and the reason of free these papillae from keratinized are allow the growth of taste buds and the performance of their function. The histological study showed that taste buds look like barrels in shape and consist of gustatory-sensory cells and are immersed in the epithelial tissue of gustatory papillaes (fungiform, circumvallate) and this result is agree with previous studies [5, 13]. Many references also showed that the cells of the taste bud consist of three types represented by gustatory cells, supporting cells and basal cells (Fig. 17) and this results is a compatibility with some studies [6, 12, 26]. The histological structure of these buds is associated with their taste function by receiving nutrients through their openings after the dissolving food elements are melted by the digesting enzymes of the serous glands (von-Ebners) to be distributing them over the surface of the tongue in general, including taste buds.

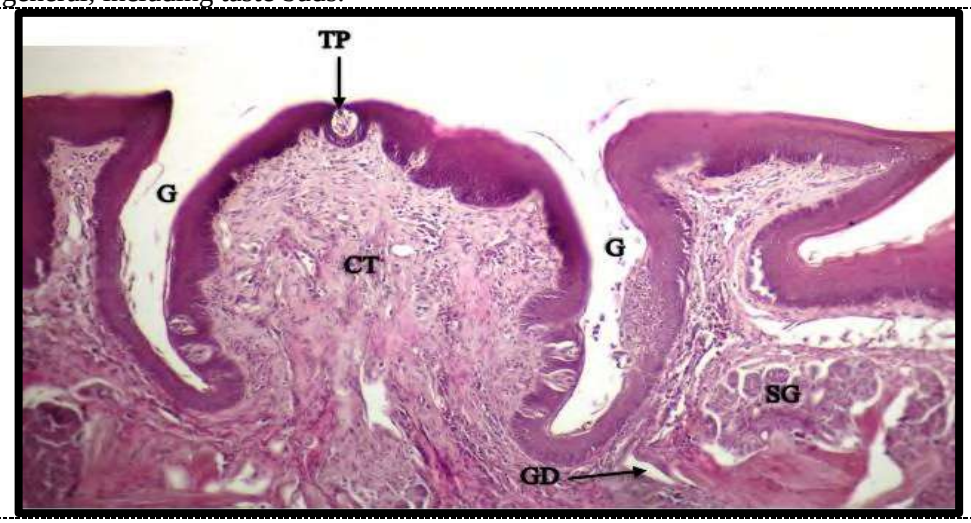

Figure 16. Longitudinal section of lingual root in mongoose showing circumvallate papillae components (CP), taste buds (TB), glosbe (G), serous glands (SG), gland duct (GD), connective tissue (CT). (H&E, 10x).

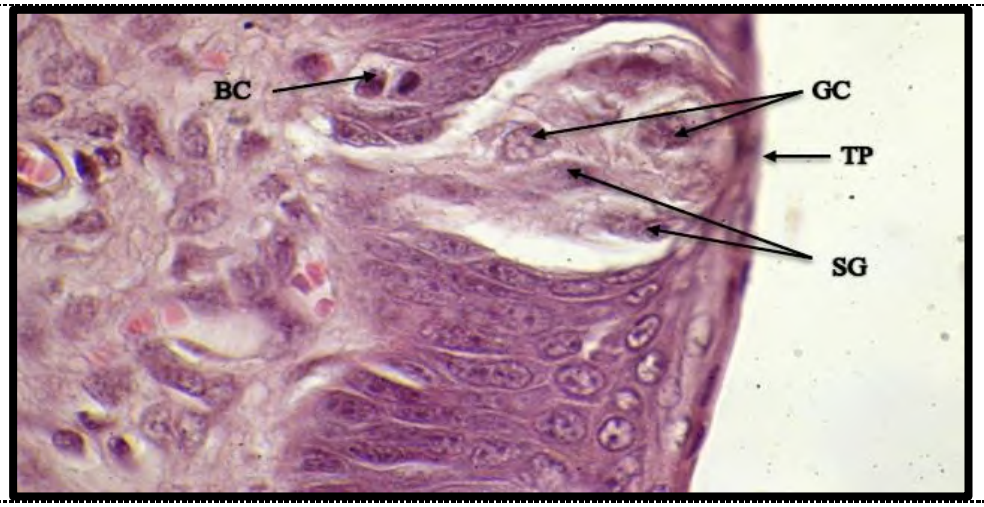

Figure 17. Longitudinal section of circumvallate papillae of lingual root in mongoose showing components of taste buds, gustatory cells (GC), supporting cells (SC), basal cells (BC), taste pore (TP). (H&E, 100x).

[1]Department of Biology, Collage of Sciences, Tikrit University, Iraq.

*E-mail: mtawis@yahoo.com

Abstract. The research aimed to evaluate piped water that supply the general company for pharmaceutical industry of Samarra and its suitable for drinking through the comparison with Iraqi and international standard for drinking. The study started from May (2015) until January (2016). Moreover, know the physical, chemical and bacterial properties piped water. The results showed that the piped water was matching of the drinking water by WHO and Iraqi standard. Only calcium quantity was higher than determination. The values rate for: Air and water temperature (29.44, 21.33) Cº respectively, EC (431.11) µs /cm. TDS (430) mg/L, the pH (7.7). DO (4.75) mg/L, while the BOD5 (1.25) mg/L, while Alkalinity hardness (157.77) mg/L, total hardness (155.55) mg/L, calcium and magnesium hardness (78.66, 72) mg/L Respectively. While chloride (68.22) mg/L, as for the phytonutrient, Nitrate concentration were (1.902) Mg/L, the phosphate concentration values rate (0.050) Mg/L, and silica concentration (1.981) Mg/L. The heavy metals, Cu (0.028) ppm, Iron (0.121) ppm, Zinc (0.203) ppm, Lead (Nil) ppm. And it was free from bacterial growth. Thus, quality of piped water, (completely purity).

Keywords. Piped water, Drugs industry, Samarra, Iraq.

1. Introduction

Water is the most vulnerable environments to pollution because of their distinguished quality, the negative effects of water pollution, are not only on humans, but also on trees and forest surrounding the world. Air and soil pollution is also the destination to watercraft, whether directly or indirectly [1]. In each country its importance, because it is the first coalition of a comprehensive reunion, aspiring to that country, according to professional and integrated development plans. In our Arab world the theme of water is very series, for more than reason, Arab world is the most arid areas and desertified in the world. In the other hand some Arab world are characterized by rain, and snow and many watercraft. Using water properly is a major problem in Arab world [2]. Water has also the potential to purify itself from its implications, with the help of the environmental purposes of self-purification, these pollutants are in the capacity of the source of affected to be affiliated with and processing [3]. Using contaminated water, caused many problems and disease moved to human such as cholera, typhoid and

dysentery as well as different chemicals accumulated in the soil [4]. Tigris river basement, which is electrical conductivity, and it's freshwater with a low salinity. The concentration of plant nutrients are less than organism needs [5]. Moreover, the research aims to study the environmental and biological factors of the piped water that provide the state company for drugs industry of Samarra.

2. Materials and Methods

Samples of the piped water were collected for 9 months, starting from May (2015) until January (2016). The samples collected monthly during that period. Three repetitions taken for each sample of piped water, to determine the properties of each sample according to standard methods are globally durable [6]. Air and water temperature measurement was measured using Mechanical mercury (0-120) C°, Measurement of Electrical conductivity by using Digital conductivity model WTW German origin, results expressed by µs /cm, Use the pH meter model JENWAY England origin to measurement pH, after calibration with Buffer solution [3, 5, 7]. At the beginning of measurement process. Using Winkler Azid modification method to determine the concentration of Dissolved oxygen in water according to described method [8] results expressed by mg/L. as the same method to measurement BOD_5 using dark bottles. Measurement Total Dissolved Salts by using Digital conductivity model WTW German origin, after filtration the sample, results expressed by mg/L. Measured total hardness, calcium, magnesium and chloride according to described method (9]. As well as Measured total alkalinity according to described method [10]. As followed method (11) to determine the nitrate, the active phosphate according to published method [12]. Depending on the American Society, for determine the concentration of active silica by using Spectrophotometer. In addition, heavy metals were determine by using Atomic absorption spectrum (AAS) [13]. The bacteriological testes by Total Plate Count as described in [14].

3. Results and Discussion

The physical properties of piped water as showed in Table (1) that air temperatures were variation and ranged between (10-40) C°, while water temperatures values between (7-31) C°, the high and low temperature surface water is affected by the air temperature [15]. EC values between (350-500) µs /cm, and it has related to the quality and concentration of the solvent ions in the water and increase with increased salinity [16]. TDS values between (350-500) mg/L, this increase maybe due to water containment on organic molecules or useful metals when it has found in the water such as nutrients or maybe cause water pollution by containing harmful material [17]. The physical properties of piped water matched with standard specification of Iraqi and international drinking water [18, 19, 20, 21].

Table 1. Monthly changed for physical test of piped water during the study period.

Months / Variables	May	June	July	August	September	October	November	December	January	Rate
Air temperature C°	35	36	37	40	38	34	23	12	10	29.44
Water temperature C°	25	22	25	31	23	26	20	7	13	21.33
Electrical conductivity µs /cm	370	450	500	440	460	350	450	360	500	431.11
Total dissolved salts mg/L	370	450	500	440	460	350	450	360	500	431.11

Table 2. Iraqi and International physical standard specification for drinking water [18, 19, 20, 21].

References / Determination	Central device of the standardization and Quality Control (1996)	US-EPA (2002)	CEOH (2003)	WHO (2004)
Water temperature C°	-	15-35	15	-
Electrical Conductivity µs /cm	-	1600	1600	1350
Total Dissolved Salts mg/L	1000	1000	450	1000

The chemical properties showed in Table (2), the pH values ranges between (7.3-8.2), and when compared pH values rate with the Iraqi and International properties in Table (4) which determinate that pH for natural water between (6.5-8.5), so it found within allowed range therefore not cause any problem in natural water [22]. DO values ranges between (4-5.9) mg/L, which suits a reflective with BOD5 that values ranges between (1-1.5) mg/L. As evaluate BOD5 values are typically with the pollution and temperature and inversely with DO concentration [23], that consistent by the Iraqi and International properties for drinking water Table (4). Thus, the water is excellent according to water resources that classified according to BOD5 values to excellent (1-75) mg/L, good (1.5-2.5) mg/L and poor (<2.5) mg/L [24]. The results of total alkalinity values showed between (120-250) mg/L, so it's within the Iraqi and international standard specification for drinking water. The higher of total alkalinity than the total hardness maybe belong to the high concentration of carbon dioxide from the air to water or moderation temperature, helping to soluble CO_2 in the water therefore increase of total alkalinity [25]. The total hardness values between (100-230) mg/L, so it's within the Iraqi and international standard specification for drinking water. The total hardness is close linked with magnesium and calcium salts, and these ions caused the hardness [26]. the results showed of high calcium values comparison with magnesium values, its maybe due to interact CO_2 with calcium more than its interact with magnesium [27], as the calcium values between (60-115)mg/L, which wasn't within the standard specification for drinking water. While magnesium values between (46-100) mg/L, the reason for low concentration of soluble magnesium than the calcium due to tends the magnesium to precipitation in large quantities [28]. Chloride values between (62-125) mg/L. notes the high quality of chloride in the winter compared to the summer, as well as the chloride levels are a factor for water quality, in the fresh water the flow of chloride is low levels and increasing in concentration in winter clearly, because the drift and ruining that washing the soil [29]. it's found within the Iraqi and international standard specification for drinking water, Table (4).

Table 3. Monthly changed for chemical test of piped water during the study period.

Months / Variables	May	June	July	August	September	October	November	December	January	Rate
pH	7.5	7.3	7.7	7.6	7.9	7.8	8.2	7.8	7.9	7.7

Total Hardness mg/l	500	250	250	500
Calcium Hardness mg/l	50	50	25	75
Magnesium Hardness mg/l	50	125	50	125
Chloride Ion mg/l	250	500	250	250

As for the phytonutrient results that showed in Table (5), the nitrate values shown between (1.102-2.702) Mg/L, it was noted increase nitrate concentration in winter, that's belong to the running and high watercraft that would be increase nitrate concentration by strong currents which causes mixing the sediments in water [30]. It's found within the Iraqi and international standard specification for drinking water, Table (6). The active phosphate values between (0.013-0.140) Mg/L, so it's found within the Iraqi and international standard specification for drinking water, Table (6). Silica values between (0.15-3.28)Mg/L, notes an increase silica comparison with the other studied phytonutrients, perhaps this increase to be more than (60%) from the earth's crust rocks and its soil contains silica, so its expected found as suitable mounts in natural water between (1-10) mg/L [7].

Table 5. Monthly changed for phytonutrients test of piped water during the study period.

Months / Variables	May	June	July	August	September	October	November	December	January	Rate
Nitrate Mg/l	1.102	1.981	2.486	2.101	1.310	1.479	2.702	1.590	2.465	1.902

Nitrate Mg/l	50	45	10	—

The results showed low of heavy metals values in piped water as shown in Table (7); the reason may be tend the heavy metals to adsorb on the surfers of sedimentation or forming complexes with the organic matters [31]. Cupper values between (Nil-0.099) Mg/L. Iron values between (Nil- 0.214)

Mg/L, so the heavy metals found less in pH more than 4 [32]. Zinc values between (Nil-0.811) Mg/L. Lead is most effective elements in the health, it has also proved several studies from which study [33]. The results showed free piped water during the study, As well as the heavy metals studied were low from the Iraqi and international standard specification for drinking water [18, 19, 20, 21] (Table 8).

Table 7. Monthly changed for heavy metals test of piped water during the study period.

Months / Elements	May	June	July	August	September	October	November	December	January	Rate
Cu Mg/l	0.070	0.045	Nil	0.053	Nil	Nil	0.099	Nil	0.084	0.028

Pb Mg/l	Nil	Nil	Nil	Nil	Nil	Nil	Nil	Nil	Nil	Nil

Table 8. Iraqi and International heavy metals standard specification for drinking water [18, 19, 20, 21].

References / Elements	Central device of the standardization and Quality Control (1996) Mg/l	US-EPA (2002) Mg/l	CEOH (2003) Mg/l	WHO (2004) Mg/l
Lead Mg/l	50	50	10	10
Cupper Mg/l	1000	1000	–	2000
Zinc Mg/l	1000	5000	5000	3000
Iron Mg/l	500	–	300	3000

The bacterial testing for water is the important testing, because its indicator for founding or absent the harmful microorganisms for health [34]. Therefore, the total bacterial count that studied, and didn't record any bacterial growth during the study. So TPC found within the Iraqi and international standard specification for drinking water, which is mount (50) cfu /ml, therefore the piped water is (completely pure), depending on the bacterial properties [35].

Abstract. The Myxozoan parasite, *Myxobolus insignis* Eiras, Malta, Varella, Pavanelli, 2005 is recorded in the present study from gills of the common carp *Cyprinus carpio* for the first time in Iraq. The fishes were caught from the Al-Ataifiya location on the Tigris River at Baghdad city during the period from January to October 2020. The measurements and description of this external parasite in addition to its illustrations were given.

Keywords. Myxozoa, *Myxobolus insignis*, *Cyprinus carpio*, Tigris River, Baghdad.

1. Introduction

Myxozoans are highly specialized metazoan parasites of aquatic hosts with a very wide host range. This diverse group of organisms is characterized by multicellular spores with polar capsules containing extrudable polar filaments. Interest in this group has intensified along with the development of aquaculture since many species cause serious disease outbreaks in farmed fish species, in both freshwater and marine environments [1]. Different fish-parasitic myxosporean is characterized by varying degrees of host specificity, while most Myxosporeans species are tissue-specific parasites, includes an intracellular stage and form spore within the cell [2]. *Myxobolus* species develop in large plasmodia which on the surface or in organs such as gills, fins, skin, eyes, heart, muscles, gall-bladder, kidneys, spleen, liver, a wall of the intestine, urinary bladder, testis and Ovaries [2,3]. The presence of myxosporea was related to epithelial hyperplasia, the fusion of lamellae, hyperplasia of mucous cells, inflammation and other pathological changes [4]. The prevalence and intensities of myxosporeans infestations were affected by the host's size, sex, organs and seasons [5]. Among the Myxozoan, species of the genus *Myxobolus* Bütschli, 1882 infects fishes with 856 nominal species throughout the world [6, 7].The first study on fish parasites in Iraq described three myxozoan parasites, namely *Myxobolus muelleri*, *M. multiplicatus* (reported as *Myxosoma multiplicata*), and M. oviformis [8]. Hence, many studies were performed that showed a record of 97 *Myxobolus* species [9]. For this, it is important to conduct more studies on fish parasites to registration more species and increase information on the parasitic fauna of freshwater fishes of Iraq.

2. Materials and Methods

Between January to October 2020, 40 specimens of the common carp *Cyprinus carpio* were collected weekly from Tigris River near Al-Ataifiya region north of Baghdad city (33°21'37.4"N 44°21'49.2"E). Fish were classified according to an account on freshwater fishes of Iraq [10]. Fresh smears the external parts (gills and surface of the body) and all internal organs (intestine, gallbladder, kidneys and liver) of fishes were examined macroscopically for visible plasmodia. Smears were made from the external and internal organs of the fish and examined with a microscope for spores. Fresh spores were photographed by a digital camera and draw with the aid of a Camera Lucida. For further examination, some spores were put into glycerol-gelatin to get permanent slides, while some other spores were fixed in absolute methanol for 2-8 minutes, and then staining them with Giemsa solution for about 25- 30 minutes in accordance [11]. Spores were described and measured according to the guidelines [12]. The scientific name of the parasite was used in accordance. [7]. All measurements are given here in μm as: minimum-maximum (mean) values. The information on the previous records of myxozoans of fishes of Iraq was obtained from the index-catalogue of parasites and disease agents of fishes of Iraq [13].

3. Results and Discussion

3.1. Myxobolus insignis Eiras, Malta, Varella & Pavanelli, 2005

Two out of 40 of common carp *Cyprinus carpio* Linnaeus, 1758 were infected with this parasite which was found on the gills of the infected fishes. The following is the description and measurements (in μm based on five specimens) of this parasite. Plasmodia of *M. insignis* appeared as small, white, irregular cysts which occurred in different size at the base of the secondary lamellae of gills. Spore Description (Figure 1). The spores are subspherical in frontal view with slightly tapering anterior end, its length is greater than the width, length 13.8-14.6 (14.2), width 11.6-12.2 (11.9), thickness 7. Polar capsules large, oval, equal in size, extend beyond the mid-length of the spore and converge at their anterior points, length 7.2-7.8 (7.5) and width 3.8-4.4 (4.2). There is a small intercapsular process at the frontal tip of the spore.

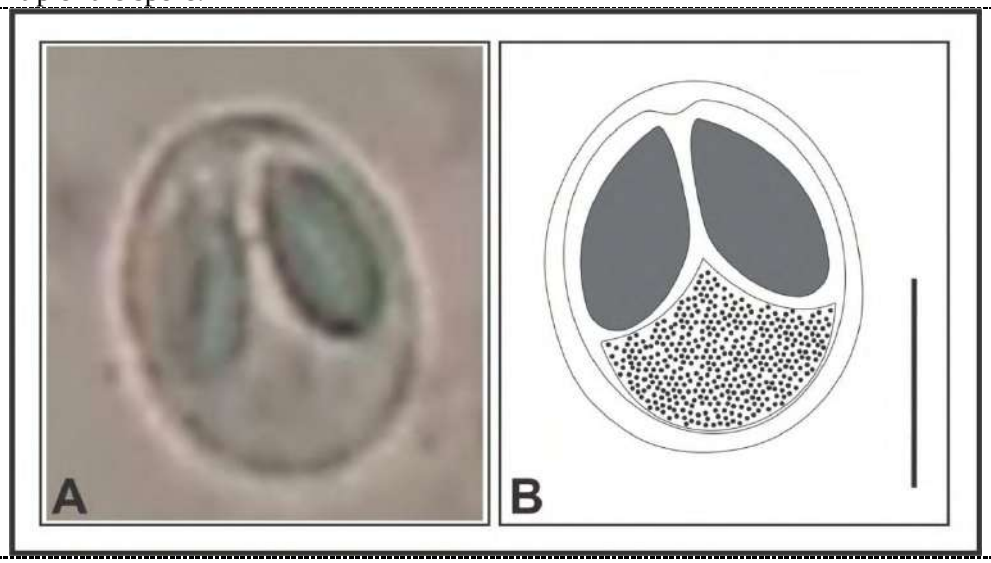

Figure 1. Myxobolus insignis: A- Photomicrograph (400 x) B- Diagrammatic drawing (Scale bar = 7.5 μm)

The descriptions and measurements of the present *M. insignis* are in agreement with those of the holotype of these parasites from secondary gill lamellae of *Semaprochilodus insignis* in Amazon River, near Manaus, Brazil [14]. Depending on the index-catalogue of parasites and disease agents of

fishes of Iraq [13], the current record of M. insignis represents its first record in Iraq, as no previous record was given for this parasite from fishes of Iraq. Previously, 14 species belonging to the genus *Myxobolus* were reported from different fish species collected from Tigris river at Al-Ataifiya location, including only *M. squamae* from *C. carpio* [15]. Although 97 *Myxobolus* species were registered recently from fishes of the different water bodies in Iraq [9], only 16 species belonging to the genus Myxobolus so far, reported from *C. carpio*. The following is a chronologically arranged list of these species with the mention of only the first record from *C. carpio* in Iraq: *M. pfeifferi* [16], *M. cyprinicola* and *M. parvus* [17], *M. muelleri* and *M. oviformis* [18], *M. dispar* [19], *M. punctatus* [20], *M. dogieli* [21] *M. intrachondrealis* [22], *M. musculi* [23], *M. squamae* [24], *M. drjagini*, *M. gigi*, *M. koi*, *M. poljanski* and *M. sphaericus* [25], besides one unidentified species [26]. With the present record of a new species *M. insignis*, the number of *Myxobolus* species from fishes of Iraq so far reaches 98 species, among which 17 species were reported from *C. carpio*.

4. Conclusion

The Myxozoan parasite, *Myxobolus insignis* Eiras, Malta, Varella, Pavanelli, 2005 for the first time in Iraq. It is the 17th species from this genus recorded from the gills of *Cyprinus carpio* Linnaeus, 1758.

5. Acknowledgement

Thanks and appreciation to Prof. Dr. Furhan T. Mhaisen for providing necessary information concerning the records of *Myxobolus* species so far known from *C. carpio* in his index-catalogue of parasites and disease agents of fishes of Iraq.

Abstract. *Bacillus cereus* isolated from different food sources. The diarrheal toxin genes such as *cytK*, hemolytic enterotoxin (*hblA*, *hblC* and *hblD*), non-hemolytic enterotoxin (*nheA*, *nheB* and *nheC*), *bceT* and *entFM* in addition to emetic toxin gene were detected by PCR. The *cyt K* gene was observed in 94.87 % of the isolates. *entFM* and emetic toxin gene were found very rare in all food samples at the percentage 2.56% and 7.69% respectively. Uncooked rice which has a highest number of bacterial isolation, also showed relatively high percentage of the *cytK* and *bceT* genes (90%). These two genes present in 100% of *Bacillus cereus* isolates in most food samples. Bacteria isolated from burger meat contain all investigated genes.

Keywords. *Bacillus cereus*, diarrheal toxin, emetic toxin.

1. Introduction

Bacillus cereus is a Gram-positive, facultative anaerobic, spore-producing, motile, bacterium in the form of a rod. Enterotoxins produced by bacteria in intestine can cause diarrhea. 10^5–10^7 cells or spores if ingested with food, heat labile toxins are produced. Incubation period of this bacterium is range between 8-16 hours. The sign of toxicity of *B. cereus* toxins appears as nausea, vomiting, diarrhea and abdominal pain [1, 2]. Three toxins produced during the vegetative cell growth of *B. cereus* in the intestine that caused diarrheal syndrome, Cyt K, NHE and HBL [4, 5, 6]. The first enterotoxin-hemolysin BL (HBL) was discovered by [7]. NHE toxin on three molecular types A, B, and C. Bacteria need these proteins for cytotoxicity of multi-component enterotoxins [5]. The HBL complex is encoded by genes on a single operon. The B, L1 and L2 proteins are encoded by the *hblA*, *hblD* and *hblC* genes [8, 9]. NHE toxin is a major cause of cytotoxicity in *B. cereus* [10]. The emetic disease is caused by a toxin produced by *B. cereus* called cereulide. This toxin showed stability against heat, acid, and trypsin. Several studies have been done previously for bacterial food contamination [11, 12 13, 14, 15]. This study was done to investigate the *B. cereus* that responsible for food poisoning by detecting the presence of diarrheal and emetic toxin genes.

2. Materials and Methods

2.1. Bacterial strains

Bacillus cereus isolates from different food sources were previously described [16]. The DNA of all isolates was extracted by genomic DNA kit (company and origin). The identification of the isolates was done by DNA sequencing using 16S *rRNA* gene [16].

2.2. Detection of diarrheal and emetic toxin genes by polymerase chain reaction

The primers used in this study for the detection of diarrheal and emetic toxin genes with the anticipated size of the amplified product were listed in Table 1.

Table 1. Primers of diarrheal and emetic toxins genes.

3. Results

3.1. Detection of diarrheal toxin genes

3.1.1. Detection of cyt K gene

cyt K gene was found in 94.87% of the isolated bacteria. No significant differences (P > 0.05) in rate of detection of this gene in the investigated samples (Table 2, Figure 1).

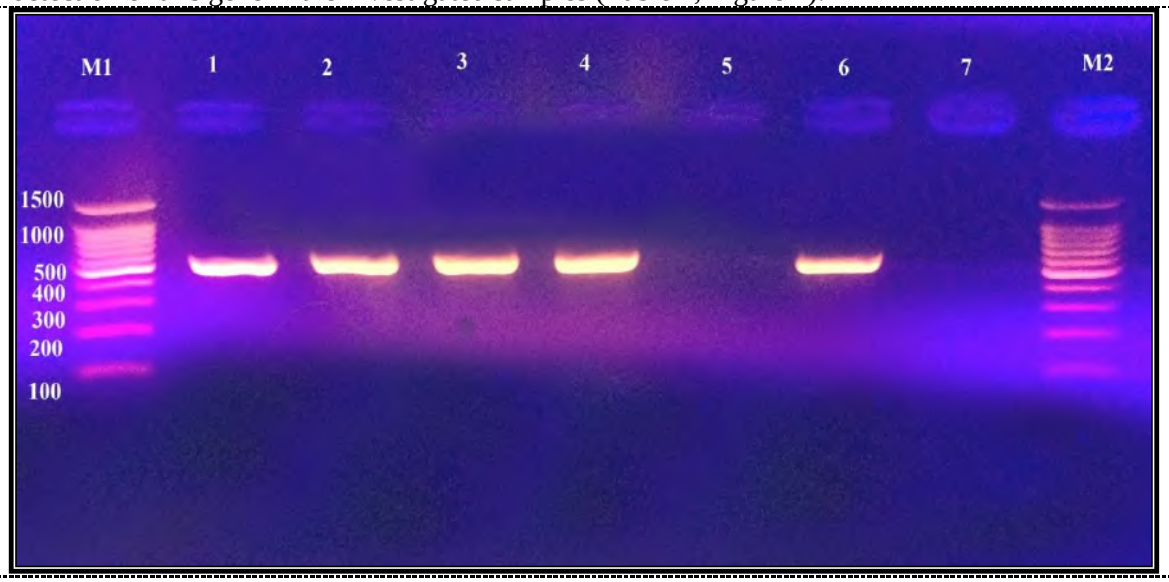

Figure 1. PCR amplification of *cytK* gene of *Bacillus cereus* isolates. M1 = Ladder; 1-4 & 6 = *cyt K* gene approximately 565 bp.; 5 = negative for *cyt K* gene; 7 = control negative.

3.1.2. Detection of (hbl and nhe) genes by multiplex PCR

Bacillus cereus isolated from different food were tested for presence of genes code for enterotoxin such as *hblA, hblC, hblD, nheA, nheB,* and *nheC* by multiplex PCR (Table 2, Figure 2). In cream isolates, the genes were detected in 6 isolates. *hblC* gene had the highest percentage 100.00 % followed by *hblA, hblD, nheA, nheB* and *nheC* genes were found in 50.00, 16.66, 50.00, 66.66 and 50.00%, respectively. In beef isolates, the genes were detected in 6 isolates. *hblC* gene had the highest percentage 66.66 % followed by *nheB* 50% and *hblD, nheA* and *nheC* genes were found as 33.33% for each one. The gene *hblA* was not found. In frozen beef isolates, the genes were detected in 5 isolates. *hblC* and *nheB* genes had the highest percentage 60.00 % followed by *nheA* and *nheC* genes were found in 40.00 % . The lowest percentage was found in *hblA* gene. The *hblD* gene was not found in all of the isolates. In burger isolates, the genes were detected in 7 isolates. *hblC* and *nheB* genes had the highest percentage 57.14 % followed by *hblD, nheC* genes were found in 42.85%. The lowest percentage was found in hblA and nheA in 28.57%. In cooked rice isolates, the genes were detected in 5 isolates. hblC, hblD and nheC genes had the highest percentage 40.00 % followed by *hblA, nheA* and *nheB* genes were found in 20.00 % for each one. In uncooked rice isolates, the genes was detected in 10 isolates. *hblC, hblD* and *nheC* genes had the highest percentage 40.00 % followed by *hblA, nheA* and *nheB* genes were found in 20.00 % for each one.

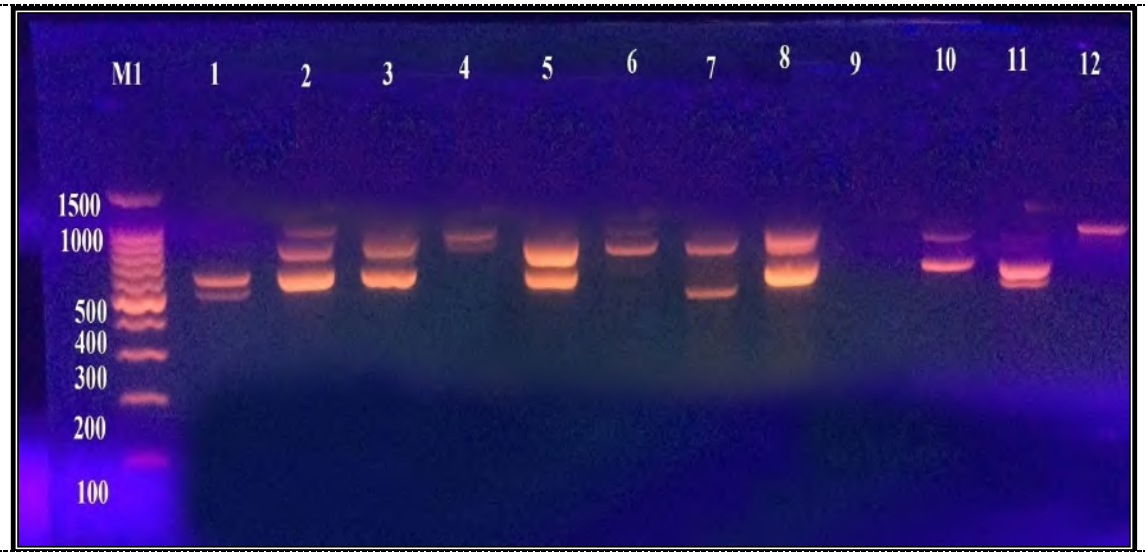

Figure 2. PCR amplification of *hblACD* and *nheABC* genes of *Bacillus cereus* isolates. Lane (M1)= Ladder, Lane 1 =*nheB, nhe* (769 and 581) bp, Lane 2 = *hblA*, hblD and *nheB*, (1154, 829 and 769) bp, Lane 3 = *hblA, hblD, nheB* and *hblC* (1154, 829, 769 and 740) bp, Lane 4 = *hblD* and *nheB* (829 and 769) bp, Lane 5 = *hblA, nheB* and *hblC* (1154, 769 and 740) bp, Lane 6 = *hblA, hblD, nheB* and *hblC* (1154, 829, 769 and 740) bp, Lane 7 = *nheB* and *nheC* (769 and 581) bp, Lane 8 = *nheB* and *hblC* (769 and 740) bp, Lane 9 = negative for genes. Lane 10 = *hblD, nheB* and *hblC* (829, 769 and 740) bp, Lane 11 = *nheB, hblC* and *nheC* (769, 740 and 581) bp, Lane 12 = *nheB* (769 bp).

3.1.3. Detection of bce T gene

The *bce* T gene was detected in 37 isolates (94.87 %) out of 39 isolates. The high rate (100%) found in beef, burger, frozen beef, and cooked rice. The lowest percentage was found in cream 83.33%. Results showed differ significantly ($P < 0.05$) in the detection of this gene in tested samples (Table 2, Figure 3).

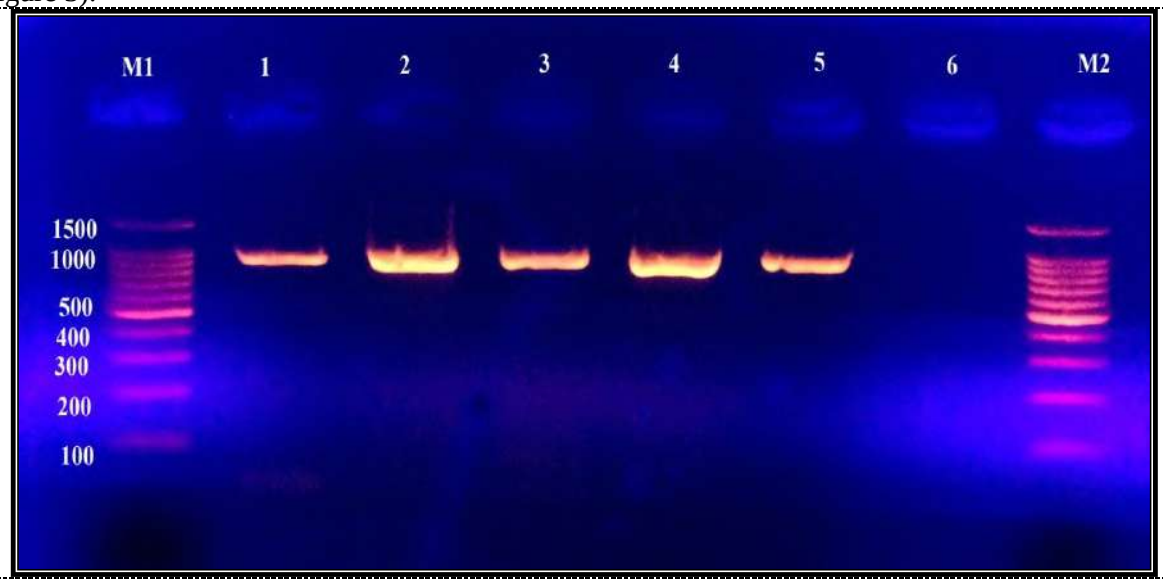

Figure 3. PCR detection of enterotoxin *bceT* gene M =Ladder; 1- 5 =positive for enterotoxin *bceT* gene approximately 924 bp.; 6= negative control.

3.1.4. Detection of enterotoxin (ent FM) gene

The *entFM* gene was detected in 1 isolate (2.5%) out of 39 isolates, it was found in burger 16.66%. The difference is non-significant (P > 0.05) in the detection of this gene in the tested samples (Table 2, Figure 4).

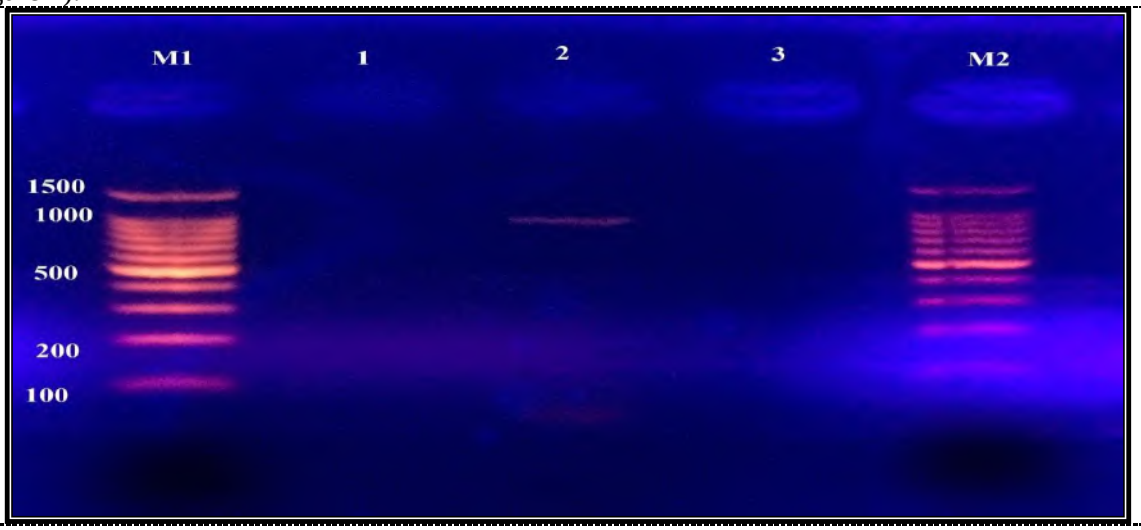

Figure 4. Detection of enterotoxin ent FM gene. M1, M2=Ladder; Lane 2=positive for *ent (FM)* gene approximately 1269 bp.

3.1.5. Detection of emetic toxin gene in Bacillus cereus

The emetic gene was detected in 3 isolates (7.6 %), distributed in cream and frozen beef and burger in 16.66, 20 and 14.28 %, respectively but was not detected in beef, cooked rice, and uncooked rice. The differences is non-significant found in the detection of emetic gene in the tested samples at (P > 0.05), (Table 2, Figure 5).

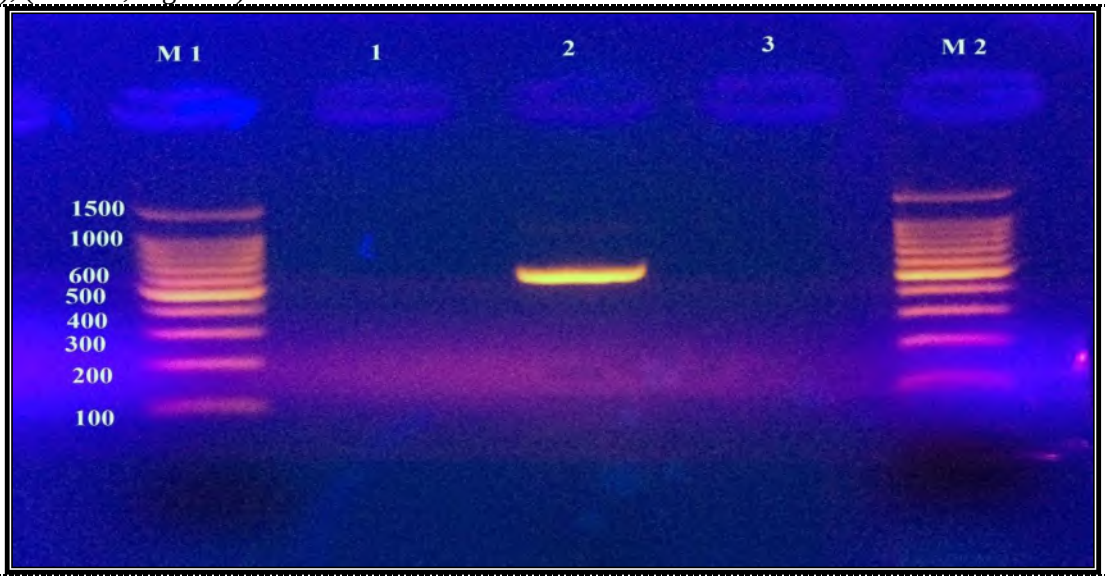

Figure 5. PCR Amplification of emetic toxin gene. M= Ladder; 2 positive for emetic gene approximately 635 bp.; 1 negative for emetic toxin gene; 3 control negative

3.2. The occurrence of diarrheal and emetic toxins genes in Bacillus cereus isolates

The presence of diarrheal and emetic toxins genes in *B. cereus* isolated from food sources are shown in (Table 2).

Table 2. The occurrence of diarrheal enterotoxin and emetic toxins genes in *Bacillus cereus* isolates.

4. Discussion

The *Bacillus cereus* spoilage depends on two main factors: bacterial concentration in dairy products and cytotoxicity of isolates [22]. Several studies reported isolates produced cytotoxins and caused spoilage of milk, while others reported that cytotoxin production was not required for spoilage. As noted earlier, several factors affected toxin production, including environment and temperature signals [22]. The *cyt K* gene was detected in 37 isolates (94.87 %) out of 39 isolates. In cream sample, *hblC* gene had the highest percentage 100% while in beef samples, *hblC* gene had the highest percentage (66.66). On the other hand, the gene *hblA* was not found in beef. In frozen beef samples, hblC and *nheB* genes have the highest percentage of 60% (for each) followed by *nheA* and *nheC* genes which were found in 40% for each. In burger samples, each *hblC* and *nheB* genes had the highest percentage (57.14%) followed by *hblD, nheC* genes were found in 42.85% for each. The lowest percentage (28.57%) was found in each of *hblA* and *nheA*. In cooked rice samples, each of *hblC, hblD* and *nheC* genes had the highest percentage (40%) followed by each of *hblA, nheA* and *nheB* genes which were found in 20% of samples isolates. In uncooked rice samples, *hblC, hblD* and *nheC* genes had the highest percentage 40% for each, followed by *hblA, nheA* and *nheB* genes which were found in 20% for each one. [20, 23, 24, 25] detected the gene *cytK* in 50, 88, 70.40 and 65.98% of their isolates. [26] found the *cytK* gene in 27 (87.09%) out of 31 isolates. *nhe, hbl, ceses, ctyK* and *cry* genes also reported in the 92 isolates of *B. cereus* which were isolated in the previous study [16]. The rate is higher than the presence of nhe and hbl in *B. cereus* from Korea's food [27]. The positive rates for *nhe* and *hbl* in twenty raw milk samples were higher than those found for fifty four milk samples in China. In the study of [28], the positive rates of *nhe* and *hbl* were 62.0% and 37.0%, respectively.[29] found that the haemolysin gene *hblA, hblC* and *hblD* found in in most isolates. Haemolytic enterotoxin gene was isolated from vegetables [30, 31]. While haemolytic enterotoxin gene of *B. cereus* not reported from milk [30, 32]. Enterotoxin gene *bceT* gene was detected in 37 isolates (94.87%). This agreed with other studies [33, 34]. Whereas [31] found that all isolates were negative for this gene. *entFM* gene was found in one bacterial isolate (2.5%) out of 39 isolates, it was found in burger. Other studies were indicated that this gene was specific for entotoxigenic *B. cereus* [17, 35, 36]. Whereas other workers noticed that the *entFM* gene was found in 27 (93 %) *B. cereus* isolates [37]. In this study, 3 isolates (7.6%) detected the emetic toxin gene. While [38] found the emetic gene at percentage of

41.6%. Analysis of PCR is quick and easy to identify foods suspected of causing enterotoxigenic *Bacillus cereus* food poisoning.

5. Conclusion

It can be concluded that most investigated food have *Bacillus cereus* bacteria and these bacteria harboring different types of genes that can be harmful for man when ingested with food. The genes are relatively highly occurred in studied samples especially *cytK* and *bceT*.

Abstract. Silver conjugated Tetracycline, was created and characterized by ultraviolet visible spectrophotometry (UV-vis), Fourier transform infrared (FT-IR), X-Ray Diffraction Patterns (XRD). Using antibacterial assays, the effects of tetracycline alone and drugs-conjugated with silver nanoparticles were tested against Gram-ve *Pseudomonas aeruginosa* isolates by well diffusion assay. The UV-vis spectra of silver-drug Nano conjugates showed a characteristic surface Plasmon resonance band in the range of 400–450 nm. FTIR analysis demonstrated the involvement of Hydroxyl groups in both drugs in the stabilization of silver nanoparticles. (XRD) showed that they cubic structure of silver and, antibacterial assays showed that biosynthesis silver nanoparticle conjugation enhanced antibacterial potential of Tetracycline compared with drug alone.

Keywords. Antibiotics, Anti biofilm, Nanoparticles, Antibacterial activity.

1. Introduction

Drug-resistant microbes are a main reason producing microbial re-emergence [1]. *P. aeruginosa* is main human pathogens causative to urinary tract infections [2]. Nanoparticles has shown abundant possible led to effectiveness of numerous Nano conjugates towered pathogenic microbes [3]. Nanoparticles have been often used as effective coatings to inhibit bacterial adhesion to surfaces as well as bactericidal agents [4]. Among these (AgNPs) have shown growth inhibitory as well as bactericidal effects [5].The high surface area of AgNPs leads to high antimicrobial activity in compared with the silver metal [6]. This study aimed to create AgNPs by tetracycline antibiotic, and evaluation the anti-biofilm activity and cytotoxicity against red blood cells.

2. Materials and Methods

2.1. Synthesis of AgNPs by Drug

Five mL (0.1 mM) Tetracyclin solution was added to five mL (0.1 mM) silver nitrate aqueous solution, the mixture was magnetically stirred for 10 min. 20 µL of 5 mM freshly prepared $NaBH_4$ was

added in mixture. Turned color from yellow to Greenish from transparent upon addition of a reducing agent indicating the reduction of silver ions and the formation of Tetra-AgNPs [7].

2.2. Characterization of AgNPs

Tetr.-AgNPs were exposed to whole analysis (UV-vis, FT-IR, SEM, and XRD) (8,9) UV-Vis spectral analysis this was done by using UV-Vis spectrophotometer (PG- T80+ UV/Vis spectrophotometer, England) from 350-700 nm at a resolution of 1 nm. XRD measurements of the silver nanoparticles solution drop-coated on glass were done on Shimadzu XRD-6000 model with 40 kv, 30 mA with Cu k α radiation at 2 θ angel. X- Ray powder diffraction is a rapid analytical technique primarily used for phase identification of a crystalline material and can provide information on unit cell dimensions. The crystallite domain size was calculated from the width of the XRD peaks, assuming that they are free from non-uniform strains, using the Scherer formula:

$D= 0.94 \lambda / \beta \cos \theta$

FT-IR analysis demonstrated the involvement of Hydroxyl groups in both drugs in the stabilization of silver nanoparticles.

2.3. Test pathogen

The cultures of 10 bacterial isolates of *P. aeruginosa* were obtained from the Microbiology Laboratory at Al Azizya-Hospital.

2.4. Antibiotics sensitivity test

Eleven different antibiotics were selected. Ciprofloxacin, Tobramycin, Azithromycin, Ceftraxime, Trimethoprim, chloramphenicol, erythromycin, gentamicin, and Clindamycin. Tests for antibacterial activity were performed with standard antibiotic discs. The inhibition zone was measured after incubation period at 37°C [8].

2.5. Antibacterial assay

Antibacterial potential of AgNPs synthesized by Tetracyclin. Was done by agar well diffusion assay towered *P. aeruginosa*. Nutrient broth was inoculated with isolates of *P.aeruginosa* bacterium for 3hours at 370C ,and the turbidity was compared with 0.5 McFarland standard. The culture (100µL)was poured on the Muller Hinton Agar(MHA) and spread using a spreader and left for 10 min to settle down .well with 8mm in diameter were made using gel puncture, nanoparticles solution (50 µL) was poured in each well and incubated for 24 hr at 370C. The diameter of zone inhibition was measured in millimetre after incubation period, and was recorded as mean ± SD of the triplicate experiment [9].

2.6. Biofilm formation, Tube method

This method was carried out by growing one colony at 24 hours in TSB medium for 24 hours in test tubes with a volume of 5 ml per tube with adding 1 ml of each concentration of silver nanoparticles concentrations (20 ,60, 100) mg / ml, to each tube in When the positive control tube was containing the medium inoculated with bacteria and the negative control tube contained the medium that was not inoculated with bacteria, and after the incubation period for 24 hours, the medium was discarded and the tubes were washed with a phosphate buffer solution of pH 7.3, and the tubes were left to dry, then stained with 0.1% of dye crystal violet for 5 minutes, then the dye was removed from the tubes and

washed with tap water to get rid of the remaining dye and the tubes were left in an upside down position to dry, and the results were recorded as follows:

- The result is given (-) if there is no biofilm production (negative control).

- A score of (+) is given if the biofilm composition is weak.

- The result was given (+ +) if the membrane formation was moderate.

- The result is given (+ + +) if the membrane formation is biotic-dense [10].

2.7. Cytotoxicity assay

The agar-well diffusion method was adopted and the concentrations 20, 60, 100 mg / ml. well with a diameter of 8 mm were made on the surface of the blood agar medium and the prepared concentrations were poured in wells while the physiological solution was added as control, after incubation period (18-24 hours, and 37 ° C) and the effectiveness of the AGNPS was determined by measuring the haemolysis area around each well [11].

3. Results and Discussion

3.1. Characterization of biosynthesized AgNPs

This The results in (Figure 1) show the change in color of cell filtrate of Tetracycline solution from pale yellow color to Greenish color after addition the Ag+ ions at 28 h.

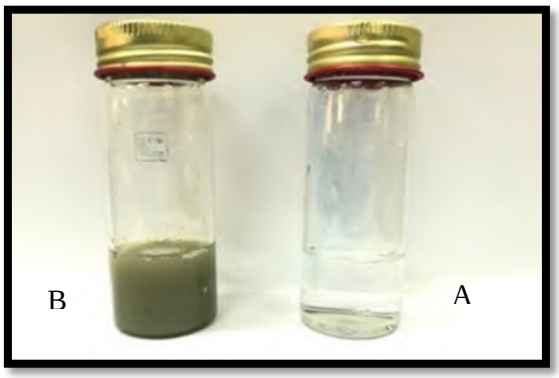

Figure 1. Synthesis of AGPS Tetracycline Coated Silver Nanoparticles (A) before treatment. (B) After treatment of silver nitrate.

Figure 2 shows the UV-vis absorption spectra of silver- nano particles, which showed absorbance peak at 390nm.

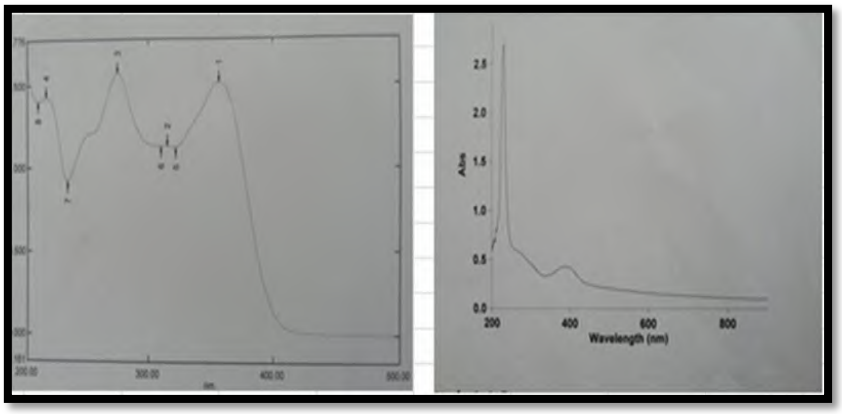

Figure 2. Uv-Vis spectrum of Silver nanoparticles for (A) Tetracycline antibiotic only, (B) Silver nanoparticles by tetracycline antibiotic**.**

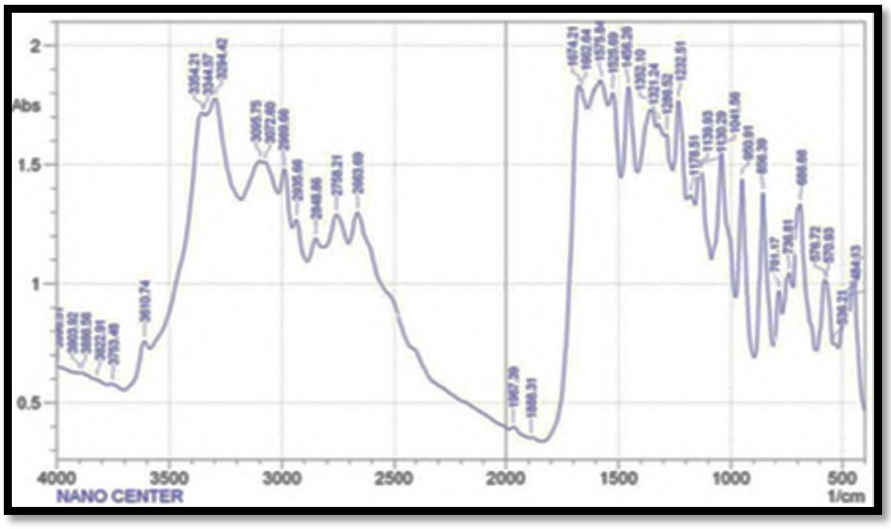
FTIR of spectrum of tetracycline antibiotic showed the absorption peaks for N-H stretching at 3344 cm^{-1} and aromatic C-H stretching at 3095.75 cm^{-1}. The vibrational peaks at 2989.66cm-1 and 1352.10 cm^{-1} were assigned to CH3 stretching .and1662.64 cm^{-1} refer to C=C stretching, respectively. Aromatic C-H bending was appeared at 1456.26 cm^{-1}.The aromatic in plane and out plane deformation peaks were appeared at 1286.52 cm^{-1} (Figure3A) [12]. The results of the spectral absorption of silver nanoparticles showed the disappearance of some bonds at certain ranges that were present in (Figure3 B), and the emergence of some bonds in other ranges and this is evidence of the formation of new compounds upon the synthesis of nanoparticles, and this is very clear at the range 3387.00cm^{-1} evidence for the presence of O-H and N-H bonds. The disappearance of the C = C and CH3 bonds is observed upon the formation of the nanoparticles, after they were present in the drug alone.



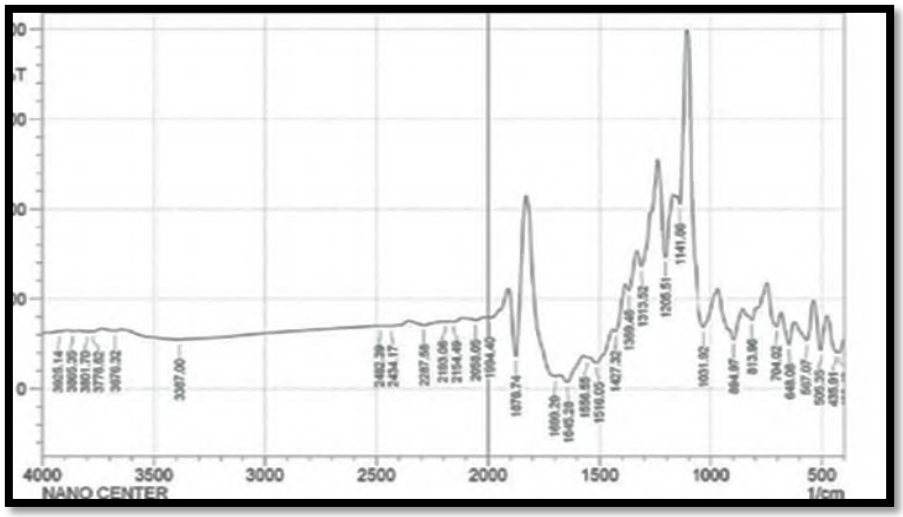


Figure 3. FTIR analysis of Silver Nanoparticles synthesized for tetracycline antibiotic (A), and (B) for to the silver nanoparticles

XRD pattern shows three strong peaks in the total spectrum of 2θvalues in 20–60, as obvious from the peaks at 2θstandards of, 35.48, 29.23, 28.03, respectively for silver. The particle size was 57.55, calculated by using Scherer equation where (Figure4).

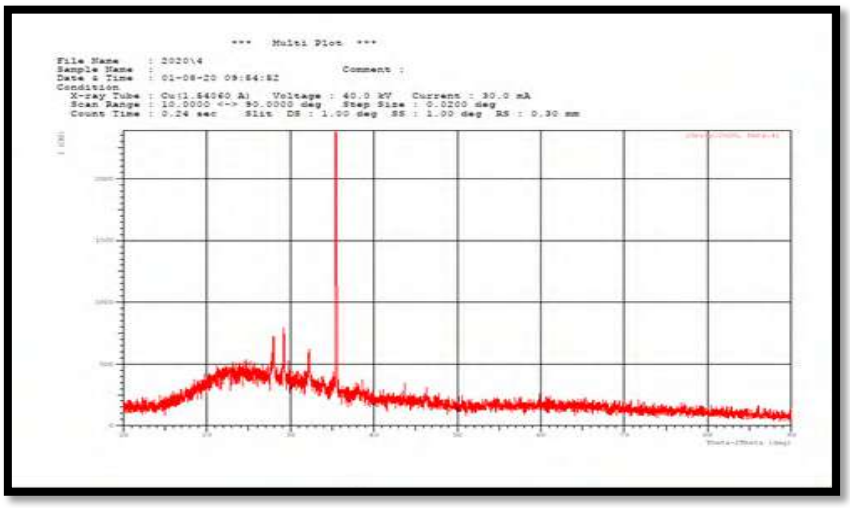

Figure 4. XRD of silver nanoparticles.

3.2. Antibiotics Susceptibility test

The result in (Table 1), shows of the antibiotics sensitivity test against the bacterial isolates, the highest recorded effect of the antibiotic Cip in the growth of isolate no. 8 with a diameter of the inhibition region reached (30 mm), followed by isolate no. 6 with a diameter of the inhibition region reached (22 mm), and the diameter of the inhibition region reached (20 mm) for each isolates (4,7,9), followed by the isolation no.3 with a diameter of the inhibition region reached (19 mm), and the isolate no. 5 with a diameter of the inhibition region reached (18 mm), while the antibiotic showed no significant effect in the growth of each of the isolates (1,2,10). As for the other isolates, the antibiotics varied in their effect. (Tob, C, AK, CN) antibiotics showed a different effect in the growth of bacterial isolates, whereas the antibiotics (Az, TMP, CTX E, DA, Tet). There was no significant effect.

Table1. Antibiotics activity test against bacterial isolates.

Isolates no. / ***Antibiotics***	Inhibition zone diameter in mm									
	1	2	3	4	5	6	7	8	9	10
Cip	6	6	19	20	18	22	20	30	20	6

CN	6	6	10	6	10	12	10	20	10	6

3.3. Antibacterial Activity of the AgNPs

The results showed that the biosynthesized AgNPs by antibiotic has a strong inhibitory effect on the growth of pathogenic bacteria. The effect of biosynthesized silver nanoparticles was the highest inhibition on the grow thin all isolates of *P. aeroginosa* at concentration of 100%, the highest of inhibition zone reached to of24.83 mm in isolate no. 10,followed by 24.33mm in isolate no 1 (Table2). The present investigation supports the use of biosynthesized AgNPs by Tet. Elicited a strong antibacterial activity. Thus, the biological approach could be an economical alternative to conventional chemical and physical assays of AgNP synthesis and would be suitable for the development of a biological process for commercial large-scale creation. AgNPs have wide application in different fields, such as antibacterial. Therefore, the improvement of their synthesis for nanoparticle production is the main objective of nanotechnology [13]. But the biosynthesized silver nanoparticles by Tet. Have a strong inhibitory effect because silver nanoparticles have a very effective against bacterial and fungal infections. These properties are due to silver nanoparticles having a large surface area of the volume ratio which increase their association with bacterial cell well causing changes in the membrane and thus cell death [14]. That can also release silver ions that interfere with thiol groups in biomass enzymes, which inhibit them. Silver ions also inhibit respiratory enzymes and during the inhibition process reactive oxygen species are generated. (ROS) attack the cell itself and thus die [15]. Silver nanoparticles have the ability to interfere with the sulfur and phosphorus bases of DNA and thus lead to the breakdown of DNA and cell death due to a disturbance in the DNA replication of bacteria and microbes [5]. This agreement with that AgNPs has wide application in different fields, such as antibacterial. Therefore, the improvement of their synthesis for nanoparticle production is the main objective of nanotechnology [16].

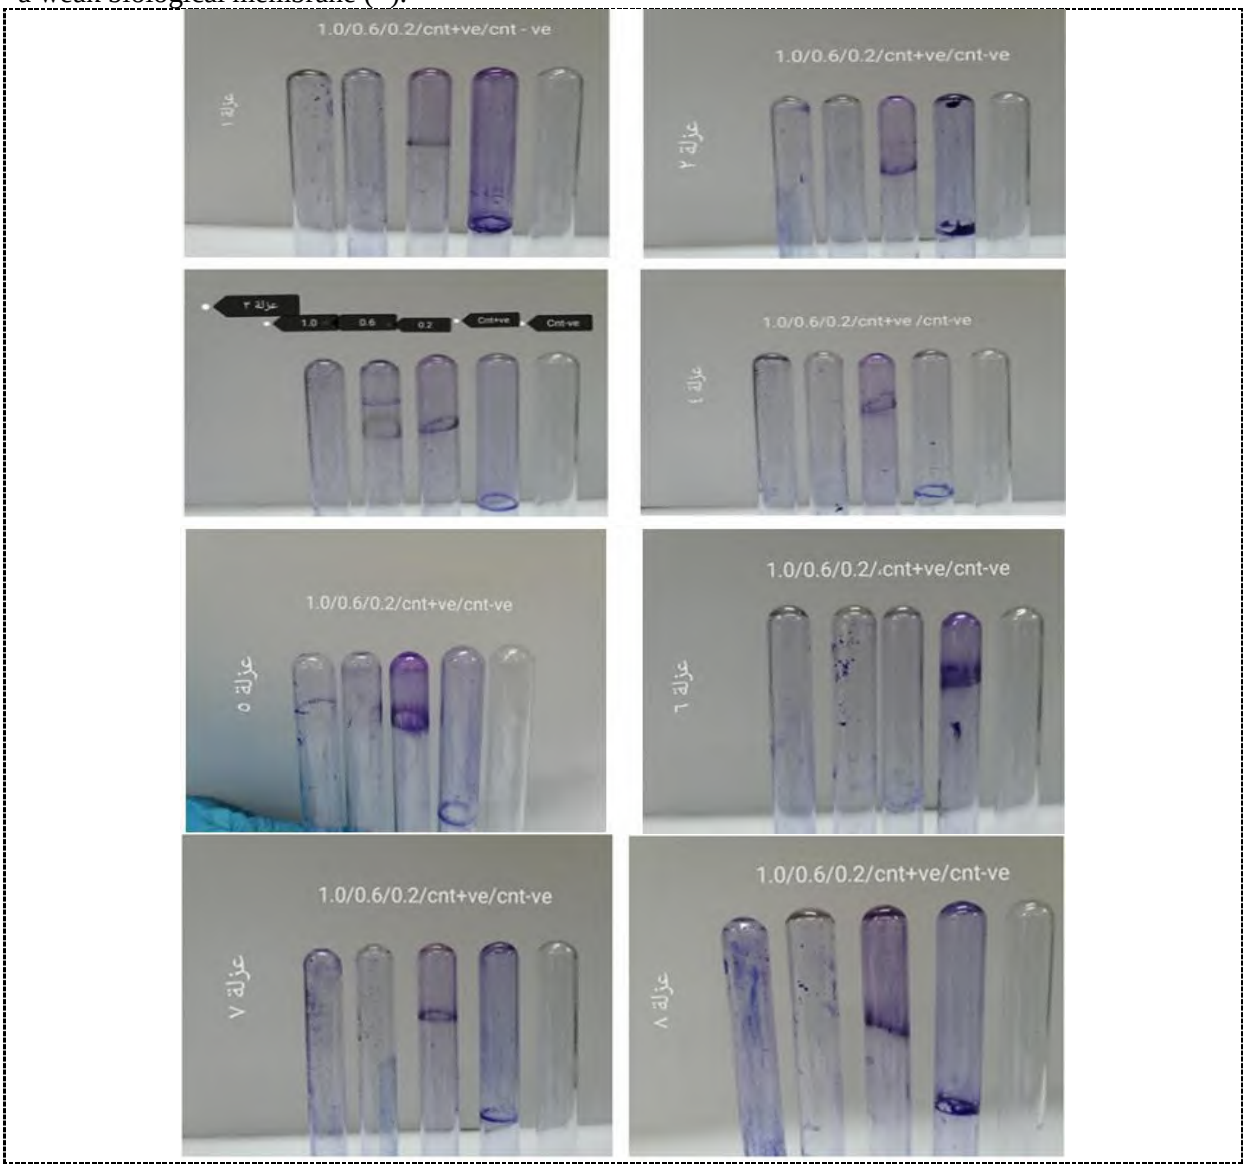
Table 2. Antibacterial activity of biosynthesis of AgNPs created by Tetracycline antibiotic.

Isolates no.	Inhibition zone of different Conc. of AgNPs		
	0.2	0.6	1
1	18.16 ±0.61	19.8 ±0.6	24.33 ± 0.4
2	14.5 ±0.5	16±1.0	0.7± 18.8
3	15 ±0.81	15.33 ±0.23	18.33±0.47
4	12.6±0.94	12.9 ± 0.69	16.5 ± 0.40
5	14±1.04	15.2±0.40	16 ± 0.28
6	11.83±0.62	14.5±0.40	14.16±0.23
7	13.16±1.02	14.83±0.23	15.0 ±0.7
8	14.5±0.40	16.33±0.47	17.16±0.23
9	15.5±0.40	15.33±0.47	20.83±0.62

10	15.5±0.40	16.0±0.40	24.83±0.23

3.4. Determination the anti-biofilm activity for AgNPs

We explored the possibility of using the Ag+-tetracycline combinatorial therapy to treat biofilms grown in vitro. *P.aeruginosa* biofilms grown overnight were treated with Ag^{+} and tetracycline combination in different concentration, control positive, and control negative. In the present study, biofilm forming potential of *P. aeruginosa* strains (Figure 5) was assessed by test tube method. Biofilms are microbial networks of living beings follower to one another and an objective surface. Biofilm arrangement shields microscopic organisms from hydrodynamic stream conditions, for instance in the against phagocytosis, urinary tract and host resistance instruments, just as anti-infection agents. Over half of every bacterial disease detailed includes biofilm arrangement [17] (. The results appear a difference in the amount of pigment in which the tubes were formed. The positive control tube produced a dense biological membrane (+++). The negative control tube did not have a dynamic membrane (-), the 80% (+), the tubes treated with nanoparticles with a concentration of 100%, formed a weak biological membrane (+).



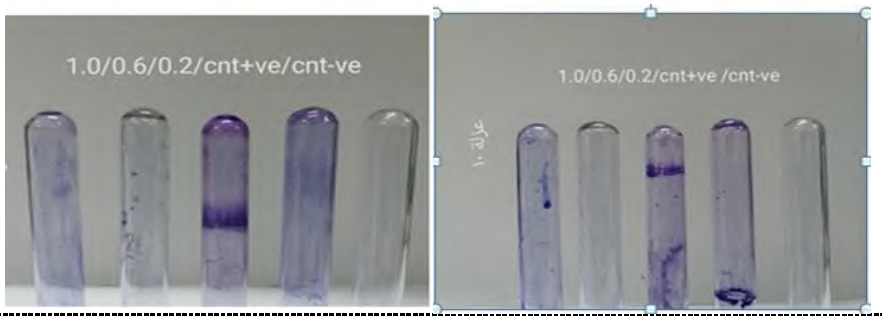


Figure 5. Anti-biofilm activity of AgNPs –tetracycline combination in different concentration.

3.5. Determination the toxicity of AgNPs on blood human

The effect of silver nanotubes in human blood on blood agar was studied at concentrations (20, 60, 100) mg / ml, through the results show there is no inhibition area (Figure 6). Which means that the silver nanoparticles are not able to cause blood cell degradation? The absorption of red blood cells and platelets of silver nanoparticles depends on the size and charge of those particles [18]. It is known that silver nanoparticles are toxic to erythrocytes at high concentrations only. Therefore, care should be taken when using silver nanoparticles at high concentrations [19].

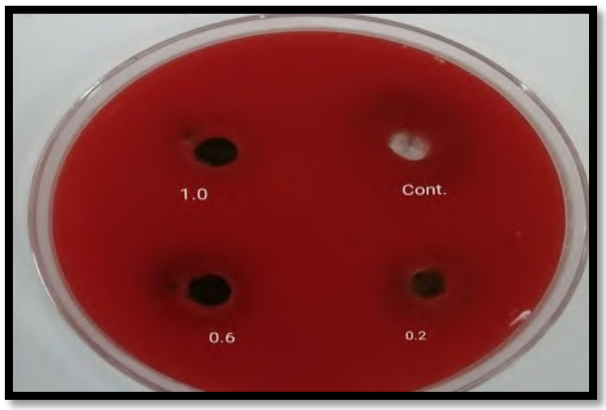

Figure 6. The effect of bio fabricated nanoparticles on human blood.

4. Conclusion

Tetr-AgNPs showed bactericidal effects against all tested isolates, and anti-biofilm activity. The exact mechanism of action of these nanoparticles is not precisely understood and it is the subject of future studies along with testing their potential *in vivo*.

Abstract. In the current study we reported for agronomic traits and yield of fifteen rice genotypes in season during 2018 and investigated at the field experimental of Al-Mashkab research station (AMRR)**,** Najaf- Iraq . The experiment was conducted following Randomized Complete Block Design (RCBD) with having three replications. These data related days to 50% flowering and heading , plant height (cm), leaf area index (LAI) , panicle length (cm), number of tiller per panicle, 1000 grain weight (g) and biological yield ,harvest index and grain yield (kg ha-1) were evaluated. The results indicated that the rice genotypes differed in plant growth characteristics and yield and yield components. 1000 grain weight and grain yields both were highest in Gohar genotype. Shiroudi genotype required shorter days to maturity and Anber33 longest days to maturity. Some of the rice genotypes particularly (Gohar) showed high promise with grain yield. Recommended, intensification of introducing more genotypes to select the best rice genotype for Iraqi condition could maximize the benefits of genotype cultivation. Agronomic data collected in the current study would be significant to realize the suitability of an individual rice genotypes of the farmer field, also were found more appropriate of the agro climatic status of Iraq.

Keywords. *Oryza sativa* L.**,** Field experiment, Yield traits.

1. Introduction

Rice (*Oryza sativa* L.) is the serves as the staple food for more than half of the globe's population, belongs to family Graminea (Poaceae) [1]. More than 90 percent of the world's rice is mature and used in Asia, where 60 percent of the earth's people and two thirds of world's needy live [2]. Different morphological characters play very significant role for most rice production with new plant type characteristics related with the plant yield [3]. Morphological property of rice also related with the yield possibility of the different rice genotypes for the selection of the best genotypes that further interested in rice breeding program [4]. Thousand rice genotypes have been developed by selection from the cultivated material many centuries ago, which are well proper to the local climate, grain yield regard a complex trait, quantitative in nature and a collective function of a number of constitutive traits. Thus, chosen for yield present may not be much pleasing unless other yield complex traits are possessed into discernment [5]. Grain yield of rice is a quantitative polygenic trait and much influenced by climate . Range and importance of

combination of yield with yield components should be believed, while determining the chosen criteria of germplasm on the basis of available genetic diversity [6]. The success of breeding program also consist onto the value of genetic variability current in the population and range to which the desired traits are heritable. Maintenance in the current search entitled of assessment of different rice (*Oryza sativa* L.) genotypes for agronomic traits and yield traits to fulfil the following objective and to detect appropriate high yielding genotype for Iraqi regions..

2. Materials and Methods

2.1. Plant materials

Current search included 15 genotypes of rice, were collected of the Al-Mushkab Rice Research Station (AMRR), Najaf, Iraq. The source of this genotypes as given in (Table 1).

2.2. Methods

This search was carried at the experimental field of Al-Mushkab research station during rice growing season from 2018. The trial was prepared in a Randomized Complete Block Design (RCBD) with three replications, the date of planting was 17/06/2018, and the seedlings were planted after 22 days old. Cultivated of the seedlings were at spacing of 20 x 20 (cm) line. Whole cultivation exercise were used approving to the proceedings recommended of rice crop in research . The recommended amount of chemical fertilizer (CF) were used : 280 kg ha-1 of urea and 120 kg ha-1 of NP as DAP fertilizer 18-46 [7].

2.3. Genetic parameters

The following genetic parameters were studied during trial which traits: days to 50% heading, days to heading , plant height (cm), Leaf area index, panicle length (cm), number of panicles/plant, number. of filled grains/panicle, sterility (%), 1000-grain weight (g), biological yield, harvest index and grain yield/plant (kg ha^{-1}).

2.4. Statistical analysis

The data famed on several genetic parameters were presented to the analysis of variance (ANOVA) method to detect the difference among all genotypes. In states where difference were begin important, averages were identified for differences employ least significant variance (LSD) test, ($P \leq 0.001\%$). The software (Genstat) was utilized for calculated both LSD and the ANOVA [8]. Variability for all the agronomic traits as shown in (Table 2).

3. Results and Discussion

3.1. Analysis of variance

The results presented in this manuscript were acquired of an trial carried during 2018 in AMRRS, the literal of this trial was to study the estimation of selected rice genotypes for agronomic traits and yield traits under ecological situation of Iraq. These results related for days to 50% flowering and heading , plant height, leaf area index , panicle length, number panicle /plant, sterility , 1000 grains weight and grain yield are given and discuss . These genotypes for the studied 12 quality as current in Table 2.

Table 2. Summary mean squares (M.S.) and analysis of variance of collective data for agronomic & yield traits in fifteen genotypes from rice grown in the field at Rice Research Station, Najaf-Iraq.

3.2. Plant growth characteristics

3.2.1. Days to panicle initiation

The vegetative growth parameters of the different genotypes and the data related days to panicle initiation included day number to 50% flowering and day number to physiological maturity are presented in (Table 3). Analysis of the data exhibited that all genotypes studied are significantly several with relate to days 50% flowering and heading. The number of days required to 50% flowering stage differed. significantly among the rice genotypes studied. The lowest number of days required to 50% flowering was observed in 86.33 days with Neda, while the maximum number of days required to 50% flowering was for Anber33 was 105.67 days, also days to physiological maturity

stage also varied significantly among the genotypes studied. Shiroudi, Dorfak and Neda took the lowest duration for maturity days, while Anber33 took the longest duration days.

Table 3. Day numbers to 50% flowering, and physiological maturity stages, plant high and leaf area index per plant.

Genotypes	Day number to 50% flowering	Day number to physiological maturity	Plant high (cm)	Leaf area index

The breeding efforts are underway to develop short plant cycle with high yield potential. The variation in the plant growth characteristics between rice genotypes are due to variability in their genotype composition. Similar result was reported by [9, 10].

3.2.2. Plant height (cm), leaf area index per plant

variation between genotype of rice were significant presented in (Table 3). There plant height , Leaf area index per plant was higher in Anber33 compared with the other genotypes which also differed among themselves in this parameter as shown in above. It is apparent from the table 3 that the plant height was lead significantly several between the genotypes. The result display that highest (142.00cm) plant height was showed in Amber Baghdad genotype directed significantly by Amber33, Amber Furat and Amber Menathera genotype having (139.33cm, 139.00 and 135.67) respectively in plant height on record, whereas least (100.33cm) plant height was showed in Neda genotype .Also differences in leaf area index among genotype of rice are given in Table 3. It was found significantly several between them, The result show that highest (22.43) leaf area index was found in Amber Baghdad genotype follow significantly by Amber33 genotype have (19.05) recorded. The difference among genotypes in plant height is may be referred to variation climatic requirements of among genotypes, also accomplished that there is different climatic requirements of each genotype. Yet , it has been notified that plant height was influenced by numerous factors such as plant density , fertilizer employments and plantation method, [11, 12]. The yield indices for number of tiller per panicle, filled grain number per panicle, sterility ratio (%), Table 4.

Table 4. Panicle length (cm), number tillers of panicle, number panicles, filled grain number/ panicle, sterility ratio(%).

Genotypes	Panicle Length (cm)	Number Tillers/panicle	Number of panicles	Filled Grain number/panicle	Sterility Ratio (%)
Amber 33	29.07	10.43	333.3	160.2	19.96
Amber al-Baraka	26.30	9.43	361.0	75.2	21.69
Amber Furat	29.43	10.00	246.0	165.2	15.51
Amber Baghdad	23.30	9.90	370.3	171.4	19.18
Amber Menathera	28.92	9.96	363.0	154.6	14.10
Sumar	23.10	10.47	372.3	133.4	18.88
Dijlah	31.80	15.77	268.7	275.2	9.24
Ghadeer	29.17	11.40	350.0	183.6	17.97
Brnamge -4	26.97	12.83	362.0	184.9	9.90
Dorfak	25.13	8.90	388.3	79.9	30.37
Gohar	27.83	11.37	396.0	174.6	14.61
Khazar	25.10	13.77	197.0	152.1	23.10
Shiroudi	28.60	9.20	329.3	107.5	19.86
Neda	23.87	9.20	412.7	188.6	8.75
Nemat	25.73	9.07	371.0	100.9	18.46
LSD 0.01	N.S.	1.31	46.15	33.94	9.02

3.2.3. The Panicle length (cm), number tiller /panicle, filled grain number and sterility ratio (%)

The results in this (table 4) indicated that the panicle length was count of the all rice genotype no differed significantly between them at (p = 0.01). The number tillers per panicle was significantly, the highest in Dijlah reached to 15.77, while the lowest in Dorfak reached to 8.90. Filled grain number per panicle was significantly highest in the Dijlah (275.2). while recorded the lowest in the Amber al-Baraka genotype (75.2). The results in this table showed that the significant variation in sterility ratio among genotypes , the Dorfak genotype showed significantly highest ratio, and the lowest in Neda genotype. Number of tillers / panicles and number of reproductive tiller / panicle supply valuable information for the rice breeders and these traits have direct influence on yield / plant [13].

3.3. Yield components

3.3.1. 1000 grain weight (g), biological yield, Harvest Index and grain yield (kg.ha^{-1})

This analysis of the data shows in table 5 that 1000 grain weight are significantly different among genotypes. The highest (29.33g) 1000 grain weight was on record in Amber al-Baraka genotype while recorded lowest weight reached to (19.67 g) in Sumer and Brnamge-4 genotypes. 1000 weight was influenced by agriculture methods . According to [12, 14, 15] notified that agriculture methods didn't have this influence on 1000-grain weight. The genotypes also showed significant differences in the biological yield was highest reached to 17860 kg.ha^{-1} Amber33 genotypes while other genotypes Sumer in biological yield. The harvest index showed significant differences among genotypes, the Sumar gave highest index reached to 49.29 % followed by Dijlah, Gohar and Shiroodi while the Anber33 gave the lowest index reached to 27.57%. Variations among genotype of rice in grain yield are given in Table 5. The apparent from that table was found significantly several among genotypes in grain yield (kg. ha^{-1}). There result shows Gohar genotype reached to maximum (7553.33) kg.ha^{-1} with producing the highest paddy yield followed by Ghadeer and Dijlah while other genotype Khazar had lowest paddy yield reached to 4116.67 kg. ha^{-1}. The variation in the yield and yield components between rice genotypes are due to variability in their genotype composition, and differed adapted to current environmental conditions. Similar result was reported by [16, 17, 18, 19, 20].

Table 5. 1000-grain weight (g), biological yield, harvest index (%) and grain yield (kg.ha^{-1}).

Genotypes	1000 Grain Weight (g)	Biological yield	Harvest Index (%)	Grain Yield (kg.ha^{-1})
Amber 33	21.00	17860	27.57	4930.00
Amber al-Baraka	29.33	14337	37.52	5383.33
Amber Furat	21.67	14097	43.51	6113.33

4. Conclusion

The Advancement grain yield for rice is the major objective of breeding program to improve genotypes . Grain yield regard is a complex trait, controlled through many genes and very influenced by climate . Supplement, grain yield as well attached to other traits like as growth duration, plant kind and yield compound [21]. Traits like as number of reproductive tillers and number of tiller / panicle are immediately responsible for the ultimate yield while trait like as plant height, leaf area index and numbers of total tillers are not very important as yield determinants. All these traits are possessed in to seeing when the rice genotypes are choose for the commercial cultivation. However, some of rice genotypes particularly (Gohar) showed high promise with grain yield and Integrating the promising genotype into the farming system could boost rice productivity and provide the basis for national food security as well as generate sustainable income. Further, intensification of introducing more genotypes to select the best rice genotype for Iraqi condition could maximize the benefits of genotype cultivation. In the current search gives average values for each genetic parameter and these data can be employed when different genotypes are screened for future breeding programs.

5. Acknowledgement

Abstract. It was clinically and surgically proven that sixty- four patients were infected with a hydatid cyst. Follow up was done in Al-Sadder Medical City, Najaf/Iraq during the period between January and December 2018.The incidence of the prevalence of hydatidosis female was higher than that of males. The youngest patients infected was five years, and oldest was over than 70 years old. The age group 21-30 years old had the highest percentage of hydatidosis infections. The rate of infection in females 64 (61%) more than males 25 (39%). Compared to males, there was a substantial rise ($P < 0.05$) in females. The percentage of liver hydatidosis relative to other organs was higher (67.18%). There were many patients with big cyst size (>5cm) than those with small cyst sizes (<5cm).

Keywords. Hydatid cyst, *Echinococcus granulosus*, Najaf, Iraq.

1. Introduction

Human *Echinococcus granulosus* infections occur as zoonoses mainly in sheep-raising areas where domestic dogs are used for herding [1].This parasite may potentially exist in all area as of the world, but the Mediterranean and Middle East countries, including Iran, parts of Africa. In addition to, Latin America and China are the primary sources of human infection [2]. Adults of *Echinococcus granulosus* and worm living in the intestine of the dog, eggs which are eaten by intermediate hosts (cows, dogs, rodents, deers and human) release the embryo into the duodenum. Then from there into the portal circulation; some of these embryos are stuck in the liver, the others migrate through the liver and spread, to other organs and turn into a hydatid cyst [3]. There are three layers of the liver hydatid cyst; the first is the pseudocyst (adventitia), composed of fibrous tissue, which product of the livers response to the parasite it is grey and closely attached to the liver, indistinguishable from it. The whitish and elastic ectocyst (laminated membrane) formed by the parasite itself contains a single layer of cells lining the cyst that internally secretes the hydatid fluid and externally the laminated membrane [4]. Hydatid fluid is colorless or yellowish and contains a complexity of protein, lipid, glucose, minerals and enzymes [5]. Hydatid cysts are usually well-tolerated in humans before their formation results in a strain on neighboring tissues or organs [6]. In humans, the hydatid cyst normally involves a single cyst in one organ, about 20-40% of patients have multiple cysts and usually, it involves multiple organs. The liver is the most prominent hydatid cyst site (50-70%) followed by the lungs (25%) but

less frequently in the spleen, kidney, heart, bones, and CNS around 25% of the patients had both lung and liver cysts [2].

In Iraq, hydatidosis is one of the main endemic diseases and has been recognized in both humans and animals [7, 8]. The occurrence of hydatid disease was 8 per 1000 patients admitted to the medical City Teaching Hospital in Baghdad for various cases [8]. It has been shown to be more frequent in young and middle age groups [9], 90 patients with hepatic hydatid cyst were confirmed to have been surgically treated in the first surgical unit at Baghdad Teaching Hospital since May 2009,among them,55 female (61.3%) and 35 male (38.7%). The purpose of the research was to determine the prevalence of hydatidosis parasite infection in the Province of Najaf /Iraq.

2. Materials and Methods

Sixty -four patients (25 males and 39 females), age range (5- > 70 years) with hydatidosis were confirmed surgically from Al-sadder Medical City in Najaf / Iraq, during the period between January and December 2018. The cysts were in the liver, lungs, omentum, and peritoneal cavity. Each individual patient filled a questionnaire sheet, shown in the appendix in this study.

3. Results and Discussion

3.1. Gender distribution

In this study, the total number of hydatidosis patients was 64 females (61%) and 25 males (39%), there was a significant increase ($P<0.5$) in females compared to males (Table1).

3.2. Age distribution

The age range of the patients included in this study is between 5-70 years old. In most cases, 18(28.12 %) both (male and female) were in the age group 21-30 years. There was a significant ($P < 0.05$) increase in age group 21-30 compared to other age groups.

3.3. Site of infection

Different organs were infected with hydatid disease, but the number of patients with liver hydatidosis had the highest percentage 43(67.18%) when compared to other sites of infection, followed by lung14 (21.89 %).The other organs were omentum and peritoneal cavity 1(1.56%) and 4(6.25 %) respectively. Compared to other tissues, there was a significant increase ($P<0.05$) in liver infection (Table 3).

3.4. Size and site of the cyst

Only 50 cysts were measured from the total of 64 patients.11 (45.83%) had cysts less than 5 cm in diameter, whereas the remaining13 (54.16%) cyst larger than 5cm in diameter, (Table 4). From a total of 20 liver cyst, 9(45%) has less than 5cm in diameter and 11(55%) has more than 5cm, whereas from a total of 9 lungs cyst, 3(33.33%) were less than 5cm in diameter, 6(54.54%) were more than 5 cm in size (Table 5).

Table 1. Gender distribution of 64 hydatidosis in Najaf/Iraq.

Female (%)	Male (%)	Ratio	Total
39(61 %)	25(39%)	1:1.56	64

Table 2. Distribution of 64 patients' according to age and sex with hydatidosis in Najaf/Iraq.

Ag(year)	Male No.%	Female No.%	Total
1-10	4 (50)	4(50)	8
11-20	5 (38.46)	8 (61.5)	13

<5	6 (66.66)	3 (33.33)	9 (45)
>5	5 (45.45)	6 (54.54)	11 (55)
Total	11	9	20

4. Discussion

The occurrence of hydatid disease in the Province of Najaf is dramatically increased in this study, this may be due to the lack of appropriate personal hygiene practices to prevent ingestion of the eggs. The practice of feeding dogs potentially contaminated viscera and poor educational program for inhabitant in the area (at risk) for the transmission of the parasite [10]. Insufficient meat inspection, poor dog management and inappropriate legislation [11] no active collaboration between veterinarians and public health workers [13] and the high number of stray dogs or sheep dogs [14]. All these rare responsible for transmission of disease. The gender distribution shows that the prevalence of hydatidosis was higher in females (78.3%) relative to males (21.7%). This has been also observed by [8, 15, 16], where they found that the infection rate was higher in females than in males. This may be due to the social life in our district where the females are confined to house working and this will make them more exposed to the source of infection especially in a rural area. The age range of the case

studies was from five years up to 70 years. The highest prevalence with regard to age distribution was between 21-30 years. It was shown that the age range between 11-40 years was the age of highest incidence [17, 18], while [8] and [16] found that the greatest prevalence of infection was between 20 and 30 years of age. The study showed that most of the patients had hydatidosis of the liver followed by the lungs peritoneal cavity and omentum. This finding is well documented by [2, 18]. This is probably because most frequently, the oncosphere enters the portal vein in the liver and then to the first capillary filter. If it passes the liver, it reaches the lung and other distant foci [17]. *Echinococcus granulosus* cysts never infiltrate or invade the tissue of the host and therefore remain as a foreign entity. In this study, a high percentage of patients had a large cyst size (more than 5cm in diameter). These wide cysts have been found more in the lung than in the liver. The cyst morphological features are primarily determined by the resistance of the organs concerned. In the soft parenchymatous tissues of the lungs, the cysts grow quickly and can become very large. In contrast, the firm liver texture exerts a definite restraining effect on the cysts growth, so it remains very limited in size [18].

Abstract. This research was carried out in quail in the laboratory of histopathology diseases during four months . The objectives of this study was to detecting the effects of the addition of the alcohol extract of ginger to ovary tissue of quail. The two groups of birds were in almost similar weights and were placed in cages. Each group consisted of 8 quails. The first group (control group) fed on regular feeding without adding alcoholic extract of ginger .The second group (treated group) fed on the same normal food after adding the alcohol extract of ginger at a concentration of 300 mg / kg. The results indicated that ginger have positive effects on folliculogenesis.

Keywords. Ginger, Ovary, Flliculogenesis.

1. Introduction

The cultivation of medicinal and aromatic plants and herbs has spread in most parts of the world and has been used for their medicinal effectiveness and quick cure for diseases which are used as whole herbs, powders, or aqueous or aquatic or oily extracts [1, 2, 3]. Zinger is a plant that is found in the warm regions. Rizhomes are used under the soil and contain volatile oils with pungent smells and pungent taste.. They contain the ginger root nodes, which are the most important parts of the plants [4, 5, 6].

2. Materials and Methods

2.1. Preparation of the alcoholic extract of ginger

The ginger bought from the local markets and cut the raw ginger into very small pieces, dissolve 30 g of raw material in alcohol to get the ginger extract in 70 ml of 96% of ethyl alcohol and place in a clean glass jar in a dark place for at least two weeks, the solution is then filtered with Whatman1 filter paper , the solution is then placed in the rotary evaporator, at a temperature of 45 ° C for the purpose of extracting .The solution was then placed in an electric oven at 45 ° C for 20 minutes to dispose of the remaining alcohol. After extracting the extract weighed by a sensitive balance and stored in clean containers [7].

2.2. Dissection of birds

A total of 16 quail birds at ages 15 weeks , divided into two groups of 8 birds each , the first as a control group and the second treated with alcoholic extracts of ginger concentration (300 mg / kg) (treated group). The birds were dissected and the ovary removed and fixed in 10% formaldehyde.

2.3. Histological preparation

The methods of [8, 9, 10] were employed in the histological technique of the present study, the chemical and stain used: 10% Formaldehyde, Ethyl alcohol; ascending concentrations of ethyl alcohol 30%, 50%, 70%, 80%, 90% and 95% using distilled water. Alcoholic eosin stain. Harris Hematoxylin stain. Paraffin wax methods used according to [9, 10] as the following; Fixation of the specimens in a 10% formalin solution for 24 hours. Washing with tap water, dehydration by ascending concentrations of ethyl alcohol, clearing with xylene, infiltration and embedding with paraffin wax, melting point 58° C, sectioning at 7 micrometer using Rotary Microtome. Staining with routine stain (H&E) then Dextrin Plasticizer Xylene (D.P.X) used as a mounting media. Finally, microscopic examination and photography; Histological slides were examined using a light microscope at various magnification powers suit for the current study requirements. The microscopic slides were selected with a digital microscope equipped with a digital camera and a standard 12-megapixel Canon camera was used.

3. Results and Discussion

This The results of the current study showed some effects of alcohol extract of ginger in the ovary tissue of the quail (Figure 1, 2, 3). Birds fed on a standard diet with an alcoholic extract of ginger at a concentration of 300 mg / kg, showed some changes represented by an increase in the size of the ovaries, improvement in the fertility rate, as well as an increase in sexual receptivity and early ovulation by the birds [2, 11].

Figure 1. Transverse section passes through the ovary of quails treated with alcoholic extracts of ginger concentration (300 mg /kg): shows more Immature follicles (IMF), numbers of primary follicles (PF), secondary follicles (SF), medulla (M), (H&E) (40X).

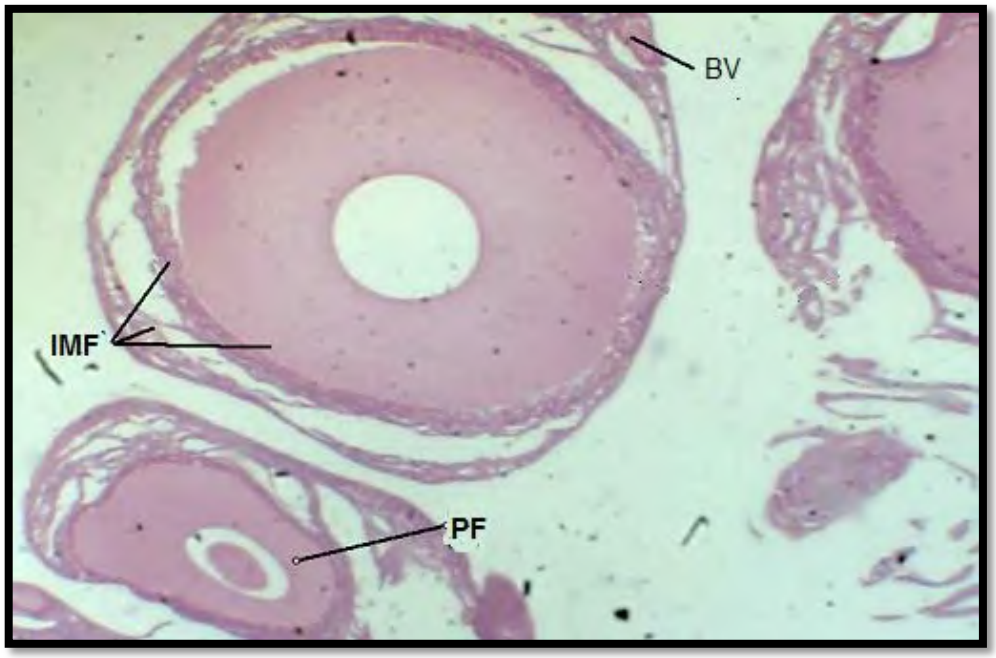

Figure 2. Transverse section passes through the ovary of quails treated with alcoholic extracts of ginger concentration (300 mg / kg): shows the Immature follicles (IMF), numbers of primary follicles (PF), Blood vessels (BV), (H&E) (40X).

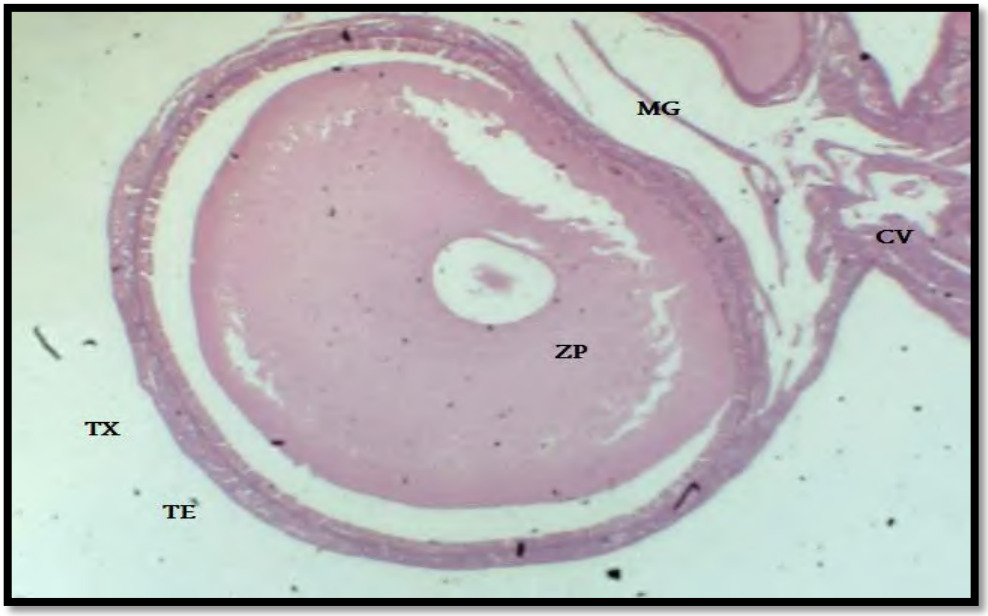

Figure 3. Transverse section passes through the ovary of quails treated with alcoholic extracts of ginger concentration (300 mg / kg): shows the Mature Follicles (MF), Blood vessels(BV), Theca Interna (TI), Theca Externa (TE), Oocyte (O), Zona Pellucida (ZP), (H&E) (40X).

The histological sections showed an increase in the growth and differentiation of ovarian follicles and the presence of several distinct follicles early in growth balanced with the control treatment and this is due to the fact that the alcoholic extract of ginger contains physiologically active substances ,these substances are similar to steroid hormones by their association with hormone receptors and estrogen receptors and with proteins that transport those hormones, and that substances also have an effect on

the metabolism of estrogen hormones and support its action which has the main role in accelerating the growth and differentiation of the follicles in early stages because ginger contains volatile oils [12]. and the proliferation of tissue the ovarian stroma has a greater degree of control, and increased ovarian cellularity and the presence and congestion of the blood vessels in the ovarian wall observed, this proportion fed by alcoholic extract led to early differentiation in the primary and secondary follicles, during folliculogenesis, also [13] stated that the ginger indicate positive effects on folliculogenesis. Ginger play an important role in goodness fertilization as it contain high level of vitamin C and A, minerals and some amino acids which are related with the activation of the endocrine gland and growth increasing [14], this foundation probably explain the activity of the ovary and increasing the number of primary and secondary follicles in quail birds treated with ginger alcoholic extract in this study. The ginger rhizomes essential oil enhances bird reproductive performances , proteins and reproductive hormone levels and hatchability traits in treated female quails [12,15].

Abstract. This study amid to evaluate the role of plant's root (*Astragalus spinosus*), in biochemical parameters and histological sections effect in reduce the oxidative stress induced by hydrogen peroxide in rabbits *Oryctalagus cuniculus*, 7-9 months age and (1300-1500 g) of weight. Animals were distributed to three groups, every group were included five rabbits; group (1) control received water and diet. Group (2): animals treated with H2O2 (0.05) and drinking water. Group (3): animals treated with H2O2 and alcoholic extract of the plant root (5mg /kg body weight) for period one month. Study showed high significant increasing in Creatinine and ALP, LDH concentrations of animals treated with H2O2 alone (1.74±0.40) (9.900±1.058), (260.40±26.66) respectively, in compared with control (0.838±0.08) (8.420±1.132), (154.0±49.79) respectively while the concentration of Creatinine, ALP and LDH had been decreased with high significant (P≤ 0.05) in group treated with H2O2 and extract of the plant roots (0.79±0.09), (9.220±0.801) and (166.2±36.08) respectively in compared with H_2O_2 group. And the result of histological sections of liver, kidneys and heart, which showed an improvement of cells in group treated with the extract of the plant which had been induced by oxidative stress.

Keywords. Oxidative, Antioxidants, *Astragalus*, liver.

1. Introduction

Oxidative stress represents a situation in which the production of active oxygen varieties (ROS) increases in number that exceeds the ability of antioxidants to get rid of them, which results in an imbalance in the delicate balance between the production of free radicals and the body's ability to remove them or repair their destructive effects, resulting in damage to the various tissues in the body due to fat oxidation by the action of free radicals [1] of the active oxygen varieties is the negative superoxide root (O2-), which is one of the most toxic free radicals, hydrogen peroxide (H2O2) and hydroxyl radical (OH-) [2]. As for antioxidants, they are substances that prevent or slow down the generation of free radicals and oxidative processes in the body. Therefore, they form a line of defense against free radical activity and reactions [3]. Antioxidants are a substances that work to prevent or slow down the generation of free radicals and oxidative processes in the body. Therefore, they

constitute a line of defense against the destructive activity of free radicals in chain reactions [4] primary role of antioxidants of various types is work on giving an electron to the free root to prevent its reactions and stop its destructive activity, or it works on materials that scavenge free radicals, such as the superoxide dismutase (SOD) enzyme that captures the negative superoxide root, or it acts as metal chelating agents [5]. Genus *Astragalus*, consisting of about 3000 species, is a valuable reference of herbal drugs. The review article comprises scientific data concerning morphological, distribution and phytochemical characters of the genus. Polysaccharides, saponins, and flavonoids are considered main active principles. *Astragalus*. have long been used as medicinal plants in folk medicine as cardiovascular, antihypertensive, diuretic, choleretic, as well as antimicrobial and antiviral agents, this plants of the exhibit a broad spectrum of pharmacological effects, among which major include anti-inflammatory diuretic, antibactericidal, and hypotensive [6]. Plants of the genus *Astragalus* have been used in traditional medicine in many countries for centuries, which the genus *Astragalus* being the largest in the family Fabaceae. It is known to contain various metabolites such as saponins flavonoids and polysaccharides. Flavonoids, which possess a wide range of pharmacological activities [7, 8]. The present study aimed to test the effectiveness of the alcoholic extract of *Astragalus* plant's root through its protective and antioxidant role on experimental animals by measuring creatinine, basal phosphatase, lactic dehydrogenase, and a histological study of the kidneys, liver and heart to clarify the effect of oxidative stress induced by hydrogen peroxide and the protective role of the plant's root of *Astragalus spinosus*.

2. Materials and Methods

2.1. Experience Design

The animals were divided randomly into three groups (5 animals in each group), and the experiment was designed as follows; first group G1: the control group was given only water and food. Second group G2: were given water containing hydrogen peroxide (0.05) and food only. Third group G3: were dosed orally with alcoholic extract at a concentration of 5 mg /kg body weight. The amount was given according to the weight of the animal, and hydrogen peroxide was added to the drinking water at a concentration of (0.05) in addition to the food. After the ending of one-month dosing period, the animals were forbidden from food for 24 hours, after which the blood was collected by cutting the jugular vein and placing the blood in test tubes. The blood was separated by using of a centrifuge at a speed of 3000 rpm for 15 minutes to obtain serum, and then prepared blood serum was withdrawn by micropipette and placed in tubes and kept at -20 °C.

2.2. Collection and preparation of the plant root

The roots of the *Astragalus* plant were obtained from the desert areas in the west of the Tigris River between Samarra and Tikrit.

2.3. Preparation of extract

The alcoholic extract was prepared from the plant roots according to the method mentioned by [9]. The amount of extract obtained from every 100 g of the plant's root was 2 g.

2.4. The active dose of the plant

Twenty one animals were used to know The effective dose of plant, animals were randomly divided into 7 groups (3 animals for each group), and in the table below was determined the effective dose of the alcoholic extract .The experiment was carried out during three days, and the animals were dosed orally at a single dose every 24 hours, and after 3 days, blood samples were collected through the

ear's vein, and the concentrations of sugar and cholesterol were measured, and the effective alcohol dose was concentration (5 mg / kg body weight).

2.5. Determination of Lactate Dehydrogenase (LDH) and Alkaline Phosphatase (ALP) Enzymes

The activities of LDH were determined spectrophotometncally by measuring the oxidation rate at 340 nm [10]. The activity of ALP enzyme was determined according to the colour method, as the amount of liberated phenol is measured after its reaction with potassium free cyanide and 4-aminoantipyrine to produce a coloured complex with the highest absorption at the wavelength 510 nm.

2.6. Determination of Serum Creatinine

The concentration of creatinine was estimated by using of an analysis kit (BIOLABO SA, France) kit [11]. The microscopial and histological slides were prepared according to [12] for histological study.

2.7. Statistical analysis

For a statistical data, Statistical Package Social Science (spss) version 22 was used, and Student's t-test, the level of significance was $P \leq 0.05$.

3. Results

The results finding (Table 1) show significant increasing ($P \leq 0.05$) in the level of Lactate dehydrogenase (LDH), ALT, and Creatinine in group G2 which were treated with H2O2 when compared with control group G1, while group G3 which treated with plant's root alcoholic extract showing significantly decreasing in the level of LDH, ALT and Creatinine when compared with group G2 and showed no significant differences when compared with control group G1.

Table 1. The parameters of study groups.

Groups	Parameters		
	LDH	ALP	Creatinine
G1 control	154.0±49.79	8.420±1.132	0.838±0.08
G2	260.40±26.66	9.900±1.058	1.74±0.40
G3	166.2±36.08	9.220±0.801	0.79±0.09

N+5, P $P \leq 0.05$, ± = Standard error

Results in the present study showed increasing in the level of LDH significantly ($p \leq 0.05$) in group G2 giving H_2O_2 ,while group G3 showed no significant differences when compared with control group G1 (Figure 1).

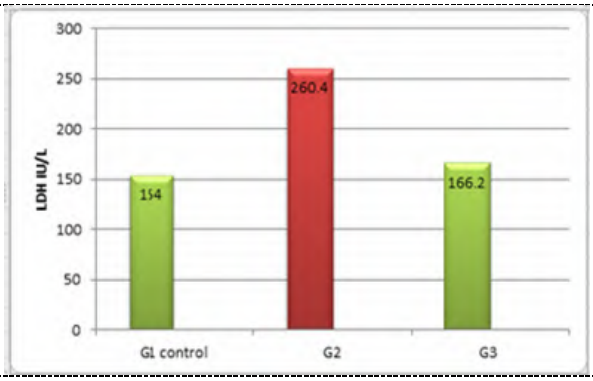

Figure 1. LDH level for study groups.

Results preserved increasing in the level of ALT significantly ($p \leq 0.05$) in group (G2) were treated with H_2O_2 ,while group G3 showed no significant differences when compared with group control (Figure 2).

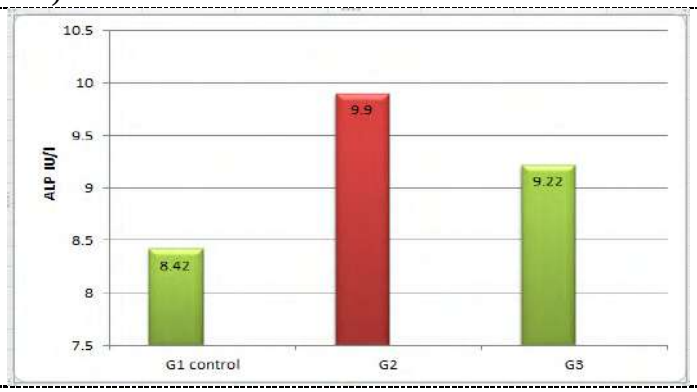

Figure 2. ALP level for Study groups.

(Figure 3) Results showed increasing in the level of Creatinine level significantly ($p \leq 0.05$) in group (G2) were treated with H_2O_2, while group G3 showed no significant differences when compared with group control G1.

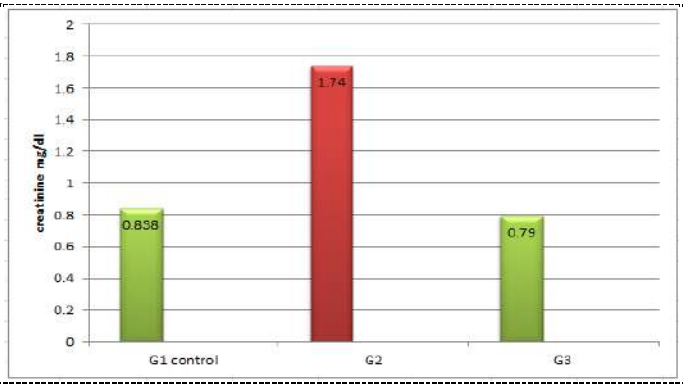

Figure 3. Creatinine level for study groups.

Histological study results in (Figures 4, 5, 6) showed the changes in the heart tissues of study animals in the group G1,G2 and the group G3.Fgures (7, 8, 9) that show the changes in liver tissues. Figures (10, 11, 12) show the changes in kidney tissues.

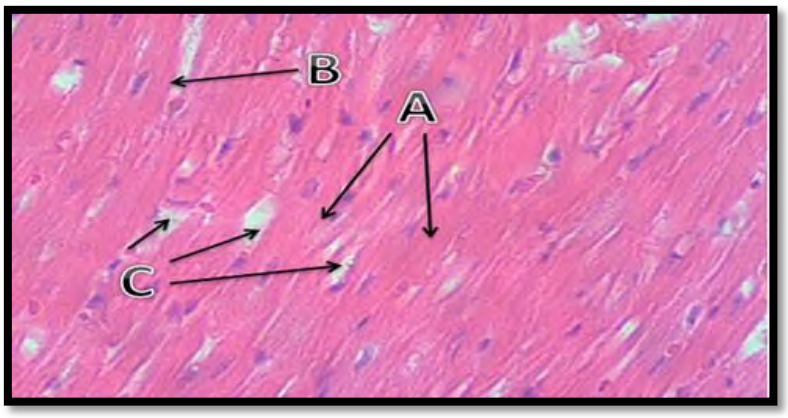

Figure 4. Histological section in the heart of control group G1. Show:A- cardiac of muscle fibres

(CMF), B- nuclei (N), C- Endomysium.

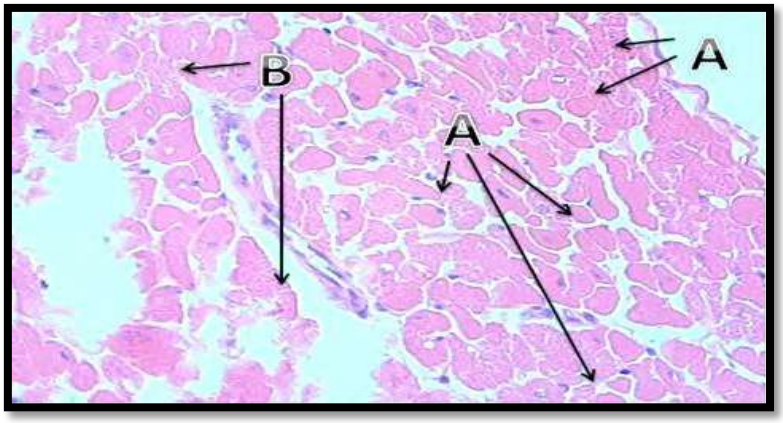

Figure 5. Cross section of heart in animal treated with hydrogen peroxide (0.05) G2 show :
A- heart, atrophy of cardiac muscle, B- Degeneration of sarcoplasm with disappearance of its nuclei (H&E stain 400x)

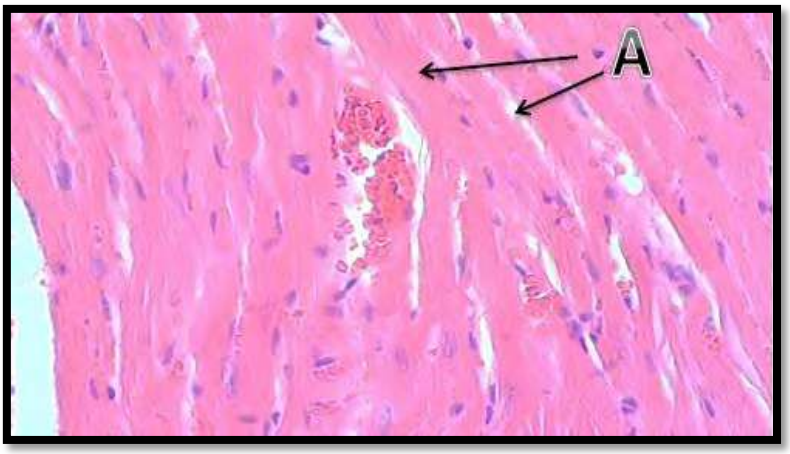

Figure 6. Longitudinal section of heart in animal treated with hydrogen peroxide (0.05) using dose of (5mg/k body weight) of the plant's root extract, group G3 show: A- cardiac muscle fibres with its normal archete chare (sarcoplasm and nuclei).

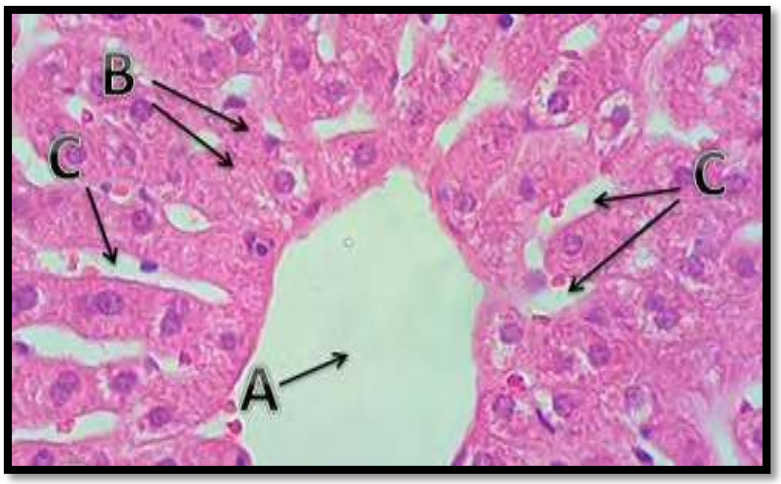

Figure 7. Histological section of liver in control group G1 show: A- central vein (CV) B- Columns of hepatic cells with its spherical nuclei (HC), C- Blood sinusoids with Kuepfer cells (BS) (H&E stain

400X).

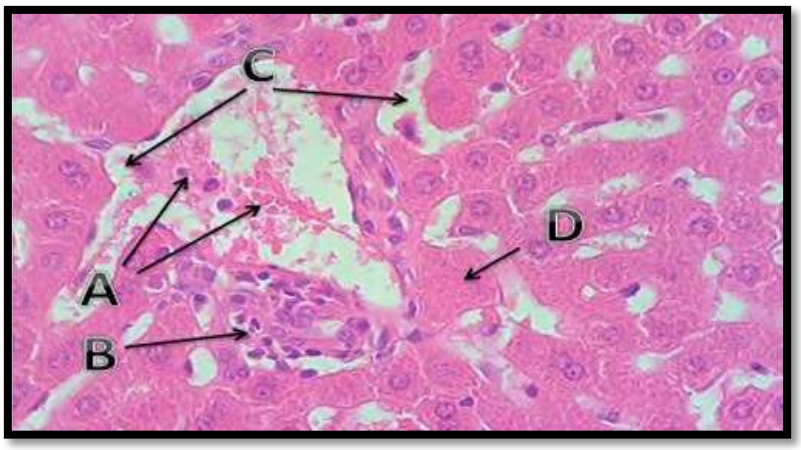

Figure 8. Cross section of liver in animal treated with hydrogen peroxide (0.05) G2 show: A- blood clot in the in the central vein, B- Lymphocytic nodular aggregation , C- Hypertrophy of Kuepfer cells in sinusoid, D- Disappearance of nuclei Frome certain number of hepatic cells (H&E stain 400X).

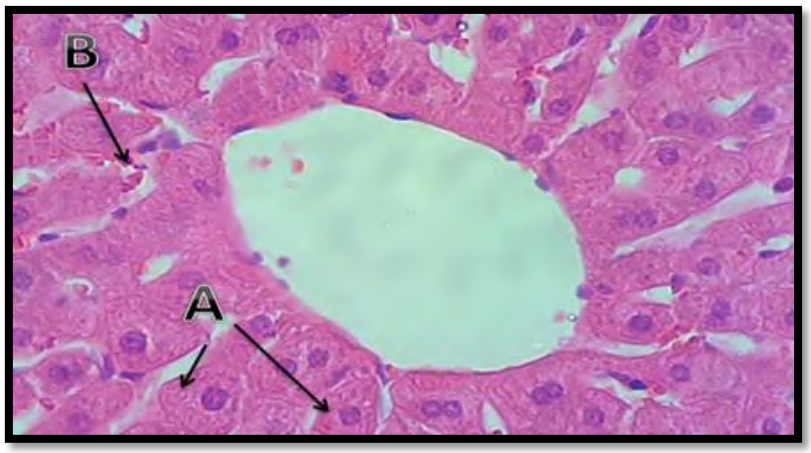

Figure 9. Histological section of liver in animal treated with hydrogen peroxide (0.05) and dose of (5mg/k body weight) of the alcoholic extract of the plant's root group G3 show: A- normal Architecture of hepatic cells with its spherical nuclei, B- Kuepfer cell in the blood sinusoid (H&E stain 400X).

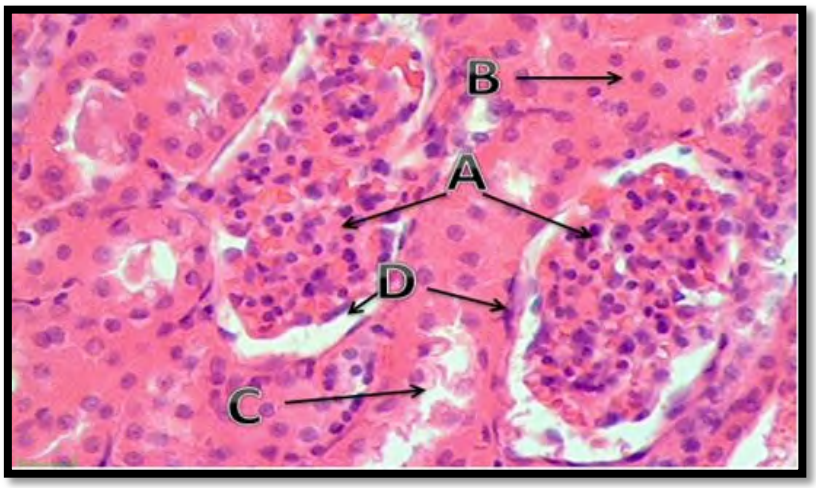

Figure 10. Figure (10) Histological section of kidney in control group G1 show: A- renal cortex ;

glomerulus G, B- proximal convoluted tubule PCT, C- Distal convoluted tubule DCT D- Bowman's capsule BC (H&E stain 400X).

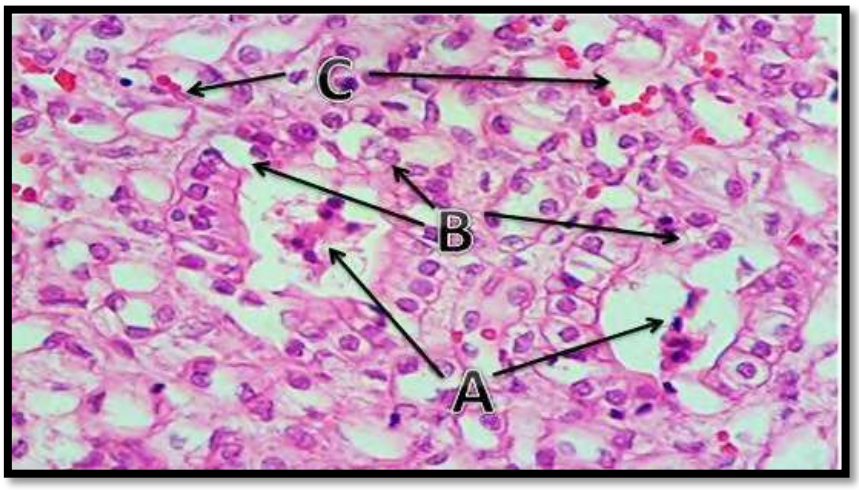

Figure 11. Histological section of kidney in animal treated with hydrogen peroxide (0.05) group G2 showing: Renal medulla, epithelia, desquamation inside the lumen of collecting ducts (A), degeneration of epithelial cells of collecting ducts (B) RBC present in between Henle loop (C) (H&E stain 400X).

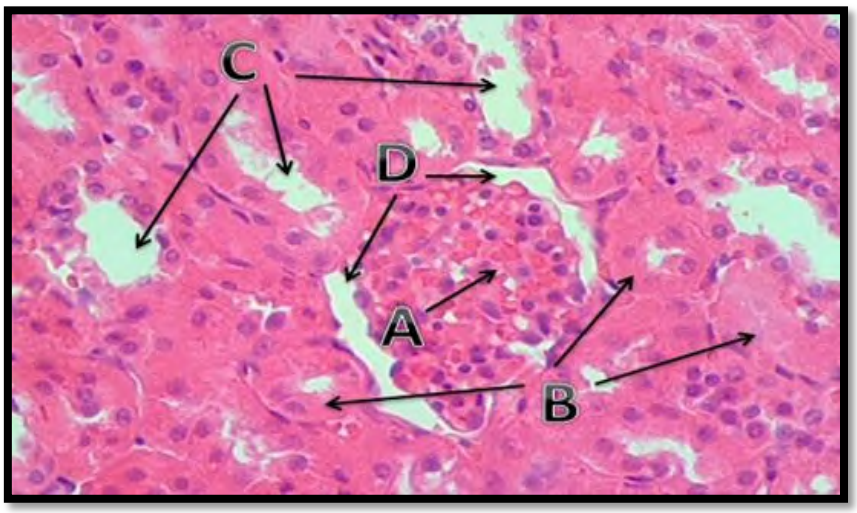

Figure 12. Histological section of kidney in animal treated with hydrogen peroxide (0.05) and dose of (5 mg/k body weight) of alcoholic extract of the plant root G3 show: A- renal cortex, hyperplasia of glomerular epithelia cell, B- Proximal convoluted tubule, C- distal convoluted tubule, D- Capsule space.

4. Discussion

The results showed a significant increase p ($P \leq 0.05$) in the LDH enzyme concentration in the blood serum of animals exposed to oxidative stress mediated by hydrogen peroxide, the results were (260.40±26.66) in compared with the control group (154.0±49.79) and the reason is due to the increase in oxidative stress resulting from the free radicals generated by H_2O_2, which damage the cells and tissues of the body, so the increase in the activity of this enzyme in the blood serum is an indication of the breakdown of the cells of the body organs, Histological section in the heart of treated with hydrogen peroxide (0.05) showing atrophy of cardiac muscle and degeneration of sarcoplasm with

disappearance of its nuclei compared with control group which show histological section in the heart of myocardium; degeneration cardiac muscle fibers. The oval nuclei in the sarcoplasm, endomysium. The cause of the high LDH is attributed to the harmful physiological effects of free radicals and stress on the heart muscle cells, which leads to its destruction and damage, and consequently damage to the cell membranes and the release of enzymes into the circulation [13]. And when the plant extract was treated, it led to a significant decrease in the total LDH level in the blood serum (166.2±36.08) compared to the H_2O_2 group (260.40±26.66). Also, a clear improvement was observed showing cardiac muscle fibers with its normal architected (sarcoplasm and nuclei) RBC outside the blood vessel. The results are in agreement with [14] where isoflavonoids were isolated from the *Astragalus* roots where the protective roles and antioxidant effects and increased the antioxidant enzymes, prevented the release of LDH from cells and stabilized the cell membrane structure. The results of ALP were (9.900±1. IU/l) in the group treated with hydrogen peroxide compared with control group (8.420±1.132 IU/l). It is evident from above results that the level of ALP increased in the serum of the group treated with hydrogen peroxide in compared with control, and this is an indication of the occurrence of liver damage as a result of the effect of free radicals, while the groups treated with plant extract show a significant decrease on probability ($P \leq 0.05$) of the level of the enzyme ALP (9.220 ± 0.801 IU / l) in compared to the group treated with hydrogen peroxide (9.900±1 IU / l). This indicates an improvement in liver cells and as shown in the Figure (7) Histological section in the liver of animal treated with hydrogen peroxide (0.5%) showing: blood clot with WBC in the Blood clot in CV with WBC Lymphocytic nodular aggregation, Hypertrophy of Kupffer cells in sinusoid, Disappearance of nuclei from certain number of hepatic cell compared with control Figure (8) showing: hepatic lobule central vein, Columns of hepatic cells with its spherical nuclei, Blood sinusoids with Kuepfer cells, Draining of blood from blood sinusoid to CV this result is agreed with [14, 15] indicated oxidative tissue damage and acute infections caused by the drug by increasing lipid peroxidation, and this leads to an increase in the permeability of the cell membrane and thus increases the movement of enzymes and their infiltration into the blood, which leads to an increase and decrease in the level of enzymes in the blood serum. In the liver, the study [16] indicated that the presence of such toxic substances leads to self-degradation of hepatocytes as a result of the increased activity of the lysosomes, which leads to the death of hepatocytes that cause an increase in the level of the three enzymes in the blood serum, and here the protective role of *Astragalus* appears spinous. Because it contains antioxidants, flavonoids can neutralize different types of oxidizing species including superoxide anion($O^{\bullet}{}_2^-$), hydroxyl radical (OH), or peroxyl radicals ($ROO.^-$) [17] Figure (9) showing section of liver of animal treated with hydrogen peroxide (0.5%) and treated with daily dose of (5mg/k body weight) of the extract of the plant sho normal Architecture of hepatic cell with its spherical nuclei , Kupffer cell in the blood sinusoid with WBC, total flavonoids, obtained from Radix Astragali showed significant antioxidant activity and inhibited the lipid peroxidation caused by $O\bullet{}_2^-$, H_2O_2[18, 19] and total flavonoids in *Astragalus* showed Protective effect from against DNA strand breaks, caused by (OH.) [20]. Flavanonols from *Astragalus sinicus* showed potent antioxidant activity determined by 2,2-diphenyl-1-picrylhydrazyl (DPPH) assay [21]. Flavonoid fraction obtained from the seeds of *Astragalus complanatus* showed significant radioprotective effect against injury induced by γ-irradiation in mice, flavonoids increased fraction on survival rate of the experimental animals and made the damaged organs recover normal appearance because of enhancing immunity [8]. Observed effect of flavonoid of *Astragalus* m against reperfusion hepatic injury in hemorrhagic shock [22]. Figure 3 shows a high increase ($P<0.05$) of creatinine (SCR) of animals exposed to oxidative stress with hydrogen peroxide, where the results were (1.74±0.4 mg / dL) compared to the control group (0.838±0.08mg / dL) and the cause may be due to increased oxidative stress, which leads to impaired renal function, leading to an increase in creatinine in the blood and less excretion in the urine levels of serum creatinine (SCR) manifest the ability of renal tissue to remove the creatinine from blood and gather it in the urine. However, kidney dysfunction could lead to the levels of SCR increased through weaken the ability to filter creatinine. In addition, the injured kidneys could cause the levels of serum urea nitrogen (SUN) elevated on account of the kidney tissue have no ability to remove the urea from

the blood [23, 24], demonstrated that astragalosides, especially astragalo- side V isolated from the root of *Astragalus* radix, inhibited the formation of advanced glycation end products in vitro. In rats induced diabetes, and treatment with *Astragalus membranaceus* improved renal function [25]. And when treating animals exposed to oxidative stress mediated by H_2O_2 with *Astragalus* extract, there was a significantly decrease in the SCR, as the results in figure 1 were (0.784 ± 0.050 mg / dL) compared to the control exposed to oxidative stress with H_2O_2 only (1.526 ± 0.260 mg / dL). While the groups treated with plant extract decreased significant on p ($P \leq 0.05$) of the activity enzyme ALP (0.79±0.09IU/l) compared to the group treated with hydrogen peroxide (1.74±0.40IU/l). Figure (10) Histological section in the kidney of animal treated with hydrogen peroxide (0.05) showing: renal medulla ; epithelia; desqumation inside the lumen of collecting ducts, degeneration of epithelial cells of collecting ducts , RBC present in between Henle loop , compred with control Figure (11) showing: renal cortex; glomerulus, proximal tubule convoluted, distal convoluted This indicates an improvement in liver cells and as shown in Figure (12), animal treated with hydrogen peroxide (0.05) and treated with daily oral dose (5 mg/kbody weight) of the extract of the plant show : renal cortex ; hyperplasia of glomerular epithelia cell , proximal convoluted tubule, distal c.t , Capsule space. The reason is due to *Astragalus* contains the high capacity of antioxidants that inhibits oxidative processes in the biological system, *Astragalus membranaceus* has a complex chemicals. Its major active constituents include *Astragalus* flavonoids, saponins, and polysaccharides [26]. Result is in accordance with [27] with cisplatin induced in mice kidney. The flavonoids made the damaged organ recover normal appearance [20].

5. Conclusion

From our results we can conclude that alcoholic extract *of Astragalus spinosus* root have a protective role against the oxidative stress effects on biochemical parameters include LDH, ALT, and Creatinine, and have a histological protective from harm effect of hydrogen peroxide and free radicals.

Abstract. The goal of the current study was to assess the effects of povidone iodine 10% in comparison with 5% of povidone iodine on full-thickness cutaneous wounds healing in rabbits. This was on twenty-four healthy male rabbits, weighing from (1.5–1.8 kg). Under the effect of intramuscular administration of a mixture of xylazine hydrochloride 5mg / kg, ketamine hydrochloride 35mg / kg and diazepam 1 mg / kg. On each animal, in the dorsal back area, one square (2 x 2) cm full-thickness skin wounds were made. The animals were divided into two groups, group (A) as the treatment group was treated with 10% povidone iodine daily for 1 time for day 7 post operation. While, at the same time in group (B), the rabbits were treated with 5% povidone iodine. For clinical evaluation, each group was divided into four subgroups (two wounds/subgroup) on 3rd, 5th, 7th, 9th, 14th and 21th days post-wound induction and treatment. Clinically, the result showed that 10 % of iodine was more effective than 5 % of iodine, and the wound healing rate in group (A) was faster than group (B). This was followed by statistical analysis results showing the wound healing process ((20%, 40%), (70%, 85%) contraction) and ((10%, 20%), (50%, 70%) re-epithelization).Respectively, there were significantly more ($P \leq 0.05$) than the iodine 5% during the study period. Conclusion; Povidone-iodine solution 10% is more efficient than iodine 5% so that lead to acceleration and enhancement of full-thickness cutaneous wounds healing.

Keywords. Iodine, Wounds healing, Rabbits.

1. Introduction

The wound healing in skin is an all-around coordinated endurance instrument that can be impacted by different conditions prompting a superior or worse course of healing [1]. As of late, there is an equally mounting proof that mental impacts (for example stress, social help, positive effect, and environmental enhancement) may also connect with wound healing [2]. In any case, infection and sepsis can be caused by spoiling with a pathogenic microbial agent, which disturbs the repair continuum [3, 4]. Infection evolution is driven by a dynamic relationship between the host and microorganisms, and further affected naturally and medicinal interventions [5]. There are a few germ-free skin-purging specialists accessible to the specialist to use for patients experiencing perfect, clean, clean-contaminated, contaminated, and dirty surgery. The conventional sterile purifying operator of decision is povidone iodine (PI). It is modest, viable, and the most regularly utilized operator of decision

around the world [6]. Disinfectants are valuable choices for managing the bioburden in wounds with a wider range of antimicrobial adequacy, lower risk of anti-microbial obstruction progression, and minimal blowback to tissues. For that reason, the purpose of this study include assess and compare the effects of iodine in both concentrations, on full-thickness cutaneous wounds healing.

2. Materials and Methods

2.1. Experimental animals

Twenty four adult male rabbits (1.5- 1.8 kg) divided into 2 groups (12 rabbits each) were used in this study. The rabbits were kept in the animal house of the College of Veterinary Medicine, University of Karbala, maintained in individual cages along the period of the experiment under normal environment including climate, management and feeding.

2.2.Surgical operation

In the dorsal back area of each animal, a square (2 × 2) cm full-thickness skin wound was induced. The animals were divided into two groups, group (A) as the treatment group was treated with 10% povidone iodine daily for once a day for day 7 post induction. While, in group (B), the rabbits were treated with 5% povidone iodine at the same style and for the same period.

2.3. Clinical evaluations

A total clinical assessment was performed on all animals at regular intervals along the time of the examination. Advanced photos were taken for all injuries after the zone had been shaved to envision the injury edge. The scab of each wound was deliberately evacuated for better imagination of the epithelization and granulation tissue zone by utilizing saline.

2.4. Statistical Analysis

The Statistical Analysis System [7] was used. Least Significant Difference –LSD test was used to determine the significance between groups.

3. Results and Discussion

3.1. Clinical Evaluation

In fact, the clinical statement of wounds seemed to indicate that through the current analysis, both treated wounds were rapidly reduced in size. The change began on day 3 in both treatment groups, which became evident on day 9, especially in wounds treated with10 % povidone iodine. This variation continued to occur until this research was completed. Clear differences emerged between the two treatment groups in total wound healing, mostly at the end of the study (Figure 1). During the 21 days of the study, the following-up of wound healing process appeared that the percentages of effect of concentration and day in length and width of wound contraction at 3rd, 5^{th} and 7th without significant difference. While in the day of 9^{th}, 14^{th} and 21th of this study, the significant difference was clear with progress for 10% povidone iodine more than 5% povidone iodine(Table 1). At the same time, in the (Table 2) appeared the effect of concentration and day in the length and width of re-epithelization, which gave the same results that observed in the (Table 1).

Table 1. Effect of concentration and day in Length and Width of Wound contraction.

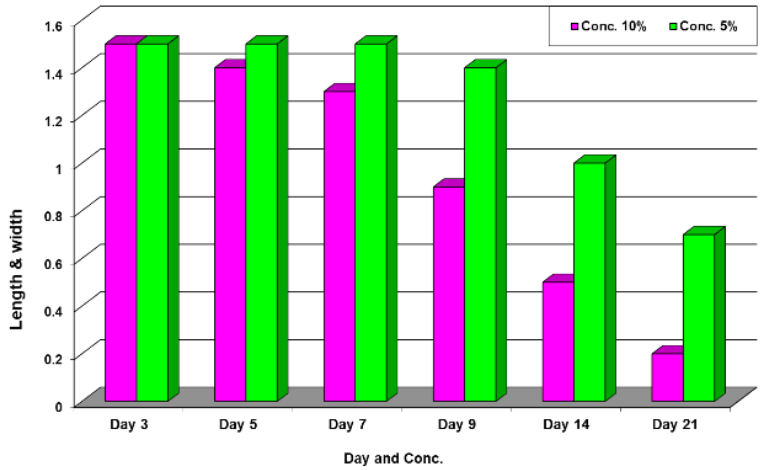

Figure 2. Effect of concentration and day the wound contraction.

4. Discussion

4.1. Clinical evaluation

In povidone iodine, the iodine factor is carried by aggregation (or micelles) and is gradually released into the solution to verify its antiseptic effect [9, 10]. Exposure to povidone iodine leads to induces cell death by destroying the cell wall, cell membrane, and cytoplasm [11]. The solution of 10% povidone iodine is widely used and does not induce resistance to microorganisms [11, 12]. The effect of PVP-1 on microbial cells was also studied by [8] and found that it affects the structure and function of enzymes and cell proteins. It damages the function of bacterial cells by preventing hydrogen bonding and altering membrane structure. The rapid death of microbes is ensured by these numerous modes of action and helps prevent the production of bacterial resistance. Since the microbicidal activity of iodine is associated with many directly toxic effects on the cell wall rather than complex molecular pathways (as used by antibiotics), tolerance is highly unlikely and there are unusually rare reports of iodine-resistant strains [8]. In the current study, the assess and compare the effects of povidone iodine solution on the healing of full-thickness skin wounds in rabbits provided by several mechanisms, including bacterial growth prevention, acceleration of the formation of granulation tissue 3–7, on all post-treated groups. The clinical observations of wounds in the present study appeared that the level of development of healing process was started rapidly in both treatment wounds. But the progression was high in the 10% povidone iodine treated groups & than those in 5% povidone iodine treated groups significantly were continued to be present until the end of the study. These results are in agreement with other animal studies in which the effect of povidone iodine on wound microcirculation has also been studied. In rabbit ear chamber wounds, the use of a 5% povidone iodine solution was associated with an early but increasingly transient reduction in blood flow [13,14]. However, wounds showed faster neovascularization with povidone iodine treatment compared to silver nitrate, sodium hypochlorite, and untreated controls in the 10 %povidone iodine study mentioned earlier[15]. Another rat model showed no adverse effects on capillary blood flow after up to 60 minutes of exposure to 1% povidone iodine solution [13]. Interestingly, povidone iodine has been shown in a recent study to enhance wound healing through TGF b, not only by increasing granulation but also by enhancing neovascularization [16]. These results are very similar to the results obtained by Cooper, 2007, with increased bacterial activity in the diluted solution due to increased free iodinelevel (up to 26 ppm in 1% to 0.1% povidone iodine solution). On the other hand, some in vitro studies have shown that povidone iodine may have a measure of cytotoxic effect [18] and no consistent deleterious effects have been shown in in vivo studies on various wound healing measures, especially at lower

concentrations of povidone iodine[17,19]. Research has also shown that a number of animal studies on povidone iodine in wound healing, were published more than thirty years ago [17, 20]. Most have shown that concentrations of up to 10% do not necessarily inhibit granulation and epithelialization processes [17].

In vitro study of the effect of zinc oxide nanoparticles on *Streptococcus mutans* isolated from human dental caries

Arshad Mahdi Hamad[1*] and Qanat Mahmood Atiyea[2]

[1]Department of Biology, College of Science, Tikrit University, Iraq.

*E-mail: arshadmnh1995@gmail.com

Abstract. Dental caries is a public health concern worldwide for which *Streptococcus mutans* has been reported Known as the potential etiology of infection. In recent years, nanotechnology has applied to Creation of novel material properties. The research was studying the effects of Nanoparticles of Zinc Oxide on *Streptococcus mutans* isolate from dental caries. In this research, Different ZnO NPs concentrations were studied as its anti-bacterial effects on *Streptococcus mutans* was isolated from dental caries cases. 27 *Streptococcus mutans* isolates were obtained, which is equivalent to 20% of the total number of 135 isolates. This nanomaterial was chosen because it has a high affinity for human cells and does not cause harm compared to other nanoparticles. The nanoparticles are those very fine materials that can be produced so that their dimensions or the dimensions of their grains range from (1-100) nanometers, and because of the small size of the nanomaterials, which made them behave differently from large-sized materials whose size exceeds 100 nanometers, and because of the small size of the particles. Nanoparticles, which gave them electrical and magnetic properties that differ from large particles of the same compounds. The well diffusion method and the MIC experiment were conducted, and the results were good, as in the well diffusion method the efficacy increased with increasing the concentration of ZnO NPs. In the MIC experiment, it was observed that MIC in the sixth tube, meaning that the MIC of ZnO NPs towards *Streptococcus mutans* equals 0. 312 mg / ml.

Keywords. ZnO NPs, *Streptococcus mutans*, MSB agar, Inhibition Zone, Dental caries.

1. Introduction

The Nanoparticales effects on human health are quite different from the macromolecules they are made from [1]. The increased nanoparticles activity may have a beneficial advantage or harmful effect, or both at the same time[2,3]. In recent times, Nanotechnology has attracted the world's attention greatly due to its characteristics compared to the giant molecules from which it is derived. The nanoparticles of zinc oxide, copper oxide and silver are used extensively industrially, including textile industries, dyes, motor oils, cosmetics, detergents and sprays [4]. A common feature of these nanocomposites is antimicrobial activity[5] . The antimicrobial effects of nanoparticles on pathogenic bacteria such as *E. coli*, *S. aureus* have been extensively studied[6]. The antimicrobial behavior of inorganic oxide metals particles such as magnesium oxide, titanium oxide, silicon oxide, titanium oxide and zinc oxide indicate that they can be used as antimicrobial treatments as possible. Use them

surgically under the heading of so-called nanomedicine [7]. One of the advantages of using inorganic oxide nanoparticles as antimicrobial agents is that they are highly effective against antibiotic-resistant pathogenic strains and are more heat resistant and less toxic [8]. ZnO NPs have a very Good safety and non-toxicity profile was Watched while taking different nanoscale sizes of The Particles of zinc oxide [9]. Tooth decay is Among the most famous oral diseases in the Oral cavity in humans [10]. It is one of the main oral problems that affect the health of all ages (children, adolescents, adults, the elderly) [11]. *Streptococcus mutans*, one of the natural flora in the mouth, is the main factor causing tooth decay and has the ability to form biofilm, and it is one of the most popular types of bacteria in this aspect [12]. The aim of this study is to investigate The directly effect of nanoparticles of zinc oxide on *Streptococcus mutans* that cause tooth decay.

2. Materials and Methods

2.1. Samples collection and isolation of bacteria

The samples were collected from the surfaces of the decaying teeth of the 135 patients attending the dental caries clinics at Tikrit city from both sexes, with different age stages between 8 to 65 years . The samples were collected using a sterile cotton swab, where the focus of this research was on isolating and diagnosing two genus of bacteria: *Staphylococcus* and *Streptococcus*, where a portion of the bacterial culture for each sample was transferred to Mannitol salt agar and MSB agar base in a plate by streaking on surface of agar, The plates were then incubated for 24 hours at 37°C. with leaving one plate from each medium as a control plate to detect the presence of contamination in the preparation of the medium. All the plates were diagnosed on the second day and the colonies growing on the agricultural media were diagnosed according to their phenotypic characteristics in terms of diameter, color, texture, shape and edge, then the characteristics of the cells and their shapes after staining them with a Gram stain as belonging to the genera *Staphylococcus* and *Streptococcus* [13]. Special biochemical tests were performed for genus discrimination *Staphylococcus* and *Streptococcus* bacteria at the age of 18-24 hours, according to the method used in to [13] to different between both genus and tests ability to produce of Catalase, Coagulase, Carbohydrate fermentation and Hemolysis. 27 *Streptococcus mutans* isolates were obtained, which is equivalent to 20% of the total number of isolates, which 135 isolates. As for other isolates, they are other bacterial types.

2.2. Preparation of Mitis Salivarius Bacitracin Agar (MSB) medium

MSB medium which observed in Figure 1 is the specific Selective Medium for *Streptococcus mutans*. This medium was prepared according to Hi-media's guidance which contained 20(w/v)% total percentage of sucrose in the medium with the addition of 200IU / L of the antibiotic Bacitracin and this ratio was prepared based on that each gram of Bacitracin it contains a number of international units and it's installed on the counter box according to the manufacturer. 0.0001 Potassium tellurite solution and 1% agar was added to ensure that the medium remained solid [14, 15, 16]. The method of preparation is by dissolving 90 grams of the medium in 1000 milliliters of distilled water and mixing well using hotplate with magnetic stirrer (zhongxing, taiwan, china) to ensure that solubility occurs well and then, to increase the selectivity of the medium for *Streptococcus mutans*, 150 grams / liter of substance was added. Sucrose for the medium so that the final percentage of sucrose is 20% in 1 liter of MSB, and after that, when the color of the medium is noticed to transparent blue, the conical flask is transferred to the autoclave to be sterilized at a temperature of 121 Celsius for 15 minutes and at a pressure of 15 pound per square inch psi, and when the medium is cooled to a temperature of 45 Celsius, potassium tellurite 0.0001, which has been sterilized by millipore filter 0.20 mm (Fisher Scientific, Wien, Austria), is added[14]. As for the solution containing the antagonist bacitracin, 1 ml of it was added after preparation as follows: By dissolving 0.364 of the powder in 100 ml of D.W, the stock solution of bacitracin was prepared. and mixed well by magnetic stirrer without any heat, and

after mixing it well, sterilize with a millipore filter (0.20Mm). The bacitracin solution is sterile at a concentration of 200IU / L . 1 ml of this solution was added to each liter of prepared medium and cooled at 45 ° C to ensure that the bacitracin is not damaged so that the ratio of this antagonist in the medium is 200 IU / L [14].

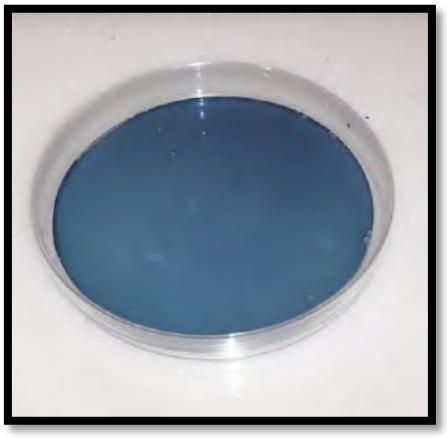

Figure 1. MSB Agar plate.

2.3. Muller Hinton Agar (MHA) preparation

Muller Hinton Agar (MHA) (Hi-media) was prepared according to the manufacturer's instructions [17] by dissolving 38 grams of powder in 1000 ml of sterile distilled water and then placed on a hot plate with magnetic stirrer until the powder completely dissolves in distilled water and the medium is clear. After that, the medium is transferred to an autoclave for sterilization at a temperature of sterilization at 121°C and a pressure of 15 pis for 15 minutes, finally it is poured into the sterilized Petri dishes , after it cools to 45-50 °C then left to harden until it is ready to cultivate the bacteria and test its sensitivity to antibiotics and zinc oxide on it.

2.4. Isolation of Streptococcus mutans

Streptoccocus mutans was isolated according to method of [18] which is summarized as follows: -

- Samples were collected using cotton swabs by passing them into the caries area and in the saliva surrounding the gums.

- The swabs were mapped on a selective culture medium (MSB) that was previously prepared.

- The plates were incubated under anaerobic conditions for 48 hours at 37°C.

- After the emergence of growth, the loop campaign of the growth appears on the surface of the medium (MSB), specifically the colonies to which the morphological characteristics are applied, are transferred and then streaked over the blood agar in order to activate the *Streptococcus mutans* bacteria, and the incubation was done at 37°C and in an anaerobic jar for a period of 24 hours.

- After the growth appeared on the medium of the blood agar, the single colony was transferred again to the MSB medium, and was streaked on the surface of the medium and then incubated in an Anaerobic jar at a temperature of 37°C for 48 hours. The benefit of last two steps is the activation of *Streptococcus mutans* bacteria as well as purification through Repeat the implantation on the selective medium (MSB).

2.5. Streptococcus mutans identification

2.5.1. Morphological feature

Streptococcus mutans was diagnosed phenotypically directly under light microscope with magnification level x15, the phenotypic diagnosis was based on colony shape on (MSB) agar plates, characteristics and based on Explanation cited by [18, 19]. Also, Hemolysis on blood agar plate , which must be (α) alpha-type, has been observed in *Streptococcus mutans* [20].

2.5.2. Gram Staining

Under aseptic conditions 1or 2 colonies were transferred from the surface of MSB Agar and exposed to Gram stain (SYR BIO, England) according to the known and scientific methods of work [21].

2.5.3. Biochemical tests

2.5.3.1. Catalase test

Colonies of *Streptococcus mutans* were taken from the MSB Agar plate by a sterile loop and transferred onto a sterile glass slide(Citotest ,Nantong , China) on the surface of which there is a drop of 3% H_2O_2 (Panreac, Barcelona, Spain). These colonies were mixed with a drop of hydrogen peroxide and the positive result of this test is bubbles [22, 23].

2.5.3.2. Test for carbohydrate fermentation (mannitol fermentation test)

Cystine trypticase agar CTA-Mannitol medium was used to the detect *Streptococcus mutans* ability to ferment mannitol sugar and convert the medium from red to yellow, which represents the positive result of the test [24]. The procedure of the test and media preparation was done according to [24]. Mannitol was added to medium cystine trypticase agar (Hi-media, India) at a concentration of 1% to form cystine trypticase manitol agar, which is used to detect the capacity of *Streptococcus mutans* bacteria to ferment manitol, ,where this medium after its preparation and autoclave sterilization at 121°C and a pressure of 15 psi for 15 minutes and after it gets cold it pours in screw capped bottles with a volume of 10 ml and keeping in the refrigerator at a temperature of 2-8 ° C until use. Later Inoculate each bottle of this medium by adding 0.1 ml of *Streptococcus mutans* bacteria samples grown on Brain Heart Infusion Broth and incubate at a temperature of 37 °C for 48 hours. The coloring change of media from red to yellow, was the indicator that the bacteria have the ability to ferment mannitol and produce acid in this reaction.

2.5.4. Diagnosis of Streptococcus mutans by VITEK-2

The diagnosis of *Streptococcus mutans* isolates was done using VITEK-2 after growing the samples on MSB Agar medium, using VITEK-2 (BIO meriex) according to the company's instructions [25].

2.6. Zinc oxide nanoparticle characterization

Zinc oxide nanoparticle was obtained from U.S Research Nanomaterial, Inc. (USA) Diameter 20-30nm, purity 99.98%, and the stock solution was made at a concentration of 10mg / ml and was diluted according to c1v1 = c2v2 [18]. The nanocomposite test was performed using scanning Electron Microscope (SEM) as shown in Figure 2.

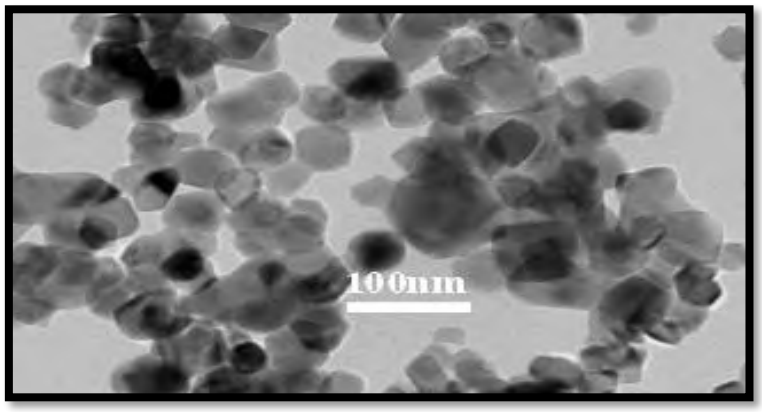

Figure 2. Zinc Oxide nanoparticles under a Scanning Electron Microscope (SEM).

In order to ensure the effectiveness of the zinc oxide nanoparticles solution, an examination was done with the UV-V device, as shown in Figure 3, and the absorption must be at its highest value at the wavelength (400–500 nm), and this is what was observed when examining these particles with UV/visible spectroscopy.

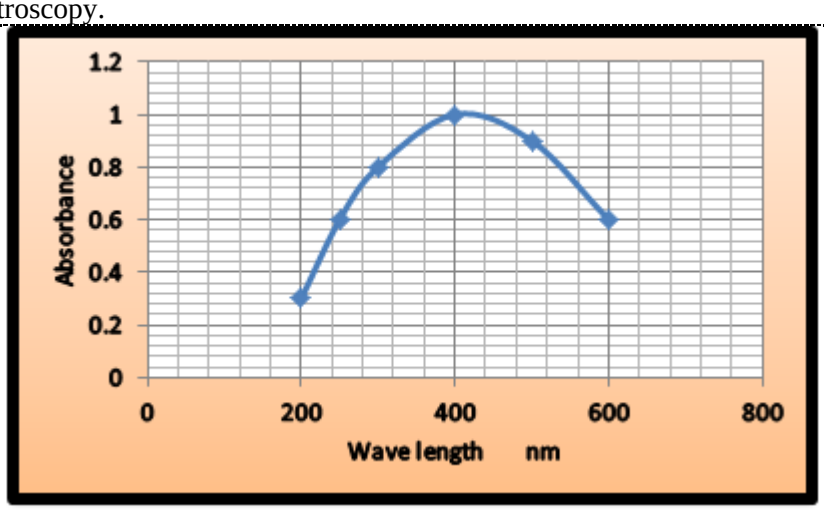

Figure 3. UV/visible spectroscopy of the ZnO NPs.

2.7. Determination of Streptococcus mutans susceptibility to various concentration of solution ZnO NPs and de-ionized water (In vitro)

The effectiveness of ZnO NPs was evaluated against Streptococcus mutans which was isolated from cases of dental caries according to method of NCCLS [26], which included the following: Greening of a bacterial suspended from *S.mutans* isolates, which we want to treat with ZnO NPs solution of different concentrations, and the bacterial suspension was made by transferring 3 colonies by sterile loop to 5 ml of Normal Saline and then compare the bacterial suspension with standard McFarland solution (0.5) to stabilize the cell numbers at 1.5×10^{8} cells /ml, then 100 µl of the prepared bacterial suspension was withdrawn and placed on a surface of Muller Hinton agar plates and were spread over the surface of MHA by a sterile swab and were planned length and width to ensure that the suspension was completely spread on the surface of the agar plate. Then, make holes in MHA by using the cork puncher (HI-Media, India) with a diameter of 5 mm and drilling serial concentrations of ZnO

NPs nanoparticles were placed. Prepared (w/v) with as a negative control, de-ionized water and the concentrations were as follows: 10 mg /ml, 5 mg /ml, 3 mg /ml, 1 mg /ml, 0.5 mg /ml, 0.1 mg /ml.

2.8. Measuring the Minimum Inhibitory Concentration (MIC) of ZnONPs

The lowest inhibitory concentration is important in the process of determining the lowest inhibitory concentration of zinc oxide in the nanoscale method by method of broth dilution. The bacterial suspension was prepared by taking 4-5 colonies from the MSB plate and transfer to the broth for 15 minutes. After mixing the bacterial suspension well, 0.1 ml of the bacterial suspension was added to each test tube containing 4.8 ml of the nutrient broth and 0.1 ml of zinc oxide solution that was prepared and added as the fellow of the concentrations 10, 5, 2.5,1.25, 0.625, 0.312, 0.156 mg / ml with a positive control tube containing broth and inoculum of bacteria to detect the ability of bacteria to grow on the nutrient broth, and a negative control tube containing only the nutrient broth and ZnONPs without bacteria was mixed well. The inoculated tubes were incubated for 24 hours at a temperature of 37°C. After that, the growth in the tubes was compared with the control tube not containing Nano-Zinc Oxide, where the lowest inhibitory concentration is the first tube with no turbidity that can be seen by eye [27].

3. Results and Discussion

3.1. Morphological Characteristic

Streptococcus mutans were examined morphologically using a light Microscope lenses (Olympos, Japan), where the colonies appeared under the microscope in blue color, 1-2 mm in diameter and have a spherical or oval shape with a little height, meaning they are convex and adherent to the surface of MSB Agar and in its center is a pool of polysaccharides, as shown in the Figure 4.

Figure 4. Shape growth colonies of *S. mutans* on MSB Agar plate.

3.2. Microscopic examination

The microscopic inspection in the oily lens Indicated that bacteria *Streptococcus mutans* Gram Positive, avoid edge and Spherical in shape and short chains to medium in length , as shown in the Figure 5.

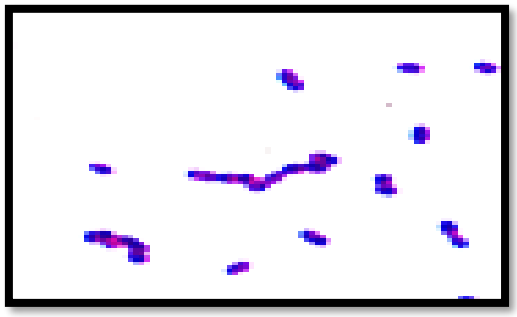

Figure 5. *S.mutans* cells with gram positive stain under light microscopic examination

3.3. Biochemical tests

Biochemical tests include the following:

3.3.1. Catalase test

All *Streptococcus mutans* are negative for catalase, meaning that they do not form bubbles when tested with H_2O_2 3%, which means that they do not have the ability to produce the catalase enzyme, It was noticed that *Streptococcus mutans* when performing the examination in the laboratory did not form any bubbles as shown in Figure 6.

Figure 6. Catalase test, shows that *S. mutans* are negative for catalase test.

3.3.2. Carbohydrate fermentation test (mannitol fermentation test)

Each *Streptococcus mutans* has the ability to ferment mannitol. The experiment was conducted in the laboratory and the result was positive, where the color of the medium changed from red to yellow, and negative control and positive control were used, and the result was positive as in Figure 7.

Figure 7. *Streptococcus mutans* - mannitol fermentation examination. A: Negative control tube (agar and mannitol without bacteria). B: Study tube (agar and mannitol inoculated with *Streptococcus mutans*). C: Positive control tube (agar and bacteria without mannitol).

3.4. Diagnosis of Streptococcus mutans by VITEK-2

VITEK2 tests showed that the Probability of *Streptococcus mutans* is 96%, and this is an excellent percentage that confirms that the bacteria isolated from caries are *Streptococcus mutans*, as noted in Figure 8.

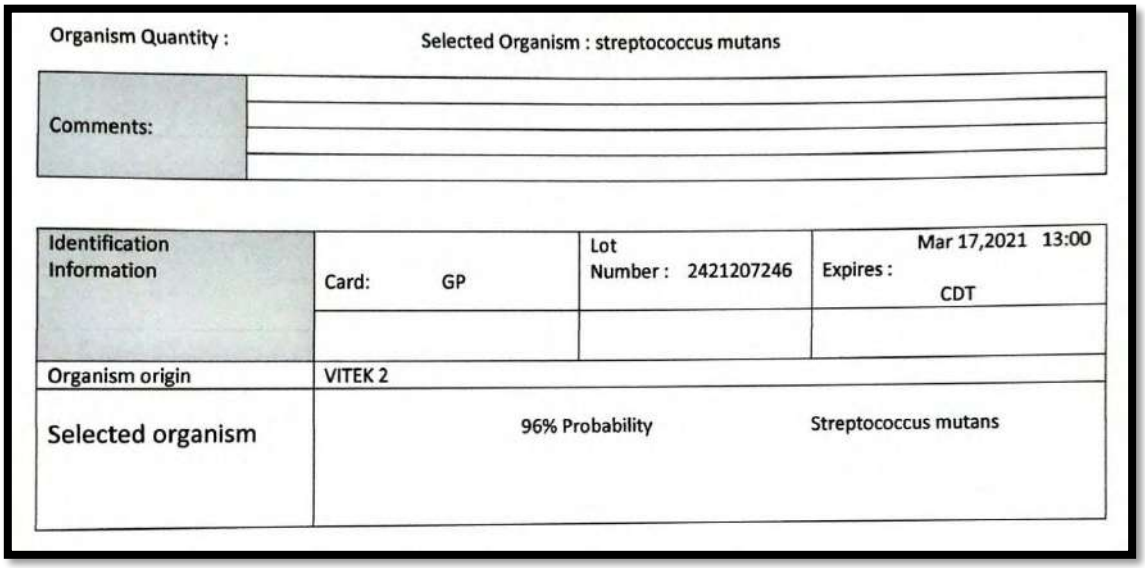

Figure 8. VITEK-2 test results.

3.5. Determination of Streptococcus mutans susceptibility to various concentration of solution Zn ONPs and de- ionized water (In vitro)

The results of the *Streptococcus mutans* susceptibility test to ZnO NPs appeared at a concentration of 0.5 mg / ml. This was the lowest inhibitory range, and it was highest at a concentration of 10 mg /ml. The highest inhibition zone appeared in Figure 9.

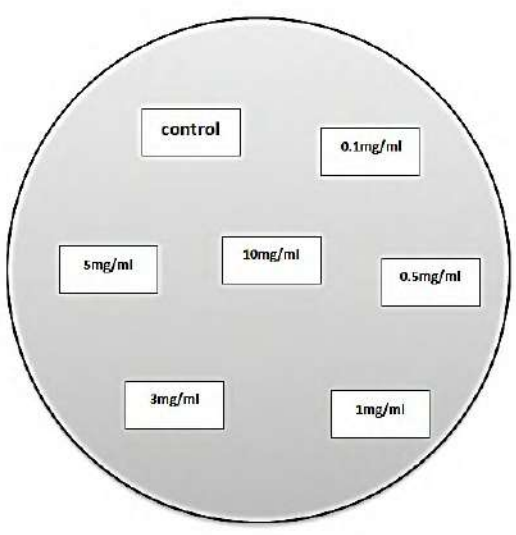

Figure 9. *Streptococcus mutans* sensitivity to different concentrations of ZnO NPs.

3.6. Measuring the Minimum Inhibitory Concentration (MIC) of ZnO NPs

MIC was determined after 24 hours of tube incubation, and where it was observed that the lowest concentration in which the growth disappeared and the tube became clear is Tube No.6, which contains a concentration of 0.312 mg/ml of ZnO NPs. For further clarification, the Table 1 below can be noted.

Table 1. Minimum Inhibitory Concentration (MIC) of ZnONPs on *Streptococcus mutans*.

Tube number	C+	C^-	1	2	3	4	5	6	7
Concentration ZnO NPs	0 mg/ml	0.078 mg/ml	10 mg/ml	5 mg/ml	2.5 mg/ml	1.25 mg/ml	0.625 mg/ml	0.312 mg/ml	0.156 mg/ml
Growth	+	–	–	–	–	–	–	–	+

= There is no growth , + = There is growth , - C = Negative Control , + C = Positive Control –

3.7. Statistical research check for Inhibition zone of ZnO Nanoparticle on Streptococcus mutans.

The arithmetic mean and arithmetic Median of inhibition zone for each conc. The inhibition zone by ZnO NPs was calculated for each of the concentrations that were used on *Streptococcus mutans* isolates. 25 isolates were selected from the diagnosed isolates and the different concentration of ZnO NPs which tested on them. The arithmetic mean of the inhibition zone was calculated for each concentration (0, 0.1, 0.5, 1, 3, 5, 10) mg\ ml which used on the 25 samples and the results were as in Table 2.

Table 2. Statistical calculations of areas of growth retardation according to the different concentrations of ZnO NPs.

ZnO NPS conc.	0mg/ml	0.1mg/ml	0.5mg/ml	1mg/ml	3mg/ml	5mg/ml	10mg/ml
Arithmetic Mean of inhibition zone for each conc. Of ZnO NPs	0mm	0mm	8 mm	11 mm	14 mm	17 mm	23 mm
Arithmetic Median of inhibition zone for each conc. Of ZnO NPs	0mm	0mm	7.6mm	12.1mm	13.5mm	15 .4mm	21 mm

4. Discussion

The quantitative evaluation of the antibacterial nanoparticle was observed by diffusion in the pits and it was observed that, the area of inhibition depends mainly on the concentration and agreement with results by the [28] which showed that the bacterial inhibition was increased with increasing the concentration of ZnO NPs and ,also the results was an agreement with [18] who are observed that zinc particles Nanoparticles have the highest effective against Gram-positive and Gram-negative bacterial activity, and ZnO NPs have excellent antibacterial activity. The increase in the zone of inhibition with the increase in concentration may be attributed to ZnO NPs the higher surface to volume ratio is due to which gives better ion exchange. The lowest concentration of ZnO NPs was 0.1 mg / ml and this concentration did not show any efficacy against *S. mutans* bacterial isolated from dental caries, many mechanisms of anti-microbial effect by ZnONPs and the activity of these molecules by generating harmful oxygen compounds to the living cell, which is H_2O_2, and when increasing the concentration of zinc oxide nanoparticles, it leads to an increase in the production of H_2O_2 and thus increase the anti-

bacterial effect. This effect occurs because of damage to the cell membranes and also causes a defect in the components of the cell, which were resulted in the cell's death permanently [18]. Another study showed that the anti-bacterial ability of ZnO NPs is due to their small size, which is 250 times smaller than a bacterial cell, and this facilitates for these particles to bind to the microorganisms' wall, which leads to their destruction and the death of living cells [18]. There is another possible mechanism for ZnO NPs activity against the bacteria through the release of Zn^{+2} ions that have the ability to break down cell membranes and interact with intracellular components[18]. The electron microscopy images showed that the effect of ZnO NPs was on the bacterial cell wall and also increased the permeability of the cell membranes as well as changing the cell morphology [18]. This was presumed to be caused by the interaction of ZnO NPs with the bacterial cell membrane, leading to a defect in the membrane function [18]. Which leads to a change in the permeability of the membrane and the leakage of intracellular components [18], then leads to cell death [18]. This interaction was likely due Electrostatic consequences attributable to the contrary charges of the nanoparticles and the cell membrane. A study by[18] showed that when ZnO NPs come into contact with bacteria, the toxic behaviour of ZnO NPs leads to the rupture of the bacterial bilayer lipid layer, which leads to leakage of the cytoplasmic contents, and there is another possible mechanism to inhibit the bacterial isolates of *S.mutans*. A weak DNA damage was observed in the treated bacteria [18]. It is believed that micro-nanostructures carry a negative charge while metal oxides carry a positive charge, and this leads to the modulation of the electromagnetic attraction between the microbe and the surface of the zinc nanoparticles. Once this attraction occurs, the microbe is oxidized and dies immediately, and in general it is believed that the production of ions by nanomaterials that interact with the dependent SH-groups. For proteins on the surface of the bacterial cell [29].

5. Conclusion

The findings indicate that nanoparticles of zinc oxide have an excellent anti-bacterial benefit., and the effectiveness of these particles increases by increasing the solution concentration that contains the nanoparticles.

Abstract. Several reports have shown that various rhizobia can interact with non-hosted plant species, enhancing mineral nutrition and promoting plant growth. To further investigate the effects of such non-host interactions on plant growth and phosphate nutrition, we inoculated *Arabidopsis thaliana* with the model rhizobacterium *Pseudomonas fluorescens* at three phosphate concentrations in the nutrient medium. *In vitro*, we showed that root colonization by *Pseudomonas fluorescens* contributes to an increase in the amount of available phosphate that is important in plant growth, especially in the shoots, in all concentrations used in the study. In addition to improving plant growth as well as increasing plant biomass production.

Keywords. *Arabidopsis thaliana*, rhizobacteria, phosphate concentration.

1. Introduction

Arabidopsis thaliana belong to Brassicaceae is a world famous model in plant biology and genetics. It was the first plant to have its genome sequenced as it has a relatively small genome, which makes it a very useful model, as it is considered a popular tool for understanding the molecular biology of many plant traits [1]. Therefore, scientists consider it a vegetarian test mouse. Its popularity stemmed from the smallness of its genomic component. It has many sites for this plant on the World Wide Web and it is the most published plant for scientific research. The Arabidopsis thaliana plant is distinguished by its short life cycle, as the plant grows rapidly to reach maturity in six weeks, and produces thousands of seeds, and the plant is self-pollinating, so the genetic makeup of the plant is not affected by the succession of its generations, and hybrid seeds are not expensive and available, as well as can be stored. The seeds are for a long period of up to five years, as they are relatively small genome of approximately 135 mega base pairs (Mbp), and they can be cultivated easy (in vitro or in the field) and inexpensive, making the genetic testing of tens of thousands of plants easy [2]. Plant growth is affected by many external and internal factors that may improve or inhibit growth due to the interference of these factors with the plant's physiological processes. Among the factors that are in relationships with other organisms such as microorganisms that have a relationship with plants roots. The great richness of a rhizosphere in organic matter promotes the development of an abundant population of microorganisms. There is an abundant population of bacteria. It is estimated that the

density of bacteria present in a rhizosphere is on average 107-109 CFU / gr soil [3]. They develop either near the roots, in contact with the roots (which colonized the rhizoplane) or inside the roots (between cells and more rarely in a cell: endophytes). This enrichment in microorganisms attracts other animals (earthworms) which will feed on bacteria or fungi [4]. The rhizosphere is a small-scale model of the primary role that a plant plays in the structuring and functioning of an ecosystem. Types of symbiosis are classified according to the degree to which each species benefits from the interaction between plant and microorganisms [5]. There are beneficial bacteria and on the other hand, pathogenic bacteria, for example certain plants establish a symbiotic relationship with rhizobacteria, enabling them to produce nodules that facilitate the conversion of atmospheric nitrogen to ammonia [6]. Plants are also affected by other factors such as nutrition, which directly contribute to the improvement and growth of plants, especially the availability of Macro-elements, many Plant Growth Promoting Rhizobacteria (PGPRs) can influence the acquisition of macro and microelements, for example, some PGPRs are free fixers of atmospheric nitrogen (*Azospirillum brasilensee* Sp245) [7]. Present near the roots, their activated will help to provide the plant with inorganic nitrogen. In some PGPRs belonging to the *Pseudomonas fluorescens* species, there is production of a non-ribosomal oligopeptide, pyoverdin (at the origin of the fluorescence of the strains), which acts as a siderophore and which promotes the iron nutrition of plants [8]. Finally, others are able to solubilize phosphate by excreting organic acids in the medium [5]. Their presence in the rhizosphere improves the solubilization of phosphate for the benefit of bacteria as well as plant obviously, the activity of these different microorganisms contributes to modifying the organization of the soil in the vicinity of the roots and consequently, the development of the roots [9]. PGPRs on nutrition can be more extensive and include plant harvesting activity, for example, an increase in the influx of nitrate is observed in rapeseed plants inoculated with PGPRs belonging to the rhizobial family [10]. The effects of PGPRs on plants may also include carbonaceous nutrition. However, interpreting this effect is difficult because if the inoculation with Bacillus subtilis GB03 improves the photosynthesis of Arabidopsis, cultivated in vitro [11], the inoculation of Arabidopsis thaliana plantlets by the PGPR Phyllobacterium brassicacearum STM196 on the contrary decreases photosynthesis [12]. The indirect effects that PGPR can have on plants also fall into two categories. Either the effect is obtained when PGPR restricts the progression of a pathogenic microorganism, or the effect is obtained by activating the defense reactions of plants [13]. In the genome of many PGPR strains belonging to the Pseudomonas family, there are genes encoding the synthesis of 2, 4-diacetylphloroglucinol (DAPG; for review [14]). It is a compound with an antimicrobial power that can limit the growth of one or more phytopathogenic bacteria. Finally, many PGPRs also it can stimulate the activity of antioxidant defense system of plants against attacks from phytopathogenic bacteria. This is called ISR (Induced Systemic Resistance [13]. This mechanism relies on the activation of a signaling pathway involving ethylene and jasmonic acid which often results in the activation of expression of genes encoding Defensins, which have an antimicrobial function [15]. Numerous bacteria which are beneficial to plant growth and present in their rhizosphere have phosphate solubilization activity. It is mainly dependent on the activity of microorganisms to secrete protons and organic acids [16]. Gulonic acid by fixing cations such as Ca2 is arguably the one that is most directly involved in the solubilization of phosphate. This is what makes gram-negative bacteria, such as for example Pseudomonas fluorescens which directly oxidize glucose to gulonic acid in the presence of glucose dehydrogenase (GCD), excellent solubilizers of inorganic Phosphate (Pi). Also, their use is gradually popularizing in agriculture. An important component of the plant environment is formed by microorganisms. They can be pathogenic / parasitic, commensal or so beneficial (symbiosis) [17]. Studying the effect of symbioses on plants is a way to study how plants interact with their environment, but also a way to see how these symbioses could help plants better protect and adapt to climate change. This is why the study of all types of symbiosis is important today [18]. The main objective of our work was to unravel potential cross talks in the control of growth of the model plant Arabidopsis thaliana in response to different concentrations Pi and in response to the presence of *Pseudomonas fluorescens*.

.

2. Materials and Methods

2.1. Biological material

The experiments were carried out using a biological system composed by the model plant Arabidopsis thaliana as the wild type (WT) and gpt2 mutant (glucose6-Phosphate/phosphate transporter2), and at the same time by strains of rhizobacteria PGPR *Pseudomonas fluorescens*.

2.2. Culture medium and plant culture

All of the experiments were conducted in-vitro. The plants are cultivated on a minimum solid mineral medium (0,5 mM $CaSO_4(H_2O)_2$, 2 mM KNO_3, 0,5 mM $MgCl_2(H_2O)_6$, 1 mM KH_2PO_4, 0,05 mM $Na_2FeEDTA$, 2,5 mM MES, 0,03 µM $(NH_4)_6Mo_7O_{24}(H_2O)_5$, 1 µM $CuSO_4(H_2O)_2$, 1 µM $ZnSO_4(H_2O)_7$, 15 µM $MnCl_2(H_2O)_4$, 50 µM H_3Bo_3) supplemented by 1.2% (p/v) agar. The pH of the medium is adjusted to 5.7 with a KOH solution then aliquoted in the bottle and finally autoclaved at 120 °C for 15 min. Before sowing, the seeds are mixed in a disinfection solution (40 mL of osmosed water, 3 drops of tween, and 2 mL of sodium hypochlorite) for 15 min. They are then rinsed 5 times with sterile water. The seeds are sown one by one and spaced 1 cm apart under laminar air flow host in square Petri dishes containing solid culture medium, using a pipette. The cover closed with thick of adhesive plaster microporeTM 1.25 cm wide. The sown boxes are placed in the dark at 4°C for at least 2 days to promote uniform germination. At the end of this treatment, the boxes are placed vertically in the culture chamber set for long days (16h day / 8h night) at 21 °C and delivering a light output of 20,000 lux.

2.3. Preparation of the inoculum and inoculation of the plants

The strains of rhizobacteria PGPR Pseudomonas fluorescens were cultivated in the culture media which was most suitable KingB (20g bacto-tryptone, 10 glycerol, 1.5g K_2HPO_4 (anhydrous) 1.5g $MgSO_4$,) at 28 ° C for at least 3 days. The plants are inoculated by contact during their growth in the culture medium. For this, a known amount of inoculum is included in plant culture medium which has been kept liquid by incubation at 52 °C after autoclaving. The inoculum is obtained by adding 8 ml of sterile plant culture medium to the Petri dishes containing the bacteria culture. The medium is incubated under this condition for 15 min. The bacteria growing on the culture medium are then resuspended. The inoculum thus formed is taken using a sterile pipette and collected in a falcon tube. The number of bacteria contained in the inoculum is determined by measuring the turbidity of the 600nm solution. The plant culture medium is inoculated with the necessary amount of inoculum to obtain a final optical density of 0.07, which corresponds on average to 108CFU/ml of culture medium. Once the plant culture medium has cooled and been solid, eight-day-old seedlings are transferred to it. Each Petri dish then containing 10 seedlings is sealed with MicroporeTM type tape, then installed in a semi-vertical position in the culture chamber.

2.4. Plant growth

The shoot fresh weight and the root fresh weight were measured separately on a precision balance (ACL SBS-LW-300A, USA). To measure the fresh weight, all the root systems present in one plate (10 in total) were carefully collected (to avoid any sampling of agar). The result was normalized the number of root system sampled. Shoot fresh weights were measured one by one. For each genotype, the root and shoot fresh weight, and the content of soluble Pi has been repeated independently at least 5 times (50 seedlings).

2.5. Soluble phosphate content quantification

The amount of soluble/inorganic Pi was determined in the shoot, root and in aliquots of the different media 10 days after transfer. All individual samples were weighed, collected in 2 ml Eppendorf tubes, and suspended in 1ml of ultrapure water. All the samples were then heated during 1h at 95°C. We measured the amount of soluble Pi in 50 µl aliquots of each extract using the standard molybdenum blue method in conjugation with UV-visible spectrophotometer [19].

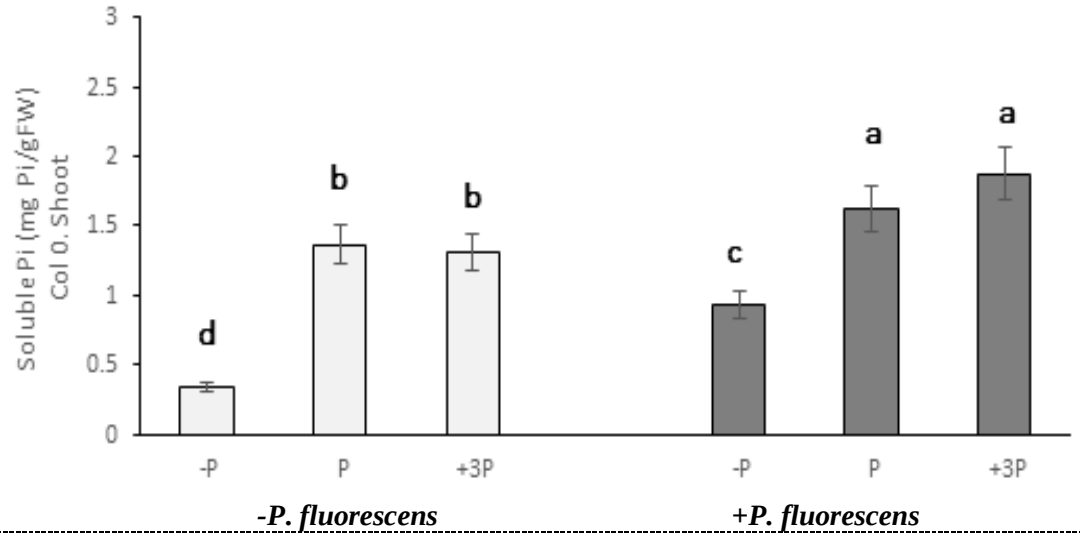
2.6. Statistical analysis

All data were collected on spreadsheets and standard statistics methods were used to describe the samples. The significance of the effect of a treatment on a variable has been tested by one - way ANOVA. The existence of differences between the observed means was tested by an LSD test at the threshold of P = 0.05. On the histograms presented in the result, the bars bearing the same letter are not considered to be significantly different. Arabidopsis thaliana seedlings were inoculated with a rhizobacteria *Pseudomonas fluorescens*. Ten days after inoculation, we measured the effect of the inoculation on the growth of the plant shoot and root at different concentrations of phosphate.

3. Results and Discussion

3.1. The presence of P. fluorescens in the Arabidopsis rhizosphere does affect the amount of soluble Pi present in plants

It is also noted in figure. 1 that the presence of Rhizobacterium Pseudomonas fluorescens an effect on the amount of phosphate absorbed by the plant after 10 days of inoculation into the agricultural medium for plant growth, as the presence of Rhizobacterium Pseudomonas fluorescens increased the amount of phosphate present in the shoot system in all phosphate levels used in the study and even at the level of deficient phosphate compared to the absence of Rhizobacteria in wild type plants (Figure 1. A), but at the level of roots, there are no significant differences at the level of normal phosphate and phosphate deficiency in both the presence and absence of Rhizobacteria in the phosphate content for the roots of wild plants, while there is a significant difference in the level of concentration 3 times phosphate by the presence of rhizobacteria (Figure 1. B).



A

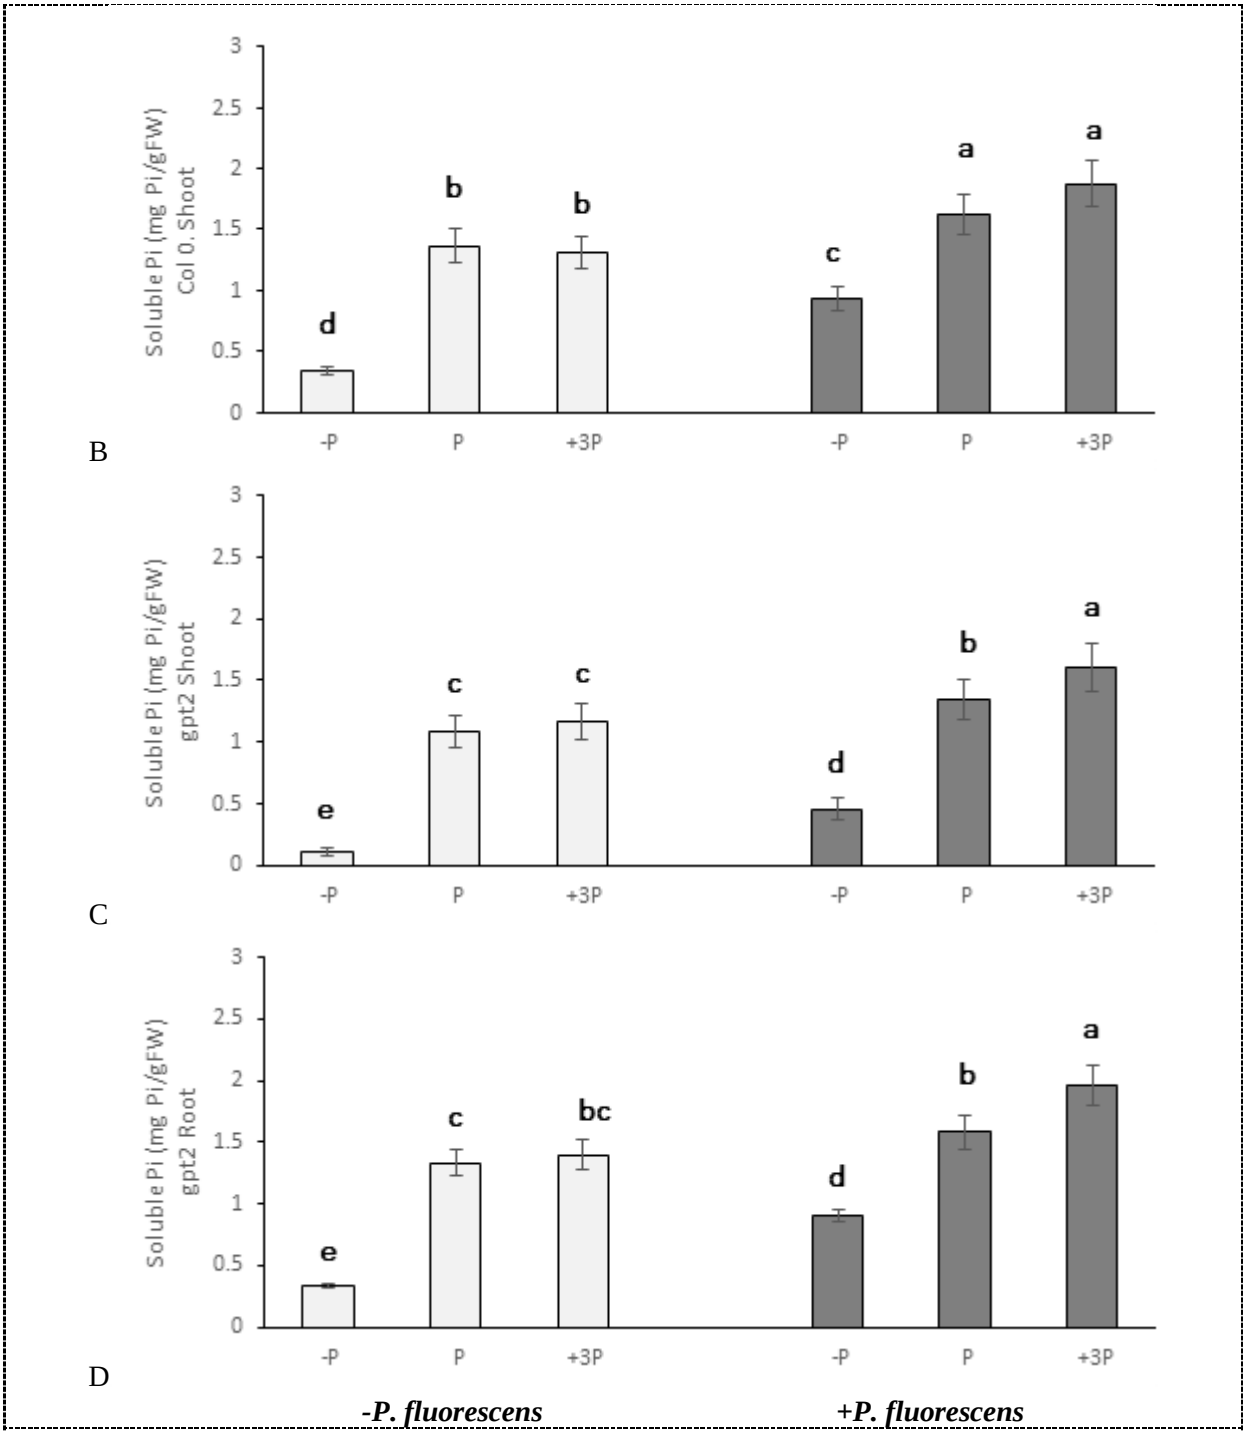


Figure 1. Phosphate content in shoot and root of Arabidopsis depends on Pi availability, Plants were transferred on different type of media: standard medium (2mM Pi), Pi deficiency medium (- Pi), and 3 time phosphate concentration medium, either with non-inoculated (- *P. fluorescens*) or inoculated (+ *P. fluorescens*). Ten days after the transfer, we measured the amount of soluble Pi. (A) Average (± SD) soluble Pi concentration in the shoot of wild type (Col 0), (B), average (± SD) soluble Pi concentration in the root of wild type (Col 0), (C) Average (± SD) soluble Pi concentration in the shoot of mutant (gpt2), (B), average (± SD) soluble Pi concentration in the root of mutant (gpt2).

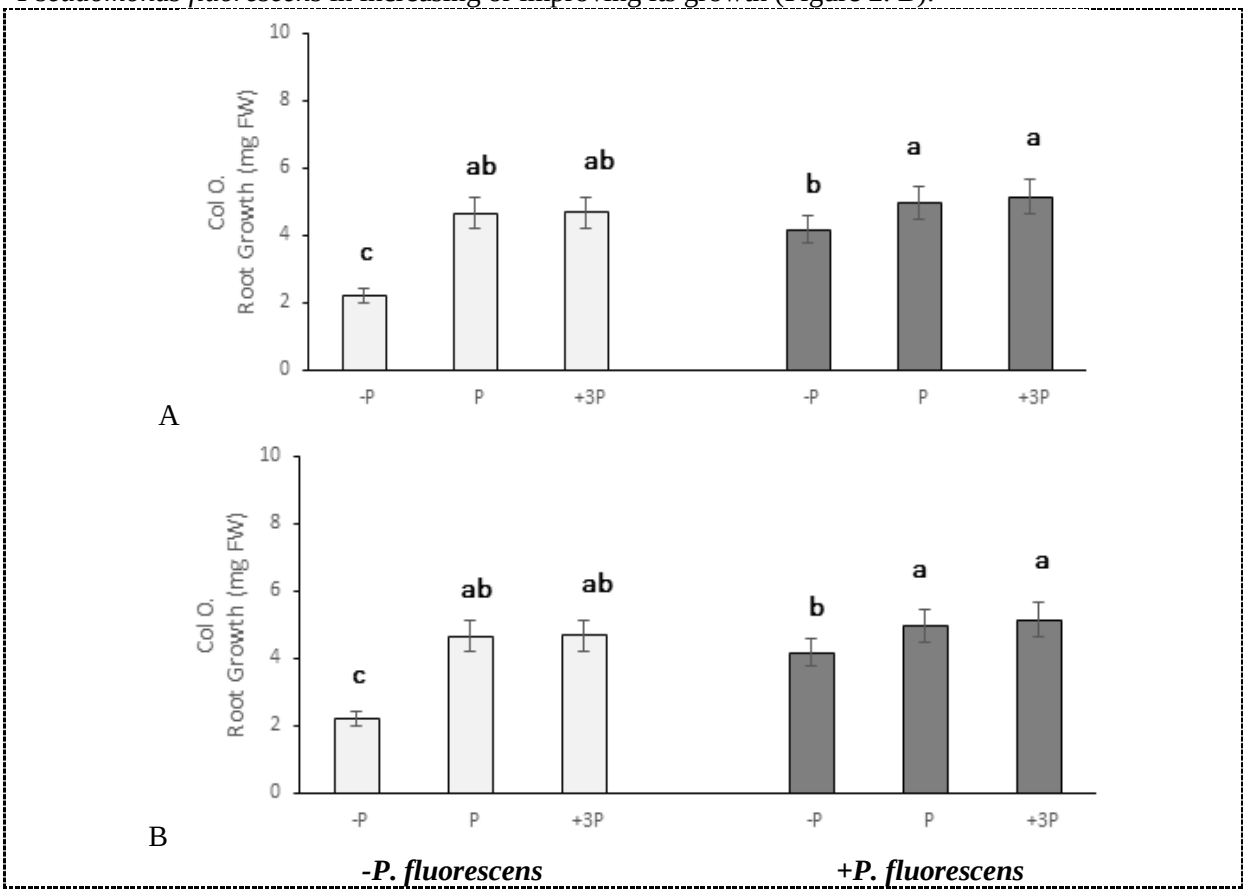
Also, the effect of Rhizobacteria *Pseudomonas fluorescens* was observed with the amount of phosphate present in the mutant plants (gpt2), the presence of *Pseudomonas fluorescens* led to increase in the phosphate content present in the triple concentration of phosphate significantly and greatly, as well as the normal concentration and the level of phosphate deficiency compared to the amount of phosphate present in the shoot. In the absence of rhizobacteria (Figure 1. C), at the root level of this mutant (gpt2), it can also be seen that the rhizobacteria led to a significant increase in all phosphate levels used in the study (Figure 1. D). From all these data, it can be confirmed that the presence of Rhizobacteria *Pseudomonas fluorescens* contributes to an increase in the amount of dissolved phosphates in the plant, but the mechanics are uncertain, it may have been by producing substances that contribute to increase the phosphates availability for absorption and converting complex phosphates into simple forms that can be absorbed through channels on the roots, thus increase its quantity within the shoot system, because phosphate has a great role in the biological processes inside the plant [20].

3.2. Inoculation with Pseudomonas fluorescens stimulates plant growth

After 10 days of culture under the different conditions, it was found that the Pi and inoculation with Pseudomonas fluorescens led to beneficial effects on the growth of the plant. For Col - 0, Pi deficiency decreases the growth of the shoot whereas, on the contrary, inoculation stimulates the growth of the shoot (Figure 2. A). Whether the plants grew in the medium depleted in Pi or on the contrary enriched in Pi, the magnitude of this stimulation is similar. However, the reverse is not true: in the presence of *Pseudomonas fluorescens*, we observe that the Pi deficiency has a slightly inhibitory effect on the shoot while the excess Pi has a slightly stimulating effect. The root is directly affected by the concentration of phosphate in the nutrient medium, and we did not notice any effect of rhizobacteria *Pseudomonas fluorescens* in increasing or improving its growth (Figure 2. B).



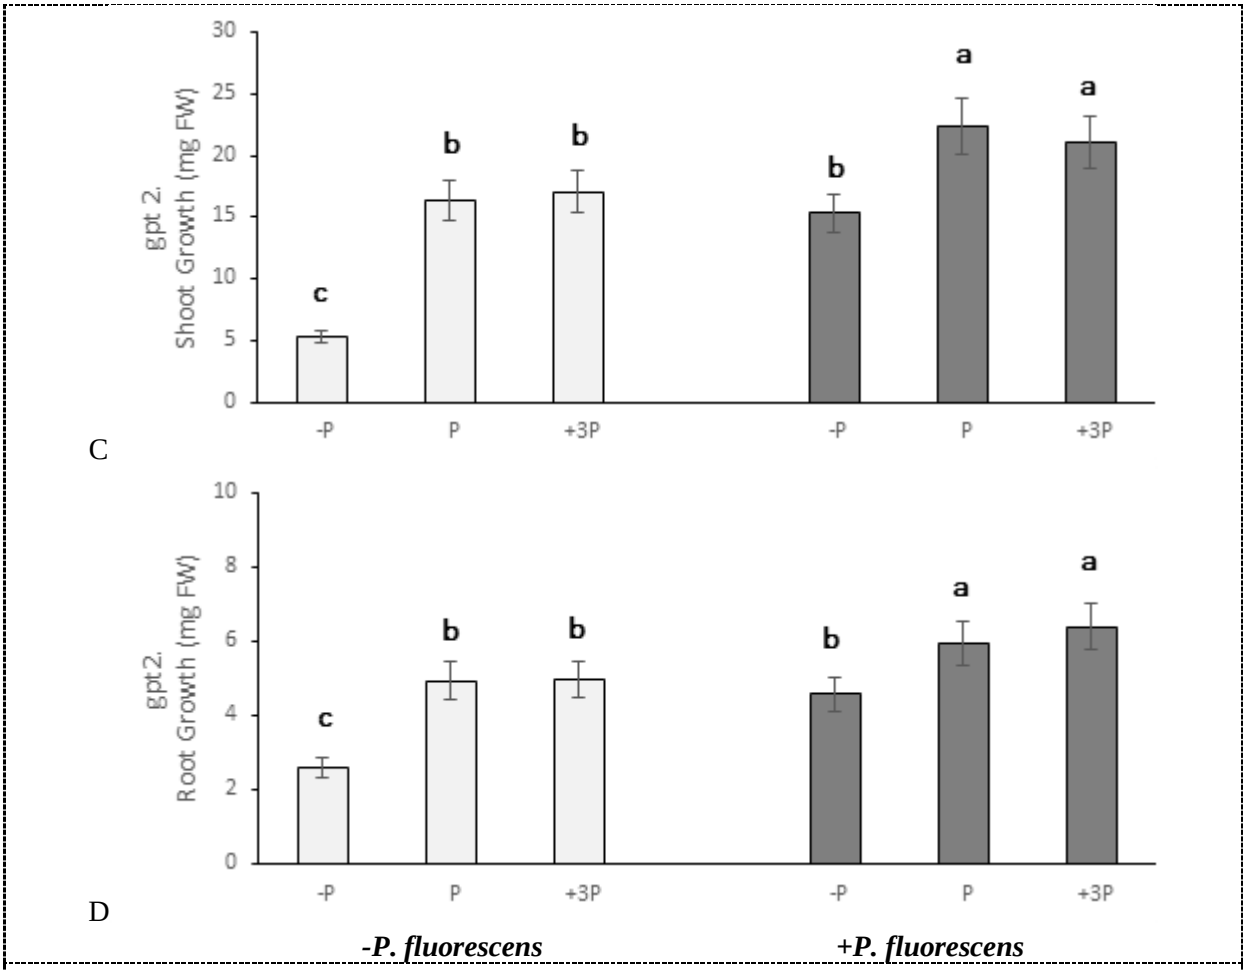


Figure 2. *P. fluorescens* promotes plant growth in vitro, regardless of Pi availability, eight days old WT Arabidopsis plantlets were. Plants were grown as described in Figure 1, ten days after the transfer, we measured the amount of soluble Pi. (A) average (± SD) shoot fresh weights of wild type (Col 0), (B), average (± SD) root fresh weights of wild type (Col 0), (C) Average (± SD) shoot fresh weights of mutant (gpt2), (B), average (± SD) root fresh weights of mutant (gpt2).

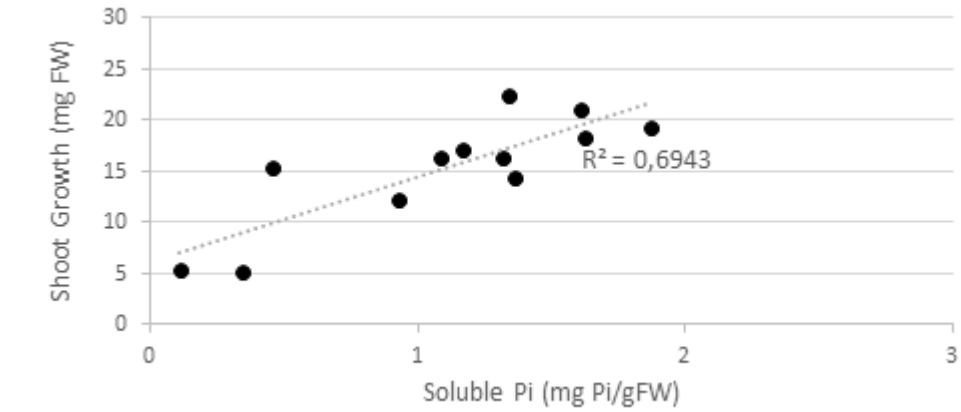
Purely additive mechanism with regard to the gpt2 mutant, it is observed that, as for Col-0, the medium with low Pi reduces the growth of the shoot (Figure 2. C). On the other hand, the presence of *Pseudomonas fluorescens* stimulates the growth of the shoot. While we noticed that the roots of the mutant gpt2 had an increased concentration of dissolved phosphate when the bacteria were present in the col-0 roots, and this increase was also affected by the concentration of phosphate directly with the nutrient medium (Figure 2. D). this is due to the capability of *Pseudomonas fluorescens* to solubilize insoluble P via two possible mechanisms: proton extrusion by ammonium assimilation and production of organic acids [21].

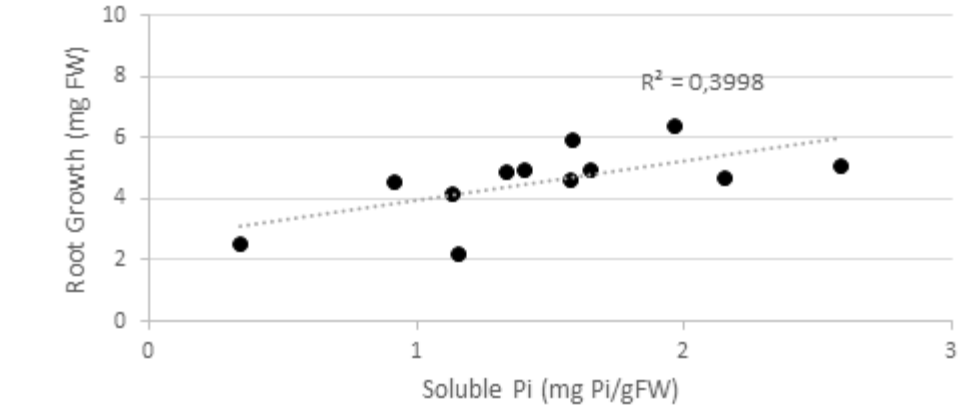
3.3. Correlation analysis reveals a dichotomy between plant growth and accumulation of Pi

To determine whether there are relationships between free Pi content in plants and fresh weight gains, we set out to systematically look for both linear (Pearson) correlations in all of our data. The goal was to represent the data as a network in which each node is a measured variable and each link is the correlation. For this type of analysis to provide information, it is necessary to have both dependent and independent variables. These variables must be in large number (to constitute a network with enough nodes so that the figure is interpretable) and be easily measurable. These variables must also be

measured under a very large number of conditions, if possible contrasting. In our case, these conditions are distributed between discrete characters (one mutant and a wild type plant in the same genetic background, treatment or not by a microorganism), but also continuous characters (3 different diets of phosphate nutrition). All these conditions do not necessarily have very strong contrasting effects. The analysis that we carried out allows us to identify strong relationships between the content of Pi in the leaves and the fresh weight of the shoot (Figure 3. A) Whereas at the roots level and the fresh weight there is no significant correlation (Figure 3. B). each of these correlations is expected because they are variables that are partly dependent on each other. For example, it is logical to observe that the P deficiency will be even more stress on the plant. In addition, some of the relationships confirm observations reported in the literature. For example, it is widely described that, in a situation of Pi deficiency, the main root stops growing [22]. These expected relationships, or so known in the literature, can be considered as positive witnesses.



A



B

Figure 3. Correlations between plant growth (fresh weight) and phosphate concentration in the plant. For the shoot part (A) and the root part (B). These variables were correlated with the phosphate concentration in the plant calculating the r of a Pearson correlation (linear correlation). To test the significance of each treatment, their p-value was also calculated. The calculations were performed using R using the Base package.

4. Conclusion

In conclusion, a medium with low Pi inhibits root and shoot growth while the presence of *Pseudomonas fluorescens* stimulates the shoot growth. The gpt2 gene plays no role in the shoot and root response.

Abstract. Cadmium (Cd) is toxic to living organisms; however, bacteria are adaptable to severe conditions, including Cd contamination. Bacteria can develop in the natural environment, as they generate resistant strains that can be used to remove Cd, but getting such adaptive strains usually takes a long time. In this study, ultraviolet (UV) light mutagenesis was used to accelerate the strain-resistant ability of *Brevibacillus agri* C15 to generate Cd^R mutant with high resistance to Cd. Its maximum tolerable concentration (MTC) to Cd was 15.00 mM. The UV light mutagenesis process resulted in the generation of the mutant *B. agri* C15 Cd^R (MTC: 20.00 mM Cd). Morphological and biochemical tests showed that there were no major differences between *B. agri* C15 Cd^R and *B. agri* C15. This study provides a basis for developing microbial Cd resistance and facilitating the application of Cd remediation.

Keywords. Cadmium, *Brevibacillus*, bioremediation, ultraviolet radiation, mutant, maximum tolerable concentration.

1. Introduction

Bioremediation is the process of transfer, forming contaminants into less harmful substances and, depending on the type of pollutant, and different approaches can be employed. One approach is the development of bacterial resistance to the pollutant with the aim of enhancing remediation efficiency. At this moment, engineering strategies are being investigated to increase further the Cd resistance of microbes, such as cloning the gene for metallothioneins, over-expressing metal-binding proteins, such as poly-histidine [1] or poly-cysteines [2]. Chemical mutagenesis approaches have been widely applied to develop bacterial detoxification systems for Cd, such as *Lactobacillus plantarum* ATCC 8014 and *Enterobacter cloacae* TU [3] . An alternative approach to increase bacterial resistant ability is the use of ultraviolet (UV) light mutagenesis. The advantages of using UV light are its simplicity, safety, and cost-effectiveness; there is also no need to establish a genetic system for the target organism, which can be useful when using it to create a mutant from a newly isolated strain. Ultraviolet (UVC) causes direct DNA damage due to the induction of the formation of DNA lesions

(photoproducts), most notably pyrimidine dimers, which block DNA replication, and RNA transcription [4]. Cd-resistant bacteria are often used as one of the remediation technologies for Cd. The main aims of this study were to generate a mutant with elevated resistance to Cd using UV-light mutagenesis. The objectives of this study were to induce mutations in wild type *B. agri* C15, a mutant screen, and to determine the effects on their specific growth rate and maximum amount of biomass formed.

2. Materials and Methods

2.1. Strain

Brevibacillus agri C15 was obtained from our previous study [4] (Jebril et al., 2020).

2.2. Mutagenesis of B. agri C15 and screening of mutant Cd^R

The *B. agri* C15 was mutagenized using UV light, according to [5] with some modifications. To obtain large quantities of *B. agri* C15, which were exposed to Cd and needed for the mutagenesis assay, the specific growth rate was first determined in 500 mL. Three thoroughly mixed 50 mL batch cultures from the late exponential phase were inoculated into 500 mL of EBS/pyruvate in Erlenmeyer flasks (2000 mL), in triplicate and with a nominal concentration of 10 mM Cd. This concentration of Cd was chosen as the possible concentration for achieving high biomass of the cells under Cd stress. The cultures were grown at 37 °C in a rotary shaking incubator at 100 rpm, and the amount of biomass was estimated as described in our previous study [4] . The effect of Cd (10 mM) on the growth of *B. agri* C15 was evaluated for the comparison of the specific growth rate values. These experiments were carried out with control in 50 mL and 500 mL of EBS without Cd. After determining the specific growth rate of *B. agri* C15 in 500 mL of batch cultures supplemented with 10 mM Cd, 50 mL culture of *B. agri* C15 was grown in a new fresh 500 mL of EBS /pyruvate in an Erlenmeyer flask (2000 mL) in triplicate, with a nominal concentration of 10 mM Cd, and incubated shaking at 100 rpm, 37 °C. The amount of biomass was determined, and from the late exponential phase, the cells were cooled in ice for an hour, centrifuged, and washed with and suspended in 0.5 EBS (two folds of diluted EBS with sterilised ddH2O, without pyruvate). The cell suspension was snap-frozen in liquid nitrogen. The counting of colony-forming units (CFUs) was used to estimate the survival of frozen cells using the serially diluting bacterial suspensions up to 1X106 CFU/mL. Each dilution was then spread on the nutrient agar plates in triplicate and incubated at 37 °C for 16 h. A CFU was determined from three sequential dilutions, and the mean was taken from all three. During the actual experiment, UV exposure was optimized by determining a survival time of *B. agri* C15 under UV exposure, a 90% drop of CFU required to increase the chance of mutant isolation. Five mL of cell suspensions of 500-1000 CFU/mL was transferred into empty plates in triplicate and exposed to a UV light lamp of 340 nm, with a distance of 50 cm from the plate to the light. The plates were irradiated for the set times (0, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, and 60 mins) using a digital timer. For each UV-exposure time point, three plates were randomly removed. For determination, the number of dead CFUs, which were killed by incubation rather than by the UV light, 500-1000 CFU/mL was transferred into empty plates in triplicate, covered with aluminium foil, and incubated on the bench at constant room temperature (22 °C). At the same time, three plates were collected as before. The removed plates were recovered on ice in the dark for 10 mins, then, 100 µL of the cell from each suspension was spread directly on nutrient agar, in triplicate. All nutrient agar plates were incubated at 37 °C for 16 h, and CFU was determined, plotted as survivors vs exposure times. The lethal time for 50% mortality (LT_{50}) was estimated from the survival curve and the time, which kills 90% of the total CFU, was determined as 20 mins. Therefore, for mutation experiments, 5 mL of cell suspension having 500-1000 CFU/mL were irradiated for 20 mins, in triplicate. The exposed cells were recovered, and then screened for mutants with elevated resistance to Cd. 100 µL of exposed, recovered cells of *B. agri* C15 were

inoculated into 50 mL of EBS/ pyruvate in Erlenmeyer flasks (250 mL), in triplicate and with different nominal concentrations of Cd. The concentrations were below MTC of *B. agri* C15 (7 mM), equal (15 mM), and above (18, 20, 22, and 24 mM). The control of EBS broth without Cd was used to determine whether there was growth at each concentration of the screening process. The batch flasks were incubated at 37 °C for 72 h. The isolation of mutants was done in terms of MTC to Cd [6] . 100 µL from each batch culture was transferred and spread onto EBS agar/ pyruvate and with the same nominal concentrations of Cd that were used in the exposed batch cultures. After growing, the colonies of the mutants were purified and the mutant amongst several mutants, which had the highest MTC to Cd, was selected and coded as the mutant Cd^R. The selected mutant was further screened for its MTC to Cd. The nominal concentrations of Cd in the broth were MTC and 0.1 MTC of the selected mutant (increases of 2 µM). MTC value obtained was tested up to three separate occasions, followed by the confirmation on EBS agar.

2.3. Characteristics of B. agri C15 and B. agri C15 Cd^R

Several experiments were performed to evaluate whether the mutant had lost some of its physical characterisations identified in *B. agri* C15 due to UV mutagenesis.

2.4. Identification analyses and optimising growth conditions

The morphological test, including Gram stain and biochemical tests (IMVIC) was performed, in triplicate, with control. Optimal temperature, carbon, and nitrogen sources were also studied for the mutant *B. agri* C15 Cd^R, according to the previous protocol described for the wild type [4]. Different pH (4.0, 4.6, 5.8, 6.4, 7.7, 8.8, and 9.0) in EBS/pyruvate was adjusted to obtain the optimum environmental conditions of these strains. The pH (4.0 and 4.6) was adjusted using acetic acid and sodium acetate. K2HPO4 and KH2PO4 were also used to acquire pH between 5.0 and 8.5, while pH 8.6 and 9.0, HCl, Trise-base were used. According to the ratio of each solution, 2 mL was added in a Falcon tube (50 mL) containing 20 mL of EBS/pyruvate. The bacterial culture was inoculated in triplicate and incubated at the optimal temperature (37 °C) for 72 h. Turbid growth was observed, and the results were recorded.

2.5. Measurement of core kinetic parameters

The growth curve, specific growth rate, and pyruvate utilised with its respective values of specific growth yields were studied for *B. agri* C15 and *B. agri* C15 Cd^R. The experiments were carried out by inoculating 1 mL of overnight culture into 50 mL of EBS/pyruvate in Erlenmeyer-flasks (250 mL), in triplicate, incubated at 37 °C and shaken at 100 rpm. 1 mL of growth culture was collected at interval times, and the dry biomass was measured; the culture was then centrifuged, and the supernatants were kept in Eppendorf tubes and stored at -20 °C until being analysed for pyruvate concentration using a pyruvate kit assay as described in our previous study [4] .

2.6. Inhibition effects of cadmium on the specific growth rate and maximum amount of biomass formed

The effect of Cd on specific growth rate and the maximum amount of biomass formed *B. agri* C15 and *B. agri* C15 Cd^R were investigated under different concentrations of Cd according to the method used by [7] . One mL of the culture was inoculated into 50 mL of EBS/pyruvate in Erlenmeyer-flasks (250 mL), in triplicate, and with different nominal concentrations of Cd: 2.5, 5, 7.5, 9, 10, 11, 12.5, 15, 16, 17.5, and 20 (mM), while the control was without Cd. Then, flasks were incubated at 37 °C for 72 h shaken at 100 rpm. The samples were collected at intervals, the amount of biomass formed was determined, and the growth curve was plotted, followed by the determination of the specific growth rate and the maximum amount of biomass formed.

2.7. Statistical analysis

Statistical analysis for these data was performed. All values were expressed as the mean and standard error of the mean (SEM). The bacterial growth curves were fitted with nonlinear regression (global curve fitting, four parameters) of the mean data utilising the SigmaPlot (version 13). The specific growth rates on the bacterial growth curves were subjected to the Student's t-test

3. Results

3.1. UV-mutagenesis of B. agri C15 and screening of mutant Cd^R

It was essential to keep the cells of *B. agri* C15 in EBS/ pyruvate completely frozen at -20°C for three weeks until the UV-mutagenesis was complete. Frozen cell beads have been known to be stable against freezing damage. It is not expected that the variable number of frozen cells will be affected for three months at -20 °C [8] . To obtain large quantities of the cells, the specific growth rate of *B. agri* C15, grown in a 500 mL of batch culture, was determined with a nominal concentration of 10 mM Cd. This experiment was carried out along with growth in a 50 mL batch culture with 10 mM Cd for the comparison in the specific growth rate between both volumes of cultures. The growth of *B. agri* C15 in 50 mL and 500 mL without Cd was studied. The specific growth rate of *B. agri* C15 grown under the effect of Cd in 500 mL was significantly low (μ= 0.11 ± 0.07 h^{-1}, Figure 1D, $^{b}p<0.05$) compared to growth in 500 mL without Cd, which showed a higher specific growth rate (0.19 ± 0.1 h^{-1}, Figure 1C, $^{a}p<0.05$). Similarly, specific growth rates were decreased from 0.12 ± 0.01h-1 (Figure 1A, $^{b}p<0.05$) when grown in 50 mL of batch culture without Cd to 0.11 ± 0.03 h^{-1} (Figure 1D, $^{b}p<0.05$) when grown in 50 mL of batch culture under the effect of Cd. However, there were no significant differences observed between specific growth rates when grown under Cd effects in 50 or 500 mL (Figure 1B, D, $^{b}p<0.05$).

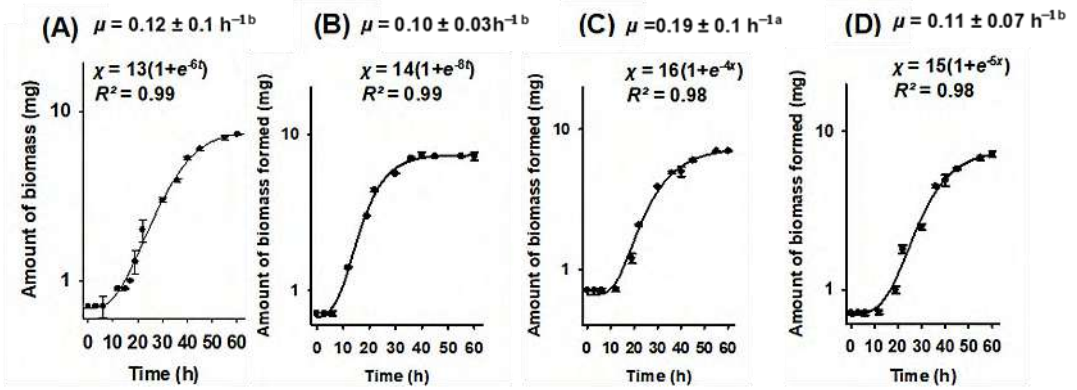

Figure 1. The growth scale of *B. agri* C15 under the effects of Cd. *B. agri* C15 was inoculated into EBS/pyruvate, incubated at 37 °C and shaken at 100 rpm. The growth was studied in different batch volumes (A) 50 mL (control) and (B) 50 mL with a nominal concentration of 10 mM Cd, (C) 500 mL (control), and (D) 500 mL with a nominal concentration of 10 mM Cd. The specific growth rate ( ) is shown. The error bars indicate the standard error of the mean of three batch cultures.

After the determination of the specific growth rate during growth at 500 mL of EBS under Cd effects, the growth of *B. agri* C15 in EBS broth (500 mL) was performed; the cells were harvested and suspended in 0.5 EBS without pyruvate to make the cell suspension form as beads to keep the cells of frozen at -20°C until the UV-mutagenesis was complete. After forming the frozen cells as beads, CFU/mL of *B. agri* C15 in these beads was estimated at 1×10^6 CFU/mL. The length of UV light

exposure that would kill 90% of cells (as CFU) to increase the chance of mutant isolation was determined at a fixed distance. Controls for CFU death just by incubation at room temperature were performed; 90% of *B. agri* C15 cells were killed after 20 mins of UV exposure (Figure 2). Thus, this was chosen as the length of exposure to induce the mutagenesis. The 50% mortality (LT_{50}), which was the time for 50% of *B. agri* C15 CFU to die, was 5.92 mins.

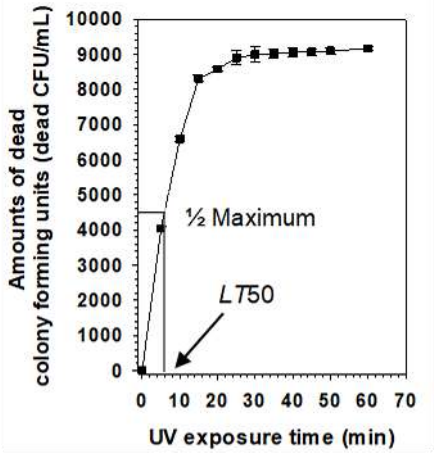

Figure 2. The lethal time curve for *B. agri* C15 after UV light exposure. 5 mL of 500–1000 CFU/mL in empty plates in triplicate were exposed to UV light (340 nm, brand Pisces, watt 13) at a 50 cm distance. The control plates were incubated on the bench at a constant room temperature of 22 °C (data not shown, used to get the final amounts of CFU death). The error bars represent the standard error of the three plates. The lethal time for 50% mortality (LT_{50}) after UV light exposure was estimated to be at 5.92 mins.

UV-mutagenesis of *B. agri* C15 was done for 20 mins, followed by the growth of exposed cells in batch cultures, with nominal concentrations of Cd: 7, 15, 18, 20, 22, and 24 mM Cd. The selection of putative mutants on EBS/pyruvate agar supplemented with the same concentrations of Cd was performed. The mutant selection was based on the growth of exposed cells at a given concentration of Cd in the plates. This showed no growth on plates with > 20 mM Cd, with few colonies at 15, 18, and 20 mM Cd. Among these, the most resistant colony to Cd was selected and considered a Cd-resistant mutant strain due to its ability to grow at 20 mM Cd and was termed as '*B. agri* C15 Cd^R'. The MTC of this mutant was 20.00 mM Cd, giving a higher MTC value than the wild type (15.00 mM).

3.2. Characteristics of B. agri C15 and B. agri C15 Cd^R

Several experiments were carried out to compare the different characteristics between *B. agri* C15 and *B. agri* C15 Cd^R.

3.2.1. Identification analyses and optimising growth conditions

Optimal growth conditions were studied to investigate whether *B. agri* C15 Cd^R had major phenotypic changes other than *B. agri* C15. Gram-stained smears of the *B. agri* C15 and the *B. agri* C15 Cd^R showed no key morphological changes. Both remained Gram-stain-positive (Figure 3A, B). Basic chemotaxonomic characters (IMVIC test) showed the same results for *B. agri* C15 Cd^R, as reported for *B. agri* C15 earlier in our previous study [4]. This data and the morphological data gave a preliminary indication of no major phenotypic changes and that *B. agri* C15 Cd^R was a bona fide mutant, not a contaminate. Amounts of biomass formed by both strains under various conditions are compared in Table 1. The statistical analysis of the biomass values showed the significant biomass obtained at 37 °C, using pyruvate and ammonia as carbon and nitrogen sources, respectively. These

biomasses were not significantly different between the two strains ($^{*}p<0.05$). The growth at a different range of pH showed that both strains could grow within a range of 4.00 to 7.70, with no significant differences between them.

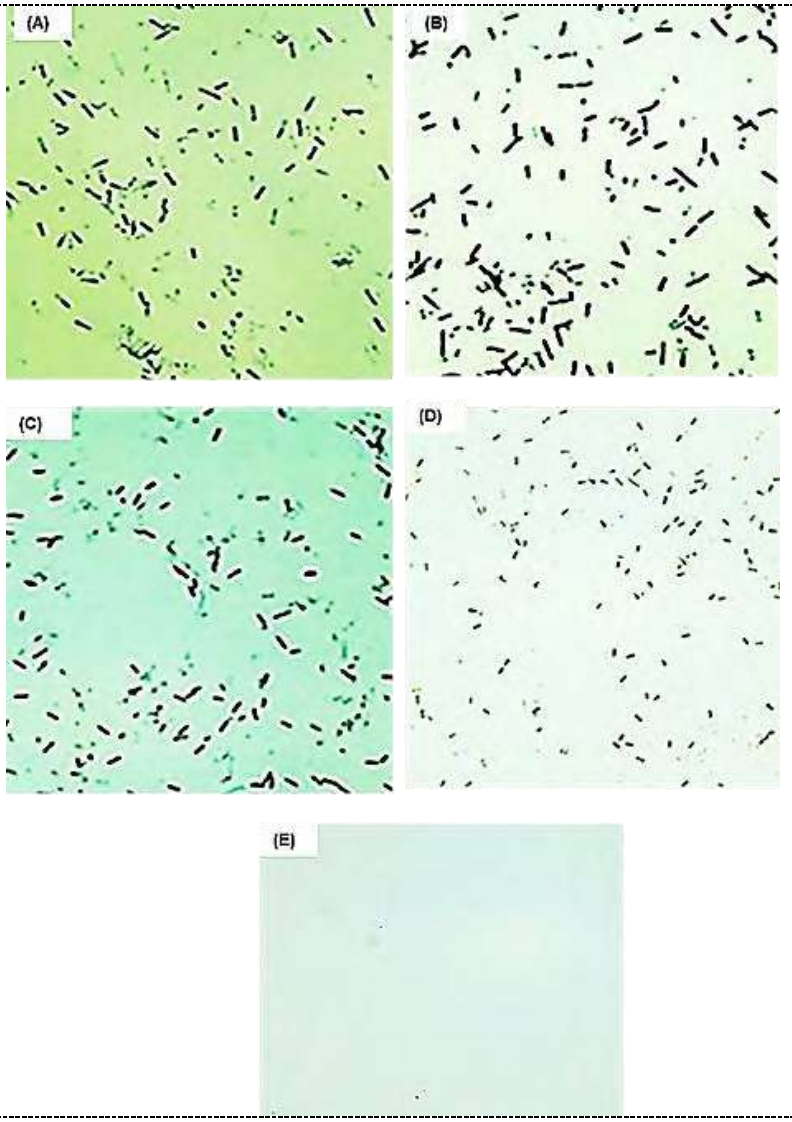

Figure 3. Morphological characterisation using Gram stain of (A) *B. agri* C15, (B) *B. agri* C15 Cd^{R}, (C) Bacillus subtilis (Gram-stain-positive control), (D) C. metallidurans DSM 2839^{T} (Gram-stain-negative control) and (E) uninoculated slide. Stains were performed symultaneously in triplicate on three separately grown nutrient agar plates. Gram-stain-positive: purple to the blue colour; Gram-stain-negative: orange to brown colour, Bismarck brown

Table 1. The growth conditions of the wild type *B. agri* C15 and the mutant *B. agri* C15 Cd^{R}. ± represents the standard errors of the mean (n = 3, batch experiments). The biomass values for the growth conditions of each strain were subjected to a t-test to analyse the difference within each growth condition, and *show a significant difference in growth values resulting from different temperature, carbon source or nitrogen source, respectively within the strain. **No biomass was obtained.

Growth conditions	Growth conditions values of :

3.2.2. Measurement of core kinetic parameters

Specific growth rates for *B. agri* C15 and *B. agri* C15 Cd^R are 0.12 ± 0.07 h-1 and 0.11 ± 0.02h-1, respectively, with no statistically significant differences (Figure 4A, B, respectively). Mutant *B. agri* C15 Cd^R formed a specific growth yield higher than the wild type *B. agri* C15 (Figure 4C).

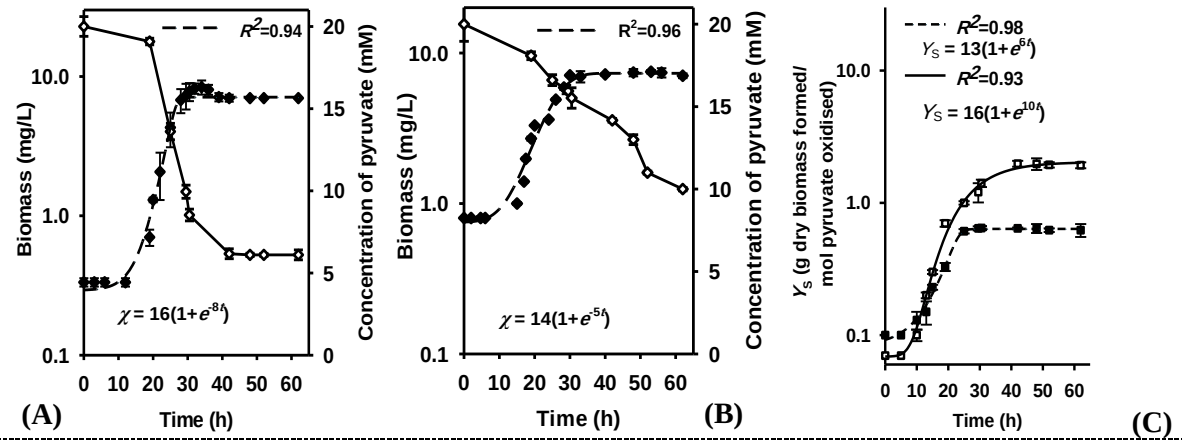

Figure 4. The amount of dry biomass formed (ϕ) and pyruvate utilisation (◊) of (A) *B. agri* C15 and (B) *B. agri* C15 Cd^R, and their respective (C) Y_S of (■) *B. agri* C15 and (□) *B. agri* C15 Cd^R. The specific growth rate ($\int$) is shown. The error bars indicate the standard error of the mean of three batch cultures

3.3. Inhibition effects of cadmium on the specific growth rate and maximum amount of biomass formed

The effects of Cd on the specific growth rate and maximum amounts of biomass formed *B. agri* C15 and *B. agri* C15 Cd^R were compared. Both strains showed a Cd-dependent fall in a specific growth rate, and the significant rate was for *B. agri* C15 (Figure 5A). The maximum amount of biomass under different concentrations of Cd showed that the lethal doses for *B. agri* C15 and *B. agri* C15 Cd^R were 15.80 and 20.00 mM Cd, respectively (Figure 5B).

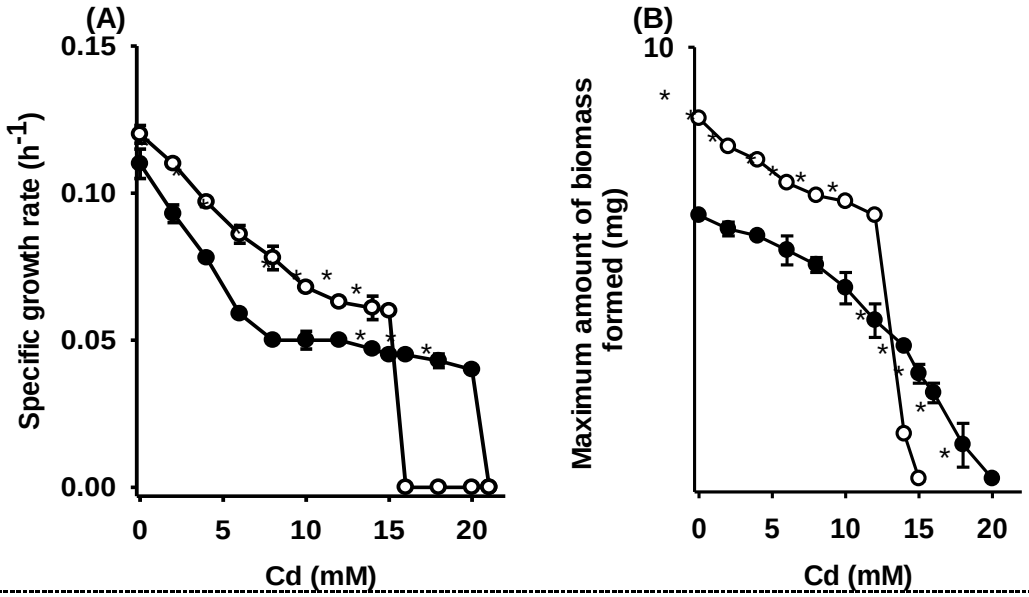

Figure 5. The inhibition effects of Cd on (A) specific growth rate and (B) maximum amounts of biomass formed of (○) *B. agri* C15 and (●) *B. agri* C15 Cd^R. The error bars indicate the standard error of the mean of three batch cultures at each Cd concentration. *Significant difference between strains at each Cd concentration.

4. Discussion

In this study, a distinct approach was carried out to achieve increased resistance in the *B. agri* C15. Isolate *B. agri* C15, which has an intrinsic ability to resist Cd (MTC: 15.00 mM), was used to increase its natural resistance to Cd. [9] found that growing a bacterium with Cd induces a mutant with elevated resistance to Cd. Using this process, several mutants were successfully generated from the wild type *B. agri* C15 by UV light mutagenesis; one of these mutants *B. agri* C15 Cd^R was able to grow in the highest Cd concentration (20.00 mM) and was chosen. The generation of Cd-resistant mutants in the growth medium can be affected by the concentration of Cd, the steps to isolate the mutants and the increase of the Cd concentrations in the medium during each step. Exposing cells, cultivating in the medium (with a high Cd concentration), and spreading exposed cells on agar plates containing Cd may have increased the resistance of the *B. agri* C15 by an MTC value of 0.25 fold. However, if the process was used repeatedly with increasing Cd concentrations in the low fold [10] , it could generate a mutant with higher MTC value (eightfold). Mutant *B. agri* C15 Cd^R had improved resistance to Cd, tolerant to 20.00 mM, and showed no key morphological or biochemical characteristics compared to wild type *B. agri* C15. Mutant *B. agri* C15 Cd^R had higher biomass than the wild type and exhibited slower growth when grown with Cd than wild type *B. agri* C15. The inhibition of the bacteria's growth led to a diminished specific growth yield; these results are similar to the results of the study performed by [11] on the Cd- mutant *P. aeruginosa* G-1.After three days of Cd exposure, it was found that wild type *B. agri* C15 was less likely to respond to Cd compared to mutant *B. agri* C15 Cd^R. Also, the inhibition appeared Cd-dependent, and both strains showed similar responses in specific growth rate and biomass under different Cd concentrations. Still, mutant *B. agri* C15 Cd^R had less specific growth rates and biomass with addition Cd concentrations (15-20 mM). Few

studies have investigated Cd effects on mutants. The mutants of Escherichia coli were found to be less responsive to a concentration of 6 mM Cd [10]. [7] found that the mutants of *E. coli* had slower growth rates when exposed to a tolerant Cd concentration of 0.7 mM. These results, together with this study, suggest that Cd concentrations influence mutant growth.

5. Conclusion

The *B. agri* C15 Cd^R mutant was generated from isolated *B. agri* C15 by UV light mutagenesis, and this mutant showed enhanced resistance to Cd and had a MTC value of 20.00 mM to Cd, which was higher than the MTC of the wild type (15 mM). Thus, it is concluded that this mutant could be suitable for the development of a Cd-bioremediation process; therefore, further studies are needed to investigate this possibility.

Abstract. The current study aimed to identify the morphological description and branches of the bronchial tree and lung for the weasel *Herpestes javanicus* as one of the Iraqi mammals inhabiting the Iraqi environment. In the current study, 10 samples with an mean weight of 288-564 g were used, trachea and lung were removed from the samples and confirmed using proven solutions and laboratory tests were conducted on 5 samples of the study to identify the branches of the bronchial tree using the technique of casting resin and then exposing the samples to erosion. Weasel has a pair of bright pink sponge lungs that occupy most of the thoracic cavity. The lungs look similar to the clover leaf have a top and three surfaces represented by the costal surface that is convex, and the middle surface, characterized by a narrow and diaphragm surface and is identical to the diaphragm. The right lung is larger than the left lung and the right lung consists of four lobes: apical, middle, caudal and an accessory lobe, while the left lung consists of three lobes: apical, middle, caudal lobes the top of the right lung appeared small and semi-sharp, while the left lung is round and blind. The right primary trachea branched into two branches, the upper branch enters into the apical lobe and branches in turn into two secondary branches, while the lower branched into three branches, the first of which enters into the middle lobe and the second to the middle lobe, the third branch into two branches enter the accessory lobes, while the primary left trachea branch into three secondary or lobe branches before entering the left lung branch, where the first branch enters into apical lobe when the second enters the middle lobe while the third section enters the caudal lobe.

Keywords. *Herpestes javanicus,* Lung, bronchial tree, Iraqi weasel.

1. Introduction

The Weasel is small animals widespread, carnivores and lives in different environments and he belongs to the family of Herpestidae of order carnivores, there are two types of this family in Iraq, namely the weasel *Herpestes javanicus* that lives in the areas extending along the strand of the Tigris and Euphrates rivers, which is the most widespread, the second type is the Indian grey mongoose (*Herpestes edwardsi*) found in central and northern Iraq and is less prevalent than the first type [1]. Studies have shown that mammalian lungs are a complex of composition organ that shows a variation in form, location and composition in different species, as each lung has its triangular shape and possesses a cranial apex, caudal base and the two sides of costal and middle with three border: dorsal,

ventral and basal [2]. The color of the lung varies according to the amount of blood it contains, as it is pink during life and in cats appear bright red [3]. The lungs of the carnivores are divided into lobes, where the right lung consists of four lobes, apical or cranial lobe, middle or cardiac lobe, caudal lobes and accessories lobes, which are larger than the left lung consisting of apical and caudal lobes [4]. While [3] study in *Cats domesticus* L. showed the right lung is larger than the left lung by size and weight, the right lung is consist of four lobes as well as accessory lobes, while the left lung is composed of two apical and caudal lobes, dividing the apical lobe into two parts of a cranial or apical and another part of caudal with deep notch. The study of [5] in long-eared hedgehog *Hemiechinus auritus* reported that the lungs are in the form of a spongy pair of organs located inside the thoracic cavity and not directly connected to the ribs, covered with two layers of pleura inside the visceral pleura. Many studies have dealt with weasel in many ways, such as [6] study of the digestive and respiratory system of the grey Indian weasel and [7] study of thyroid gland, and study of a comparison of the appearance and anatomical length and weight of the body and lung and some organs of the digestive system between two types of weasel [8]. The current study aims to identify the morphological description of the bronchial tree and lung in the weasel.

2. Materials and Methods

The study included 10 samples of *Herpestes javanicus* weasel with different ages and weights ranging from 288-565 g obtained from Najaf province and the hunting process was carried out using special nets, the samples of the study was anatomized and removed the trachea and lungs and put them in the normal saline solution 9% and then put in the fixative solution until the completion of other work procedures.

2.1. Morphological study using methylene blue stains

The samples were placed in methylene blue for 1.5 minutes. Left until the lungs lobes are clear and the possibility of counting them accurately. Then transferred to ethyl alcohol 70% for 2 minutes until the samples are clear for study.

2.2. Bronchial tree study

This study was carried out on the bronchial tree by the process of resin cast and then exposing the sample to erosion according to [9]. In this study, five samples of both sexes were obtained and the samples of the trachea and lung were obtained in the same anatomy manner referred to in above with the note taking parts of the neighboring organs to avoid rupture of the tissues that may lead to the ejection of resin during injection and the samples are kept freezing until use. In this study was selected for the proper resin, which is characterized by its viscosity at room temperature and at the same time possesses solidification to give the required results after the process of maceration.

2.3. Injection technique

The injection was performed as follows: Prepare the resin by dissolving 1 g of resin powder in 12 ml of liquid resin 12 min before the injection. The samples were removed from the freezer and melted before the injection. A 4 mm plastic feeding tube was inserted through the larynx and fixated by a surgical suture wire to prevent resin from being ejected during injection. The injection was done by hand using a 20 ml plastic syringe. The first sample was injected with 6 ml, the second sample was injected with 8 ml and the third injected by 12 ml and the fourth sample by 15 ml and the fifth sample injected by 20 ml and then closed the trachea opening by a thick thread, and the sample was left all night at room temperature 30-25 ºC to complete the hardening of the resin. The maceration was performed by placing the samples in a suitable plastic tank containing 500 ml of potassium hydroxide

KOH at a concentration of 40% for 5-4 days. After the maceration process is completed, the samples were washed thoroughly and carefully with water running for at least an hour. The samples were then dried using hot air so that the sample would be ready for examination. The samples were examined with the naked eye or using an anatomy microscope and then the samples were photographed using a digital camera.

3. Results

The results of the macroscopic examination of the weasel *Herpestes javanicus* lungs showed that it is possess a pair of lungs similar to clover leaf pattern and each lung looks in the form of a bright pink sponge organ and occupy most of the thoracic cavity similar to the shape of the thoracic cavity, and extends from the third rib to the twelfth rib. While anatomically, the results of the current study showed that each lung in the weasel has an apex and three surfaces represented by the costal surface which is convex, and the middle surface and characterized by its narrow and diaphragmatic surface and is identical to the diagram (Figure 1). The results showed that the right lung is larger than left lung and the right lung is composed of four lobes represented by cranial or apical lobe, middle or intermediate lobe, caudal or basal lobe and accessory lobe (Figure 2, 4). While the left lung consists of three lobes represented by the cranial or apical lobe, intermediate lobe, caudal or basal lobe (Figure 3, 4).

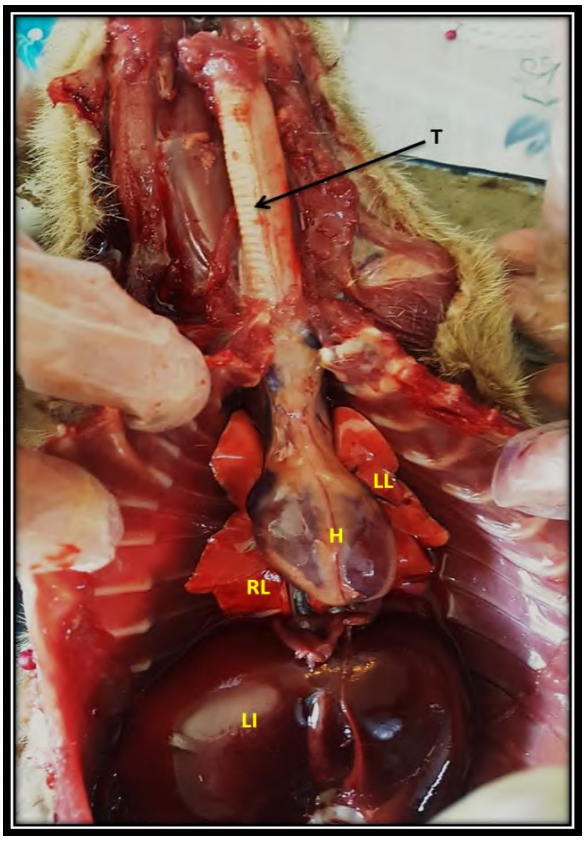

Figure 1. The internal anatomy of weasel *Herpestes javanecus* shows the location of the trachea (T) in general and the location of the lung (L), the heart (H), the liver (Li).

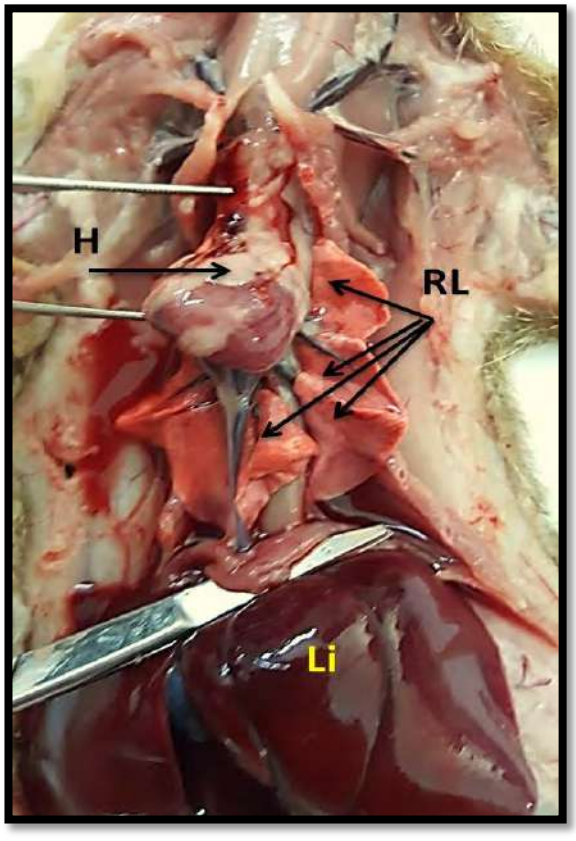

Figure 2. Figure 2: The internal anatomy of weasel *Herpestes javanecus* shows the lobes of right lung (RL),Trachea(T) ,the heart (H), the liver (Li).

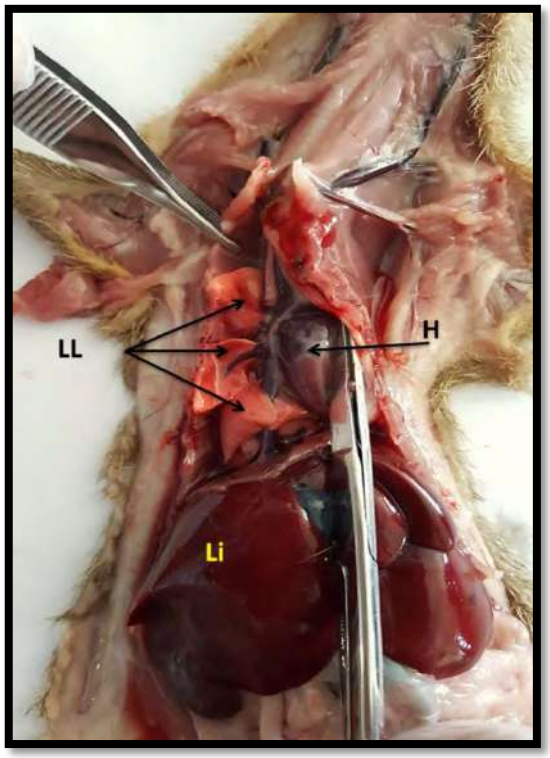

Figure 3. The internal anatomy of weasel *Herpestes javanecus* shows the lobes of left lung (LL) ,Trachea(T) ,the heart (H), the liver (Li).

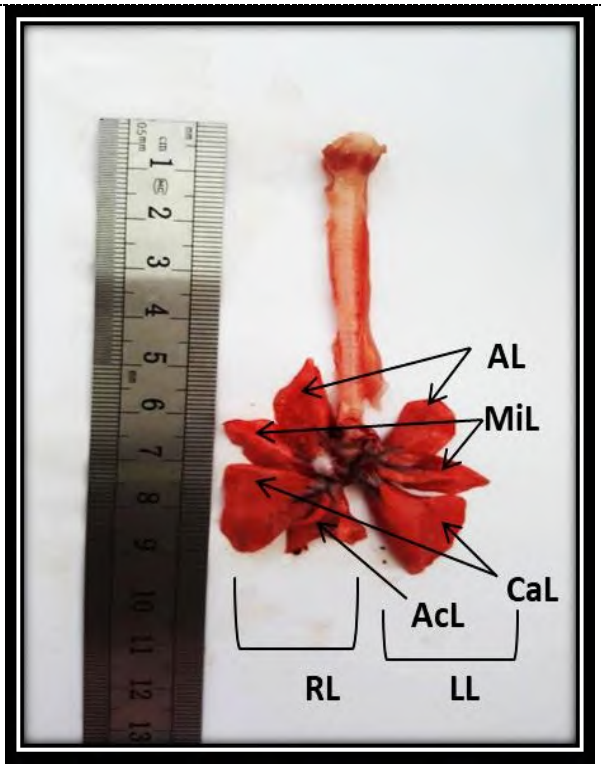

Figure 4. Shows the shape of the lungs in the weasel and its lobes, the apical lobe(AL), middle lobe (MiL), caudal lobe (CaL), accessory lobe (ACL), right lung (RL), left lung (LL).

The results also showed that the right lung top is small and semi-sharp compared to the left lung, which shows its top round and blind (Figure 4, 5). The mean length of the right lung is 4.9 cm and the mean length of the left lung is 4.4 cm, and the results showed that the total lung width was 5.9 cm (Table 1). The results of the morphological study using resin cast technology showed that the trachea in the weasel appears as a long tube branching into two main branches represented by the right primary bronchus and the left primary bronchus. It was noted that the right primary branched into two secondary branches; secondary or lobular (Lobar) bronchi after entering the right lung represented by a superior branch that enters the cranial or apical lobe, which in turn branches into two secondary branches representing the first branch tertiary bronchi, the latter also branched into a number of bronchioles, which as a result end with alveoli, while the second branch (inferior branch) of the right primary bronchus is divided into three branches: superior enters the middle lobe, and the medial enters the caudal lobe, while the third branch in turn is divided into two secondary branches entering each of its branches into the accessory lobes. The results of the current study showed that the primary left bronchus branched into three secondary or lobar before entering the left lung, as the first branch enters the apical lobe while the second branch enters the middle branch while the third branch enters the caudal lobe (Figure 6).

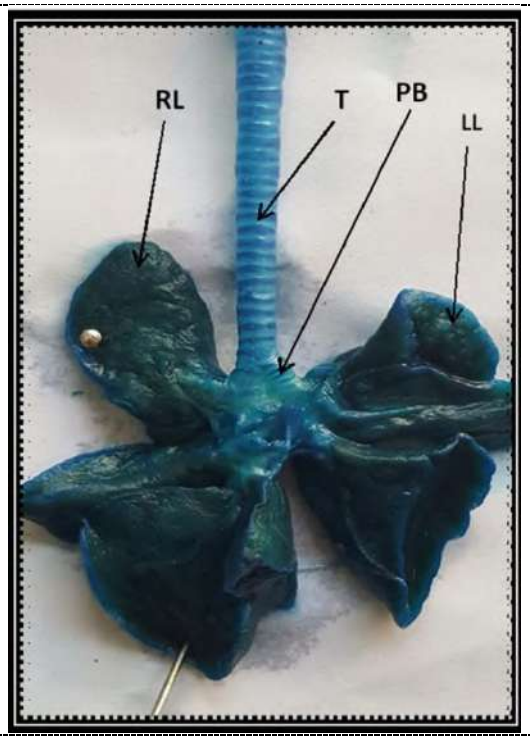

Figure 5. : Shows the branching of the trachea (T) into two branches of the primary bronchi (PB), the entry of a branch to the right lung (RL) and a branch to the left lung (LL), (Methylene blue stain).

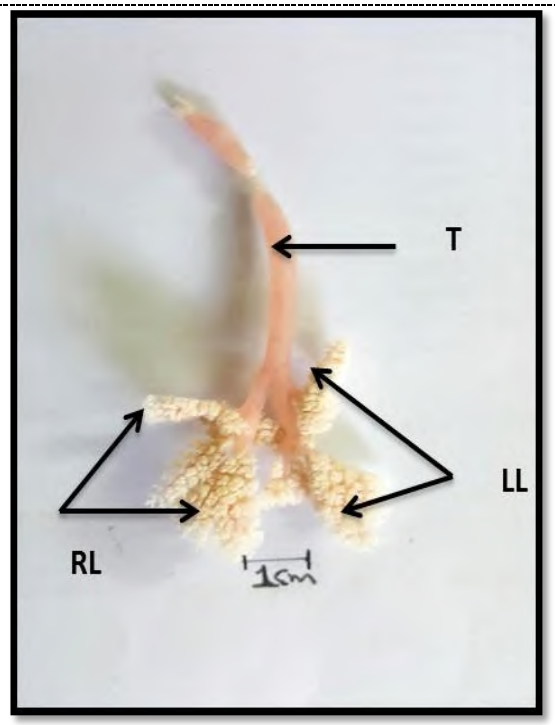

Figure 6. Whole preparation of the lung using resin casting technique shows the branches of the bronchi, trachea (T), right lung (RL), left lung (LL).

Table 1: Shows the rate of length and weight of lung for study samples.

Sample number	Real length/ cm	standard length/ cm	animal weight/ g	Length of left lung/ cm	Length of right lung/ cm	Total width of lung. cm
1	56	28	341.26	4.5	5	5.5
2	60	30	435.81	4.5	5	5.5
3	61	32	564.14	4.5	5	6
4	60	32	396.32	4.5	4.5	6
5	54	26	288.17	4	5.2	6.5
Mean	58.2	29.6	405.14	4.4	4.94	5.9

4. Discussion

The macroscopic examination showed that weasel *Herpestes javanicus* has a pair of bright pink sponge lungs that surround the heart and occupy most of thoracic cavity and shows its shape identical to the thoracic cavity it occupies and these results are fully consistent with references for the study about domestic animals [10, 11]. The results of the current study showed that the lungs of the weasel are in the form of clover leaf pattern and this result of appearance is contrary to the lungs of naked-bellied tomb bat [12] whose appearance is pyramidal in shape because the structural of the lung fits with the thoracic cavity that contains it. The lung is smooth-surface and each lung has a cranial apex that resembles the apical lobe and caudal base, which similar to the diaphragmatic surface of the caudal lobe, and each lung has three borders: dorsal and ventral abdominal, caudal (Basel) borders. The results of the anatomical study of weasel's lungs were consistent with the results of [13, 14] in

Canis lupus and [15] in ruminants, as it was found that the top of the right lung looks small and semi-sharp while the top of the left lung is round and blind. The results are contrary to what was shown by the results of [16] about the local rabbits *Oryctolagus cuniculus*, as mentioned study explained that the top of the left lung is sharp and small, while the top of the right lung is large, rounded and blind, these results are partly consistent with same study in the cats *Feils catus*, this study showed that the right lung top is sharp as it is contrary to the lung of the naked-bellied tomb bat [12] because the top of the right lung is sharp but folded down, while [17] study on *Feils catus* showed that the right lung was contained on a pointed top, which is not consistent with the results of the weasel study because the right lung contains a semi-pointed top. The left lung of the weasel in the current study showed smaller than the right lung and consists of three lobes represented by the cranial lobe, the middle lobe and the caudal lobe, while the right lung is larger than the left lung and consists of four lobes, a cranial, middle, caudal, accessory lobes. This result is consistent with the results of the study of the guinea pig *Cavia porcellus*, which showed that the right lung contains four lobes and the left lung contains three lobes [18]. The results of the current study were also contrary to the results of [16] on the local rabbit *Oryctolagus cuniculus*, as the anatomical results showed that both lungs have two lobes; one of which is apical lobe and the other is caudal lobe, and the left lung is divided into two lobes unequal in shape and the apical lobe is smaller than the caudal lobe. In addition, it disagreement with [19] study in *Cryptotis parva*, as it has a right lung containing four lobes represented by a cranial, middle, caudal and accessory lobes, while its left lung has one caudal large lobe, which is fully integrated with the small cranial lobe so that no clear dividing line between the lobes appears.

Abstract. The flavonoid and alkaloid content in the alcoholic extract of the shoots and flowers were identified in two species of the tribe Pimpinelleae / Apiaceae: *Pimpinella armena* and *Pimpinella kotschyana*, and the flavonoids that were detected in this study are: (Apigenin, Coumarin, Kaempferol and Quercetin). The total alkaloids are estimated for these two species. It has been noticed that the species *Pimpinella armena* is a new record on the Iraqi flora, as it was identified through the genetic analysis of nucleotide sequences and registered in the National Center of Biotechnology (NCBI).

Keywords. Apiaceae, *Pimpinella*, flavonoids, alkaloid.

1. Introduction

The Apiaceae family is considered one of the most important families of flowering plants at the functional level, as its inflorescences had a great role in diagnosing them long before they are described scientifically for the first time [1]. Researchers disagreed about the number of genera and species belonging to this family, as [2] indicated that it includes (200) genera and (2900) species. [3] indicated that this family is widespread and spreads in tropical to temperate regions and that it includes (400) genera and (4250) species. In Iraq, this family is represented wildly by about (60) genera and (143) species [4]. The largest genera by the number of species *Pimpinella* genus, which includes about 15 species ,while [5] indicated that there are (130) wild species and (9) cultivated species. [6] also mentioned that this family is the fifth largest plant family in Iraq and that it is represented by approximately (67) genera and (155) species. The plants of this family contain many important chemical compounds that have contributed to strengthening their role as medicinal plants and a source of treatment for diseases, and the most important of these compounds are flavonoids [7, 8]. This family is considered to be one of the most economically important families, as many of its species are used as food or flavorings such as the *Foeniculum vulgare* Mill. , and *Anethum graveolens* L. In addition, many of the species are medicinal plants, such as Pimpinella. Pimpinella plants have been used in the treatment of several medical conditions due to their containment of very important effective compounds such as essential oils, volatile oils, flavonoids and alkaloids [9, 10, 11]. A review of the available scientific references revealed that the current study is the first local study in which the

flavonoid and alkaloid contents of the two studied species are identified. The species *Pimpinella armena* is a new record on the Iraqi flora, as it is identified through the genetic analysis of nucleotide sequences and registered in the National Center of Biotechnology (NCBI).

2. Materials and Methods

2.1. Collection of Plant Specimens

Fresh plant specimens are collected during the flowering time and then labelled with the necessary herbal information such as (place of collection, collector's name, common name of the plant, and date of collection). These samples are dried and pressed with the aforementioned herbal information recorded. The taxonomic keys and the Iraqi flora / fifth volume are used for the diagnosis of the samples, and it is confirmed by comparing the collected samples with the herbal samples kept in the Kurdistan Botanical Foundation herbarium in Sulaymaniyah and the Iraqi national herbarium in Abu Ghraib.

2.2. Chemical Study

2.2.1. Extraction of plant samples

The most common procedures used to analyse polyphenols' and simple phenolic in natural plants are Liquid-liquid and solid-liquid extraction. The main reasons behind this widely usage are their ease of use, effectiveness, and wide ranging applicability. Commonly used extraction solvents are alcohols (methanol, ethanol), acetone, diethyl ether, and ethyl acetate. Milling and homogenization are the first steps in preparation process. Extraction is the major step for recovering and isolating the bioactive phytochemicals from plant materials, before analysis. The main factors that influence extractions are their chemical nature, the extraction method employed, sample particle size, as well as the availability of interfering substances. Additional steps would be of such importance if the removal of unwanted phenolic and non-phenolic substances just like waxes, fats, terpenes, and chlorophylls. Thirty grams of plant powdered was extracted using 15 ml chloroform with constant stirring for 24 hours at the ambient temperature. The extract was placed in an ultrasonic device for 15 minutes. Then 100 ml of butanol was added and then transferred to the separation funnel. The polar organic layer (butanol) is collected and transferred to the rotary evaporator device to obtain a dry extractor. The operation is repeated three times to gain an adequate amount prior to analysis.

2.2.2. Condition of HPLC for analysed phenolic and flavonoid components

Samples are analysed by using high performance liquid chromatography HPLC model (SYKAM) Germany. Pump model: S 2100 Quaternary Gradient Pump, Auto sampler model : S 5200, Detector: UV (S 2340) and Column Oven model : S 4115. The mobile phase is = (Methanol : D.W : acetic acid) (85 : 13 : 2), the column is C18-ODS (25 cm * 4.6 mm) and detector UV – 360 nm at flow rate 1ml/min.

2.2.3. Total alkaloid content

Extraction: The 20 gm of each plant material was ground and then extracted with methanol for 24 hours in a continuous extraction (Soxholet) apparatus. The extract was faltered and methanol was evaporated on a rotary evaporator under vacuum at a temperature of 45°C until dryness.

2.2.4. Qualitative estimation (Test for alkaloids)

Presence of alkaloid was confirmed by Dragendroff's method .A part of extract was dissolved in diluted HCL and 2 drops of Dragon drops are added, presence of alkaloid is indicated by the presence of crystalline precipitate. The sample which has showed positive alkaloid is then subjected to further quantitative evaluation.

2.2.5. Separation of alkaloid

A part of extract residue is dissolved in 2N HCL and then faltered. 1 ml of this solution is transferred to reparatory funnel and washed with 10 ml chloroform. The pH of this solution is modulated to neutral with 0.1 N NaOH. This step is followed by adding 5 ml of Bromocresol Green (BCG) solution and 5 ml of phosphate buffer to the solution.

2.2.6. Standard carve

Carefully-measured aliquots of Atropine standard solution (0.4, 0.6, 0.8, 1 and 1.2 ml) is altered into various reparatory funnels. After that 5 ml of pH 4.7 phosphate buffer and 5 ml of BCG solution are taken, then the outcome mixture is shaken with extract of 1, 2, 3, and 4 ml of chloroform. These extracts have been collected later in 10 ml volumetric flask and then have mixed to adjust solution with chloroform. The absorbance of the complex in chloroform is measured at spectrum of 470 nm in UV-Spectrophotometer (SHIMADZU UV-1800) against the blank that is prepared according to the method mentioned above but without Atropine.

3. Results and Discussion

The results of the chemical study (Table 1) have showed the presence of four types of flavonoid compounds in the alcoholic extract of the shoots. These compounds are: Coumarin, Catchine, Kaempferol and Quercetin. The results of the chemical analysis have showed that the shoots are free of the flavonoid compound Apigenin. The concentration of Coumarin in the shoots is 361.4µg. ml^{-1} in *P.armena*, and the concentration of this compound reached 404.1µg / ml in *P.kotschyana*. As for the compound Catchine, the concentration reached 71.9 µg. ml^{-1} in the species *P.armena*, while the species *P.kotschyana* recorded higher concentration of this compound, which is 121.8µg /ml. It should be noted that the concentrations of Kaempferol is 39.6 µg / ml in species *P.armena* =, while the concentration is lowest in species *P.kotschyana* which is 28.64µg. ml^{-1} (Table1). Regarding Quercetin, the highest concentration is 55.14µg. ml^{-1} in species *P.armena*, and the lowest concentration is 51.2 4µg. ml^{-1} in *P.kotschyana*. It is also found from this study that the flavonoid compound Coumarin is the highest concentration compound in the alcoholic extract of the shoot of all the studied species (Table 1). As for the total content of flavonoids in the alcoholic extract of the shoots in the studied species, the highest value of it is in the *P.kotschyana* and reached 606.6 µg. ml^{-1}, while the lowest value for the total content of flavonoids is 528 µg. ml^{-1} in *P.armena* (Table 1). Concerning the total content of flavonoids in the alcoholic extract of flowering inflorescences in the studied species (Table 2), the highest value is recorded in *P.kotschyana* as it is 2625.4 µg. ml^{-1}, while the lowest total value is 418.6 µg. ml^{-1} in *P.armena*. It is revealed through this study that only Apigenin and Coumarin are present in the alcoholic extract of the flowers of *P.kotschyana* which have showed the highest concentration of these two compounds (120.8 and 2504.6) µg.ml^{-1}, respectively. The flavonoid compound Apigenin is absent from the flowers of *P.armena*. The lowest concentration of Coumarin is 261.4 µg. ml^{-1} in *A.visgana* (Table 2). It should be noted that the species *P.kotschyana* has recorded the highest concentration of compounds Apigenin, Catchine and Coumarin for the whole plant (both the vegetative and flowering parts). While the species *P.armena* has the highest concentration of Kaempferol and Quercetin in the vegetative and flowering (Table 3). It is worth noting that coumarins are the most abundant flavonoids in the studied species, and this is in agreement with [3] who has indicated that coumarins are among the compounds most present in the plants of the Apiaceae family.

Table 1. Flavonoid concentrations measured in µg. ml^{-1} in the shoot parts of the studied species.

no.	Flavonoides / Sp.	Apigenin	Coumarin	Catchine	Kaempferol	Quercetin	total
1	***P.armena***	0	361.4	71.9	39.6	55.1	528
2	***P.kotschyana***	0	404.1	121.8	28.6	51.2	606.6
	Total	0	765.5	193.7	68.2	106.3	1134.6

Table 2. Flavonoid concentrations measured in µg. ml^{-1} in the flowering parts of the studied species.

no.	Flavonoides / Sp	Apigenin	Coumarin	Catchine	Kaempferol	Quercetin	total
1	***P.armena***	0	261.4	0	0	0	261.4
2	***P.kotschyana***	120.8	2504.6	0	0	0	2625.4
	Total	120.8	2766.0	0	0	0	2886.8

Table 3. Total group of flavonoids (vegetative and flowering parts) measured in µg. ml^{-1} in each of the studied species.

no.	Flavonoides / Sp	Apigenin	Coumarine	Catchine	Kaempferol	Quercetin	total
1	***P.armena***	0	622.8	71.9	39.6	55.1	789.4
2	***P.kotschyana***	120.8	2908.7	121.8	28.6	52.1	3232
	Total	120.8	3531.5	193.7	68.2	106.3	4021.4

Regarding to the total alkaloids, it is found from this study that the highest percentage of alkaloids in the shoot system is 6.3% in *P.armena,* while *P.kotschyana* recorded the lowest percentage, reaching 5.3% (Table 4). The highest percentage of alkaliod content recorded in the Inflorescences is in *P.armena* and is 16.5%, while the lowest percentage recorded is 12.5% in *P.kotschyana*. It is evident from the observation of Table (4) that the species *P.armena* possesses the highest percentage of total alkaloid in the vegetative and flowering systems and of the studied species, which reaches 22.8%. Whilst, the species *P.kotschyana* recorded the lowest total percentage, which is 17.8% (Table 4). The flowering system is higher in its total alkaloid content than the shoots of the species under study, and the percentages are close in the studied species, which are sort of a few percentages and do not exceed 30% in each species. Perhaps these few percentages are the reason for the little attention of researchers in studying these important chemical compounds.

Table 4. Percentages of total alkaloids in shoots and Inflorescences of the studied species.

No	Sp	Shoots %	Inflorescent%	Total %
1	***P.armena***	6.3	16.5	22.8
2	***P.kotschyana***	5.3	12.5	17.8
	Total	11.6	29.0	40.6

Abstract. A study was done at the theatre of department of veterinary Surgery & obstetrics, College of Veterinary Medicine, University of Kerbala, Karbala, Iraq which performed to compare the effect of application of chitosan action as scaffold with collagen fibers. The histopathological findings in operation's sites showed the developments of skin graft's healing which was the guide to monitoring the healing. The results showed that the chitosan-treated grafts was healed more controllable with less scar tissue than non-treated grafts which indicates that the chitosan was coordinated the healing.

Keywords. Chitosan, Skin grafting, rabbits.

1. Introduction

Chitosan is derived from chitin which is the second maximum copious biopolymer after cellulose so it is biodegradable polymer and it accelerates wound healing [1]. It has been described that chitosan authorized regeneration of tissue elements in skin wounds and has affected positively in healing of wounds. Also it appear many benefits for topical applications, including non-irritancy and some anti-bacterial actions [2]. This study was aimed to study the availability of the applications of chitosan in healing of skin. Skin grafting a technique mainly used or reconstruction of skin defects at the last decades. The techniques of flaps and grafts considered are the two common surgeries utilized for restoration of losing of the tissue. Simple skin graft used as a thin layer harvested with a special scalpel called dermatome [3]. A free skin graft is a piece of skin that completely separated from normal area and transferred to a wound to a wound at another site that establish new vascular connections to survive. Skin grafting consider the best consideration for the wide wound closure or deep burns of wide body areas [4]. Skin grafting had been contraindicated if inosculation from receiver bed is unconfident or unpredictable or n wound infection [5]. Chitosan was discovered in 1859 by Rouget . Since then, it has been used as a pharmaceutical excipient and to promote wound healing [6]. Chitosan has been able to bind to substances, including acids, lipophilic materials and minerals [7] as well as inhibit fat absorption. The origin of chitosan is a fiber product that is obtained from deacetylated chitin. Chitin is naturally occurring substance found in the shells of crustaceans, invertebrates and fungi [6]. Chemical composition of chitosan consider as a copolymer which comprises of β – (1→4) – linked 2- acetamino- 2-deoxy-D-glucopyranose and 2-amino-2-deoxy-D-

glucopyranos units that obtained by alkaline deacetylation of chitin which is the main component of the exoskeleton of crustaceans [8]. Chitosan has a structure too similar to cellulose; which is fairly reactive compounded its formed in many forms such as powder, paste, film and fiber. The solubility of chitosan in dilute aqueous acetic, lactic, succinic and formic acids [9] (Shakeel et al , 2014) . Commercial production of chitosan by deacetylation of chitin [10]. Wound dressing, trauma, burns, dermatitis, purulent diseases, septic pod dermatitis, interdigitalphlegmon, interdigital hyperplasia, canker [11, 12, 13]. Wound infections are manifestations of disturbed host bacteria equilibrium in a traumatized tissues condition in a favor of the bacterium, the wound infection not only have the possibility to emerge a systemic restraint (sepsis) but it was highly probable to prevent the multiple processes involved in the orchestrated progression of normal wound healing, each process involved in healing are affected when bacterium proliferated in the wound [2]. Chitosan considered as non-toxic antibacterial polymer have the ability to prohibit a wide variety of fungi, bacteria, viruses and yeastswhich its interaction had been experimented in vitro and in vivo [14]. The accurate mechanism of the antimicrobial actions of chitosan are still hesitating, it has been suggested that is interactions between negatively charged microbial cell membrane and positively charged chitosan molecules can lead to the disturbance of microbial membrane, and thereafter infiltrate intracellular ingredients [15, 16]. Chitosan has exert as anti-inflammatory effects by restrain cyclooxygenase-2 protein expression and prostaglandin E2 and decline pro-inflammatory cytokines (e.g. interleukine-1β tumor necrosis-α). Otherwise, chitosan treatment raises the expression of the interleukin-10 [17]. Skin grafting is classified depending on the relation between the donor site and the recipient bed as: Autograft or autologus, which the skin grafted from different site on same body (man or animal). Isograft, syngraft or isogenic,which the grafting performed between animals or men are genetically identical (e.g. monozygotic twins). Allograft or allogenic, which the grafting performed between animals with same species, or men but genetically non-identical. Xenograft, heterograft or xenogenic, which the grafting performed between different speicies.[18].

2. Materials and Methods

2.1. Experimental design

Eighteen adult female rabbits divided randomly to two groups; the first group (A) which compel to skin grafting by transplantation from forelimb to hind limb using chitosan as pad under the graft and the second group(B) which compel to same grafting in (groupA) without addition of chitosan application on grafting area.

2.2. Chitosan

The chitosan which used in this experiment is manufactured Vitex Pharmaceuticals ®; Australia. The experiment done at the theatre of department of veterinary surgery and obstetrics, college of veterinary medicine / University of Kerbala, Karbala, IRAQ. Study parameters were hematological parameters and histopathological findings 21days post graftings and compare the healing of the skin according to gross findings and histopathology.

2.3. Surgical operation

2.3.1. Preoperative preparation

The animals of this study were prepared to surgery by fasting for 12 hours withheld of food and 6 hours of water before the operation, the area of medial tibial region was clipped and shaved and prepared aseptically. The skin was scrubbed by bovidine – iodine 2.5%. The rabbits were put at a lateral recumbency and covered with surgical drapes which fixed to the skin with towel clips.

2.3.2. Anesthesia

All the operations were performed under general anesthesia by intramuscular administration the combination of Xylazine and Ketamine at the dose (3:35 mg per kg B.W.) with additional dose of Xylazine to increase depth and prolong anesthesia [19, 20, 21].

2.4. Surgical technique

2.4.1. Group A

The technique which performed in this experiment was the transplantation of a square – shape of skin with 1cm×1cm in diameter from forelimb transplanted to a gap made in hind limb filled with chitosan powder then the borders of graft sutured with original skin by simple interrupted suturing covered by gauze pad changed every two days with 5 postoperative days of treatment with penicillin-streptomycin mixture to prevent any type of infection (Figure 1).

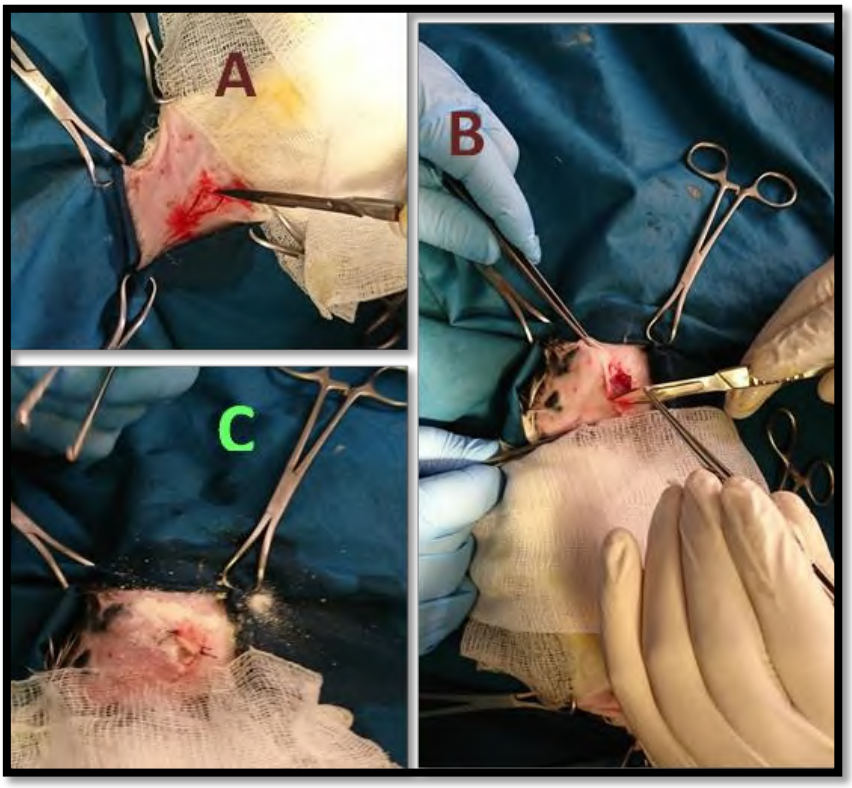

Figure 1. Shows the stages of experiment's operation: (A) Ablation of the graft from intact skin. (B) Preparation of grafting site. (C) Implanting of graft with application of chitosan.

2.4.2. Group B

The technique had been done same as in group A without adding of Chitosan at the site of operation. Other provisions was done consequently.

2.5. Postoperative care

The treated animals were housed in semi-opened house as confine within house garden fed with grain and vegetables along the period of experiment receiving freely water and food (containing green grass and grain). Experimented animals were administrated with mixture of Penicillin and streptomycin with a dose of (20000 I.U. : 10 mg per kg B.W.) for three days post operatively. Diclofinac*sodium in a dose of 1mg/kg B.W. were administered intramuscularly for 3 days post operatively. Rectal temperature, respiratory rate and heart rate were recorded daily for three days post operation.

3. Results and Discussion

The study showed that usage of chitosan as application with skin grafting was possible and useful . A total of 18 rabbits underwent successful healing with or without chitosan application , and it was observed that the normal clinical progress was without any clinical sign of complication or death due to the skin grafting and animals were in good general health and clinical condition, unless a mild signs of inflammatory signs in chitosan treating animals at first 2 days. The animals continued food intake directly after surgery with normal intensification of body weight. Understanding of the clinically and patience were very important for success of technique. However our previous experience showed that the chitosan-treated animals showed, in post mortem finding, most successful skin healing compare with non-treated animals, in addition to that there were reduce time of operation site's injury healing in chitosan-treated animals, reduced recovery time and postoperative wound complications.

3.1. Postoperative observation

The surgical phase of anesthesia was attained by administering Xylazine + Ketamine in all the animals . Injectable anesthesia was the method of choice for maintaining anesthesia during the procedure. It was perfectively done in rabbits in this experiment , and the animals completely lost consciousness without response to pinprick with excellent muscle relaxation. The post-surgical recovery from anesthesia in the two experimental groups were uneventful. The intramuscular administration of Xylazine with a dose of 3mg/kg B.W. and Ketamine with a dose of 35 mg/kg B.W. were given one by one injection produced about 45 minutes duration of general anesthesia with additional Xylazine could be added if depth of anesthesia was not adequate without any significant complication that might occur as regurgitation, delayed recovery. The surgery of indication of skin grafting in both groups were preformed successfully in all experimental animals. During the transplantation of skin graft; no trauma or injury to any muscle, blood vessels or nerve that could happen. At the beginning of the study consumed longer duration time for the chitosan- treatment's technique, but with more experience, the time became shortened, the maximum time required to obtain the chitosan application skin grafting 35- 45 while the duration time of non-treated animals 30-40 minutes.

3.2. Post-operative findings

3.2.1. Zero time

The Post-operative findings showed normal traumatic reactions with clear edges of wounds at the site of operation in both of groups immediately after the operation (Figure. 2).

Group A

Group B

Figure 2. Fig.2: shows the site of operation in both groups (time zero)

Twenty first days Post-operatively; the site of operation appear the complete healing with appearance of hair growth in grafting area. Hematological parameters shows no significant differences between both groups or within each group.

3.3. Histopathological findings

Group (A); a good healing signs with many hear follicles which grows within grafting tissue, with a thin line of scar tissue, Although, an accumulation of few inflammatory cells (Figure 3).

Group (B) ; the healing signs shows the hear follicles which grows within grafting tissue but less the which appeared in group A, with marked line of scar tissue, However, a negligible accumulation of inflammatory cells (Figure 4).

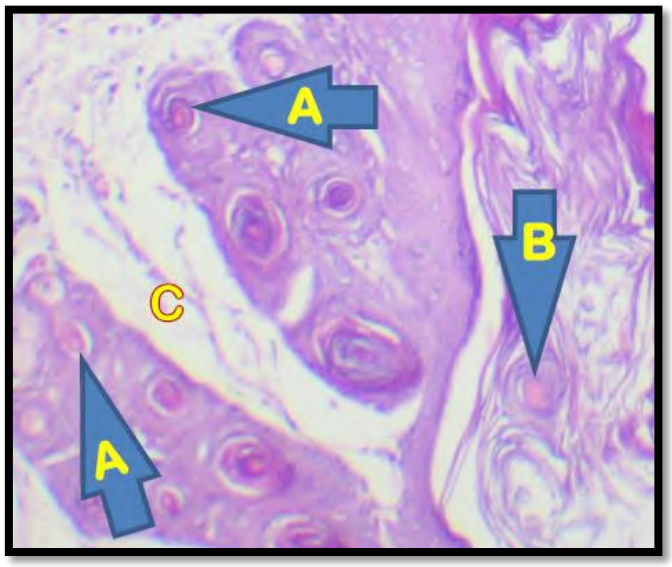

Figure 3. Shows the healing in group (A) which appear the growth of hair follicles (A) revascularization (B) with perfect scar formation(C), (X10). (C is not visible in both picture, make it like A and B). (C) refer to the area of scar tissue area which histologically classified as granulation and fibrous tissue (appear as white area).

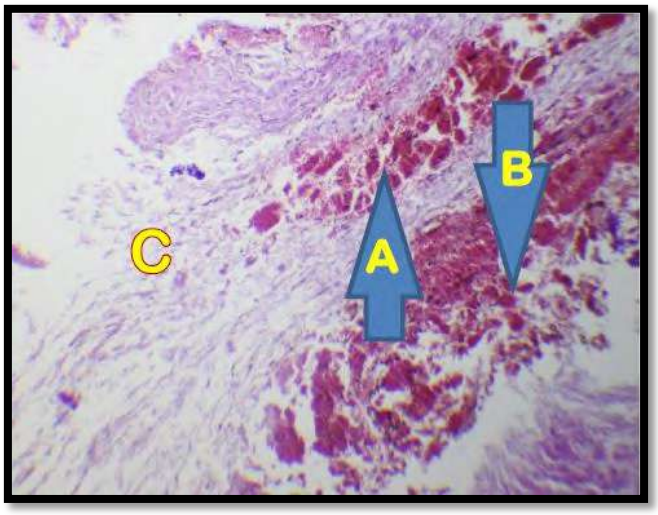

Figure 4. Shows the healing in group (B) which not appear the hair follicles (A), no marked revascularization (B) with huge margin of scar formation (C), (X4).

4. Discussion

In this study; it was appeared that Chitosan play a significant role in skin grafting healing similar with [22] that chitosan accelerate wound healing, as well as controlled the healing because the chitosan shared with other materials to scaffold the wound gap. this findings agreed with [23] and same with [24] who appeared its effect on bone marrow stromal cell osteogenesis and angiogenic factor secretion. Totally the organization of skin grafting healing which showed in chitosan-treated group in rabbits is followed the conclusion of [1] that chitosan, the biodegradable polymer, is enhance wound healing. In conclusion, the application of chitosan as filling the gap under graft can be done successfully in rabbits, despite the fact that Chitosan act as raw fibers in collagen-coated under the skin. Although, the chitosan accelerate healing of the skin grafting as well as it coordinate and controlled the scar formation .

Abstract. Metal complexes Mn(II), Co(II), Cu(II), Zn(II) and Ag(I) of the ligand 1,6-bis(1-benzimidazolyl)hexane were synthesized by the reaction of the ligand and appropriate metal salts in 1:1 mole ratio. The ligand and its complexes were characterized using IR, Uv-Vis, 1H and 13C NMR, Mass spectroscopy, and elemental analysis CHN. Depending on the abovementioned techniques, a polymeric structure was proposed to the prepared complexes. Further, all the synthesized compounds were tested against some of the soil-borne fungi namely; *Rhizoctonia solani*, *Fusarium oxysporum*, *Fusarium solani* and *Pythium aphanidermatum*. The results showed that the tested compounds have an effect on the growth of pathogenic fungi. This leads to thinking that these compounds could be used one day as new chemical pesticides as an alternative to chemical compounds that have been shown to be resistant to pathogens.

Keywords. Benzimidazole, NMR, Metal complexes, *Rhizoctonia solani*, *Fusarium oxysporum*, *Fusarium solani*, *Pythium aphanidermatum*.

1. Introduction

The use of synthetic chemical pesticides is still the most widely used method by farmers in the control of plant diseases. But, unfortunately, over the years and because of the ability of some fungi to develop their resistance, some of these pesticides became inactive and a major problem in agriculture [1]. Despite continuing the research to control the various diseases, many phytopathogens fungi have developed multiple mechanisms of resistance where fungicides are becoming challenged increasingly [2]. At the same time, alternative chemicals pesticides are synthesized, investigated, and then used

successfully to prevent fungal pathogens from growing and spreading in different environments. The introduction of inorganic fungicides such as copper, sulfur, or mercury compounds, followed by organic fungicides such as phthalimides (e.g., captan) dithiocarbamates (e.g., maneb) was the first milestone in the development of fungicide [3]. Many important chemical fungicides used extensively in the last 50 years in the protection of plants such as dicarboximide, benzimidazoles, strobilurin, phenylpyrrole, anilinopyrimidine, Q. respiration inhibitors, and demethylation inhibitors (DMI) [4]. But, over time some of them lost their importance as a result of the resistance of fungi strains [5]. A new class of fungicides was discovered during the 1960s offered curative of plant disease control, ability to longer-lasting protection, and lower application rates. The benzimidazoles were welcomed enthusiastically by farmers and plant pathologists, but the farmers soon reported great resistance to pesticides and large losses in field crops [3].Imidazole, benzimidazole and their metal complexes are exhibited different coordination modes [6] with a wide variety of applications, especially the biological [7-13], and catalytical ones [14-16]. Both copper and sulfur elements are used from the 1940s until present in integrated and organic farming. Only a few years after used them, resistance development in the pathogen fungi and the loss of fungicide activity were observed [5]. Excessive spraying programs of fungicides have resulted in appearing of multi-resistant strains of gray mold fungus Botrytis cinerea in several fields, particularly in strawberry ones [5]. Although quinol oxidation inhibitors (QoIs) are the most successful in fungicides, it was proved that they were resistant to fungi through mutations in the cytochrome b gene CYTB in some fungi pathogens [17]. To produce high-quality and quantitatively yield crops, researchers should provide optimal growth conditions for plants and protected from damage caused by pests, including insects, weeds, and fungi pathogens. Also, it is necessary to find new active compounds against the pests, at least at the moment. Therefore, this study aimed to use some synthetic compounds for the first time in the control of plant diseases caused by some soil-borne fungi. It is worth to be mentioned that the tested fungi are causing significant economic losses. In the present study, new transition metal complexes derived from the ligand 1,6-bis(1-benzimidazolyl) hexane were synthesized. The ligand and its complexes are tested against some soil-borne fungi namely *Rhizoctonia solani*, *Fusarium oxysporum*, *Fusarium solani* and *Pythium aphanidermatum*. According to the results obtained, we think that these compounds could be used as alternatives for chemical pesticides after more studies and experiments.

2. Materials and Methods

2.1. Materials and Instrumentations

All the chemicals used in the present work were purchased from commercial sources and used as it is without further purifications processes. 1H and 13C NMR spectra were recorded using Bruker UltraShield TM 500MHz spectrometer, Switzerland in d6-DMSO. Dionex Ultimate 3000 spectrometer, Germany, was used to record the mass spectrum of the ligand. The abovementioned techniques are available at School of Chemistry, University of Leeds, UK. CHN analysis was carried out using Euro EA elemental analyzer CHNS, EA3000 analyzer, Germany. Infra-Red spectra were recorded using a SHIMADZU spectrometer, Japan, on potassium bromide disks in the range 4000-400 cm-1. These techniques are available at the department of chemistry- College of science, Al-Mustansiriyah University, Baghdad, Iraq. Furthermore, the spectrophotometer Sp-3000 nano OPTIMA, South Korea, was used to record uv-vis spectra in the range 200-800 nm, which is available in the department of chemistry- college of science- University of Wasit, Iraq.

2.2. Synthesis

2.2.1. Synthesis of the ligand 1,6-bis (1-benzimidazolyl) hexane

The method used in synthesis of the ligand 1,6-bis(1-benzimidazolyl)hexane is described in our previous works [18, 19], except using of 1,6-dibromohexane instead of 1,4-dibromobutane. The resulted light beige precipitate was left standing for 2 hrs, then filtrated, washed with plenty of distilled water and dried at room temperature. The yield percentage was 95 %. Anal. Cal. For $C_{20}H_{22}N_4$: C, 75.44; H, 6.96; N, 17.60 %, found: C, 75.12; H, 7.18; N, 17.43 %. IR: ν(C-$H_{aromatic}$): 3091-3043 cm^{-1}, δ(C-$H_{aromatic}$): 767-634 cm^{-1}, ν(C-$H_{aliphatic}$): 2933-2852 cm^{-1}, ν(C=C): 1496-1670 cm^{-1}, ν(C=N): 1506 cm^{-1}. 2.2.2. Synthesis of the metal complexes

2.2.2.1. General method

To a solution of the ligand 1,6-bis(1-benzimidazolyl)hexane prepared by dissolving 1 mmol in 10 ml of ethanol, 1 mmol of the appropriate metal salts dissolved in 10 ml of ethanol was added dropwise. The resulting mixture was heated with stirring for 1 hr at ≈ 60 oC. The obtained precipitates were filtered and washed with fresh ethanol and distilled water and left to dry at ambient temperature

2.2.2.2. Synthesis of Mn (II) Complex

The complex was prepared by the reaction of the ligand with $MnCl_2.2H_2O$. The reaction produced the complex as a white precipitate with a yield of 74 %. Anal. Cal. for $(C_{20}H_{22}Cl_2MnN_4)_n$ (H_2O): C, 51.96; H, 5.23; N, 12.12 %, found: C, 51.32; H, 5.47; N, 11.83 %. IR: ν(C=N): 1492 cm^{-1}.

2.2.2.3. Synthesis of Co (II) Complex

The complex was prepared by the reaction of the ligand with $CoCl_2$. The reaction produced the complex as a blue precipitate with a yield of 69 %. Anal. Cal. for $(C_{20}H_{22}Cl_2CoN_4)_n$: C, 53.59; H, 4.95; N, 12.50 %, found: C, 53.41; H, 5.11; N, 12.39 %. IR: ν(C=N): 1494 cm^{-1}.

2.2.2.4. Synthesis of Cu(II) Complex

The complex was prepared by the reaction of the ligand with $CuCl_2$. The reaction produced the complex as a light-green precipitate with a yield of 66 %. Anal. Cal. for $(C_{20}H_{22}Cl_2CuN_4)_n$: C, 53.04; H, 4.90; N, 12.37 %, found: C, 53.22; H, 5.08; N, 12.15 %. IR: ν(C=N): 1468 cm^{-1}. IR: ν(C=N): 1494 cm^{-1}.

2.2.2.5. Synthesis of Zn(II) Complex

The complex was prepared by the reaction of the ligand with $ZnCl_2$. The reaction produced the complex as a white precipitate with a yield of 76 %. Anal. Cal. for $(C_{20}H_{22}Cl_2ZnN_4)_n$: C, 52.83; H, 4.88; N, 12.32 %, found: C, 52.52; H, 4.94; N, 11.96 % IR: ν(C=N): 1494 cm^{-1}. ^{1}H NMR (DMSO-d^6, 500M Hz): δ 1.217 (t, 4H, 2×CH_2), 1.749 (m, 4H, 2×CH_2), 4.281 (t, 4H, 2×CH_2-N), 7.271-7.333 (m, 4H, 2×Ar-H), 7.646 (d, 2H, 2×Ar-H), 7.824 (d, 2H, 2×Ar-H), 8.455 (s, 2H, NCHN). ^{13}C NMR (DMSO-d^6, 125 MHz): δ 25.35 (CH2), 28.89 (CH2), 44.41 (CH2-N), 111.06, 118.71, 122.52, 123.15, 133.15, 141.14 (Ar-C), 144.45 (NCHN) ppm.

2.2.2.6. Synthesis of Ag(I) Complex

The complex was prepared by the reaction of the ligand with $AgNO_3$. The reaction produced the complex as a light-grey precipitate with a yield of 72 %. Anal. Cal. for $(C_{30}H_{33}AgN_6)_n(NO_3)_n$: C, 55.65; H, 5.14; N, 15.14 %, found: C, 55.37; H, 5.31; N, 15.02 %. IR: ν(C=N): 1495 cm^{-1}. ^{1}H NMR (DMSO-d^6, 500M Hz): δ 1.203 (t, 4H, 2×CH_2), 1.734 (m, 4H, 2×CH_2), 4.261 (t, 4H, 2×CH_2-N), 7.293-7.303 (m, 4H, 2×Ar-H), 7.625 (d, 2H, 2×Ar-H), 7.80 (d, 2H, 2×Ar-H), 8.426 (s, 2H, NCHN). ^{13}C NMR (DMSO-d^6, 125 MHz): δ 25.33 (CH2), 28.69 (CH2), 44.38 (CH2-N), 110.86, 118.59, 122.50, 123.19, 133.11, 141.15 (Ar-C), 144.47 (NCHN) ppm.

2.3. Pathogen fungi materials

The pathogens soil-borne fungi *R. solani*, *F. oxysporum*, *F. solani*, *P. aphanidermatum* isolates were obtained from the field crops department, College of Agriculture, Wasit University, Iraq and maintained and cultured on autoclaved potato dextrose agar (P.D.A) medium (200 g peeled potato, 20 g dextrose, 15 g agar to 1 liter distilled water) in the dark at 25±2°C. The laboratory experiments were conducted in the microbiology laboratory of field crops department in the winter season of 2019.

2.3.1. In vitro inhibition of mycelia length growth

To determine the effects of the tested compounds on mycelial length growth of pathogens fungi in dual-culture techniques, 0, 10, and 20 ppm of each compound were added as 1-20 ml to Petri dish contain molten P.D.A media (40˚C ± 2˚C) (autoclaved at 121°C 15 psi for 30 min) separately, and mixed properly prior to plating. One mycelium of 5-mm of each pathogen was inoculated at the center of each Petri dish, separately. For the control, a set of plates was inoculated similarly, but with the pathogen only. Three replicate dishes per fungus strain with each concentration combination were set up and incubated at 25˚C ± 3˚C for 6 days. The radial mycelial growth of the pathogens (measured in centimeters) was assessed after 6 days, and the percent mycelial growth inhibition of each pathogen was calculated using the following growth inhibition equation:

Percent inhibition = R - r / R x 100

Where R (a control value) represents the radial growth of fungus pathogen in control sets, and r is the radial growth of the fungus in sets with tested compounds.

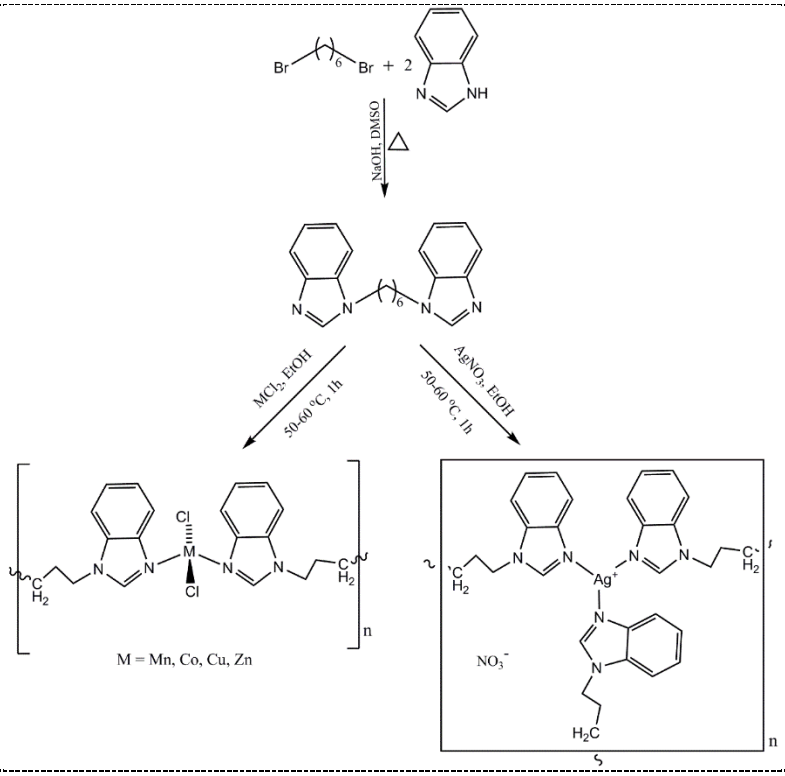
2.4. Statistical analysis

GenStat software was used to analyze the significant differences between different treatments using least significant difference (LSD) tests and the means ($P < 0.05$).

3. Results and Discussion

3.1. Synthesis and Characterization

In the synthesis of the ligand 1,6-bis(1-benzimidazolyl)hexane, an equimolar of benzimidazole and NaOH were reacted in DMSO at 80-90 °C for 2 hr. After cooling the mixture to about 40 °C, a half equivalent of 1,6-dibromohexane was added with constant stirring for more 2 hr. Then, the resulted mixture was poured into cooled distilled water to give instantly the product as an off-white precipitate which was filtered and washed with plenty of distilled water and left to dry at ambient temperature. For the complexes, an equimolar of ethanolic solution of the ligand and appropriate metal salt was heated with stirring between 50-60 °C for about 1 hr. The resulted precipitates were filtered, washed with fresh ethanol and water and left to dry (Scheme 1).



Scheme 1. Synthesis of the ligand and its metal complexes.

FT-IR spectrum of the ligand showed different bands at the range 3091-3043 cm^{-1}. These bands can be assigned to the stretching of aromatic C-H bond and to the vibration of benzimidazole ring. The bending of same groups appeared at the range 767-634 cm^{-1}. The stretching of aliphatic groups appeared at the range 2933-2852 cm-1, while the starching of C=C bond appeared at the range 1670-1496 cm-1. Last but not least, a characteristic band of ν(C=N) of benzimidazole is appeared at 1506 cm^{-1}. It is worth to be mentioned that most of the abovementioned bands are appeared too in complexes spectra, but in different positions or shapes or intensities. Particularly, the stretching vibration of benzimidazole ν(C=N) which shifted to lower frequency in all complexes (Figures 1 and 2). These changes assigned to the coordination of tertiary nitrogen in azoles with the metal ions [20-22].

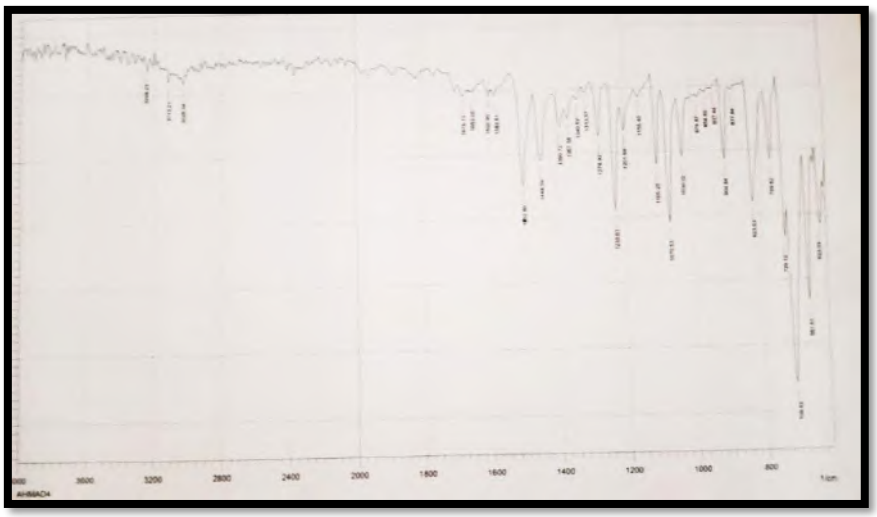


Figure 1. IR spectrum of the ligand.

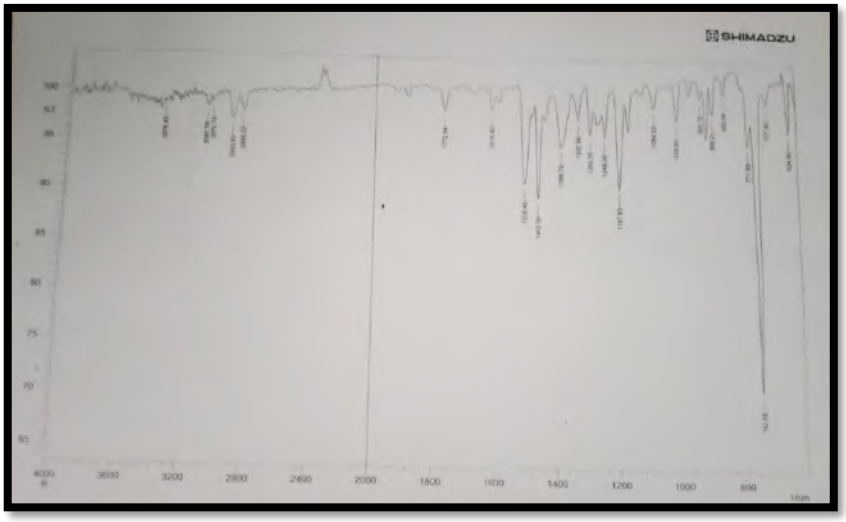

Figure 2. IR spectrum of Mn^{+2} complex.

In uv-vis spectra, the free ligand showed a broad band with two shoulders in the range 250-300 nm. These peaks are belongs to the transitions n→π* and π→π*, respectively. In complexes spectra, the mentioned peaks are slightly shifted to higher wave length, which is another evidence for complexation with metal ions [19]. ^{1}H and ^{13}C NMR spectra for the ligand and their Zn(II) and Ag(I) are recorded in DMSO-d^{6}. In the ^{1}H NMR spectrum, the ligand showed the characteristic signals which consistent with its proposed structure. The signals at δ 1.242, 1.738 and 4.181 are belongs to (-CH_2-), (-CH_2-) and (-CH_2-N), respectively (Figure 3). The signals of the benzimidazole appeared in the range δ 7.159-7.627. Further, the signal of the proton (NCHN) is appeared as singlet at δ 8.179. In the ^{13}C NMR spectrum (Figure 4), the signals appeared at δ 25.54, 29.15 and 43.91 are assigned to the carbon of (CH_2), (CH_2) and (CH_2-N), respectively. The signals of fused benzene ring appeared at δ 110.31, 119.37, 121.35, 122.18, 133.74, and 143.37. Last but not least, the signal appeared at δ 143.93 is belongs to the carbon of (NCN) group.

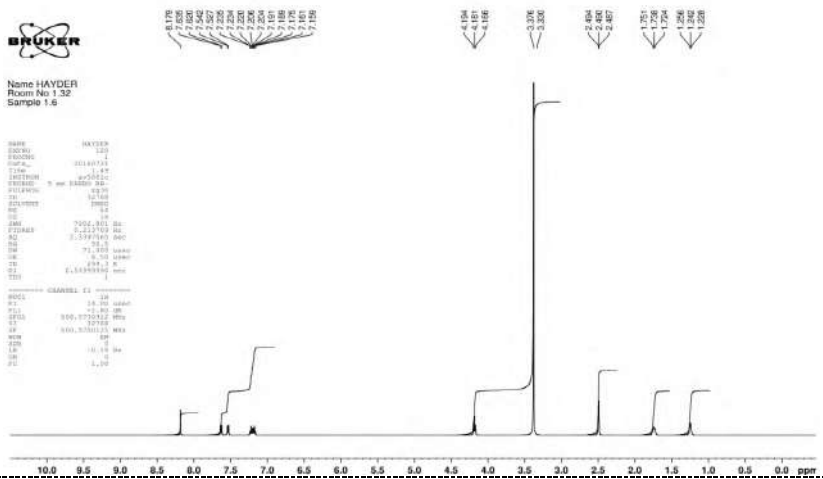

Figure 3. ^{1}H NMR spectrum of the ligand.

In Zn(II) and Ag(I) complexes, the signal of (NCHN) proton in benzimidazole is appeared at δ 8.455 and δ 8.426, respectively (Figure 5). While, the carbon signal of (NCN) is appeared at δ 144.45 and δ 144.47, respectively. Depending on the references, the observed shifting is a good signal for the coordination with metal ions [20, 22]. Unfortunately, no NMR spectra have been recorded for other

complexes due to their paramagnetism. Mass spectroscopy also confirmed the molecular weight of the synthesized ligand [M+] = 319.198 which is in fully agreement with the calculated theoretically (Figure 6).

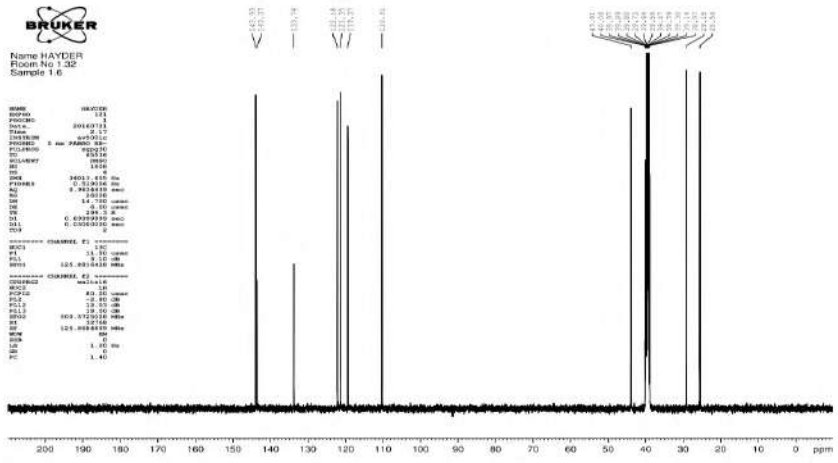

Figure 4. ^{13}C NMR spectrum of the ligand.

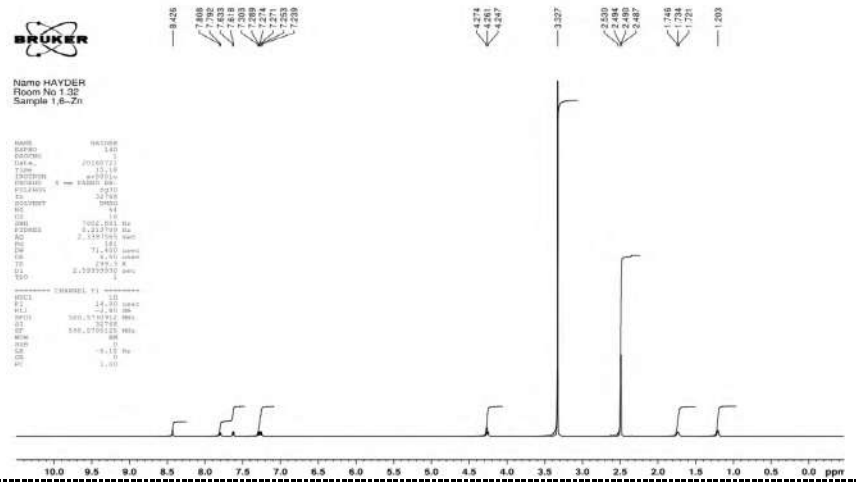

Figure 5. ^{1}H NMR spectrum of the Zn(II) complex.

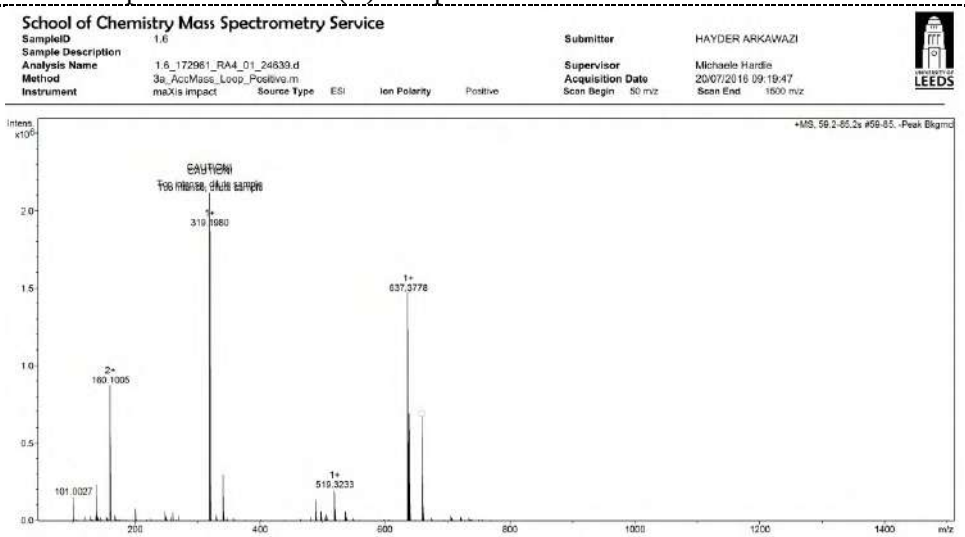

Figure 6. Mass spectrum of the ligand.

3.2. Antifungal activity

To maintain the increase of agricultural production, new possible fungicides should be diagnosed and deeply studied to know their antifungal activity. So, this study aimed to evaluate the efficiency of some new compounds towards some pathogenic fungi. The results obtained in the present study are shown in Tables (1-4). It is clear that the radial growth of all fungi was adversely affected by the tested compounds. Also, it was shown that the inhibitory effect on the growth of mycelium fungi was increased with increasing of concentrations from 10 ppm to 20 ppm of all compounds. Amongst the tested compounds, Cu^{+2} complex proved to be the most effective against all pathogens fungi with 100% inhibition in radial growth at 20 ppm.

Table 1: reveals that the R. solani fungus was affected with all tested compounds, with highest reduction in fungal growth at 20 ppm which was 100%, while, it was 64.44% at 10 ppm. On the other hand, for the tested compounds, Co^{+2} complex caused the highest reduction in growth 46.33 and 90.0 % at 10 and 20 ppm, respectively.

Compounds	Growth of *R. solani*					
	0 ppm		10 ppm		20 ppm	
	Growth rate cm	% inhibition	Growth rate cm	% inhibition	Growth rate cm	% inhibition

L.S.D	NS	NS	1.33	4.79	0.65	6.25

*Each number represents three replicates

In case of *F. oxysporum* (Table 2), Cu+2 complex again showed the highest inhibition of mycelial growth with 76.67% at 10 ppm and 100% at 20 ppm. While, the ligand showed the lowest inhibition with 9.5 % and 31.10 % at 10 ppm and 20 ppm, respectively. Co^{+2} and Zn^{+2} complexes showed inhibition of 36.11 and 48.89% at 10 ppm, whereas at 20 ppm, they showed 87.75 and 85.0%, respectively.

Table 2. Effect of different concentrations of the compounds on the growth of Fusarium oxysporum

Compounds	Growth of *F. oxysporum*					
	0 ppm		10 ppm		20 ppm	
	Growth rate cm	% inhibition	Growth rate cm	% inhibition	Growth rate cm	% inhibition

L.S.D	NS	NS	2.11	6.13	0.78	9.65

*Each number represents three replicates

The inhibitory effect of the compounds on the mycelial growth of *F. solani* isolate are shown in Table 3. In general, all the tested compounds showed more than 50% mycelial growth inhibition at a concentration of 20 ppm. Significantly, Cu^{+2} and Co^{+2} complexes were the most effective than others, showing 100% growth inhibition. While, Ag+ and Mn+2 complexes showed 86.22 and 82.22 % growth inhibition at the same concentration. At 10 ppm, the inhibitory effect of the compounds was ranging from 23.71% to 65.00%.

Table 3. Effect of different concentrations of the compounds on the growth of *Fusarium solani*.

Compounds	Growth of *F. solani*					
	0 ppm		10 ppm		20 ppm

L.S.D	NS	NS	1.56	7.78	1.02	6.81

*Each number represents three replicates

Presented data in Table 4 reveals that tested *P. aphanidermatum* fungus was also affected with all compounds. Again, Cu^{+2} and Co^{+2} complexes were the most effective compounds, showing 100% growth inhibition, followed by Mn+2 where growth inhibition of pathogen reached 93.67% at 20 ppm. The ligand was the least effective one, showing 30.33 and 63.56% growth inhibition at 10 ppm and 20 ppm, respectively. Generally, the inhibitory effect of compounds increased as the concentration increased from 10 ppm to 20 ppm, showing more than 50% growth inhibition for the fungus pathogen.

Table 4. Effect of different concentrations of the compounds on the growth of *Pythium aphanidermatum*.

Compounds	Growth of *P. aphanidermatum*					
	0 ppm		10 ppm		20 ppm	
	Growth rate cm	% inhibition	Growth rate cm	% inhibition	Growth rate cm	% inhibition

Mn^{+2} complex	9.00	0	3.62	59.78	0.57	93.67
Co^{+2} complex	9.00	0	1.45	83.89	0	100
Cu^{+2} complex	9.00	0	1.11	87.67	0	100
Zn^{+2} complex	9.00	0	5.83	35.22	3.37	68.30
Ag^{+} complex	9.00	0	2.84	68.44	0	100
L.S.D	NS	NS	1.17	13.81	0.64	5.06

*Each number represents three replicates.

These results are consistent with [23] reported that the tested concentrations of 12.5, 25, 50 and 75 ppm of six fungicides of Techigaren 30%, Monceren 25%, Hymexate 30.0%, Moncut 25%, Topsin M70% and Aracur 72.7% led to significantly inhibition of mycelial growth of *R. solani* and *F. solani* isolates in Potato dextrose agar (PDA) medium. Godswill and co-workers [24] were determined the antifungal of two synthetic fungicides (SF1) and (SF2), at different doses against *F. oxysporum* and *P. microspora*. One of the tested compounds (SF1) showed 100% inhibition against both fungi, while

SF2 was less effective at all doses. Three pesticides Benomyl (fungicide) and Karate (insecticide) Galex (herbicide) were lead to significant inhibition, and reduction of mycelial weights of growth of some fungi, *Aspergillus flavus*, *Fusarium oxysporum* and *Fusarium monilliforme* at 0, 100, 200, 400 and 500 mg L -1 rate [25]. [26] studied several fungicides including carbindazim (BCM) for inhibiting the growth of *S. sclerotiorum* fungus, where the percentage of inhibition reached 100% when adding different concentrations of the fungicide from 50, 100, 200, 500 and1000 ppm. Youssef et al [27] reported ability of some chemical to reduce the mycelium growth of *S. sclerotiorum*, the colony diameter of fungus inhibited by 100% at 8 days after being treated with 0.1 % SA and prevented formation of new sclerotia until 21.

4. Conclusion

The ligand 1,6-bis(1-benzimidazolyl) hexane and its respective metal complexes Mn(II), Co(II), Cu(II), Zn(II) and Ag(I) are synthesized and characterized. Depending on the results obtained in this work and the literature, a polymeric structure was proposed for the synthesized complexes. Furthermore, the ligand and its complexes are tested against some soil-borne fungi namely; *Rhizoctonia solani*, *Fusarium oxysporum*, *Fusarium solani* and *Pythium aphanidermatum*. In general, all the tested compounds showed an activity against the studied pathogens. Significantly, Cu^{+2}, Co^{+2} and Mn^{+2} complexes were the most effective on mycelial growth of soil born fungi pathogen isolates. The effective compounds acts as anti-fungal agents and inhibits their growth possibly because they negatively affect the metabolic process of these pathogenic fungi.

Abstract. *Trogoderma granarium* Everts (Khapra beetle) is a serious pest of stored barley and wheat worldwide. The current research evaluates the efficacy of local isolates of *Meterhizium anisopliae* and *Beauvaria bassiana* compared to an imported isolates when khapra larvae sprayed with concentration of later isolates under laboratory condition, mortalities were recorded for more than two weeks after treatment. Results demonstrated that the larvae were more susceptible to the local isolates of the two fungi than the imported isolates. Cumulative mortalities were 86.67 and 50 when larvae sprayed with 10^9 conidia/ml of local and imported isolates of *M. anisopliae* respectively, and 86.67 and 66.67 when larvae sprayed with 10^9 conidia/ml of laocal and imported isolates of *B. bassiana* respectively after two weeks. The findings of the current study clearly showed that the local isolates caused higher mortalities than the imported one so they may be used as a good candidates for pragmas of integrated pest management of stored grain pests.

Keywords. *Meterhizium anisopliae*, *Beauvaria bassiana*, *Trogoderma granarium*, Larvae, Barely.

1. Introduction

Khapra beetle, *Trogoderma granarium* Evert (Coleoptera, Dermastidae) is a serious pest of stored grain product especially under warm dry condition, it is considered to be one of the worst invasive pests worldwide [1]. Weight losses and damage by sever infesting can be up to 30% and in extreme cases 73% [2]. Grains that heavily infested become unpalatable and unmarketable by consumers, high infestation by khapra beetles reduces content of fats, sugar protein and carbohydrates, of the grains along with increase of level of uric acid [3]. Moreover this pest was responsible for health problem for man like asthma and dermatitis caused by its skin [4]. Khapra beetle undergoes five larval instars and the development period for these instars may range between 30-50 days depending on relative humidity and temperature of storage conditions, but under un adversed conditions these larvae may enter into diapause where it may molt but does not feed while keep inactive, and larval period prolonged up to four years, therefore the infested food products are vulnerable to their attack, the

diapaused larvae are tolerant to common insecticides and other control methods that are very effective against other pests of stored grains [5, 6]. Fumigations the stored products by methyl bromide was the most promising way against khapra beetle since it acts as suffocating against. Killing the insects by blocking its breathing. Recent studies reveled that methyl bromide was a major ozone depleting agent there for many countries minimize its usage under strong controlled conditions [7]. Previous concerns led to look out for other alternate ways to control khapra beetles such as biological control methods [8]. Controlling khapra beetles by using predators such as *Xylocoris flavipes* (Hemiptera: Anthocoridae) had been studies [9]. Potential of the larval parasitoid *Anisopteromalus calandra* (Hymenoptera: Pteromalidae) and *Laelius pecdatus* (Hymenoptera: Bethylidae) to control larvae of khapra beetles in cereal had been studied [10, 11]. Entomopathogenic agents such as bacteria and fungi investigated to control this pest, [12] reported that the *Bacillus thuringiensis* was very effective against larvae of khpra beetles. Entomopathogenic fungi were applied and used to control many pests, one of them khapra, since these fungi infects the insect topically (by contact) then it penetrates its cuticle and kills it by the toxins and enzymes that they secret inside the insects body, so these fungi considered to be a good alternatives to control these pests [13]. Moreover entomopathogenic fungi are specific to the hosts that they infected, therefore they have no effect on mammalian animals and fishs since it is a natural enemies of insects [14]. Many species of entomopathogenic fungi such as *Meterhizium anisopliae*, *Beauvaria bassania* and *Isaria farinosa* were known to be good natural enemies of many species of stored grain pests, there for these fungi seem to be the most promising and native strategy to control these pests, especially they are available and registered for using and commercially produced. It is safe to treat the grains directly without any decreasing of its quality and marketability [15]. The aim of this study is to examine the efficacy of *M. anisopliae* and *B. bassiana* (Two isolates of each one introduced while the other local) against the larvae of *T. granarium* under lab conditions.

2. Materials and Methods

2.1. Rearing of rest insects

Infested barely with *T. granarium* (one Kg) was brought from the local market to the laboratory of entomology in Department of Biology, College of Education for Pure Science (Ibn-Al-Haitham) at September 2018, fifty adult beetles were collected than added to a sterilized plastic jar (1L) containing 500 gm of sterilized barely, two replicates were done, Jars kept in an incubator at 30±5C° and 50±5% relative humidity. The emerged second-third instar larvae of *T. granarium* was used for the later experiments, adults beetles were identified by Iraqi natural history museum, University of Baghdad [16].

2.2. Entomopathogenic isolates and preparation of fungal suspensions

Two isolates of each *M. anisopliae* and *B. bassiana* were examined against *T. granarium* larvae each of fungus were isolated from soil of Baghdad area and marked as a local isolate, so we have two local isolates one is the a local isolate of *B. bassiana* and the other is a local isolate of *M. anisopliae*. The other fungus isolate was marked as imported by Agricultural research center-Ministry of Science and Technology so we have two imported isolates, one of them *B. bassiana* imported isolates and the other *M. anisopliae* imported isolate. All isolates (The four isolates) were cultivated and suspension concentrations (10^7, 10^8, 10^9 conidia/ml) were prepared as in [16].

2.3. Bioassays

Ten larvae of *T. granarium* were placed in a petri dish, then sprayed topically by hand sprayer with two ml of each fungal suspension sprayed, larvae transferred to another petri dish containing 10 gm of

sterile barely grins. Three replicates of each of the three concentration, for the four fungal isolates were done for control treatment larvae were spread with sterile distilled water with tween-20 (0.01%). Experimental petri dishes kept in an incubator at 28±2C° and 55% relative humidity [17]. Larvae were monitored every 24 hr to record number of dead insects, and photographed them by camera fitted with a simple microscope (Dissecting). Cumulative mortality were calculated.

2.4. Statistical analysis

Percentages of mortalities were recorded and corrected according to Abott's equation [18]. Subsequently SAS was used to analyze the data which show the sensitivity of the concentrations of the fungal isolates in larvae mortalities [19]. The significant differences were compared between mean and least significant differences.

3. Results and Discussion

Insects infected by many kinds of pathogens, which cause a deadly disease fungi are one of these pathogens, infections may be by a direct contact, after the conidia/spores land on the body wall of the insects they will start to germinate and penetrate forcely through the cuticle into the insects body which kill the insects, in case of the conditions are suitable the fungus start to sporulate and make more spores which continue the infection, finally caused a slowly death to the insects. These fungi can be used as a biological control agents by causing natural epizooties diseases and reduced insects populations [20]. Laboratory assessments of isolates of *M. anisopliae* and *B. bassian* (Imported and local) against *T. granarium* larvae were done under laboratory conditions to decide whether these isolates are good candidates for biological control of *T. grananrium* larvae. Many researches had been done by the local isolates of *M. anisopliae* and *B. bassiana* and proved to be effective against many species of insects [16, 21, 22, 23] . Our study proved that the local isolate of *M. anisopliae* was very effective against larvae of khapra beetles. Table (1) shows that 109 and 108 conidia/ml led to cumulative mortality by 86.67%, and this isolate was more effective than the imported ones which have the concentrations 10^9 and 10^8 conidia/ml led to cumulative mortality by 50 and 26.67% respectively. Figure (1) shows that mortalities depend on time, insects death started after about four days of treatment since the fungus takes time to penetrate through the body wall of the larvae and invade the cavities of its body, producing hyphal mass and many kinds of toxins and secondary metabolites such as Destruxin, conidial growth demonstrated that the larvae died by the fungus which appeared greenish (Figure 2).

Table 1. Cumulative mortalities of *Trogoderma granarium* larvae sprayed by concentrations of *Meterhizium anisopliae* (Imported and local isolates).

Concentration Conidia/ml	Cumulative mortalities %	
	Imported isolate Mean%±S.E	Local isolate Mean%±S.E
Control	3.33±3.33	3.33±3.33
10^7	10.00±0.00	56.67±8.81
10^8	26.67±12.02	86.67±6.67
10^9	50.00±5.77	86.67±3.33

*S.E.: Standard error.

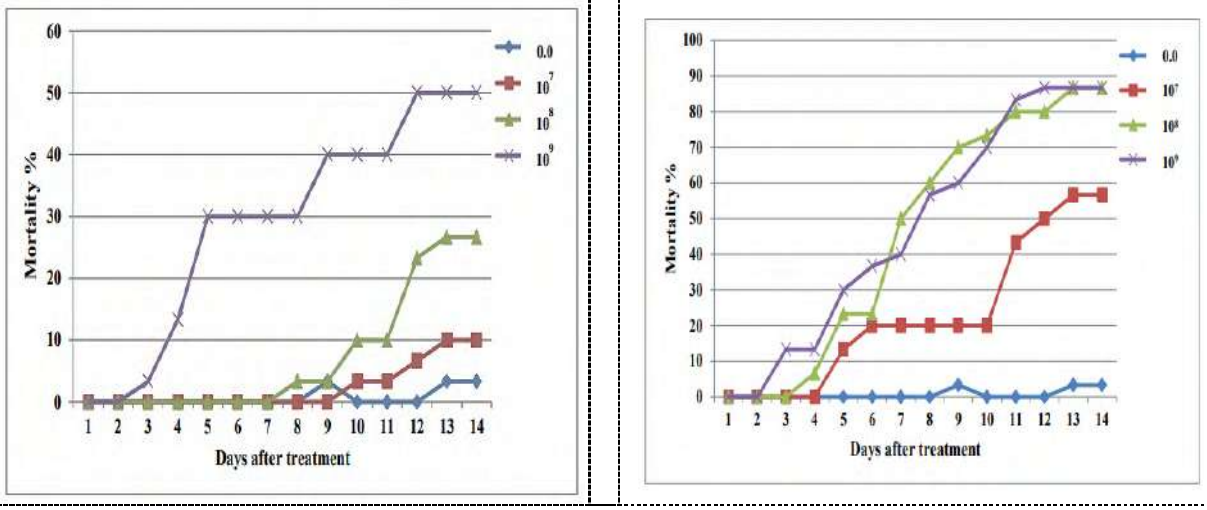

Figure 1. Mortality percentage mean of *Trogoderma granarium* sprayed by *Meterhizium anisopliae* days after treatment (A: Imported isolate ; B: Local isolate).

Figure 2. Postmortal mycelia and fungus growth on *Trogoderma granarium* infected by *Meterhizium anisopliae* (A: Imported isolate ; B: Local isolate).

Since *M. anisopliae* had known to cause the green muscardin disease. The current finding of our study confirm with [23] who proved that the some local isolate of *M. anisopliae* was effective against *Chrysomya megacaphalo* larvae. Similar result was reported by [16] when they revealed that the same local isolate of *M. abisopliae* was very effective against Tribolium castanum adult and 10^9 conidia/ml caused 80% cumulative mortality after about two weeks and they revealed that the local isolate was more effective than the imported isolate. Another research had proved that the local isolates very effective against pest of storage grain, [24] proved that Iranian isolates of *M. anisopliae* were effective against *T. castanum* and *Oryzaephilus surinamensis* when they evaluated these isolates through bioassays and found that 8.5×107 conidia/ml of one of these isolates led to 77.8% mortality percent of *O. surnamensis* and 89.9% mortality percent of *T. castanum* after ten days. The final finding of our study about *M. anisopliae* is that the local isolate was more effective against larvae of *T. granarium* than the imported isolate so it may use as a promising microbial against to control this pest. *B. bassiana* was known to be one of the most effective entomopathogenic fungi since it has high ability to infect and kill as host of many different insect species, our finding listed in Table (2) shows that 10^9 conidia/ml of the imported and local isolates led to 66.67 and 96.67 respectively as accumulative mortality percent when *T. granarium* larvae were sprayed with, after about two weeks (Figure 3), these results refer that the local isolate was more effective than the imported isolate against the larvae.

Dead larvae appeared distorted and growth of fungal hyphae spinning above then and their bodies were covered with white fungal growth (Figure 4).

Table 2. Cumulative mortalities of *Trogoderma granarium* larvae sprayed by concentrations of *Beauvaria bassiana* (Imported and local isolates).

Concentration Conidia/ml	Cumulative mortalities %	
	Imported isolate Mean%±S.E	Local isolate Mean%±S.E
Control	10.00±0.00	10.00±0.00
10^7	46.67±12.02	46.67±6.67
10^8	60.00±0.00	50.00±15.28
10^9	66.67±15.28	86.67±6.67

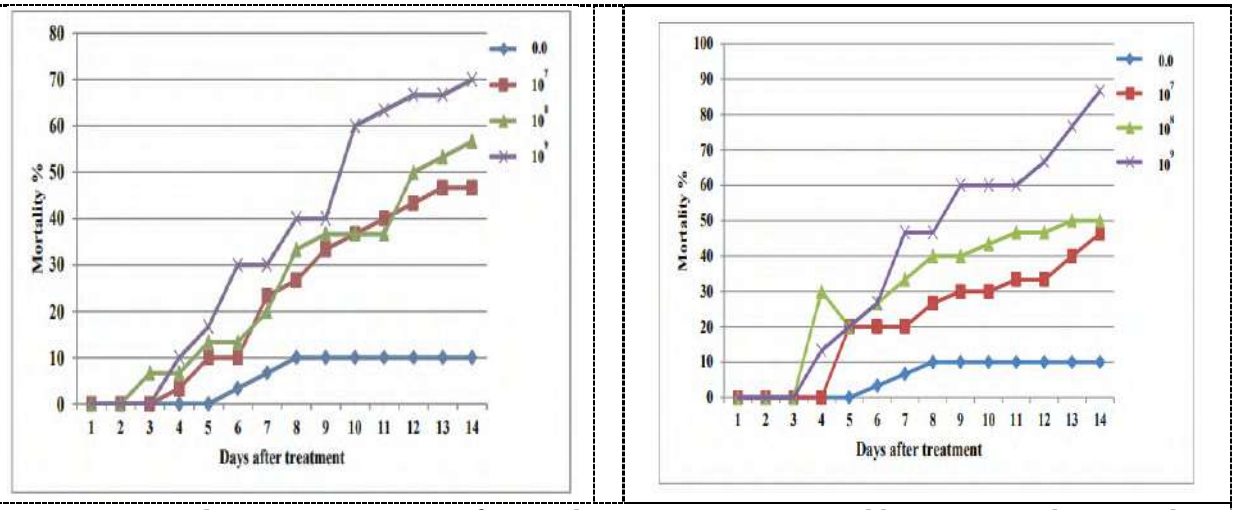

Figure 3. Mortality percentage mean of *Trogoderma granarium* sprayed by *Beauvaria bassiana* days after treatment (A: Imported isolate ; B: Local isolate).

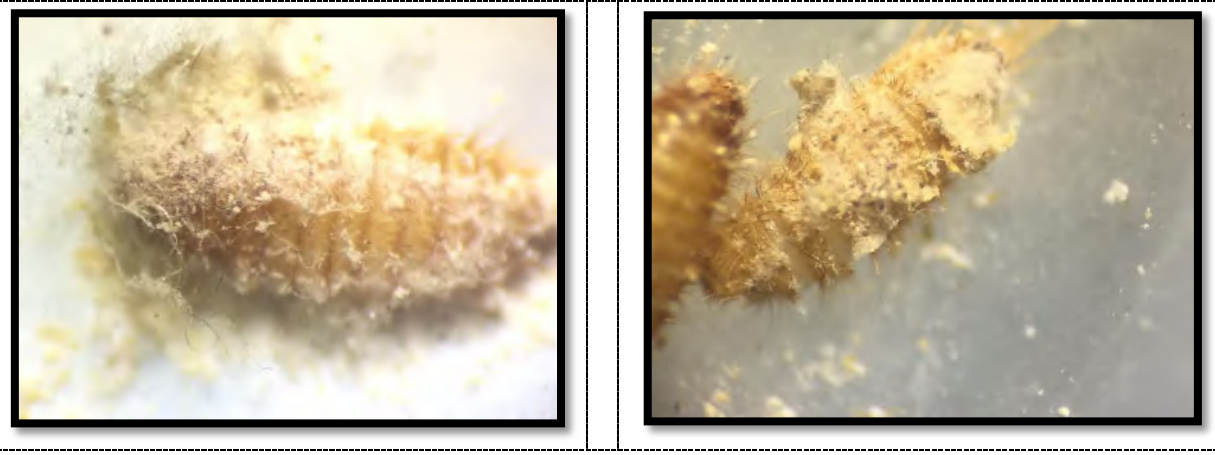

Figure 4. Postmortal mycelia and fungus growth on *Trogoderma granarium* infected by *Beauvaria bassiana* (A: Imported isolate ; B: Local isolarte).

These results were in a good agreement with those of [21, 22]. Also these results agreed with [25] who revealed that the treatment of larvae of *Agrotis ipsilon* with a concentration of *B. bassiana* (2×10^8 conidia/ml) led to mortalities after one week and hyphal fungi emergence from dead larval bodies, after 10-13 days. Mortality rates of the treated larvae were attributed to the growth of the fungus inside

the insect body which was accompanied by secretion of toxin and enzymes that finally led to destruction and decaying the host body, the most effective enzyme of the fungus were protease and chitinase which analyzed the insects body and allowed the fungus to enter inside the larval body, then the fungus started to grow inside the insects hemocole. Some toxins such as Beauverien was secreted by the fungus, followed by a growth of hyphae outside the dead insect body that carry spores/conidia of the fungus, which considered to be source of infection [26]. The present findings are in line with [27] who revealed that local isolates of entomopathogenic fungi *B. bassiana* and *M. anisopliae* which recovered from samples of soil fields (Crops, Orchards and Vegetables) were very effective against *Rhynchophorus ferrugineus*, therefore these isolates would be the most promising biocontrol agent against *R. ferrugineus* which is a serious date palm orchard pest. Similar results recorded by [28] who assessed five Iraqi isolates of entomopathogenic fungi including *B. bassiana* against *T. granarium* larvae, found that the younger larval instars were more susceptible to the fungus than the last larval instar and adult, and mortalities percentages were recorded after 10 days post treatment, these results demonstrate that these isolates (*B. bassiana*) have a good potentials biological control agent against larvae of *T. granarium*. Further investigations are required to determine the virulence of the local isolates which may be play an important role for the safer management of pests that attack stored grains since it is environment friendly agents instead of chemical insecticides.

4. Conclusion

This study shows higher susceptibility of *T. granarium* larvae to the tested concentration of the local isolates of *M. anisopliae* and *B. bassiana* than the imported isolates. Thus they can be used as promoting biocontrol insecticides agents in terms of practical application that verified from similar studies

Diversity of Mollusca in some sites of Euphrates River

Diversity of Mollusca in some sites of Euphrates River

Feryal Ameen Merza[1*]

[1]Department of Biology, Faculty of Sciences, Kufa University, Iraq.

*E-mail: firyala.hussein@uokufa.edu.iq

Abstract. This investigation of molluscs was carried out at some sites on the river of the Euphrates. Samples of molluscs were collected monthly from June 2019 to November 2019. Fourteen species were investigated which belonged to two Classes: Bivalvia (three species) and Gastropoda (eleven species). The species *Corbicula fluminalis*, *Pisidium dubium*, *Melanoides tuberculata*, *Physa acuta*, *Gyraulus convexiusculus*, and *Gyraulus intermixtus* seemed in all sites. According to the index of Shanon-Weiner, species diversity ranged from 0.5 to 2.5 bits/individual. Index of Jaccard's similarity showed that the highest similarity was recorded between site one and site two with 60 %.

Keywords. Molluscs, Taxa, River, Euphrates.

1. Introduction

Molluscs is variable and distributed phylum in the kingdom of the animal. Their members are the heights in animals phyla behind the Arthropoda, about 85,000 existing species are renowned [1]. Fossil species are appraised between 60,000 and 100,000 species [2]. The percentage of undescribed species is great, although many taxa endure languidly studied [3]. Mollusca are the biggest number of creatures of marine phyla, involving around 23% of total marine creatures. Various members likewise live in non-salty waters. Some molluscs are utilized like bioindicators to observe the health of locations in waters, as they are characteristic of the setting where they are sampled or place because they are sessile. [4]. Molluscs contains only two classes viva in freshwater, while other classes viva in salty waters. There are several surveys concerning molluscs in Iraq, as [5] studied two species in Shatt Al-Arab. [6] investigated 20 species for the first time in Gharaf River, while [7] identified 10 taxa in Kufa river. The local studies are so significant to investigating mollusca in Iraq.

2. Materials and Methods

Three sites in the river of Euphrates were selected: Site one established (after passing the river along Hindiya barring city), site two sited (after passing the river sideways city of Hindiya), and site three sited around 2500 m away from site two. Monthly, three replicates were handling from every site from June to November 2019 via Ekman Dredge, and they were conserved in four percent of Formalin, and then calculated and recognized via using a compound microscope. The molluscs member were identified via the keys of classification [8, 9, 10, 11]. Shanon-Weiner index and Jaccard equation were

calculated as described in [12, 13] respectively, while calculation of relative abundance index was depending on [14].

3. Results and Discussion

Table (1) displays the taxa of molluscs identified throughout the period. Fifteen taxa were recognized in this investigation. They were categorized into two classes: Bivalvia which contained three families and four taxa, and Gastropoda which contained ten families and eleven taxa. The number of taxa in class (Gastropoda) was higher than in taxa in (Bivalvia), this agrees with the earlier studies as [6, 7]. Among taxa, *Corbicula fluminalis*, *Pisidium dubium*, *Melanoides tuberculata*, *Physa acuta*, *Gyraulus convexiusculus*, and *Gyraulus intermixtus* seemed in all sites. *Melanoides tuberculata* showed abundant species, whereas other species were frequent or rare species. Local investigations displayed that the species of molluscs select moderate waters in its running with a content of organic supplies [15]. The quantity of taxa designated in this research was low. This might be conferred to the inadequate investigated parts or the dissimilarities in the nature in the investigated ecosystems. There are several Iraqi investigations which recorded various numbers of taxa due to differences in investigated aquatic areas. Various strategies of the gathering of taxa and the differences in the taxonomic aspects of connecting with non-diagnosis of some taxonomic levels [16, 17]. [18] identified 17 Mollusca species which live in the Shatt Al-Arab. [19] recorded 13 mollusca in their investigation in Lake of Al-Habbaniyah. Whereas, [7] identified 10 taxa in the river of Al-Kufa. The densities of mollusca ranged between (100-2340) Ind./ m2 in July and September, consecutively (Figure 1). It was exhibited that there was a decrease in densities through summer. Whereas it was exhibited a rise in the mollusca densities through autumn (Table2). The source for that might be the increases of temperate temperature and suitability of the environmental conditions which might be appropriate for its eggs to hatch; likewise, low water levels, current water through autumn might be cause change in densities [20, 21, 22]. Index of Shanon-Weiner presented site one in July was the highest diversity, whereas site one in August was the lowest diversity (Figures 2). If the values of Index of Shannon-Weiner >3 bit/Ind. that designates clean waters and biodiversity was excessive; if the value was <1 bit/Ind appoints contaminated environment that causes decline of some taxa [23]. Index of Jaccared similarity fluctuated between 60% in sites one and two; 42.86% in sites one and three. There were noteworthy numbers of taxa shared among the sites possibly, because of these taxa have the similar source of original environment. In addition to their ability to familiarize in their environment, this reveals the relative conjunction of qualitative conformation of molluscs in the sites (Figures 3).

Diagnostic study to detect toxoplasmosis in some Iraqi sheep

Diagnostic study to detect toxoplasmosis in some Iraqi sheep

Hiba Riyadh Al-abodi[1*]

[1]Department of Environment, College of Science, University of Al-Qadisiyah, Iraq.

*E-mail: hiba.Al-abodi@qu.edu.iq

Abstract. Parasites are cause a lot of important and serious diseases which widespread to peoples and animals all over the world, vector for disease to humans by consumption of meat sheep fresh as liver or not cooked well meat, so in this way the toxoplasmosis in sheep considered one of the causes economic and social damage and important sources of transfer this infection human, for this fact we must value economic and social damage by investigate the incidence of this disease in sheep, and using accurate methods for detection of this infection in blood fluids or tissue of sheep, so in this study we using immunological and molecular methods to detection of the parasite in sheep blood specimens in Al-Shamiya city/ Al-Qadisiyah government/Iraq, the results explained presence that antibodies in 14 samples (14%) below level significant (P≤ 0.05) by using Rapid Test Cassette, while the results depending on (RT PCR) for detection of specific gene of parasite B1 gene in blood specimens showed to (9 of 100)(9%) positive infection results in examined sheep. from these results, we can give simple picture ensured rule the infected sheep in transmission the disease to human although a low percentage of positive infection, presence the disease in sheep indicator to role sheep to transfer the disease to the human an achieved the economic and social damage.

Keywords. Toxoplasmosis, sheep, R.T PCR.

1. Introduction

Toxoplasmosis is zoonotic disease; it is widespread all over the world, it causes dangerous complications of the fetus loss, and the individuals with an immune disorder exposed to acute symptoms of this disease [1, 2]. *T. gondii* is one of a unicellular parasite; it causes infertility and abnormal embryos [3]. The incidence of the disease in small ruminants not limited to abortion but it's cross to consumption of injured flesh [4]. Sheep and goat are constituting the major sources of meat for food human in Iraq. Toxoplasmosis disease causes large loss of growing to goat and sheep as a result of abortion status and embryonic damage as well as maternal infertility in the female [5]. The diagnosis of this disease depends on the body's various fluids such as (blood, tissue, the amniotic fluid, etc.) by immunological and molecular methods [6, 7]. Investigation method is an important step advance to prevent of toxoplasmosis in animals and human. The disease can be a discovery of *T. gondii* in tissues or liquids of body in by intensification of particular nucleic acid sequences by molecular methods as (RT-PCR), or its antigens, or by the segregation of the parasite [8]. This study showed to diagnose *T. gondii* in sheep depending of serological-molecular tests. The nuclear genome of this parasite is reached nearly (87 kb), and the mitochondrial genome (6 kb), an episomal is (35 kb)

plastid-like genome, a congruence of genetic and karyotype linkage mapping are reproduced (14) nuclear chromosomes for *T. gondii* parasite [9]. B1 gene is a 2214 bp on IX chromosome with unknown function, that is repeated 35 times in the genome of this parasite [9, 10], these methods used to explain the incidence of this pathogenic parasite in infected the sheep and produce a negative impact on the economic and pathogenic side with economic and social damage.

2. Materials and Methods

One hundred blood specimen were collected from different sheep herds, every specimen were divided into two parts, for immunological and molecular diagnostic methods; the immunological method represented in kit Rapid Test Cassette (Toxo-IgG / IgM) from(PLASMATEC) [6, 11]. Real Time Polymerase Chain Reaction is a modern scientific technique combining the amplification of the genetic DNA sample and the detection of the amount and quality of the amplification product in a single reaction tube [6]; it has been used to detect *T. gondii* parasite based on the specific gene B1 (399bp), this molecular test was conducted and processed by BIONEER depending on primers based on [12], used primers sequence The primers: TOXO-F (5'-TCCCCTCTGCTGGCGAAAAGT-3', 5 µM), TOXO-R (5'-AGCGTT CGTGGTCAACTATCGATTG-3', 5 µM) (12), DNA extracted by support AccuPrep ® Genomic DNA Extraction, kit is (Bioneer, Korea) depending on the protocol of manufacturer instructions. Data analyzed by the statically 10.5 SPSS version software and X2- Square test was used to determine a significant difference with a probability ($P \leq 0.05$) [13].

3. Results and Discussion

Toxoplasmosis is a serious infectious disease that affects a lot of mammalian species; infections in this disease are caused by *T. gondii* parasite when taking inadequately cooked meat or from feces of infected cats. depending on the type of antibodies in blood serum of examined sheep by using Rapid test cassette. Results were indicated that 14 samples out of 100 (14%) were positive infection results, however IgG IgM antibodies and IgG plus IgM antibodies were found in (30.31%),(17.61) and (41.23) respectively, the statically analytic of this results referred to no significance difference between this values, as in Figure (1):

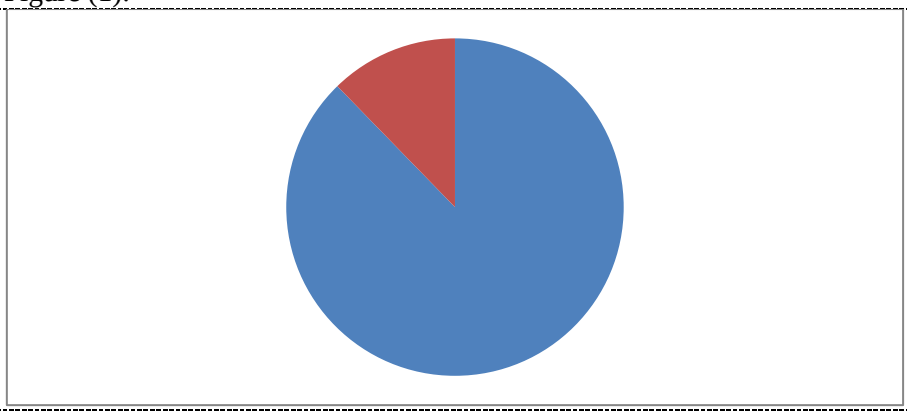

Figure 1. Positive infection rate 14% according to serological test.

This results are lower than [14] in the seroprevalence investigation of toxoplasmosis for sheep in Nepal country by collected 235 samples from sheep in different eco-zones in their country and investigate of *T. gondii* parasite with using the serological tests (commercial ELISA kit) and recorded these values: 36.17%, 32.94% as well as 9.41% positive results infection, they referred to spread infection sheep with *T. gondii* in different regions of Nepal, as well as lower than [15] in serological study for sheep when showed to 13/50 positive samples of toxoplasmosis. The Differences in positive seroprevalence results between the regions may be due to the weather and climatic in the same

country, also environmental and risk factors which affect the animal's health [5, 16]. Serological tests play a clear role in investigating and diagnosing *T. gondii* parasite through the antibodies IgG and IgM which can appear and recorded in about 8 days after infection incidence, but IgM antibodies disappear completely after a few months, IgG antibodies stay and present for lifelong of mammals [2, 6]. Real Time Polymerase Chain Reaction for investigating for B1 specific gene with infection as in Figure (2):

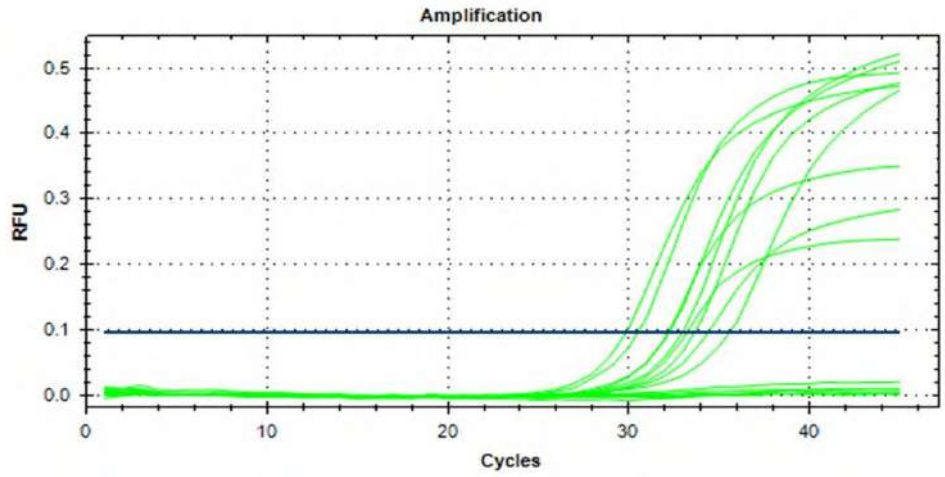

Figure 2. Amplification plot for real-time PCR assay of the positive results.

All this lower than what recorded in [15] as 26% positive infections when investigated to *T. gondii* DNA in the uterus samples, tubes, and the ovaries in the naturally sheep slaughtered in Pernambuco city in Brazil, and study of [17] when recorded 35.3% positive infections by seropositive study for abortion sheep. Some studies to spontaneous abortions in sheep due to *T. gondii* infection, for example [18] in Germany(10.6%) positive results when they used molecular method Polymerase chain reaction to detect genomic material of *T. gondii* parasite in tissues for fetal and placental for 47 samples from ovine abortions (Baden-Württemberg, Rhineland, Hesse), the amplification the specific gene B1, in this study in Germany the results explained in that toxoplasmosis infection sheep should be considered as important possible infection cause of abortions. (18.1%) positive results recorded in [19] in Italy, and (14.3%) in Brazil [20], the differences between this positive infection due to difference number of samples examined under study, so uncontrolled conditions to the laboratory that causes error in results of the polymerase chain reaction [6, 11]. This disease is one of the most important diseases of the last years, because of its widespread spread around the world and the serious human rights consequences of it, especially for pregnant women and newborn children, where many cases of miscarriage or childbirth occur for fetus during pregnancy even if the child is born after the completion of the pregnancy months, it shows serious symptoms such as damage to the retina of the eye and brain and brain hypertrophy where the head of the embryo is deformed or the head may be smaller [21, 22]. This study concluded that sheep in Al-Shamyah city in Al-Qadisiyah governorate are infected with *T. gondii* parasite, which causes the transfer the parasite to humans due to the consumption the raw meat, so it makes easy incidence the toxoplasmosis disease, and effects on the public health. Detection of small ruminant who have Toxoplasmosis infection considered important step towards preventing *T. gondii* in this animals and decreasing losses in the livestock especial abortion, and an end of the road preventing transfer to human, so it's an important step to progress in control through monitored (molecular/serologically) and depending on detect early estimated epidemiologically.

Abstract. The common use of beta-lactam antibiotics resulted in the emergence of bacterial strains capable of spreading and extended-spectrum beta-lactamase (ESβL). Up to 70 of clinical samples, 30 of *Escherichia coli* (*E. coli*) were investigated as ESβL isolates. These isolates collected from inpatients and outpatients to some hospitals in Baghdad. The samples include urine, pus, stool, and blood from both genders, different age groups. The VITEK2 was used to check production of ESβL and for the automated diagnosis of rapid antimicrobial susceptibility experimentation and to the identification of the target bacteria. Technique of PCR was applied to detect the presence of *bla$_{TEM}$* and *bla$_{CTX-M}$* genes. The results demonstrated that 30(43%) isolates of the current study were ESβL producers. The gel electrophoresis of DNA for positive ESβL isolates gives differentiate results of both *bla$_{TEM}$* and *bla$_{CTX-M}$* genes were observed in 15(50%) and 29(96%) isolates respectively. The antibiotic resistance pattern to 20 antibiotics were showed majority of isolates have the multi-drug resistant (MDR) phenotypes and susceptible to carbapenems of antibiotic. Furthermore, the results of the genetic analysis, along with the pattern of isolates for antibiotic resistance, it may give an acceptable explanation for the higher presence of the *bla$_{CTX-M}$* gene compared with the proportion of the *bla$_{TEM}$* gene in the same isolates.

Keywords. *Escherichia coli*, ESβL, *bla $_{TEM}$*, and *bla$_{CTX-M}$* genes, antibiotic resistance.

1. Introduction

Escherichia coli is a various group of facultative anaerobic Gram-negative bacilli related in Enterobacteriaceae, and consist of variety strains ranging from commensal organisms to extremely pathogenic variants especially the intestine and urinary tract [1, 2]. Extended-spectrum beta Lactamase (ESβL) has been produced by several bacterial genes and noticed an increased rate after using the β-Lactam group of antibiotics has been extensively applied in human and veterinary medicine against several bacterial pathogenic infections [3]. [4] reported that the unconsidered use of antibiotics led to the evolution of many bacterial strains resistant to beta-lactam antagonists. On the other hand, the excess in the incidence of β-lactam resistance in Gram-negative bacteria has become a major clinical problem worldwide and then limits therapeutic choice, this reduces the chances of identifying appropriate antibiotic options for the resistance of newer isolates of beta-lactam in an Enterobacteriaceae [5]. The ESβLs are a series of enzymes that lead to resistance increase in

Aztreonam, Ceftazidime, Cefotaxime related oxyimino-β-lactams, Cephalosporins, and penicillins, but Clavulanic acid can be effected on them [6]. In the present work, more than 400 different ESβL variants have been identified [7]. Moreover, *TEM*, *SHV*, and *CTX-M* are three main types of ESβLs genes were known to mediate by chromosomes, plasmids, and transposons, which can effortlessly spread from one organism to another [8], and they are sporadically described all over the world, while *CTX-M* type is the master type in some countries [9] and *TEM* gene has become more spread than another genes [10]. Also, TEM β-lactamase (‘‘Temoniera’’) was isolated from recovered a Greece patient called Temoniera who infected by one strain of E coli and first reported plasmid-mediated β-lactamase which was isolated [11]. Another commonly accruing (ESβL) is the *CTX-M* was first discovered in an *E. coli* isolate recovered from Munich, German in1989. Bacterial strains that produce ESβL often demonstrate the resistance to antibiotics belongs to other classes which make strategies of treatment more complex [12], especially prevalent among a wide range of clinically important bacteria Widespread in the world [6]. Due to the lack of studies on the prevalence of beta-lactam genes, the current study was conducted to discuss the range of the prevalence of bla_{TEM} and $bla_{CTX\text{-}M}$ genes and the presence of extended-spectrum beta Lactamase in clinical *E. coli* isolates collected from different hospitals in Baghdad, to determine characteristics and patterns of antibiotic resistance among isolates of *E. coli* clinical specimens. The aims of the current study to investigate the extent of spread two ESβL genes (bla_{TEM} and $bla_{CTX\text{-}M}$) as well as investigating the antimicrobial resistances in the clinical isolates of E coli producing beta-lactamase.

2. Materials and Methods

2.1. Bacterial isolates

A total 70 bacterial isolates were collected from different clinical specimens includes urine, wound swab, stool, pus and blood samples from both genders patients with different ages and were collected from some Baghdad hospitals between the period 9/10/2019 to 20/12/2019. Standard microbiological techniques were depended for isolation [13] and Conventional microbiological procedures were employed to identify the isolates. The VITEK 2 compact system was used to re-identify them (BioMerieux, France) [14], and applied for the bacterial identification at the species level to determine antimicrobial susceptibility test (AST) of rapid clinically significant human bacterial pathogens.

2.2. Identification of E.coli isolates

All *E. coli* Isolates were identified and tested for their susceptibility profile using the VITEK 2 compact system by different antimicrobial susceptibility test cards (AST- cards), according to the expected bacterial pathogens. The regarding cards were inoculated and incubated in the instrument according to the manufacturer's instructions. A VITEK 2 susceptibility tests outcome were obtained as MIC values and shown as susceptible, intermediate, or resistant and estimate according to the periodical values of the National Committee for Clinical Laboratory Standard's breakpoint [13]. Final results were explicate according to the instructions of [15] CLSI (2019) using advanced expert system (AES), according to [16]. A total 17 different antibiotics were used and tested in AST-GN71 (bioMérieux) card that included ampicillin (AMP), ampicillin / sulbactam (SAM), aztreonam(ATM), cefazolin (CFZ), cefepime (FEP), trimethoprim / sulfamethoxazole (SXT), ciprofloxacin (CIP), Ceftriaxone (CRO), tigecycline (TGC), imipenem (IPM), meropenem (MEM), tobramycin (TOB), amikacin (AMK), ertapenem (ETP), gentamicin (GEN),moxifloxacin (mxf), nitrofurantoin (NIT)[17].

2.3. Detection of ESβLs

All isolates were tested using the VITEK 2 system with the antimicrobial susceptibility texted AST-GN71 card. This system was used to carry out both screening and confirmatory tests for phenotypic

notice of ESβL at the same plate [18]. All isolates of *E.coli* were confirmed as ESβL producing using double disc synergy (DDST) test using 30mg of aztreonam, ceftazidime, cefotaxime, ceftriaxone, and 20mg amoxicillin with10M clavulanic acid. Four discs of antibiotic were placed at 15mm apart from each other with amoxicillin /clavulanic acid disc which is placed at the centre (Figure l). Isolates of ESβL production was considered positive when the zone of inhibition around any antibiotic disc was Overlap With the amoxicillin/clavulanic acid disc [19].

2.4. Dtection of bla_{TEM} and bla_{CTX-M} genes coding for ESβL production

Only the *E. coli* isolates considered positive for ESβL, were selected for the genotypic study. The detection of bla_{TEM} and bla_{CTX-M} resistance genes were performed after extraction of total DNA of *E. coli* using the PCR and gel electrophoresis techniques isolated as maintained by the manufacturer's instruction using the ABIO pure kit (USA). The concentration and the purity of the DNA was determined by a Quantus fluorometer (Promega, USA).

Table 1. Primers details of ESβLs genes used in this study.

Genes	Primer name and sequences (5`-3`)	Expected amplicon size (bp)	Annealing temp (°C)	Reference
$\boldsymbol{bla\text{-}_{TEM}}$	TEM. Forward 5`ATAAAATTCTTGAAGACGAAA3` TEM. Reverse 5`GACAGTTACCAATGCTTAATCA3`	1080	50	[20]
$\boldsymbol{bla_{CTX-M}}$	CTX-M.Forward 5`GACGATGTCACTGGCTGAGC3` CTX-M. Reverse 5`AGCCGCCGACGCTAATACA3`	499	55	[21]

Analysis of PCR technique was applied for encoding two genes of the β-lactamase family: TEM and CTX –M. Primers were supplied by Macrogen Company for the oligonucleotide primer sets (Table 1), Which is used as a specific for the bla_{TEM} and bla_{CTX-M} genes, and the cycling conditions in PCR assay have been adopted and which was described by [22]. The PCR was performed in a PCR Thermal Cycler (BioRad, USA).

3. Results

A total 30 isolates of positive ESβL Out of 70 collected isolates of *E. coli* were identified from different clinical specimens in the patients of both genders and at different ages in all hospitals of Baghdad city. The investigation of isolates was determined up to species level using the VITEK2 automated microbiology system [23]. The isolates were confirmed as ESβL producing E.*coli* using method of double-disc synergy test (DDST), as outlined in the Figure 1. The results of DDST for 70 isolates showed that 30 isolates (43%) had been ESβL producers and 40(57%) were non-producers.

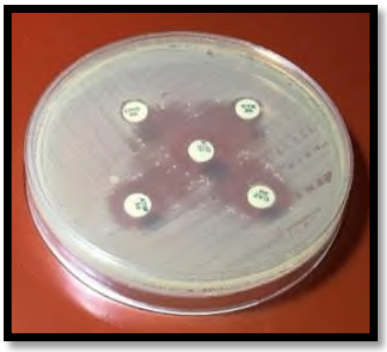

Figure 1. Photograph showing DDST.

A total of 30(43%) clinical isolate of ESβL producing in bacterial isolated from various infections was showing that 18(60%) isolates in urine tract infections and 2(6.0%) isolates in stool 4(12.1%) isolates in pus samples and 6(18.1%) isolates in the wound swab samples and these results showing in the Table 2.

Table 2. Type and number of positive samples for ESβLs.

Samples	Number of samples	Male%	Female%
Urine	18(60%)	7(23.3%)	11(36.6%)
Stool	2(6.6%)	1(3.3%)	1(3.3%)
Pus	4(13.3%)	5(16.6%)	1(3.3%)
Wound swab	6(20%)	3(10%)	1(3.3%)
Total	30	16(53.4%)	14(46.6%)

3.1. Sensitivity of antibiotic

The resistant pattern of 30 ESβL producers isolates have been detected with 17 different antibiotic using AST-GN71 card of antimicrobial agent (Table3). The results were showed that all isolates of the present study were susceptible to imipenem, ertapenem, meropenm, tigecycline, and (96 %) of isolates susceptible to amikacin and nitrofurantion and showed a high of resistance (P value) (100%) to (ampicillin, cefazolin, ceftriaxone and aztreonam) and 96% to cefepime and 90 % to ampicillin/sulbactam whereas resistance to other antibiotic was moderate.

Table 3. Showing the percentage of antimicrobial resistant for ESβL producing *E.coli*.

No.	**Antibiotics**	NO. of resistant isolates	Rat of resistant %
1	**Ampicillin**	30	100%
2	**Ampicillin/Sulbactam**	27	90%
3	**Cefazolin**	30	100%
4	**Ceftriaxone**	30	100%
5	**Cefepime**	29	96%
6	**Aztreonam**	30	100%
7	**Ertapenem**	0	0%
8	**Imipenem**	0	0%
9	**Meropenem**	0	0%
10	**Amikacin**	1	3.3%
11	**Gentamicin**	13	43.3%
12	**Tobrmycin**	15	50%
13	**Cioroflxacim**	21	70%
14	**Moxifloxacin**	21	70%

15	**Tigecycline**	0	0%
16	**Nitrofurantion**	1	3.3%
17	**Trinethoprim/Sulfamethoxazole**	20	66.6%

3.2. Gel Electrophoresis Analysis of ESβLs gene

Polymerase chain reaction (PCR) technique was conducted to detect the ability to produce and Expression on 30 ESβL recognized as positive isolates of *E. coli*, were selected. The *bla*$_{TEM}$ gene was detected for the 30 ESβL positive isolates shown in (Figure 2 A and B). The bands of the expected size (1080bp) using the TEM-F and TEM-R primers were seen as positive TEM genotype and observed in 15 (50%) of total 30 *E. coli* isolates.

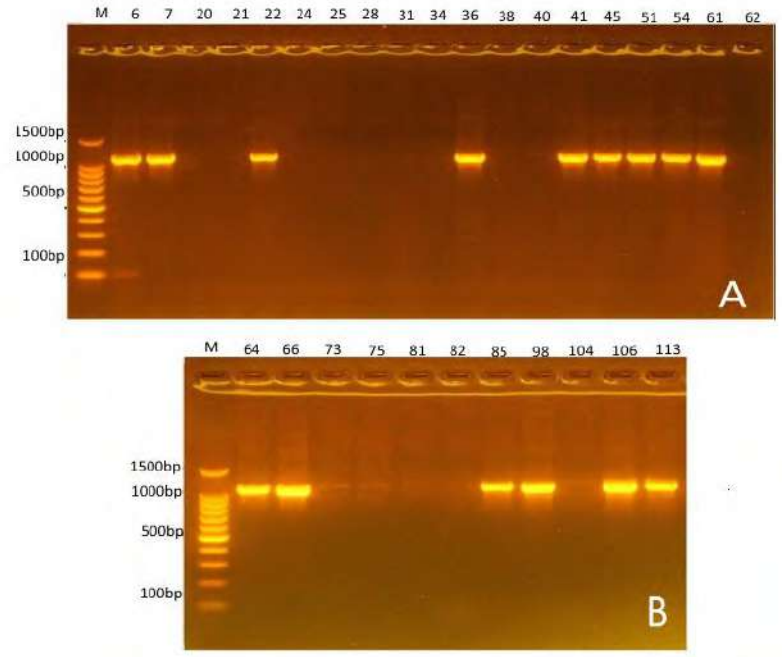

Figure 2. Gel electrophoresis analysis for PCR amplified fragment products of *bla*$_{TEM}$ (1080 bp) genes for 30 bacterial isolates of study using 1.5% agarose and DNA markers (1500 -100bp) are shown in lane M.

On the other hand, results of *bla*$_{CTX-M}$ gene was showing in the (Figure3 A and B). The bands of expected size 499bp using CTX-M-F and CTX-M-R primers were seen as a positive samples the genotype and observed in 29 (96.6%) of a total 30 *E.coli* isolates.

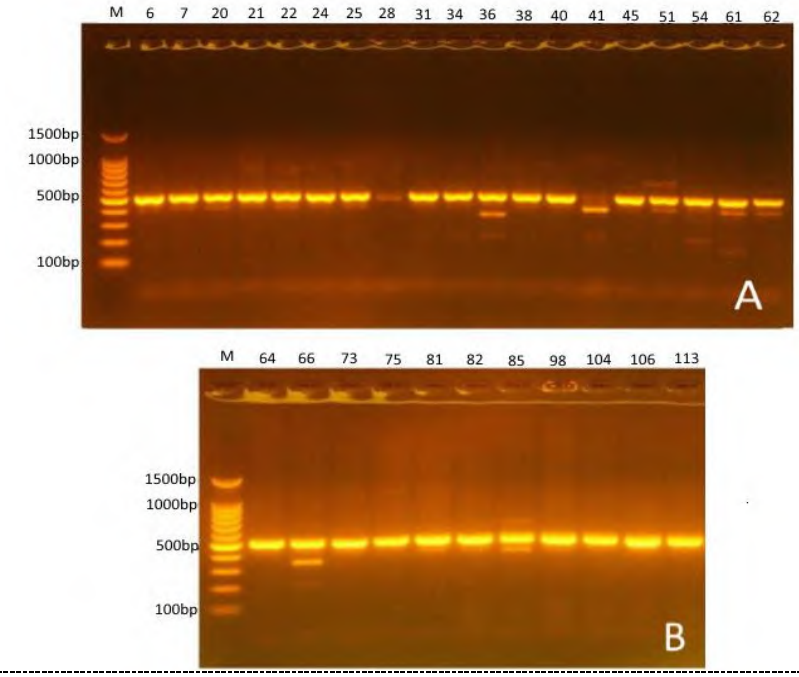

Figure 3. Gel electrophoresis analysis for PCR amplified fragment products of *bla*$_{CTX-M}$ (ca. 499 bp) genes for 30 bacterial isolates of study using 1.5% agarose and DNA markers (1500 -100bp) are shown in lane M.

3.3. Genotype patterns of ESβLs

Analysis of the PCR amplified DNA fragment of 30 *E. coli* ESβLs producers using the specific primers revealed that the two genotype patterns were obtained in (Table 4). These results also showed that predominant genotype rate was CTX - M (50%) then genotype amalgamation of TEM + CTX - M (46.6%). The commonness rate of the two different ESβL genes in the present study demonstrated that *bla*$_{CTX-M}$ gene was the most predominant type (29/30; 96.6%) while TEM gene was less dominant type (15/30; 50% respectively).

Table 4. Showing ESβLs genotype patterns among *E. coli* isolates.

ESβLs Genotype	No. of isolates	Percentage (%)
***bla*$_{TEM}$ only**	1	3.3%
***bla*$_{CTX-M}$ only**	15	50%
***bla*$_{TEM+CTX-M}$**	14	46.6%
Total	30	100

4. Discussion

The increasing rate with the progression of ESβL producing by Enterobacteriaceae has threatened the entire world. However, nowadays the main challenge to infection control is entailing continuous monitoring systems for the emergence and spared isolates of Enterobacteriaceae that produce of ESβLs. In the present study, a total 30 bacterial isolates of *E. coli* from total samples (43%) were identified as ESβLs producers. These results give a dangerous indication of public health in Iraq and the need to take caution from the excessive use of antibiotics. Also, *E. coli* and other genera of gram-negative bacteria have possessed a naturally occurring, chromosomally mediated β- lactamase and plasmid-mediated of β–lactamase [24]. The unconstrained use of these antibiotics in developing countries, poor dosing, ineffective empiric antibiotic therapy, prolonged antibiotic treatment, and

antibiotic misuse are the most reasons for the development and high resistance rates in bacterial infections [25]. Although Phenotypic tests, such as DUST method it's commonly used, for detection of ESβLs and confirm whether an ESβL is produced by bacterial isolates but cannot detect the ESβL subtype easily. Furthermore, [26] reported that although molecular methods appear sensitive, but the time consuming, expensive and require specialized equipment and expertise. Definitive identification is possible only by molecular detection methods. On the hands, the techniques, that are necessary for the task of the exact ESβL subtype, are available only in research facilities. Also, PCR fragments products for bla_{TEM} and bla_{CTX-M} genes produce expected bands of 1080 bp and 499 bp respectively. Moreover, using the same primers in the present study, the amplified DNA products of comparable molecular weight were obtained in the different worldwide studies and showed the same results of [22]. Also, some studies performed in some countries, such as Iraq, Iran, and Turkey to detect other ESβLs genes using different primer sequences gave amplified products with various molecular weights [27], which confirms that there are many genes responsible for producing of ESβLs. The covariance in the molecular weights of the amplified products could be indicating the differentiation in primer sequences or in the type of the gene that detects, currently, more than 150 gene TEM types are recognized are there [28]. For example, CTX-M gene is divided into five subgroups that have more than 80 enzymes. This variety supplies an auxiliary way to follow the prevalence of individual resistance genes. Interestingly, that 96.6% of ESβLs producer *E. coli* have sheltered the CTX - M gene. Furthermore, TEM gene was found in 50% of bacterial isolates and that consistent with the present study and with diffusion worldwide including the Middle East area, where CTX- M- type has replaced, and therefore the TEM type and became the predominating ESβL among isolates of Enterobacteriaceae [29]. Different studies that conducted in Iraq and adjacent countries have declared that the CTX-M type was the predominant gene type in *E. coli* [30], while the studies in Turkey and India showed that the TEM type was the dominant type [31]. Data analysis revealed that there are six genotype patterns of ESβLs exist among the 70 isolates. CTX - M was the most prevalent genotype (50%) followed by the genotype combination TEM + CTX - M (46.6%). This genotype combination has also been published to be the most dominant genotype in Japan, India, and Arabia Saudi kingdom [32, 33] said that in some isolates means that the ESβL producing strains may be regarding to a complex antimicrobial resistance. Finally, the results were demonstrated that the TEM gene is a broad spectrum ß- lactamase that is always concerted with CTX - M on the same plasmid. The release of TEM+CTX-M collection can cause resistance to carbapenems; this is worrisome and more serious for the community [34].

5. Conclusion

In the present study, a 43 % of the uro-pathogenic isolates of E. coli were identified as ESβLs producers. All isolates were certain by PCR to have one or more ESBL genes. Type of CTX - M was the dominant ESβL in the isolated E. coli and followed by the genotype of TEM+CTX-M combination. So, it is very important to highlight on antimicrobial resistance must be perceiving as an healthy as well as ecological problems and increase efforts to monitor and control the spread of antimicrobial-resistant strains in hospitals and communities.

Abstract. In the current study, the myxobolid, *Thelohanellus wuhanensis* Xiao & Chen, 1993 was recorded for the first time in Iraq from the gills of *Carassius auratus* (Linnaeus, 1758) that was caught from Tigris river near Al-Shawwaka location in Baghdad city during the period from May to October 2020. With this registration, *T. wuhanensis* become the fourth species of the genus *Thelohanellus* so far recorded from the Iraqi fish**.** The description and measurements of this external parasite as well as its illustrations are given.

Keywords. *Thelohanellus wuhanensis*, *Carassius auratus*, Myxozoa, Tigris river, Iraq.

1. Introduction

Myxozoans are microscopic metazoan parasites of marine and freshwater fishes from natural and aquaculture resource, this group is important from an economic point as it causes losses of production and makes fishes unfit for human consumption [1]. The phylum Myxozoa includes over 2,180 species belonging to 60 genera of Class Myxosporea of the Phylum [2]. *Thelohanellus* (Kudo, 1933) the sixth most species genus with 108 nominal species reported worldwide [3], 52 nominal species of this genus infected freshwater fishes in India up to 2015 [4]. Species of *Thelohanellus* are mostly histozoic, bivalvular myxosporeans, tear-shaped or pyriform to broadly ellipsoidal in valvular view, more slender in sutural view, and have a single polar capsule either pyriform or tear-shaped with a single coil of polar filament [2]. These myxozoan parasites are mainly plasmodia-forming parasites of freshwater fish with a great diversity of sites of infection such as gills, fins, scales, skin, muscles, gallbladder, kidneys [3, 4]. *Thelohanellus* species have strict tissue specificity and shown inclined to the epithelium, connective tissue, cartilage, or vascular tissue that usually occurs within the gill apparatus [5]. The plasmodia of this genus are classified according to their location in the gill filament, the interfilamentous vascular type which occupying the tip, and intralamellar vascular type which occupying the side [6]. The present paper documents the first record in Iraq of *T. wuhanensis* Xiao & Chen, 1993 from gills of *Carassius auratus* (Linnaeus, 1758) from Tigris river near Al-Shawwaka location in Baghdad city.

2. Materials and Methods

In this study, nine live specimens of *Carassius auratus* (Linnaeus, 1758) were caught from Tigris river near Al-Shawwaka location in Baghdad city between May to October 2020. The lives fishes were brought to the laboratory and classified according to an account on freshwater fishes of Iraq [7], then investigated for myxozoan infection. To detect the plasmodia, fresh smears the external parts such as the skin, fins, gills, and operculum and all internal organs such as kidneys, spleen, liver, the wall of the intestine, urinary bladder, gall-bladder, eyes, heart, muscles, testes and ovaries of fishes were examined under a dissecting microscope. A smear using fresh spores were made from the external parts and internal organs of the fish and examined with a compound microscope. Spores were freshly photographed by a digital camera. The spore was drawn using a Camera Lucida. For permanent specimens, the spores were fixed in absolute methanol for two to eight minutes and then stained with Giemsa solution for about 25-30 minutes, then washed in tap water and dried [8]. Myxosporian spores were measured and described according to the guidelines [9].The scientific name of the parasite was checked with lists [3]. All measurements are presented (in μm) as minimum-maximum followed by mean values. The information on the previous records of myxozoans of fishes of Iraq was obtained from the index-catalogue of parasites and disease agents of fishes of Iraq [10].

3. Results and Discussion

3.1. Thelohanellus wuhanensis Xiao & Chen, 1993

This parasite found in the skin and gills of two out of nine of *Carassius auratus*. The infection of these fishes was not severe, the plasmodia were not found during the examination. Groups of spores distributed in the tissues examined were obtained, so the identification has been based on the characters of spores. Description and measurements (in μm) based on five fresh spores are listed below and shown in Figures 1 and 2. Spores large-sized, oval elongated slightly tapering anteriorly in frontal view, lemon-shaped in lateral view with the straight sutural line, the anterior end slightly narrow, a pit near on the anterior end, asymmetric valves, length of spore 22.6-24.2 (22.9) and width 12.3-12.6 (12.45), thickness 10.8-11.4 (11.1). One subspherical polar capsule with triangle protrusion at the upper end near the anterior end of the spore and occupies almost half the size of the spore, measuring 11.1-11.9 (11.5) long and 7.9-8.3 (8.1) wide. Sporoplasma occupying most of the extracapsular space behind the polar capsules with the small dark granules.

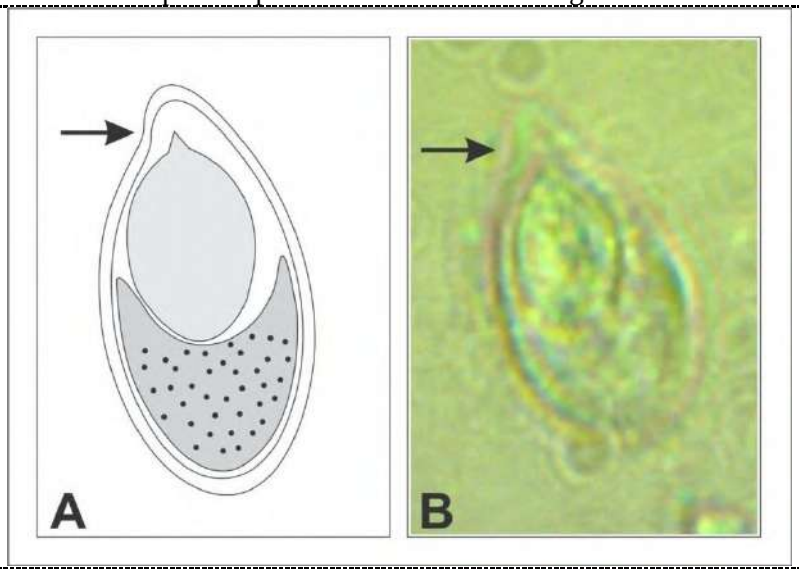

Figure 1. *Thelohanellus wuhanensis* in frontal view. A-Diagrammatic drawing (Scale bar = 11.5 μm), A: Photomicrograph (4 00 x). The arrows appear in the pit on the anterior end of the spore.

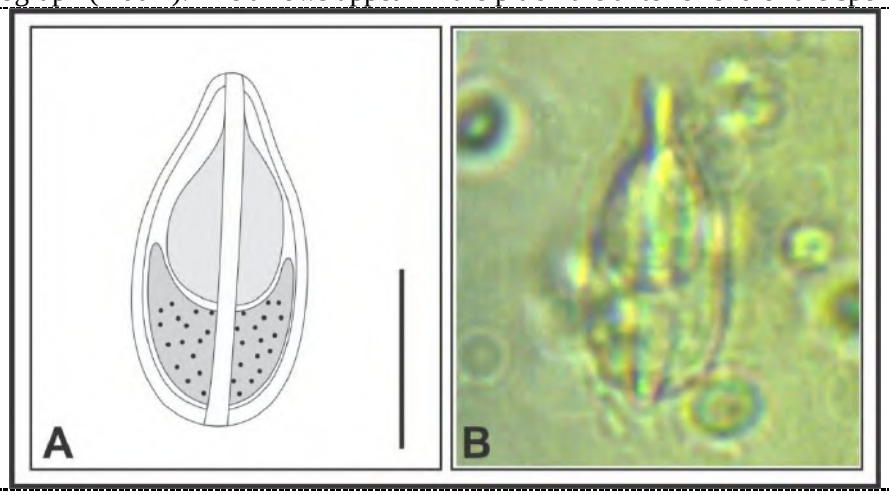

Figure 2. *Thelohanellus wuhanensis*, Lemon-shaped in lateral. A- Diagrammatic drawing (Scale bar = 11.5 μm), B- Photomicrograph (4 00 x).

The descriptions and measurements of *T. wuhanensi* in this study are corresponded with those of the holotype of the parasite from on the skin of silver crucian carp *Carassius gibelio* (Bloch, 1782) (= *Carassius auratus gibelio*) in Wuhan City and Jingshan County of Hubei Province, China [3]. This is the first record of *T. wuhanensis* in Iraq, as it has not been recorded in any studies of the parasites of Iraqi freshwater fish [10]. *T. wuhanensis* Xiao & Chen, 1993 was first identified on the skin of allogynogenetic silver crucian carp in Wuhan City and Jingshan County of Hubei Province, China. Subsequently, this parasite was described and supplements its ultrastructural and histological characteristics from the same fish host from a pond in Honghu City, Hubei Province, China [11]. Although many species of the genus *Thelohanellus* showed less pathogenicity to their hosts, *T. wuhanensis*, caused the mortality of infected fish [3], for being leads to the formation of obvious swellings on the skin of infected fishes, and severe epidemic thelohanellosis and mortality of the heavily infected fish [12]. In Iraq, three *Thelohanellus* species have been described from freshwater fishes from different water bodies. The first species, *T. catlae* (Chakrawarty and Basu, 1958) was registered from the gills of *Cyprinion macrostomum* for the first time in Iraq from the Tigris river within the limits of Baiji city [13). Then, three other host fish species are so far known as hosts for this parasite: *Planiliza abu* (= *Liza abu*) [14], *Carasobarbus luteus* [15] and *Carassius auratus* [16]. The second one, T. dogieli (Akhmerov, 1955) was reported for the first time from Iraq in gills of *Cyprinus carpio* from Tigris river near Al-Zaafaraniya region at Baghdad province [16].The third one, T. misgurni (Kudo, 1919) registered for the first time in Iraq from the gills of *Garra rufa* from the Tigris river within the city limits of Al-Ataifiya [17]. Accordingly, *T. wuhanensis* is the fourth species of the genus *Thelohanellus* so far recorded from the Iraqi fish.

4. Conclusion

The Myxozoan parasite *Thelohanellus wuhanensis* Xiao & Chen, 1993 was recorded from gills of *Carassius auratus* (Linnaeus, 1758) for the first time in Iraq and becomes the fourth species of the genus Thelohanellus so far recorded from the Iraqi fish.

5. Acknowledgement

Thanks to Prof. Dr. Furhan T. Mhaisen for providing previously recorded species of the genus *Thelohanellus* species in Iraq.

Abstract. Somatic embryogenesis is a valuable tool for investigating the totipotency of plant cells. A simple and efficient protocol for inducing somatic embryogenesis from seeds of *Arabidopsis thaliana* were established. Surface sterilized seeds were placed on agar-solidified Murashige and Skoog (MS) medium free from growth regulators. Callus initiation began7days after seeds culture and became visible with the naked eye within 10-14 days. It was friable and yellowish white in color. Within 20 days, callus was transferred to Gamborg's B5 medium containing 1.0 mgL-1 2, 4-D (2, 4-dichlorophenoxyacetic acid) and 0.05 mgL^{-1} Kin for multiplication. The results indicated that somatic embryos had been recorded only in B5 medium supplemented with 0.4 mgL^{-1} TDZ (N-phenyl-N'-1,2, 3-thidiazol-5-ylurea) and it was the best one. Through our observation, different stages of somatic embryos have been found. The results revealed that the continuous transfer of small masses containing several embryos at different stages to the same induction medium subsequently formed a large cluster of shoots, which were rooted in MS medium free from growth regulators and MS hormone-free medium with 0.2activated charcoal. The percentages of rooting were 63% and 51% respectively. This study proved that Arabidopsis thaliana seeds are a novel source for somatic embryos.

Keywords. *Arabidopsis thaliana*, Seeds, Somatic Embryos, TDZ, Plant regeneration.

1. Introduction

Somatic embryogenesis (SE) is a method of differentiating cells to bipolar structures similar to zygotic embryos in plants [1]. The (SE) process shows that plants' specific development capabilities have already evolved to move to embryogenic development program in somatic cells [2]. Plant cells have been recognized for their ability to be reprogrammed into embryogenesis [3]. Somatic embryos (SEs) formation has been demonstrated as evidence of plant cell totipotency since the development of SEs was observed from colonies of single cell origin [4]. In addition to being a tool for studying and understanding early embryonic growth, SE is also a key plant biotechnology tool used for the asexual propagation of (hybrid) plants and it is also important to rapidly reproduce, preserve, or regenerate genetically modified plants during transformation processes [5]. SEs may grow into whole plants and since the 1960s; numerous protocols have been developed that allow the efficient regeneration, through *in vitro* cultivation conditions, of dozens of plant species through SEs [6]. Although hormones and stress are common treatments that can encourage SE [7, 8], there is little understanding as to how

these causes contribute to SEs formation, including mechanisms interacting to align the SEs with regulatory networks of transcription factors [9].The detection of exogenous and endogenous factors facilitating embryogenic transfer to *in vitro* cultured somatic cells contributes to a deeper understanding of the totipotency of plant cells. Unlike advanced tissue culture experience which encourages the SEs induction [10]. Much less are known the endogenous factors that determine the capability of the tissue to an embryogenic response. However, in the last decade there were strong progress in deciphering the molecular mechanism regulating the embryogenic transformation of somatic plant cells and extensive molecular analysis of the functioning of auxins in SEs induction [2]. The Somatic embryogenesis process is usually divided into two major phases: one phase of the induction and one development. During the induction process, isolated somatic cells undergo conditions that facilitate cell proliferation and dedifferentiation and are assumed to have the capacity to undergo SE and some of the cultivated cells begin to differentiate in somatic embryos during the developmental phase [11]. A host of factors, including cell-to - cell signaling, have been involved in SE induction [12], modification of the wall composition [13]. The alteration in hormones [14,15] and the epigenetic shifters [16,17]. In plant biology, due to lack of early cytological or morphological markers for SE the key experimental factor was the impossibility to precisely isolate and study the cells reacting to SE-induction. As a result, the molecular processes that affect exactly the fate and embryogenicity of such cells in the callus are not known yet. Many plant species like *Arabidopsis thaliana* (*Arabidopsis*), well respond to somatic embryogenesis [18,19]. *Arabidopsis* has been instrumental in disclosing fundamental molecular pathways for regulating *in vitro* plant somatic cell developmental plasticity. Recently it has built a rather good framework for the study, among others, of functional genomics, biology systems, synthetic biology and *in vitro* embryogenesis [20]. SE has earned the most recognition, due to its cognitive as well as functional importance in the field of plant biotechnology, among the various morphogenic pathways induced by cultivated plant explants [21].The goal of this study was to obtain plants from somatic embryos of *Arabidopsis thaliana* seeds which represent a novel source of SEs.

2. Materials and Methods

2.1. Plant material and callus formation

Arabidopsis thaliana col-0 seeds were supplied from Nottingham Arabidopsis Stock Center (NASC),UK. These seeds were surface sterilized by submerging in ethanol alcohol 96% for 3 min, then rinsed three times with sterilized distilled water under a laminar flow hood. Dried seeds were germinated on agar- solidified MS medium [22] free from growth regulators and incubated in the culture room in the dark at 25∓ 2℃. Once callus was induced from the intact specimens seeds, they were transferred to 16 h light/8 h dark photoperiod provided by cool-white fluorescent tubes. The callus induction frequency was recorded after 3 weeks of culturing. For calculating the callus induction frequency, the following equation has been used:

$$\text{Calli induction frequency} = \frac{(\text{Number of seed with calli})}{(\text{Number of incubated seeds})} \times 100\ \% \quad \ldots\ldots\ldots\ldots\ldots\ldots\ [1]$$

2.2. Somatic embryogenesis and plant regeneration

During 20 days, callus was transferred to Gamborg's B5 medium [24] containing 1.0 mgL^{-1} 2,4-D and 0.05 mgL^{-1} Kin for multiplication. Sub culturing of this callus was carried out at 3-4 week intervals at the same medium. To enhance proliferation and plant regeneration, clumps of about 0.5 gm. of callus were cultivated on B5 medium supplemented with four different combinations of plant growth regulators as shown below:

1-5.0 mgL^{-1} BA

2-5.0 mgL^{-1} BA + 0.9mgL^{-1} IAA

3-0.4 mgL^{-1} TDZ

4-0.4 mgL^{-1} TDZ+ 0.1mgL^{-1} IBA

All the samples were kept in the growth chamber at 25∓ 2℃ (16h Light/8h dark). A binocular dissecting microscope was used to investigate different phases of somatic embryos.

2.3. Rooting and acclimatization

Shoots originating from germinated embryos were individually removed, and transplanted in 100 ml volume glass jars containing agar solidified hormone-free MS0 medium which was also used with 0.2% activated charcoal for rooting. Subsequently, rooted shoots were removed from the medium washed from the agar carefully, and each plantlet was transferred to small pot with a diameter of 6.5cm and 5cm height containing peat-moss for adaptation.

3. Results and Discussion

The results of this study showed that *Arabidopsis thaliana* seeds which were placed on MS hormonal-free (MS0) germination media, seven days after cultivation, can form callus rather than seedlings. Recent transcriptomic data confirm that calli can form through different initial routes, whereby a coordinating stress, hormone and evolved responses converge into a single gene regulatory network [25]. This callus became visible with the naked eye within 10-14 days and the callus induction frequency was 100%. In general, It was yellowish white in color with friable texture (Figure 1, A).It was recognized that calli are highly diverse and can be grouped according to their macroscopic properties calli without obvious organ regeneration, for example, are usually known as friable or compact callus [26]. In one hand, we don't find any previous study referred to callus induction from *Arabidopsis thaliana* seeds on MS medium free from growth regulators. On the other hand, [27] have suggested a potential callus induction from *Arabidopsis thaliana* seeds on Gamborg's B5 media with 20 g /l sucrose, 0,5 mgL^{-1} (2,4-D) and 0,05 mgL^{-1} kinetine. Also callus formation from seeds, stems and leaf pieces of *Arabidopsis thaliana* was observed on B5 medium and modified B5 medium [28]. Addition of auxin and cytokinin promotes callus in various plant species. In general, an intermediate proportion of auxin and cytokinin facilitates induction of callus [26]. Since the seeds of *Arabidopsis* are very small and delicate, forceps may have damaged them when they are being carried to the cultivated medium, so callus induction occurred. Iwase and his colleagues [29] pointed out that wounding promotes callus formation in various parts of *Arabidopsis* seedlings and they showed that an AP2/ERF transcription factor, WOUND INDUCED DEDIFFERENTIATION 1 (WIND1), is participates in the control of *Arabidopsis* cell differentiation. At the wound site WIND1 is immediately induced and facilitates cell de-differentiation and subsequent cell proliferation to form a mass of pluripotent callus cells. As a consequence, cell dedifferentiation is genetically regulated mechanism. The results obtained showed that somatic embryos were recovered only in B5 medium supplemented with 0.4mgL-1TDZ, and it was the best one, and through our careful observation, different stages of somatic embryos have been found (Table1).

Table1. Number of somatic embryos stages produced from seeds callus of *Arabidopsis thaliana*.

Media	*No. embryos stage			
	Globular	Heart	Torpedo	Cotyledonary
B_5 + 0.4 mgL^{-1} TDZ	117	87	73	72
B_5+0.4 mgL^{-1} TDZ+ 0.2 mgL^{-1} IBA	100	0	0	0
B_5+1.0 mgL^{-1} 2,4D+0.05mgL^{-1} Kin	0	0	0	0
B_5 + 5 mgL^{-1} BA + 0.9 mgL^{-1} IAA	0	0	0	0
B_5 + 5 mgL^{-1} BA	0	0	0	0

*Average of 6 replicate \ treatment

Cell differentiation and initiation of embryogenesis may be regulated by hormones [30, 31, 32]. In the induction of somatic embryos in *Paeonia Ostii* [33] a combination 0.5 mgL^{-1} thidiazuron (TDZ) and 0.5 mgL-1 2,4-D was found to be successful. Thidiazuron has received considerable attention over recent decades because of its prominent significance in *in vitro* culture with Auxin as well as cytokinin like effects in various plant species [34]. There are some available theories that describe the mode of action of TDZ, but it is still unclear. The TDZ action mechanism can be described as helping in accumulate and/or synthesize endogenous growth hormones [35]. Our study showed that the callus is easily divided and formed abundant green nodules. These nodules developed and emerge repeatedly in this callus to embryogenic masses after 15 days (Figure 1.B) which produced globular stage after 45 days (Figure 1.C), then developed after 60 days to heart stage (Figure 1.D). High numbers of these heart embryos were started elongation and transformed to torpedo stage (Figure 1.E). Subsequently after 3th sub cultures majority of them transform to the differentiated cotyledonary stage (Figure 1.F).

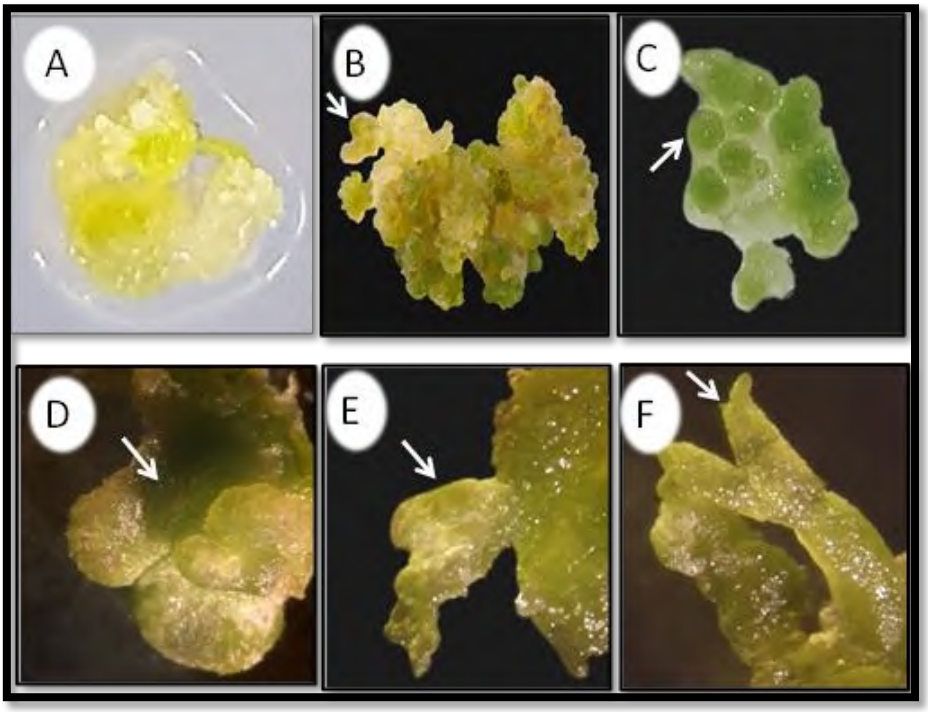

Figure 1. Somatic embryo developmental stages from nodule-like structure produced in callus of Arabidopsis thaliana L: (A) Callus initiation from seeds on MS0 medium. (B) Embryogenic masses formed on B5 medium + 0.4 mgL^{-1} TDZ after 15 days of culture (arrows) (C) Development of globular stage embryos in (a) (arrows). (D)Heart stage embryos (arrows). (E)Torpedo stage (arrows).

(F) Cotyledonary stage (arrows).

Additionally, subculture of the embryogenic masses at the same medium (B5 + 0.4 mgL^{-1} TDZ) led to the emergence of a new variety of nodules (Figure 2.A). It was followed by its development into secondary embryo: globular, heart and torpedo that have basic roots (Figure 2.B). When these structures were left at the same medium, leaf-like structures appeared within 4 weeks (Figure 2.C) ,easy to separate and subsequently transferred to the MS0 medium for additional 3 weeks that allowed the complete development of the leaves (Figure 2.D) which were finally formed plants. In addition, to increasing root system growth.

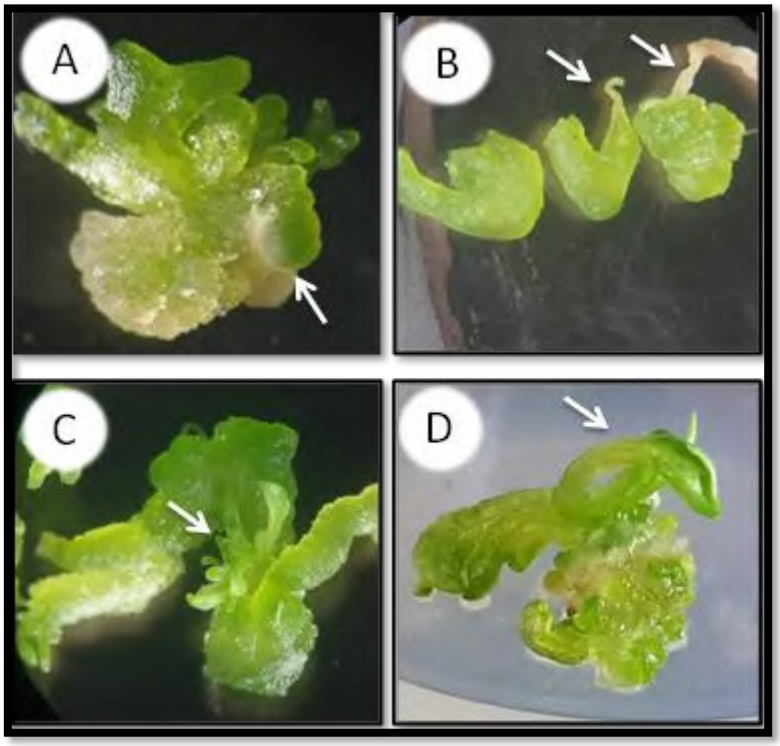

Figure 2**.** Secondary embryos developmental stages from subculture of *Arabidopsis thaliana L.* callus on B_5 + 0.4 mgL^{-1} TDZ: (A) Formation of abundant green nodules and development of globular stage embryos. (B) Embryo-genic masses development and shine Heart, Torpedo stages embryos. (C)After 4weeks cotyledonary stage embryos (arrows). (D) Separation and subsequently transferring of shoot to MS0 medium.

When the cell lines reach the point of moderation, somatic embryogenesis can be formed, and this will involve the addition of Cytokinins, which prevent the polar transfer of auxin while raising hormone levels within the cell because keeping the auxin in the medium prevents the development of embryos that is, the spherical phase does not produce auxin during the formation of primitive embryogenesis masses, after which embryos continue to develop and function like somatic embryogenesis masses [27]. *Arabidopsis thaliana* is known by its high capacity to form somatic embryos directly and indirectly, and this is depending on the type and age of the explant [36, 37, 38]. Indirect somatic embryos formation is more efficient and less stable as mutant plants may form [39]. The results indicated that the continuous transfer of a small masses containing several embryos and secondary embryos at different stages to the same induction medium subsequently formed a large cluster of young and small shoots (Fig 3.A) and upon transfer100 branch, some of them had roots (Figure 3.B) separately to the MS0 media. These branches had the ability to grow and configure them for the root

system (Figure 3.C) after 15 days (Table.2). After that the regenerated plants adapted to the soil conditions (Figure 3.D).

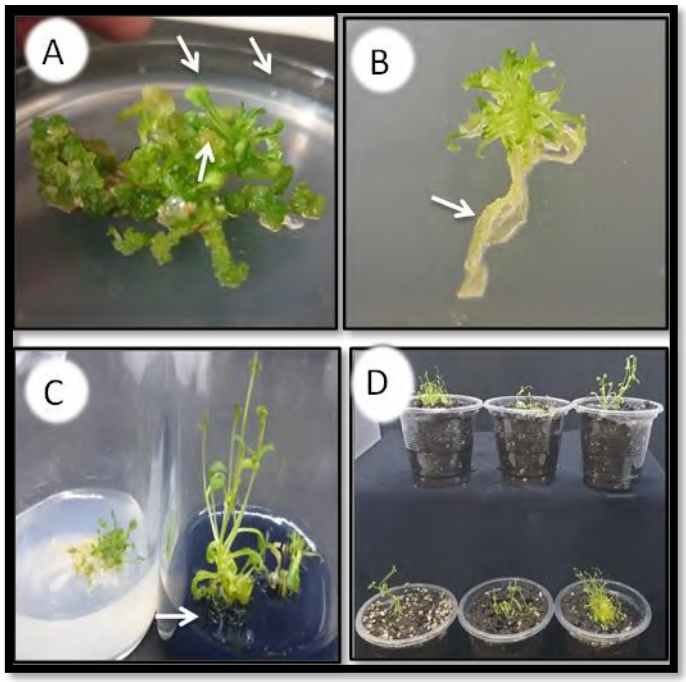

Figure 3**.** Evolution of the vegetative branches of the *Arabidopsis thaliana L*. embryos. (A)Somatic embryos on stimulation media. (B) Rooted derived shoots in A. (C) Rooting of shoots in MS0. (D) Hardening of regenerated plants in the soil.

Although TDZ is grouped under cytokinin because of its natural cytokinetic response in *in vitro* culture, there are evidence in different plant species such as soybeans which refer that TDZ has both auxin and cytokinin-like activities [40].

Table 2. Rotting of *Arabidopsis thaliana L*. shoots regenerated from somatic embryos.

Media	No. Shoot regeneration/ No. Shoot regeneration from secondary embryos		Rooting%
	Transferred shoots	No. rooted shoots	
MS0	100/20	36/5	36/25
MS with 0.2 charcoal	100/20	51/10	51/50

Generally TDZ at low concentrations induces somatic embryogenesis in different plant species such as olive [41] blume orchid [42], the geranium [43]. TDZ induced the synthesis and accumulation of purines [44], moreover it alters cytokinin metabolism [45]. Somatic embryogenesis is characterized by their capability to grow simultaneously and to give a large number of foetuses, and by their capacity to repeat the production of embryos until a full year after the transference to new media [46]. Finally, the protocol of this paper is easy and very efficient to produce large quantities of SEs which considered a very attractive system for studying plants development. Also this method could be used as helpful tool to explain various biochemical and physiological embryogenesis events.

4. Acknowledgement

The authors are very grateful to the University of Mosul, College of Education for Pure Sciences for their provided facilities which help to improve the quality of this works.

Abstract. Silver nanoparticles were biosynthesized using alkhal mother shae. Nanoparticles were characterized using four methods. The results of the fourth methods proved that silver nanoparticles are spherical shape with a size ranging between 30-40 nm. AMS-AgNPs has antibacterial and antibiofilm activity against gram negative and gram positive tested bacteria, and it has antifungal and antivirulence activity against five types of fungi. Results declare the effect of AMS-AgNPs on the fungus, it can disrupt the integrity fungal cell wall, promoting the permeability and the leakage of the cell constituents, and eventually induce cell death, which is reached from the Congo red dye absorption test and the formation of swelling in the hyphae of the fungal. This study revealed that AMS-AgNPs can be used as an alternative medicin for pathogenic bacteria and fungi.

Keywords. Alkhal Mother Shae, Silver nanoparticles, antibacterial, antifungal, antivirulence.

1. Introduction

Alkhal Mother is a substance composed of yeast and acetic acid bacteria especially, Acetobacter xylinum which forms a cellulose pellicle on shae broth. It is produced by fermenting shae using a "symbiotic 'colony' of bacteria and yeast" (SCOBY). Actual contributing microbial populations in SCOBY cultures vary, but the yeast component generally includes Saccharomyces and other species, and the bacterial component almost includes A. xylinus to oxidize yeast-produced alcohols to acetic and other acids [1]. Tea is the oldest and cheapest health beverage in the world next to water [2]. Today, tea is produced in over 20 countries in tropical, sub-tropical and temperate regions. It is the most widely consumed beverage after water, due to its health, sensory, stimulant, relaxing and cultural properties [3]. The beneficial effects of tea are owing to its polyphenolic compounds. Among the shae polyphenols, flavonoids, especially catechins, are the leading functional components, which accounts for 30% of the dry weight of green tea leaves. Fresh tea leaves are very rich in catechins, which include mainly epicatechin (EC), epicatechin-3-gallate (ECG), epigallocatechin (EGC), epigallocatechin-3-gallate (EGCG), and gallocatechin (GC). EGCG is the most abundant catechin in green tea which accounts for at least 65% of the total catechin [4]. Black tea which grows in many parts of world, is used as an herbal tea for Drinking. *Camellia sinensis* leaves (Black tea) have been reported to contain considerable amounts of tannin products [5]. In Iraq, mats of personally are

individually circulated among those people seeking for health remedy. So, this mat is called "Alkhal mother" as an acquired local traditional Iraqi name, however, it has little scientific studies. The goal of this study is to examine the antibacterial and antifungal activities of silver nanoparticles synthesized using Alkhal Mother Shae (AMS).

2. Materials and Methods

2.1. Collection of bacteria

The bacteria were isolated from patients with infection wounds and burns attending to Al-Yarmouk Teaching Hospital for the period from October to December, 2019. and used as an antimicrobial.

2.2. Collection of fungi

Five types of fungi isolates from Mycotoxins laboratory. Faculty of Sciences, University of Baghdad.

2.3. Alkhal Mother SCOBY

Alkhal Mother SCOBY was obtained from (Dr. Al-Kalifawi, Esam J.), as described by [6].

2.4. Cultivation of Alkhal Mother SCOBY

Alkhal Mother cultured as described by [7].

2.5. Extracellular synthesis of silver nanoparticles

AMS-AgNPs synthesized as described by [8].

2.6. Properties of AgNPs

2.6.1. UV-Vis analysis

The silver nanoparticle colloidal was examined for the absorption peak, which falls within the range 350-450 nm

2.6.2. FT-IR Spectroscopy

The active biological groups present in Alkhal Mother Shae, which serve to reducing and capping the resulting silver nanoparticles, have been identified as described by [8].

2.6.3. XRD analysis

The peaks of the AgNPs were determined using the XRD device as described by [9].

2.6.4. SEM Analysis

The silver nanoparticles were scanned to find out the shape and clustering of the particles.

2.6.5. Antibacterial activity determination

The effect of AMS-AgNPs was determined as described by [10].

2.6.6. Antibiofilm activity determination

Detection of antibiofilm activity of AMS-AgNPs against *Pseudomonas aeruginosa* and *Staphyloccocus aureus* isolates using Microtiter plate method as mentioned in [11].

2.6.7. Antifungal activity determination

The antifungal activity of AMS-AgNPs was tested by the radial growth of tested fungi, after the addition of different concentration of silver nanoparticles to potato dextrose agar medium. The media inoculated with the tested fungi and incubated at 25±2°C [12].

2.6.8. The effect of AMS-AgNPs on cell wall function

The effect of AMS-AgNPs on cell wall efficacy was studied by phenotypic changes and congo-red dye test [13].

3. Results and Discussion

The fresh suspension of (AMS) was bright brown but it turned reddish brown after adding it to the silver nitrate solution. This color change indicates the completion of the reaction and the formation of silver nanoparticles Figure 1.

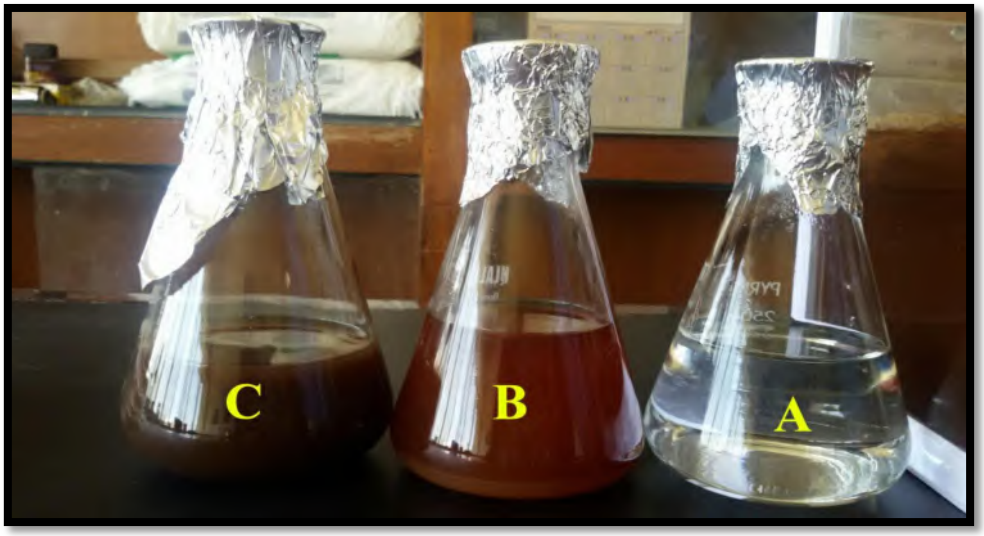

Figure 1. Synthesis of AMS-AgNPs: A- Solution of silver nitrate. B- (AMS), and C- AMS-AgNPs colloidal.

3.1. UV-Vis Spectrophotometry

UV-Vis absorption spectrum of AMS-AgNPs is shown in figure 2. It's at 430 nm.

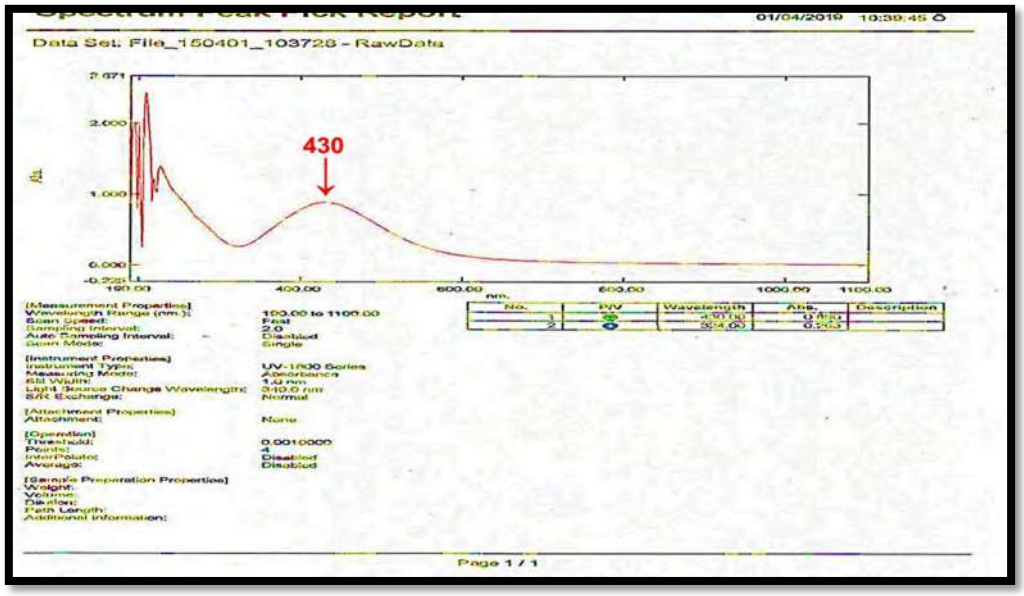

Figure 2. UV-Vis absorption spectra of AMS-AgNPs.

3.2. Fourier Transform Infra-Red Spectroscopy

Figure 3 shows the spectra for Alkhal Mother Shae were obtained using an FTIR spectrophotometer. Several peaks were observed indicating the Alkhal Mother Shae is composed of various functional groups. The broad band at about 3448.72 cm^{-1} can be attributed to bond –OH groups. The band at about 2356.89 cm^{-1} can be attributed to C=N bond Amine I groups are also observed at 1635.64 cm^{-1}. The peak at 1543.05 cm-1 is attributed to secondary amine groups. The peaks at 1458.18 and 1396.46 cm-1 are both related to the symmetric bending of CH3. While the peak at about 1107.14 cm^{-1} can be attributed to C=O stretching vibrations groups. The peak at 470.63 cm-1 correspond to stretching vibration of amine groups.

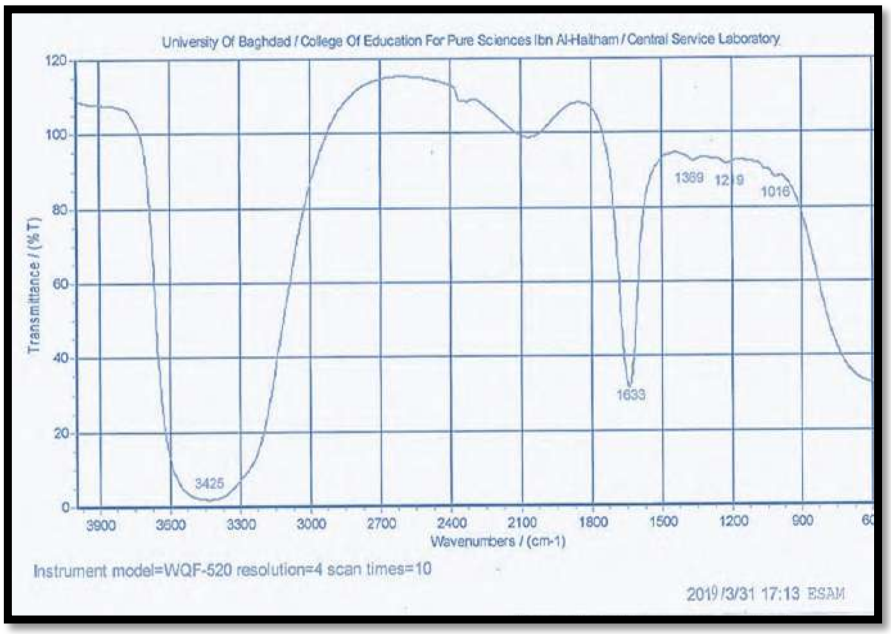

Figure 3. Fourier Transform Infra-Red Spectroscopy image of AMS-AgNPs.

3.3. XRD pattern of AMS-AgNPs

Figure 4 shows the main peaks obtained at 111, 200, 220, and 311 correspond to reflections with 2θ values of the Bragg angles 38.12°, 44.31°, 64.46 °, and 76.98 °, respectively. These results confirm that the material tested are AgNPs and are of high purity. The average crystallite size of AMS-AgNPs in arrange (30-40 nm).

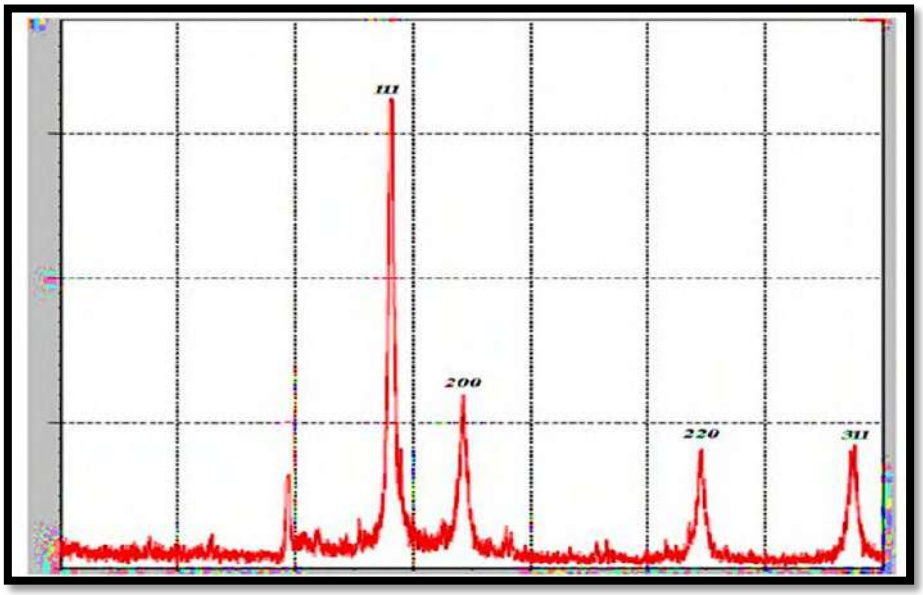

Figure 4. X ray diffraction of AMS-AgNPs.

3.4. SEM analysis of AMS-AgNPs

The scanning showed that the AMS-AgNP s are spherical in shape and are aggregated in clusters Figure 5.

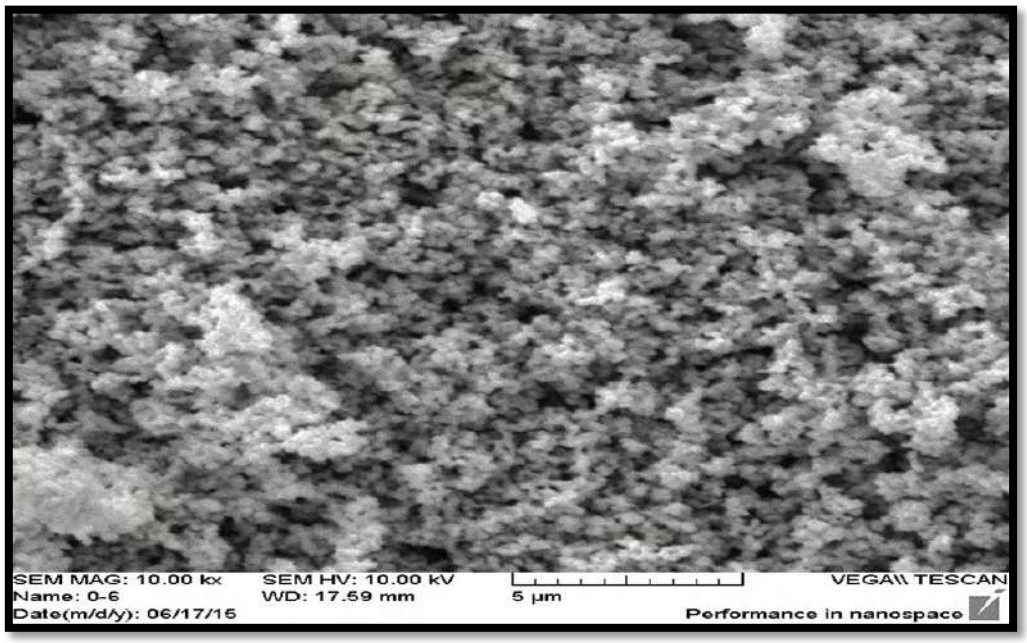

Figure 5. SEM micrographs of AMS-AgNPs.

The results in Table (1) and Figures (6 and 7) shows the inhibition zone was 18 mm for *P. aeruginosa* No.1, 3, 4, 7, 9, 10 and *S. aureus* No.3, 5, 6, 9. 16 mm for *P. aeruginosa* No.2, 8 and *S. aureus* No.4, 10. 14 mm for *P. aeruginosa* No. 5, 6 and *S. aureus* No.1, 2, 7. The IZ was 10 mm for *P. aeruginosa* No.1, 4, 6, 8, 9, 10 and *S. aureus* No.2, 3, 7, 8, 9. 11 mm for *P. aeruginosa* No.2, 5 and *S. aureus* No.1, 5, 10. 12 mm for *P. aeruginosa* No.3, 7 and *S. aureus* No.4, 6.

Table 1. Activity of the AMS-AgNPs against the tested bacteria.

Isolated bacteria	Zone of Inhibition (mm)

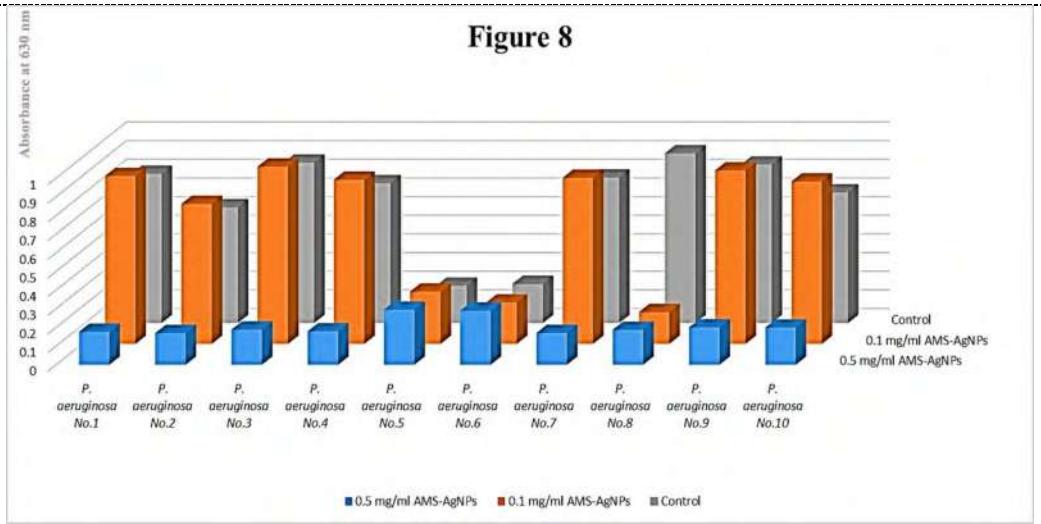

Figure 8. Inhibition of biofilm formation of Pseudomonas aeruginosa using AMS-AgNPs.

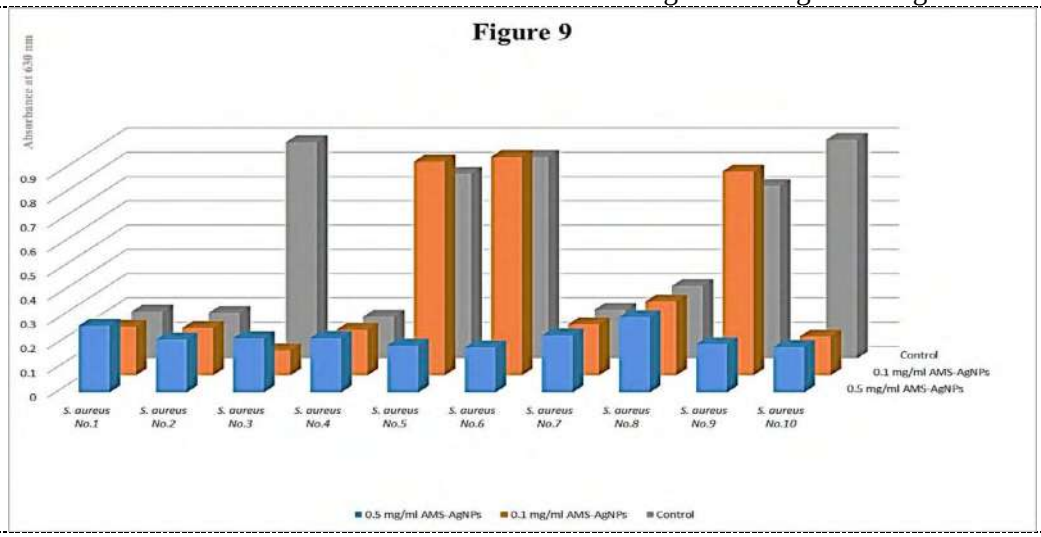

Figure 9. Inhibition of biofilm formation of Staphylococcus aureus using AMS-AgNPs.

The results in Table (3) and Figure (10, 11) shows that AMS-AgNPs has effective antifungal activities on the *Aspergillus flavus*, *Aspergillus parasiticus*, *Aspergillus niger*, *Fusarium oxysporum* and *Fusarium verticillioides* as indicated by the diameter of their radial growth. The radial growth of *Aspergillus flavus*, *Aspergillus parasiticus* and *Aspergillus niger* reduce from 9 cm for control to 2cm at 15% concentration of silver nanoparticles in the culture media. Whereas the radial growth of *Fusarium oxysporum* and *Fusarium verticillioides* reduce from 7 cm for control to 1cm at 15% concentration of silver nanoparticles in the culture media.

Table 3. The antifungal effect of the AMS-AgNPs.

Isolated microbes	Diameter of growth*			
	control	5%	10%	15%
Aspergillus flavus	9	7	4	2
Aspergillus parasiticus	9	7	4	2
Aspergillus niger	9	7	3	2
Fusarium oxysporum	7	2	1.5	1
Fusarium verticillioides	7	3	2	1

* Radial growth of fungi (cm).

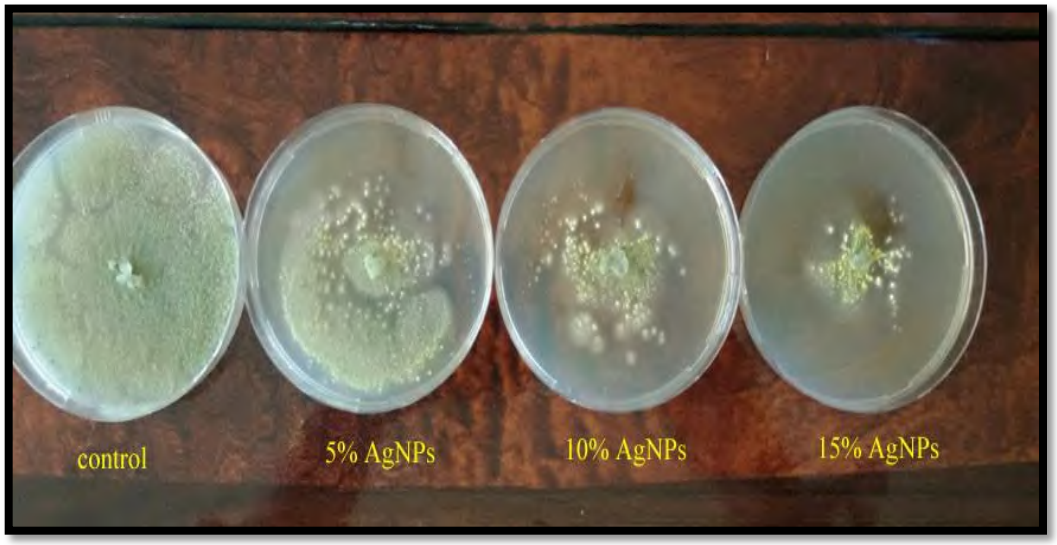

Figure 10. Antifungal activity of AMS-AgNPs against *Aspergillus flavus*.

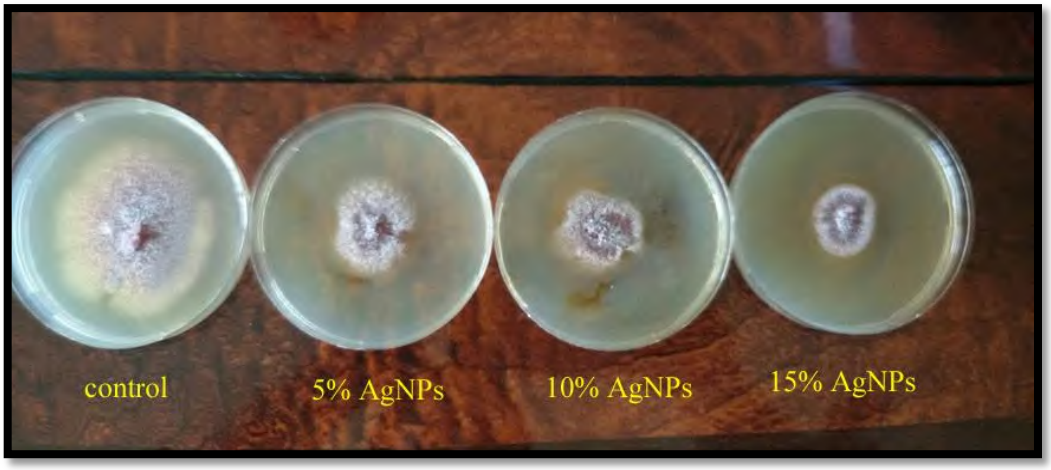

Figure 11. Antifungal activity of AMS-AgNPs against *Fusarium oxysporum*.

The effect of silver nanoparticles on the fungus was also studied and it was found that AMS-AgNPs lead to swelling in the fungal hyphae Figure 12. These swelling effect on permeability of hyphae cell and thus kill it, which is reached from the Congo red dye absorption test Figure 13.

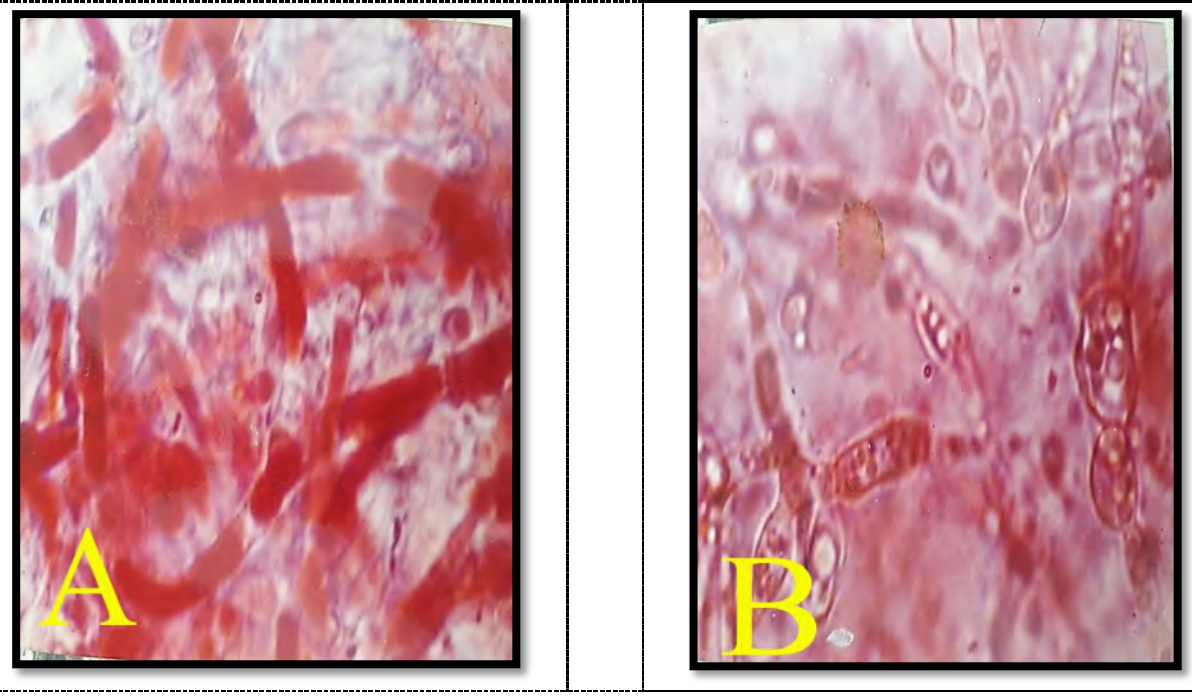

Figure 13. Show the Congo red dye absorption test. A- Normal hypha of *Fusarium verticillioides*. B- treated with AMS-AgNPs. Power of magnification 100X.

4. Discussion

In the present study, AgNPs was biosynthesized using alkhal mother shae. Production of AgNPs was confirmed by the change in colour and formation of gray aggregates of AgNPs. This result is in agreement with many studies [16, 17, 18] which found that the formation of gray aggregates is

evidence of completeness of reaction and formation of AgNPs. The crystalline AgNPs were confirmed by UV absorption spectrum at 430 nm. This result is accordance with several studies [19, 20, 21] which reported that the peak absorption of AgNPs is around 300-500nm. The functional groups associated with the process of reducing and stabilizing AgNPs were analyzed using Fourier Transform Infrared Spectroscopy. Several peaks were observed indicating that the alkhal mother shae is composed of various functional groups are attributed to secondary amine groups. These finding are acceptable with many studies [22, 23, 24] which found these groups are responsible for reducing and capping of AgNPs. The results of X-ray Diffraction spectrum with 2θ values was at Bragg angles 38.12, 44.31, 64.46 and 76.98, respectively. These results are consistent with several studies in which biosynthesis of nanoparticles of silver molecules using tea leaf extract and kombucha tea [25, 26, 27]. Particle size causes the broadening of peaks in the XRD patterns and by using Debye-Scherrer's equation, the average particles size were arrange 30-40 nm. Results of the present study show that AMS-AgNPs have antibacterial activity against Gram positive and Gram negative bacteria which tested. The antimicrobial activity of alkhal mother shae has less effect against tested isolates. These finding are in agreement with several studies [28, 29, 30, 31]. Who's found that the silver nanoparticles synthesized by leaf tea extract had antibacterial activity against Gram-negative and Gram-positive bacteria. The inhibition of biofilm formation for *P. aeruginosa* and *S. aureus* was 70% and 60%, respectively when using AMS-AgNPs at 0.1 concentration. While the inhibition of biofilm formation for *P. aeruginosa* and S. aureus was 80% and 70% respectively when using AMS-AgNPs at 0.5 concentration. These finding are in agreement with several studies [32, 33, 34] which found that the antibiofilm activity of AgNPs was between 50 to 90 in Gram negative bacteria and about 50 to 80 in Gram positive bacteria. AMS-AgNPs has antifungal activity on the *Aspergillus flavus*, *Aspergillus parasiticus*, *Aspergillus niger*, *Fusarium oxysporum* and *Fusarium verticillioides* as indicated by the diameter of their radial growth. The radial growth of *Aspergillus flavus*, *Aspergillus parasiticus* and *Aspergillus niger* reduce from 9 cm for control to 2cm at 15% concentration of silver nanoparticles in the culture media. Whereas the radial growth of *Fusarium oxysporum* and Fusarium verticillioides reduce from 7 cm for control to 1cm at 15% concentration of silver nanoparticles in the culture media these finding are in agreement with several studies which found the effect of silver nanoparticles against various plant pathogenic fungi [35, 36, 37]. The two species have been selected because they are producers of the mycotoxins. The *Aspergillus*, especially A. flavus and A. parasiticus, which produce aflatoxins and *Fusarium*, which produces *Trichothecenes*. Aflatoxins is the leading cause of cancer. *Trichothecenes* is used in chemical warfare [38, 39]. For these reasons, the eradication of these fungi protects plants, from the infection of and animals, humans from their toxins [40, 41]. The effect of silver nanoparticles on the fungus was also studied and it was found that silver nanoparticles lead to swelling in the fungal hyphae and thus kill it, which is reached from the Congo red dye absorption test [42]. These finding are in agreement with several studies [43, 44, 45] in which found AMS-AgNPs disrupt the integrity fungal cell wall, promoting the permeability and the leakage of the cell constituents, and eventually induce cell death.

5. Conclusions

We concluded that the AMS-AgNPs can be used as an alternative medicin for pathogenic bacteria and fungi.

Anatomical study of the *Carissa macrocarpa* (Apocynaceae family) in Iraq

Anatomical study of the *Carissa macrocarpa* (Apocynaceae family) in Iraq

Feryal K. Khalaf[1*]

[1]Department of Biology, College of Education for Pure Science (Ibn Al-Haitham), University of Baghdad, Baghdad, Iraq.

*E-mail: firial.k.k@ihcoedu.uobaghdad.edu.iq

Abstract. This study was conducted to examine the anatomical aspects of *Carissa macrocarpa*, of stem, leaf and leaf venation. The results obtaind showed that the tissue of the studied parts have important anatomical characteristics in terms of the shape of the cross-sectional of stem and vertical-sectional of leaves. The stem section appeared in circular and the midrib was crescent shape and the stomata appeared on the upper surface of the leaf only, Tetracytic in type. Druses crystals and Aleurone granules appeared on both surfaces of leaves. The venation type was Brochidodromous in which the secondary veins do not end at the edge of the leaf, and each secondary race is connected with the higher race and linked together with a series of prominent arches.

Keywords. *Carissa macrocarpa*, Anatomical study, Apocynaceae, Iraq.

1. Introduction

The Apocynaceae family consists of 300 genera and more than 1300 species spread all over the world and in Iraq have 4 wild species and 7 cultivated species [1]. The species is considered domestic in South Africa and is grown in Egypt [2]. Most of the plants in this family were herbs or shrubs or trees with milky juice, the leaves were simple, bracelet or alternate with smooth edge, the flowers radial symmetry and the seeds are often covered with hairs [3]. Most of the plants are grown for decoration, but many species are poisonous to humans and animals if they eat the fruit and their vegetative compositions, extracting a number of drugs and tanning materials [4]. We did not find published data provides clarify anatomical information to describe the species under study in Iraq, so the aim of this study provide and description anatomical features and enhanced measurements and forms which can be adopted the morphological studies of this species and applications of phylogenic relationships [3, 5, 6, 7].

2. Materials and Methods

The present study relied on the fresh samples of the species Carissa macrocarpa (Figure 1) collected at the flowering stage from the Botanical Garden of the College of Education for pure sciences-Ibn Al-Haitham, parks, public parks and some office located within the areas of AL-Adhamiya, Alkraiat, and

Al-Ameriya in the Baghdad at the period from (20/12/2017 - 20/3/2018). The diagnosed of the species by taxonomic keys and fluorescent Arabic and international as well as Internet sources. The fresh samples of the stem and leaf were cut up to 2-3 cm from the middle of each part [8]. The samples were fixing by formalin acetic acid alcohol (F.A.A.) for 24 hours at room temperature according to [9] and then washed with alcohol concentration 70% to remove traces of the fixative solution and then kept in the same concentration of alcohol in the refrigerator until used. Several samples of preserved samples were selected to prepare the epidermal of leaves to study the stomata and the other Accessories of the epidermis. The epidermis of the leaf was peeling by a razor blade also the samples of stems and leaves have cut off by using the hand sectioning method follows by [10] were the parts of stem sectioned into thin pieces by a razor blade too. All the samples of the stem, leaf, and epidermis of leaf were put in the 0.5% sodium hypochlorite for 5 mints to remove the chlorophyll pigments, then the samples were transported to Petry Dish with Safranin pigment to gives color to the tissue of stems. Finally, the samples of the stem were put on the slides and mounted by cover slides with D.P.X. and fixed by Olympus light microscope then photographed using the Omax camera. The measurements of tissue were made using the Ocular micrometer and the characters were studied that are, the epidermis features, the cross-section of the stem and the cross-section of leaves also the dimensions of the stomata were measured and the stomatal index was calculated according to [11].

$$\text{Stomatal index} = \frac{Number\ of\ stomata}{Number\ of stomata + Number\ of\ ordinary\ epidermal\ cells} \times 100$$

Also doing clearing of vegetative leaves to identify the system of venation as followed [12]. The study also relied on the terms contained in [3, 5, 6, 13].

Figure 1. General shape of the species C*arissa macrocarpa by* digital camera.

3. Results and Discussion

3.1. Cross section of stem

The cross-section of the stem circular shape (Figure 2). The epidermis of stem consists of small cells, simple, uniseriate and cubical shape with straight walls, the thickness of it reached 13.4 µm. the epidermis covered by cuticle except for the position of stomata. The cortex consists from two layers the first layer it's the collenchyma tissue under the epidermis consists from 5 rows free of intercellular

spaces and the thickness of it reached to 75 µm, the second layer it's chlorenchyma tissue consist from parenchyma cell riches of chlorophyll, the cell were very thin circular to polygonal shape and throw it the intercellular spaces, the thickness of it reached to 133 µm. the average thickness to all cortex reached 210 µm. The vascular bundles open and collateral ensue as a wavy circular ring around the pith, the thickness of it 20 µm consist of phloem and xylem. the phloem consists of sieve tubes and companion cells have a transparent area being responsible for the milky white secretions that come out when the stem is broken and this is agreed with [2]. The thickness of phloem reached to 8 µm and the xylem thickness reached to 10 µm, also the number of vessels rows in xylem reached to 8-10 rows (Table 1). The pith consists of many layers of parenchyma cells storage, circular to polygonal shape with thin walls throw it intercellular spaces, the pith occupied the central part with solid tissue, the Druses crystals diffuse in the cortex and pith, and this is agreed with [2].

Table 1. characters cross section of stem in the species *Carissa macrocarpa* (µm).

Epidermis thickness	Collenchyma thickness	Chlorenchyma thickness	Cortex thickness	Phloem thickness	Xylem thickness	Number of xylem rows	Vascular bundles thickness
7.5-15.2 (13.4)	70.4-78 (75)	125.9-135.8 (133)	200-215 (210)	6-10 (8)	8-12 (10)	8-10 (8)	15-26 (20)

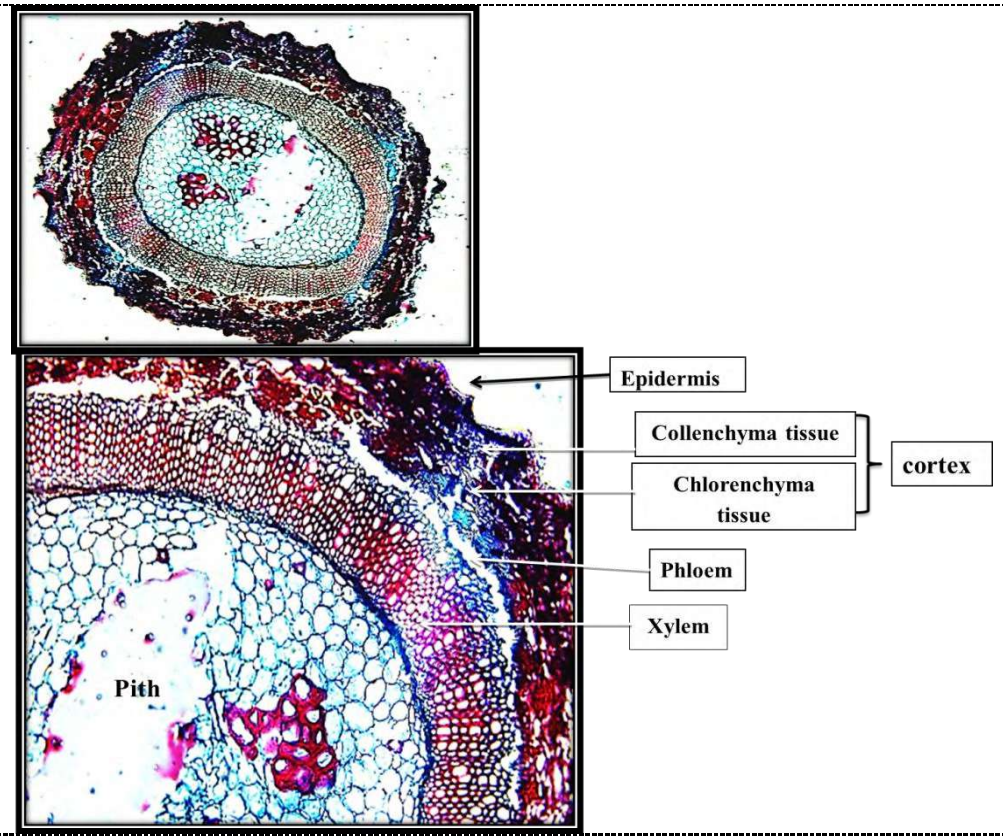

Figure 2. Cross section of stem in the species C*arissa macrocarpa* X40.

3.2. Leaves

3.2.1. Service view of leaves

The ordinary epidermal cells on both sides of leaf consist from oblong to-coordinate cells like bee cells with straight walls to semi-wavy on the side (Figure 3) this is due to changes in the shape of the outer tangential walls and the inner tangential walls of the cells [14]. The average of cell long on the upper epidermis of leaf reached to 46.2 µm and the average of width 43.2 µm also the average of cell long on the lower epidermis reached to 32 µm and the average of width 29 µm.

3.2.2. The Complex of stomata of leaves

The stomata appeared on the lower surface only and these results agree with [1]. Their diffused on that surface varied as they appeared in high density, were circular in shape, and the stomatal model was Tetracytic type, which is surrounded by four normal cells on that surface (Figure 3). It is possible to rely on the variation in the dimensions of stomata and stomatal evidence as an important anatomical characteristic that helps in the diagnosis and isolation of the species, it is also a demonstration of plant efficiency in photosynthesis [2].

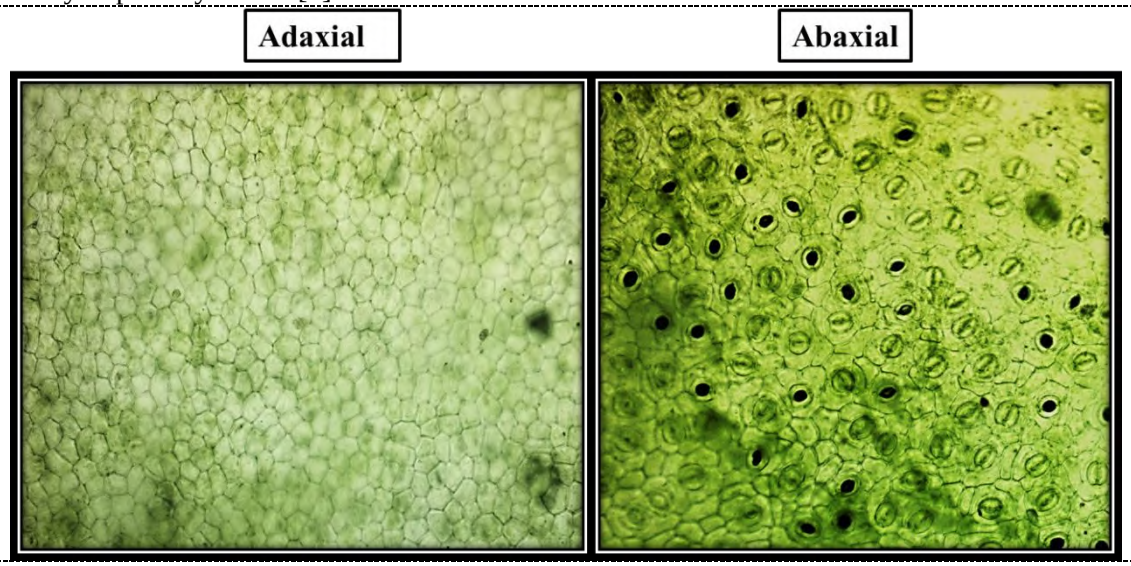

Figure 3. Characters of the epidermis and stomata of leaves in the species C*arissa macrocarpa* X100.

3.2.3. Longitudinal section of leaves

The epidermis of blade was characterized by upper epidermis and lower epidermis, but they were almost identical, were consist from simple and uniseriate epidermal cells, with square shapes to polygonal ridges, stacked together, and straight walls have low wavy, and the lower epidermis appeared thinner and more stomata than the upper epidermis, the average thickness of upper epidermis reached to 22 µm, while the average thickness of the lower epidermis was 10 µm. The epidermal cells covered a layer of the thick-toothed cuticle (Figure 4). The mesophyll tissue, which follows the upper epidermal layer, appears to consist of the upper Palisade parenchyma and the lower spongy parenchyma, the type of this arrangement of mesophyll known bifacial and this type is a common form in the most leaves of plants. The palisade layer consist from 1-2 rows of oblong cells with narrow intercellular space between cells, its longitudinal axis is perpendicular to the leaf surface and contains chloroplasts, the average thickness of palisade layer reached to 62 µm, so the spongy layer of mesophyll consists from loose tissue have air lacunae between the cells and the cells irregular shape

consist from druses crystals and ailerons grains, the rows of it reached to 2-3 rows and the average thickness of spongy layer reached to 94 µm, so the average of thickness of blade reached to 120.8 µm (Table 2). The result of the study of appeared that the midrib has almost straight from the upper to the zigzag from the lower (Figure 4) the tissue of midrib consist from two types of cells, the Angular collenchyma, occupied the corners of the middle race against the vascular bundle and exchanged with chlorenchyma cells, spherical to polygonal shape, containing an abundance of chloroplasts. The Crystals were also observed in the tissue and around the vascular bundles. The study showed that the vascular tissue in the midrib is only an extension of the vascular strand from the stem to the blade. Therefore, the vascular tissue retained its components of xylem and phloem elements. The vascular tissue appeared in the midrib in the form of veins, consisting of vascular bundles branching into several intertwined branches and thus the main vascular bundle showed the largest bundles in the middle ovate broad shape, and the average thickness of the vascular bundle was 33 µm. In addition to the emergence of sub-vascular bundles spread in the leaf blade less in size as we move away from the midrib, 1-2 rows of parenchyma cells surrounded by the vascular bundle compose the bundle sheath. The results of the present study confirmed that there are differences in the anatomical characteristics shown by the leaves of the species under study and the leaf consider is the most plant-specific part of the anatomical characteristics and the most consistent, this agrees with [8] that appeared the leaf has been used extensively to solve the most difficult taxonomic problems between different genus and species.

Table 2. Characters of longitudinal section of baled and midrib of leaves in the species *Carissa macrocarpa* (µm).

Upper Epidermis thickness	Lower Epidermis thickness	Palisade layer thickness	Spongy layer thickness	Blade thickness	Vascular bundles thickness
18-24 (22)	9.2-13.1 (10)	220-305 (62)	260-300 (94)	115-130 (120.8)	20-38 (33)

*The number between parentheses refer to average

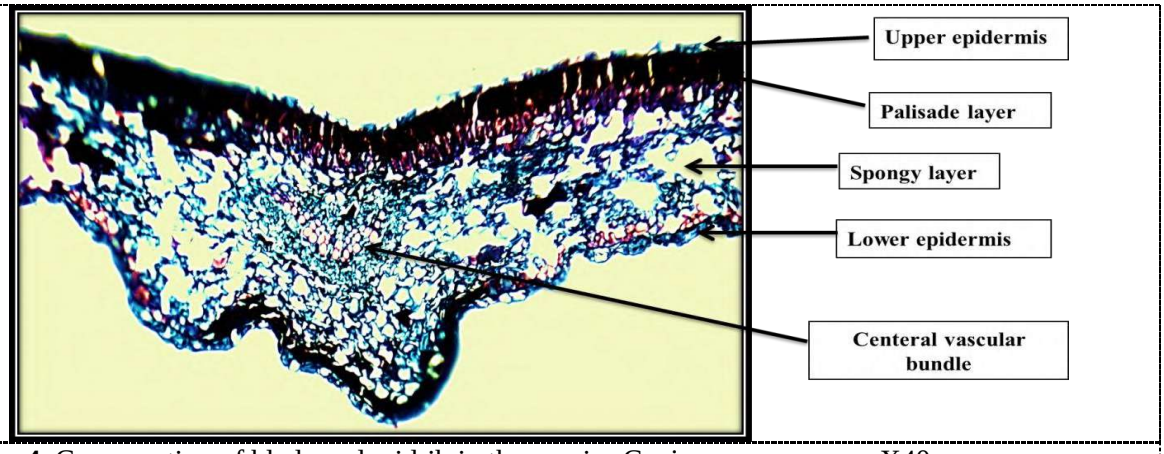

Figure 4. Cross section of blade and midrib in the species C*arissa macrocarpa* X40.

3.3. Crystals

The results of the present study showed crystals and their forms, and that one plant species may contain two or more types of crystals of different shapes and sizes and this is due to the form and nature of the isolated cell Idoblast, which acts as a template responsible for the shape of the crystal, the

crystals consist from calcium oxalate is a toxic acid which is produced by the plant's biological activity. Oxalic acid is a toxic acid and is therefore transformed by cells into insoluble compounds in the form of crystals that minimize their toxic effect [1]. The druses crystals appeared as a diffuse on the upper and lower leaves surfaces and appeared within the spongy layer and parenchyma tissue of their blade, as well as in the tissue of the cortex and pith of stem (Figure 5).

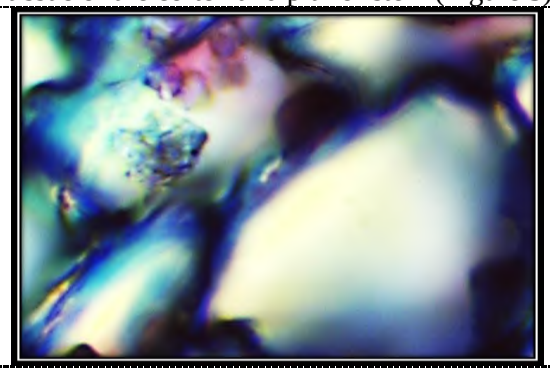

Figure 5. Druses crystals of the leaves in the species *Carissa macrocarpa* X100.

3.4. Starch grains

The starch is one of the most important materials stored in plant cells and the composition of these granules depends on the physiological conditions associated with the plant [15]. The phenotypic characteristics of these plants vary depending on the location and shape of the starch grains like the center of the grain formation (hilum), and the presence or absence of layers as well as the nature of those granules layers of being simple or complex or semi-complex [16]. The starch grains appeared in the parenchyma tissue as complex types have two hilum and the arrangement of the layers around each of them, the hilum circular shape un-centric location (Figure 6) also showed the Aleurone grains in the epidermis of leaves (Figure 7). Starch grains are an important anatomical characteristic in isolating plant species [17].

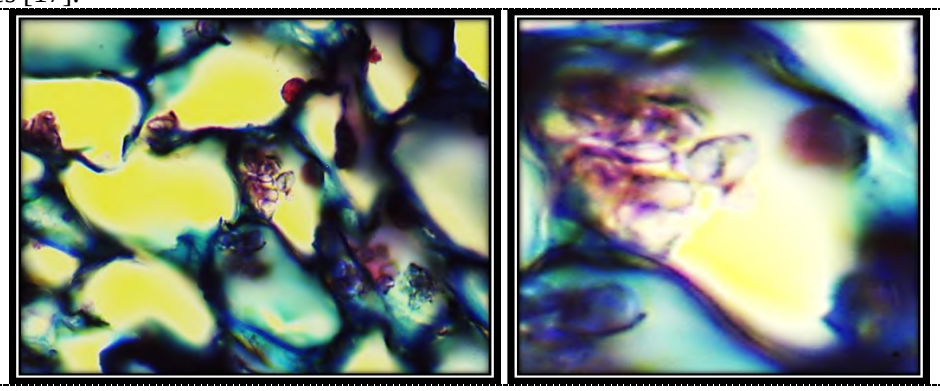

Figure 6. starch grains of the leaves in the species *Carissa macrocarpa* (X100).

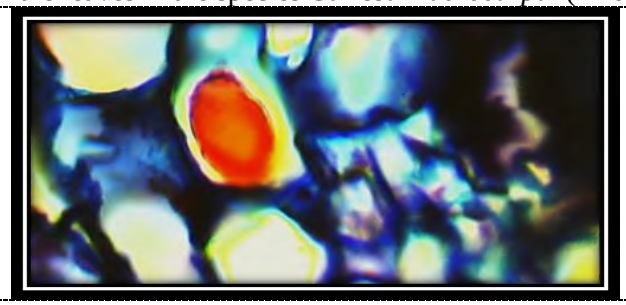

Figure 7. Aleurone grains of the leaves in the species *Carissa macrocarpa* (X100).

3.5. Venation system of leaves

The type of venation in the leaves of this species has a reticulate system, a characteristic of Dicotylidone [18], which was a type of Camptodromous, in this type the midrib penetrates the blade longitudinally, characterized by being larger than the rest of the veins, thicker and longer than the rest veins, the secondary veins. Branching from the midrib don't reach to the margin of leaf and this veins branching and bifurcate and come back together to form a brochidodromous network type, in this type the veins do not end at the edge of the leaf and each secondary veins is connected with the higher vein and linked to each other composes prominent arches (Figure 8).

Figure 8. Venation pattern of the leaves in the species *Carissa macrocarpa* (cm).

Abstract. In this study, we synthesized a series of benzimidazole compounds containing. 1,3,4-thiadiazole ring from many reaction steps. The obtained benzimidazole series were characterized by melting point, Data from FT-IR and 1H-13C-NMR and In vitro screening of antibacterial activity against strains of selected pathogenic Gram-positive (*Staphylococcus aureus, Bacillus subtilis*) and Gram-negative (*Acinetobacter baumannii, Pseudomonas aeruginosa*) bacteria relative to (Amoxicillin) and (Ciprofloxacin) as standard antibacterial agents has shown high pharmacological activity.

Keywords: benzimidazole, 1,3,4-thiadiazole, antibacterial activity, 1,2-*o*-phenylenediamine

1. Introduction

Benzimidazoles remain one of the most robust classes of antimicrobial agents, despite several attempts to create a new structural template in the search for more effective antimicrobials. [1–8]. Benzimidazoles are considered to be a possible class of heterocyclic bioactive compounds with a wide range of biological activities. In fact, this nucleus is a component of vitamin B12 [9]. As a consequence, benzimidazoles have diverse biological properties, such as antifungal.[4], antitumor[10–12],antiviral[13,14] ,antihistaminic[15]. benzimidazole and its derivatives have also been used as optical lasers and polymer dyes in optoelectronics.[16,17], For the identification of biologically important molecules such as DNA, RNA or proteins and enzymes, organic luminophores, fluorescent fags [18]. In a large spectrum of therapeutically important agents, The nucleus of 1,3,4-thiadiazole has been incorporated. Which mainly provides antimicrobial operations [19]. In many fields, There are enough applications for 1,3,4-thiadiazole. As antibacterial medicines, the first applications of the medicinal industry were [20].

2. Experimental

2.1. Materials and physical measurements

Without purification from Aldrich, many of the starting materials and solvents were collected and used.On the SHIMADZU model FT-IR-8400S, the FT-IR spectrum was registered, 1H and 13C-NMR spectra were recorded on the BRUKER model Ultra Shield 500 MHz spectrophotometer using DMSO-d6 as solvent and TMS as internal comparison. The melting points were registered and are unreliable by the Stuart smp3 electronic system.

2.2. Methods of preparation and physical data of synthesised compounds 1(a,b), 2(a–e), 3(a-e), and 4(a-j).

2.2.1. Common method for synthesizing 1(a-b) of compounds.
Mixing (20) mmol of *o*-phenylene diamine derivatives, (20 mmol) of CS_2, (20) mmol of KOH, (25) mL of EtOH and (5) mL of reflux-heated H2O in a 100 ml circular flask for 3 hours, carefully inserted (0.5 g) of (charcoal) and continued reflux for 10 minutes, Filtered charcoal was extracted by filtration and (25 mL) of hot water was added.. In order to complete the crystallization, the mixture obtained was held in an ice bath for (3 h), the material obtained was distilled, dried and recrystallized from ethanol, and TLC(mobile phase: $CH_3(CH_2)_4CH_3$: $CH_3COOCH_2CH_3$ (1:1))

2.2.1.1. 2-mercaptobenzimidazole (1a).

Light beige powder, m.p 305-307 °c, FT- ir (cm^{-1}) 3155 (NH), 3093 (CH, aromatic), 2569 (S-H), 1620 (C=N), 1585 and 1462 (C=C, aromatic) was obtained.

2.2.1.2. 2-mercapto-5-methylbenzimidazole (1b).

Light brown powder, yield (80%), m.p 286-288 °C, FT-ir (cm^{-1}) 3132 (N-H), 3041 (C-H, aromatic), 2968-2862 (C-H, aliphatic), 2573 (S-H), 1625 (C=N), 1593 and 1469 (C=C, aromatic) was obtained.

2.2.2. Specific protocol for compound synthesis 2(a-e).
For 3 hours, The resultant mixture of (ArCOOH) (20 mmol), ($NH_2NHCSNH_2$) (1.82 g, 20 mmol) and $POCl_3$ (10 mL) was refluxed gently. H_2O (50 mL) was applied slowly after cooling and The mixture of reactions was refluxed and purified for 4 h. The distilled KOH solution neutralized the solvent and the precipitate was purified and recycled from EtOH,and TLC was tested for the completion of the reaction and for the purity of the compounds (mobile phase: $CH_3(CH_2)_4CH_3$: $CH_3COOCH_2CH_3$(1:3)).

2.2.2.1. 2-Amino-5-(phenyl)-1,3,4-thiadiazole (2a).

Pale yellow powder, yield (76%), m.p 224-227 °C, FT- ir (cm^{-1}) 3275 and 3113 (NH_2), 3043 (C-H, aromatic), 1631 (C=N), 1581 and 1469 (C=C, aromatic) was obtained.

2.2.2.2. 2-Amino-5-(4-chlorophenyl)-1,3,4-thiadiazole (2b).

Yellow powder, yield (80%), m.p 226-229 °C, FT- ir (cm^{-1}) 3271 and 3105 (NH_2), 3047 (C-H, aromatic), 1631 (C=N), 1597 and 1462 (C=C, aromatic) was obtained.

2.2.2.3. 2-Amino-5-(2-chlorophenyl)-1,3,4-thiadiazole (2c).

Yellow powder, yield (70%), m.p 214-216 °C, R_f = 0.58; FT- ir (cm^{-1}) 3282 and 3105 (NH_2), 3028 (C-H, aromatic), 1635 (C=N), 1597 and 1458 (C=C, aromatic) was obtained.

2.2.2.4. 2-Amino-5-(4-nitrophenyl)-1,3,4-thiadiazole (2d).

Dark yellow powder, yield (78%), m.p 244-247 °C, FT- ir (cm^{-1}) 3259 and 3113 (NH_2), 3066 (C-H, aromatic), 1627 (C=N), 1597 and 1458 (C=C, aromatic), 1508 and 1346 (NO_2) was obtained.

2.2.2.5. 2-Amino-5-(3,5-dinitrophenyl)-1,3,4-thiadiazole (2e).

Dark yellow powder, yield (75%), m.p 265-268 °C, FT- ir (cm^{-1}) 3275 and 3116 (NH_2), 3055 (C-H, aromatic), 1624 (C=N), 1593 and 1419 (C=C, aromatic), 1539 and 1350 (NO_2) was obtained.

2.2.3. Common method for synthesizing 3(a-e) compounds.
Compounds 2(a-e) (5 mmol) were dissolved in DMF, and the reaction mixtures were added to TEA (5 mmol). The reaction mixtures were slowly applied to chloroacetyl chloride (10 mmol). The mixture of reactions was

heated under reflux for 2 h. The solution was then applied to crushed ice, filtering the substance collected, Washed with H_2O, dried and recrystallized from C_2H_5OH.

2.2.3.1. 2-chloro-N-(5-phenyl-1,3,4-thiadiazol-2-yl)acetamide (3a)

Pale yellow powder, yield (82%), m.p 233-235 °C, FT- ir (cm^{-1}) 3182 (N-H), 3043 (C-H, aromatic), 2947, 2835 (C-H, aliphatic), 1705 (C=O), 1627 (C=N), 1573 and 1438 (C=C, aromatic) was obtained.

2.2.3.2. 2-chloro-N-(5-(4-chlorophenyl)-1,3,4-thiadiazol-2-yl)acetamide (3b)

Beige powder, yield (85%), m.p 254-256 °C, FT- ir (cm^{-1}) 3170 (N-H), 3043 (C-H, aromatic), 2943, 2835 (C-H, aliphatic), 1705 (C=O), 1631 (C=N), 1570 and 1442 (C=C, aromatic) was obtained.

2.2.3.3. 2-chloro-N-(5-(2-chlorophenyl)-1,3,4-thiadiazol-2-yl)acetamide (3c)

Beige powder, yield (84%), m.p 230-232 °C, FT- ir (cm^{-1}) 3174 (N-H), 3032 (C-H, aromatic), 2939, 2831 (C-H, aliphatic), 1708 (C=O), 1624 (C=N), 1581 and 1438 (C=C, aromatic) was obtained.

2.2.3.4. 2-chloro-N-(5-(4-nitrophenyl)-1,3,4-thiadiazol-2-yl)acetamide (3d)

Dark beige powder, yield (80%), m.p 250-252 °C, R_f = 0.47; FT- ir (cm^{-1}) 3163 (N-H), 3032 (C-H, aromatic), 2943, 2839 (C-H, aliphatic), 1708 (C=O), 1627 (C=N), 1593 and 1438 (C=C, aromatic), 1519 and 1346 (NO_2) was obtained.

2.2.3.5. 2-chloro-N-(5-(3,5-dinitrophenyl)-1,3,4-thiadiazol-2-yl)acetamide (3e)

Pale brown powder, yield (86%), m.p 240-243 °C, FT- ir (cm^{-1}) 3182 (N-H), 3035 (C-H, aromatic), 2943, 2877 (C-H, aliphatic), 1712 (C=O), 1624 (C=N), 1593 and 1438 (C=C, aromatic), 1543 and 1350 (NO_2) was obtained.

2.2.4. The general protocol for compound synthesis 4(a-j).

A mixture of 2-chloro-N- (5-((un)substituted phenyl)-1,3,4 thiadiazole-2-yl) acetamide (5 mmol), compouds 1(a,b) (5 mmol) and K_2CO_3 (5 mmol) in DMF (25 mL) was refluxed for 10 h. The solvent was then added into the crushed ice, refining and recrystallizing the liquid derived from ethanol, TLC tested the end of the reaction and the compounds' purity. (mobile phase: $CH_3(CH_2)_4CH_3$: $CH_3COOCH_2CH_3$ (2:3)).

2.2.4.1. 2-((benzimidazol-2-yl)thio)-N-(5-phenyl-1,3,4-thiadiazol-2-yl)acetamide (4a)

Beige powder, yield (60%), m.p 188-190 °C, FT- ir (cm^{-1}) 3336 (N-H), 3155 (N-H, benzimidazole),3035 (C-H, aromatic), 2951, 2881 (C-H, aliphatic), 1670 (C=O), 1616 (C=N), 1558 and 1435 (C=C, aromatic); ^{1}H-NMR (DMSO-d_6, 500 MHz, δ) 4.45 (s, 2H, CH_2), 7.15-7.75 (m, 9H, Ar-H), 8.58 (s, 1H, NH), 12.55 (s, 1H, benzimidazole-NH); ^{13}C-NMR (DMSO-d_6, 125 MHz, δ) 36.74, 114.35, 121.88, 122.97, 127.08, 129.66, 130.42, 131.47, 139.97, 150.62, 161.08, 162.57, 169.43 was obtained.

2.2.4.2. 2-((5-methylbenzimidazol-2-yl)thio)-N-(5-phenyl-1,3,4-thiadiazol-2-yl)acetamide (4b)

Dark brown powder, yield (71%), m.p 222-225 °C, FT- ir (cm^{-1}) 3317 (N-H), 3167 (N-H, benzimidazole),3028 (C-H, aromatic), 2908, 2808 (C-H, aliphatic), 1674 (C=O), 1627 (C=N), 1570 and 1438 (C=C, aromatic); ^{1}H-NMR (DMSO-d_6, 500 MHz, δ) 2.37 (s, 3H, CH_3), 4.43 (s, 2H, CH_2), 6.95-7.52 (m, 8H, Ar-H), 8.59 (s, 1H, NH), 13.14 (s, 1H, benzimidazole-NH); ^{13}C-NMR (DMSO-d_6, 125 MHz, δ) 21.62, 35.33, 120.04, 123.35, 125.50, 127.36, 129.78, 130.54, 131.07, 149.03, 158.81, 162.50, 167.55 was obtained.

2.2.4.3. 2-((benzimidazol-2-yl)thio)-N-(5-(4-chlorophenyl)-1,3,4-thiadiazol-2-yl)acetamide (4c)

Dark brown powder, yield (62%), m.p 190-192 °C, FT- ir (cm^{-1}) 3298 (N-H), 3163 (N-H, benzimidazole),3051 (C-H, aromatic), 2900, 2819 (C-H, aliphatic), 1678 (C=O), 1620 (C=N), 1593 and 1438 (C=C, aromatic); ^{1}H-

NMR (DMSO-d_6, 500 MHz, δ) 4.34 (s, 2H, CH_2), 7.12-7.91 (m, 8H, Ar-H), 8.55 (s, 1H, NH), 12.60 (s, 1H, benzimidazole-NH); ^{13}C-NMR (DMSO-d_6, 125 MHz, δ) 35.40, 119.71, 122.71, 128.29, 128.96, 129.55, 129.77, 130.27, 132.70, 134.40, 135.63, 149.68, 159.01, 162.73, 169.30 was obtained.

2.2.4.4. 2-((5-methylbenzimidazol-2-yl)thio)-N-(5-(4-chlorophenyl)-1,3,4-thiadiazol-2-yl)acetamide (4d)

Dark beige powder, yield (58%), m.p 190-194 °C, FT- ir (cm^{-1}) 3305 (N-H), 3159 (N-H, benzimidazole),3047 (C-H, aromatic), 2939, 2873 (C-H, aliphatic), 1678 (C=O), 1624 (C=N), 1593 and 1438 (C=C, aromatic) was obtained.

2.2.4.5. 2-((benzimidazol-2-yl)thio)-N-(5-(2-chlorophenyl)-1,3,4-thiadiazol-2-yl)acetamide (4e)

Dark beige powder, yield (68%), m.p 217-219 °C, FT-IR (KBr disk, cm^{-1}) 3325 (N-H), 3155 (N-H, benzimidazole),3035 (C-H, aromatic), 2962, 2897 (C-H, aliphatic), 1674 (C=O), 1620 (C=N), 1573 and 1435 (C=C, aromatic); ^{1}H-NMR (DMSO-d_6, 500 MHz, δ) 4.38 (s, 2H, CH_2), 7.12-7.81 (m, 8H, Ar-H), 8.62 (s, 1H, NH), 12.38 (s, 1H, benzimidazole-NH); ^{13}C-NMR (DMSO-d_6, 125 MHz, δ) 36.31, 114.35, 121.91, 128.17, 130.02, 130.94, 131.18, 131.40, 131.80, 139.94, 150.36, 157.45, 163.26, 169.06 was obtained.

2.2.4.6. 2-((5-methylbenzimidazol-2-yl)thio)-N-(5-(2-chlorophenyl)-1,3,4-thiadiazol-2-yl)acetamide (4f).

Pale brown powder, yield (55%), m.p 225-227 °C, FT- ir (cm^{-1}) 3282 (N-H), 3167 (N-H, benzimidazole),3032 (C-H, aromatic), 2920, 2823 (C-H, aliphatic), 1678 (C=O), 1631 (C=N), 1577 and 1435 (C=C, aromatic); ^{1}H-NMR (DMSO-d_6, 500 MHz, δ) 2.36 (s, 3H, CH_3), 4.42 (s, 2H, CH_2), 6.94-7.62 (m, 7H, Ar-H), 8.53 (s, 1H, NH), 12.47 (s, 1H, benzimidazole-NH); ^{13}C-NMR (DMSO-d_6, 125 MHz, δ) 21.62, 35.47, 120.49, 123.32, 126.03, 128.25, 129.42, 130.98, 131.23, 131.48, 132.16, 149.14, 158.21, 160.94, 167.96 was obtained.

2.2.4.7. 2-((benzimidazol-2-yl)thio)-N-(5-(4-nitrophenyl)-1,3,4-thiadiazol-2-yl)acetamide (4g).

Brown powder, yield (59%), m.p 193-196 °C, FT- ir (cm^{-1}) 3317 (N-H), 3155 (N-H, benzimidazole),3074 (C-H, aromatic), 2935, 2866 (C-H, aliphatic), 1670 (C=O), 1624 (C=N), 1589 and 1431 (C=C, aromatic), 1516, 1342 (NO_2) was obtained.

2.2.4.8. 2-((5-methylbenzimidazol-2-yl)thio)-N-(5-(4-nitrophenyl)-1,3,4-thiadiazol-2-yl)acetamide (4h).

Dark brown powder, yield (63%), m.p 189-192 °C, FT-IR (KBr disk, cm^{-1}) 3329 (N-H), 3167 (N-H, benzimidazole),3074 (C-H, aromatic), 2927, 2862 (C-H, aliphatic), 1681 (C=O), 1627 (C=N), 1593 and 1435 (C=C, aromatic), 1523, 1346 (NO_2) was obtained.

2.2.4.9. 2-((benzimidazol-2-yl)thio)-N-(5-(3,5-dinitrophenyl)-1,3,4-thiadiazol-2-yl)acetamide (4i).

Dark brown powder, yield (66%), m.p 246-249 °C, FT-IR (KBr disk, cm^{-1}) 3321 (N-H), 3174 (N-H, benzimidazole),3089 (C-H, aromatic), 2981, 2885 (C-H, aliphatic), 1685 (C=O), 1631 (C=N), 1589 and 1423 (C=C, aromatic), 1539 and 1346 (NO_2) was obtained.

2.2.4.10. 2-((5-methylbenzimidazol-2-yl)thio)-N-(5-(3,5-dinitrophenyl)-1,3,4-thiadiazol-2-yl)acetamide (4j)

Dark brown powder, yield (60%), m.p 215-218 °C, FT- ir (cm^{-1}) 3348 (N-H), 3167 (N-H, benzimidazole),3101 (C-H, aromatic), 2951, 2873 (C-H, aliphatic), 1662 (C=O), 1624 (C=N), 1589 and 1423 (C=C, aromatic), 1543 and 1346 (NO_2); ^{1}H-NMR (DMSO-d_6, 500 MHz, δ) 2.31 (s, 3H, CH_3), 4.52 (s, 2H, CH_2), 6.93-7.76 (m, 6H, Ar-H), 8.61 (s, 1H, NH), 12.47 (s, 1H, benzimidazole-NH); ^{13}C-NMR (DMSO-d_6, 125 MHz, δ) 21.38, 36.23, 123.59, 125.94, 126.19, 128.52, 130.60, 132.06, 132.87, 136.05, 148.70, 159.16, 162.74, 168.17 was obtained.

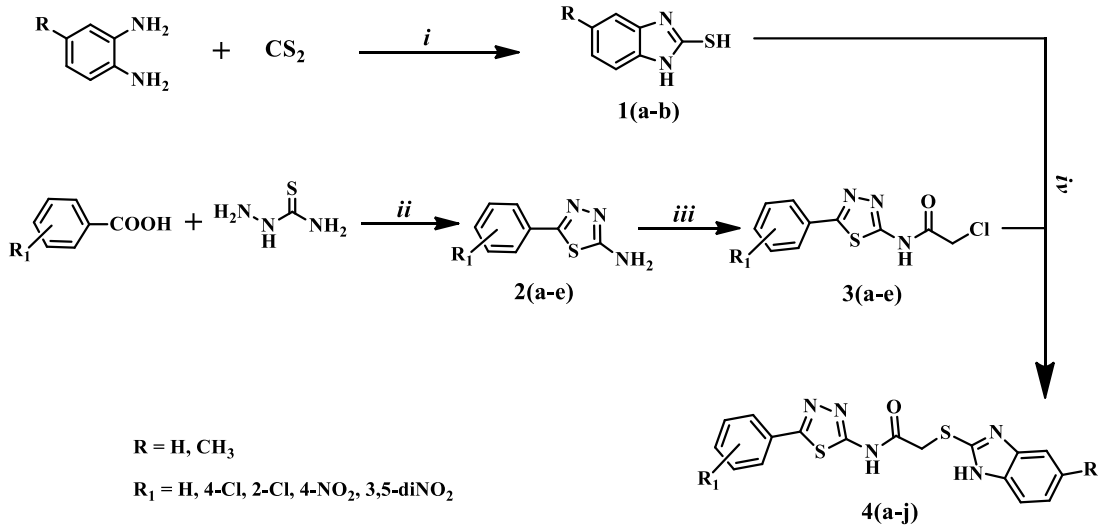
3.Results and discussion

3.1.Synthesis

The synthetic route of title compounds 4(a-j) is presented in Scheme 1. Cyclization of 5-(un)-substituted-*o*-phenylenediamine with CS_2 The compounds 1(a, b) were given in The existence of KOH in the EtOH medium. These synthesized compounds were characterized by FT-IR. In the IR spectra of the compounds, stretching band belonging to (N-H), (S-H) and (C=N) were observed at the range (3155-3132 cm-1),(2573-2569 cm-1) and (1625-1620 cm-1) respectively.

In the presence of phosphorous oxide chloride, 2-amino-5-(substituted)-1,3,4-thiadiazole 2(a-e) was synthesized by the reaction of different carboxylic acid derivatives with thiosemicarbazide. Compound 2(a-e) FT-IR spectra demonstrated the presence at (1635-1624 cm-1) of a group of C = N and two bands at (3282-3259 cm-1) and (3116-3105 cm-1) that may be attributed to asymmetric and symmetric stretching vibrations of the NH2 group.

Compounds 3(a-e) were synthesized by a reaction of compounds 2(a-e) with chloroacetyl chloride in the presence of TEA in the DMF medium to yielded compounds 3(a-e). The chemical structures of these compounds were elucidated via FT-IR. In the IR spectra of all compounds, the occurrence of amide group (N-H) bonds was confirmed through bands in the region of (3182-3163 cm-1). Due to the occurrence of a sharp peak at (1712-1705 cm-1), the inclusion of the carbonyl group (C = O) in the structure is confirmed. Also confirmed by the existence of a sharp absorption band at (1631-1624 cm-1) was the existence of C = N in the 1,3,4-thiadiazole nucleus. Compounds 1(a, b) were reacted with compounds (3a-e) in the DMF medium in the anhydrous K_2CO_3 to give the target compounds 4(a-j) in the final step. FT-IR, 1H NMR, and 13C identified the chemical structures of all target compounds. The IR data acquired for the final compounds 4(a-j) allow us to a large degree to validate their formation. By analyzing data for both synthesized compounds and absorption peaks at (3348-3282 cm-1), (3174-3155 cm-1) and (1685-1662 cm-1) the presence of N-H amide, N-H benzimidazole and C=O groups was confirmed, respectively. The presence of C-H bonds in the final products was allocated to a steep peak at (2981-2808 cm-1). sharp absorption band at(1631-1616)confirmed the presence of C=N in the benzimidazole and 1,3,4-thiadiazole nucleus In the ^{1}HNMR spectra of all compounds, the methylene protons have resonated at δ (4.52-4.34) ppm and this down filed value can be attributed to the inductive effect of the carbonyl group. The singlet NH signal of benzimidazole has appeared at δ (13.14-12.38) in all compounds. The signals belonging to the aromatic region was seen at δ (7.91-6.93) ppm. In the ^{13}CNMR spectra, the methylene carbon between the sulfur atom and carbonyl group was observed at δ (36.74-35.33) ppm. Two carbons on the thiadiazole ring were observed at δ (163.26-157.45) ppm. While the carbonyl carbon was observed at δ (169.43-167.55) ppm. All other aromatic carbons were recorded between δ (139.97) and δ (114.35).



Reagents and condition: (i) KOH, EtOH, reflux 3h; (ii) $POCl_3$, reflux 3h; H_2O, reflux 4 h; KOH; (iii) $ClCH_2COCl$, TEA, DMF, reflux 2h; (iv) K_2CO_3, DMF, reflux 10 h

3.2.Biological evaluation

The antibacterial operation in vitro was carried out against Gram-positive bacteria, including S. For aureus, B. And Gram-negative bacteria, including A, subtilis. P. aeruginosa, Baumannii. Many of the synthesized compounds 4(a-j) have been tested for antibacterial activity by calculating the inhibition zone in mm using the cup-plate agar diffusion method[22]. (Amoxicillin and Ciprofloxacin) have been used as a typical antibacterial activity medication. The observations are illustrated in Table 2.

If we display the (inhibition zone) data of some synthesized compounds 4(a-j) in Table (2), some significant findings are observed:

The first showed good activity against (P. aeruginosa) compounds (4d) (4 g), while only compounds (4d) (4 g) showed good activity against (B. subtilis). We also showed that some of the compounds (4b) (4h) have strong activity against (S. aureus), while no antibacterial activity against (A. baumannii) was seen in all compounds 4(a-j).

Table 1. The antibacterial efficacy of compounds synthesized

Comp. No.	Concentration (mg / ml)	Zone of inhibition (in mm)			
		Gram-positive		Gram-negative	
		B. subtilis	*S. aureus*	*A.baumannii*	*P. aeruginosa*

4.Conclusion

Benzimidazole compounds of thiadiazole moiety have been formed and structurally characterized using spectroscopic techniques.. Pharmacological research has been conducted to examine the replacement effects on antibacterial function, with some variants exhibiting high to moderate activity against bacteria.

Acknowledgment

Abstract. The current study measuring the effectiveness and purification of the enzyme (arginase) in the serum of kidney diseases samples were collected from Samarra General Hospital from October to December 2019, 60 samples were collected from the infected and 25 samples from he healthy people control group of ages 30-55 years, the effectiveness of the control group was 6.87 ± 2.95, and the patient group was 25.71 ± 8.39., the purification process was carried out using Sephadex G-200 and EDEA cellulose - using a column of separation with dimensions (32 x 1.5nm), the molecular weight of the enzyme was 245 kDa. The study included measuring the level of urea 83.7 ± 23.4mg/dl, Creatinine 2.85 ± 1.19 mg/dl, Total protein 3.8 ± 0.6 mg/dl, Albumin 4.120 ± 0.02 mg/dl, Uric acid 5.19 ± 1.52 mg/dl and Globulin was 1.29 ± 0.01 mg/dl. at P≤0.01.

Keywords: Arginase enzyme, purification, activity,Kidney.

1.Introduction

Arginase (EC 3.5.3.1, Arginine amidinase, canavanase, L-arginase, arginine transamidinase) is an enzyme containing manganese. This enzyme catalyzes the following reaction: arginine H_2O → ornithine+ urea. This enzyme is considered the last enzyme in the urea cycle. It is widely present in all areas of life. It is ubiquitous to all domains of life.Arginase stimulates the fifth step and is the final step in the urea cycle, which are chain biochemical reactions that occur in mammals that aim to rid the body of harmful ammonia. Specifically, arginine converts L-arginine to L-ornithine and urea [1,2] Mammalian arginase is active as a trimer, except that some bacterial arginases form hexmeric arginases. [3] In order to maintain proper function, the enzyme needs a two-molecule metal cluster of manganese. These ions coordinate Mn^{2+} with water, directing the molecule and fixing it. They also allow water to act as a nucleophilic antipyretic and attack L-arginine, breaking it down into ornithine and urea [4] In most mammals, there are two types of this type of enzyme; the first is Arginase I, which functions in the urea cycle, and its location is in the cytoplasm of the liver cells. The second isozyme, Arginase II, is involved in the regulation of arginine / ornithine levels within cells. And its place in the mitochondria in many different tissues of the body, and it is very abundant in both the prostate and the kidneys. They may also be found, at lower levels, in macrophages, lactating mammary glands, and the brain. [5] We can find a second isozyme even in the absence of other urea cycle enzymes [4]

Arginases catalyze the divalent cation-dependent hydrolysis of L-arginine as it synthesizes the non-protein amino acids L-ornithine and urea. This reaction is the last step in the biogenesis of urea in the liver. flux during this reaction is very large, that an adult person excretes about

10 kg of urea/year. The urea cycle arginase (arginase I or liver arginase) is considered cytosolic, and is the best characterized of the mammalian arginases. A second isozyme, arginase II or kidney arginase, it is location is mitochondria. The type I and type II arginases in human are related by 58% sequence identity [(6)], and they are immunologically distinct. Comparative properties of 2 arginase enzymes have been discussed in a number of new reviews [2-4]. With it, the activity of arginase has been detected in many non-hepatic tissues that lack the complete urea cycle; This reaction is thought to be a source of ornithine, the biosynthetic precursors of proline and polyamines. For example, in the lactating mammary glands, the activity of arginase is increased to about 25% found in the liver in order to provide proline needed for milk protein (prolactin) synthesis [5]. Ornithine is also a biosynthetic precursor of polyamine [6], the muscular activity of arginine is increased by 25-fold during pregnancy to provide the fast-growing fetus with polyamines to enable cell proliferation [7]. It has become evident that the rapidly dividing tissue requirement to enhance polyamine biosynthesis is achieved through increased arginase activity as found in gastric cancers [8-10] and in breast cancer [9]. Recently, arginase activity has been detected in some human colon cancer and human breast cancer cell lines [10].

2.Material and Methods

25 blood samples were collected for normal cases of both sexes as control, their ages ranged between 30-55 years Samples were collected from Samarra General Hospital for the period from October to December after being diagnosed by specialized doctors on the basis of urea and creatinine examination, as 60 blood samples were collected for both sexes, whose ages ranged between 30-55 years.

• The blood was drawn the vein using a single-use 5 ml plastic syringe and the blood was placed in clean plastic tubes with a size of the blood serum separated from the coagulated part, and then the serum was withdrawn by a micropipette, after which the enzyme activity was measured directly and the sample was kept in freezing for the purpose of Make other required measurements

a- Measuring the activity of the arginase enzyme for kidney disease samples and healthy samples, using the ready-made kit for the arginase enzyme ELISA, as mentioned[11].

b- Purification of the arginase enzyme in samples with kidney disease: it was done according to the stages[12](saturation ammonium sulphate , Dialysis, Gel filtration, Ion exchange)

Enzyme unit: It is the amount of enzyme that catalyzes a reaction of 1 µl of the substrate in per minute

2.1.Saturation of ammonium sulphate

The serum proteins were precipitated using graduated concentrations of ammonium sulphate until reaching a saturation rate of 60%, as 3 gm of ammonium sulfate was added to 5 ml of serum during a period of (60 - 45) minutes by placing the serum in an ice bath with continuous stirring, usually thawing after freezing. Precipitate with 4ml of 0.1M Tris buffer - HCl pH 7.2.

2.2.Dialysis

It is one of the most important and oldest methods used in purifying enzymes, and the aim of which is to remove the remainder of the added ammonium sulfate to precipitate the proteins by placing the dissolved protein in the above step in the dialysis bag after measuring the activity (arginase enzyme) and protein concentration, and dipping the bag in 0.1M buffer solution Tris - HCl pH 7.2 The buffer solution was changed from time to time for an entire night. This step was performed at 4 ° C to maintain the enzyme effectiveness, and after the end of the membrane separation process, the effectiveness (arginase enzyme) and protein concentration were measured.

2.3.Gel filtration

The basis for the work of this technique is the difference in the molecular weight, as it was used to purify the symmetric separated by gel filtration chromatography using a Sephadex G200 gel filtration column, as 20 fraction collected the volume of each fraction was 4 ml where the effectiveness of (arginase enzyme) was measured and the total protein level of all the separated parts was measured.

2.4.Ion exchange

A separation column with dimensions (32 x 1.5) cm was used that contains DEAE cellulose-25 gel, which separates the compounds depending on the charge, and the gel material was placed at a height of 20 cm by pouring the gel on the walls of the separation column quietly and diagonally to prevent the formation of bubbles, after placing a suitable piece of glass wool at the end of the column, The blood serum was injected into the separator column in a circular motion and on the walls of the separator column, followed by ashake prosses using the buffer solution with a pH of 7.2, and the collection process was carried out at a flow rate of 0.63 ml/min, i.e. at a rate of 1.09 ml/ minute for each part, by a manual method, as was followed up. Calculation of the protein concentration by measuring the absorbance of the separated parts, where the activity of arginase enzyme was measured and the total protein level was measured for all the separated parts at 450nm wavelength.

-Estimation of the enzyme molecular weight: the molecular weight of the enzyme was estimated by filtering at [13,14].

2.5. Biochemical tests

The level of urea, creatinine, albumin, total protein and uric acid was measured using a ready-made assay (Kit) supplied by Biolab Corporation. The globulin was calculated from the following equation Globulin concentration = total protein - albumin

3.Results and discussion

1- The Effectiveness of (arginase enzyme) was measured in the serum of patients have kidney diseases compared with healthy patients, according to the following table kidney and healthy patients, according to the following table

Table 1. shows the Effectiveness of the arginase enzyme in the blood serum of kidney diseases and healthy people at the probability level P≤0.01

Arginase Enzyme activity (unit)	Total and standard deviation	P-Value
Control group	6.87±2.95	≤0.01
Patient group	25.71±8.39	

It is evident from the table above that the activity of arginase enzyme in the serum of kidney patients increased compared to healthy people at the probability level P≤0.01, and this is consistent with what was mentioned (Alshamaa and. Al-Obaidi) [15], where a significant increase in the activity of the arginase enzyme was observed. In all the studied age stages, as well as the current study consistent with what was mentioned (Scalia) [16]

Those who have hypothesized that this elevation is caused by histopathology, tumors, and pathological changes such as apoptosis, kidney infection and oxidative fatigue (disruption of the balance between the production of reactive oxygen types (free radicals) and antioxidant defenses, are discussed in relation to their potential role in the production of tissue damage) that increases The nitrogen oxide ranges that block the transit of urea and creatinine throughout the liver.

The high activity of arginase associated with acute kidney disease, therefore, alters the epithelial cell function in heart disease and kidney disease. (Heisel et al.) [17] Arginase also reduces the excretion of sodium from the kidneys when consuming small amounts of salt, but stimulates sodium excretion in the case of high salt amounts (Lakowicz). [18]

Table 2. shows the stages of purification (arginase enzyme) in serum of kidney patients

Steps of purifications	Volume (ml)	Activity	Total Activity	Protein Conc (mg/ml)	Specific activity (mg)	Yield %	Folds	Total protein (mg)
Crude serum	5	10.1	50.05	7.3	1.32	100	1	36.5
Ammonium sulphate	3.5	10.19	35.36	6.2	1.64	74.2	1.2	21.7
Dialysis	4	10.3	41.2	4.1	2.5	84.9	1.8	16.4
Gel filtration	4	10.7	42.8	2.5	4.28	88	3.2	10

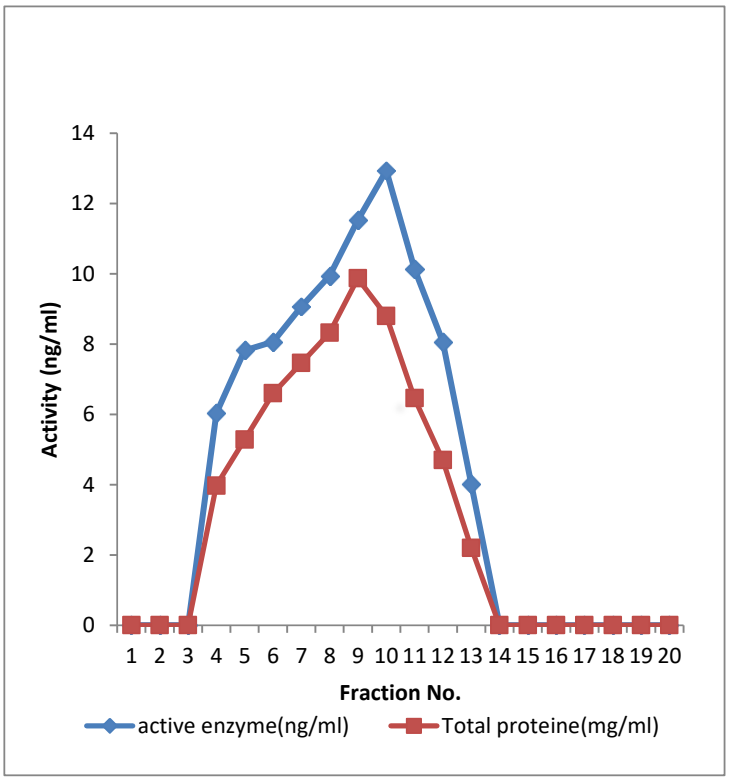

Figure 1 shows the purification of the enzyme arginase using Sephadex G-200

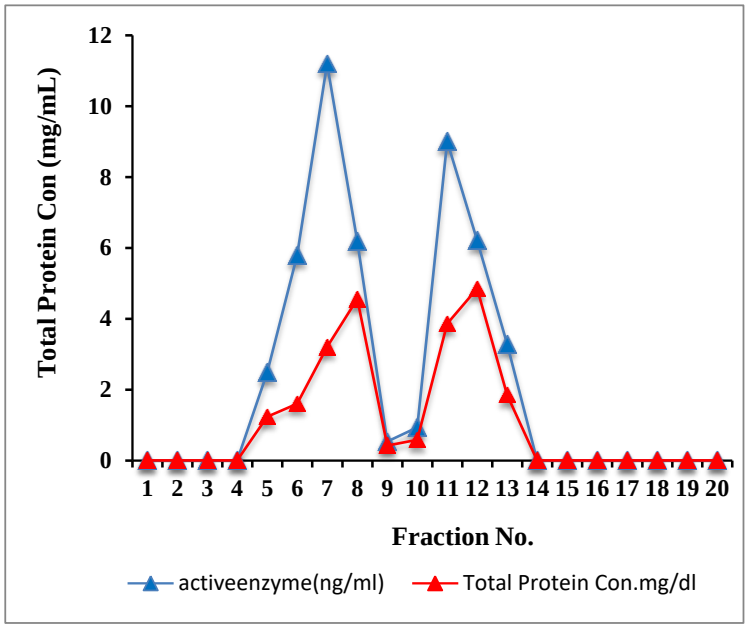

Figure 2 also shows ion exchange chromatography using EDEA-cellulose for the separated fractions versus the total protein.

The electrolysis revealed that the molecular weight of the enzyme is high and reaches 245 kDa, according to the figure below

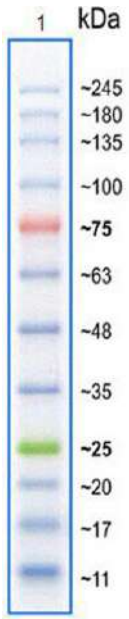

Figure 3 Electrolysis analysis showing the molecular weight of the enzyme, up to 245 kDa, using the acrylamide gel.

'Figure (3) ' shows the molecular weight of the arginase enzyme separated by electrophoresis [14,15],the electrophoresis analysis revealed the presence of two arginase peaks, according to the figure below

Figure (4) Highest effective electrophoresis of separated fractions by chromatography using Sephadex G-200 to isolate the arginase enzyme.

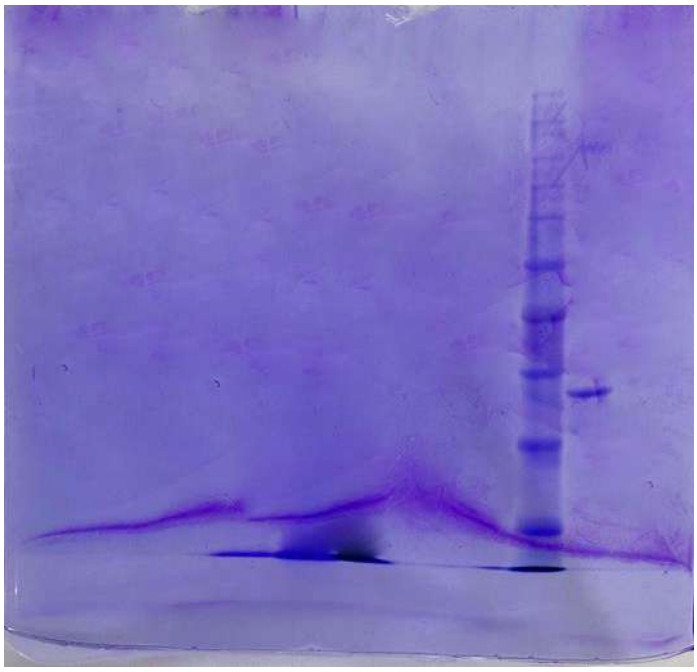

Figure 4 Electrophoresis to isolate the enzyme arginase in serum of kidney patients [13]
The literature indicates that the arginase enzyme contains two isotopes, one in red blood cells of the liver (ARGI) at a high level and the other (ARGII) at a lower level in mitochondria in many tissues [5].

Table 3. shows the level of urea in the serum of patients compared with healthy subjects measured in units (mgldL) at the probability level P≤0.01

Urea level in units (mgldL)	Mean ± standard deviation	P-Value
Control group	27.92±3.2	≤0.01
Patient group	83.7±23.4	

The above table shows a significant increase in the level of urea in the blood serum of patients with kidney disease compared to healthy people, This is in agreement with (**Hasan**) [19]
Where he found a significant increase in the level of urea in patients with renal impairment, as well as the current results are consistent with the findings of (**Al-gharaghouly**) [20] that refers to the significant increase in the level of urea in patients with renal impairment. The current result is consistent with what was mentioned by Loughridge L., [21]. The reason for this increase is the weakening of kidney function with age, as this is due to the reduction of glomerular filtrate after the age of thirty.

Table 4. shows the level of creatinine in the blood serum of people with kidney disease (mgldL) compared to healthy people with the p ≤ 0.01 level.

Creatinine level In units (mg dL)	Mean ± standard deviation	P-Value
Control group	0.83±0.7	≤0.01
Patient group	2.85±1.19	

The table above shows a significant increase in the level of creatinine in the serum of kidney diseases compared to healthy people, and these results were consistent with the result of (Hababi) [22], (Philip et al.)[23]. The reasons for the increase in the level of creatinine in the blood indicate the fact that creatinine is waste of nitrogen metabolism processes, which are excreted with urine in the normal state, but in the case of a kidney disorder that may lead to a

gradual loss of kidney function and a failure in filtration, which leads to an increase in the concentration of creatinine in the body. The patients who suffer from chronic renal failure and diabetic nephropathy suffer from a decrease in the value of glomerular filtration(Hasan) [19]

Table 5. shows the level of total protein (mg/dL) in the serum of kidney patients compared with healthy people with a probability level P≤0.05

Total protein level In units (mg/ dL)	Mean ± standard deviation	P-Value
Control group	6.53±0.2	≤0.05
Patient group	3.8±0.6	

Table 5 the level of total protein in the serum of kidney patients compared with healthy people, where it was found that there are significant differences at the level of probability P≤0.05 and this is consistent with (**Al-gharaghouly**) [20], where it was mentioned that there is a decrease in the level of total protein at all ages. In patients with renal insufficiency, and also agrees with(Muthu), [24] that the reason for this decrease is inflammation in the renal glomeruli, which leads to its appearance in the urine.

Table 6. shows the level of albumin in kidney disease serum compared to healthy people with the probability level P≤0.01

The level of albumin unit (mgldL)	Mean ± standard deviation	P-Value
Control group	4.120±0.02	≤0.01
Patient group	2.51±0.39	

Table 6 The level of albumin in kidney disease serum compared to healthy people, where a significant difference was found at the probability level P≤0.01. The result of the current study is consistent with what was found by**(Hasan)** [(19),] where a significant decrease was observed compared with The result is also consistent with the findings of healthy people (Junlin et al) [25], The reasons for the decrease refer to kidney damage resulting from chronic renal failure and diabetic nephropathy, which leads to loss of albumin through damaged filter units and glomeruli, the amount of albumin in the urine increases and there is a decrease in the concentration of albumin in the blood, which ultimately leads to a state of hypoalbuminemia. Roche, M.;] [26], or that the possible cause is due to poor nutrition and the increased need for albumin in the body [Maher Borai @eta] [27].

Table 7. shows the level of globulin in serum of kidney disease compared to healthy people with the probability level P≤0.01.

Globulin level (mgldL)	Mean ± standard deviation	P-Value
Control group	2.41±0.06	≤0.01
Patient group	1.29±0.01	

Table 8. shows the level of uric acid in the blood serum of kidney patients compared with healthy people with no significant differences.NS = 0

Uric acid level in units (mg dL)	Mean ± standard deviation	P-Value
Control group	4.7±0.28	NS
Patient group	5.19±0.28	

It can be seen from Table 8 uric acid is one of the non-protein organic compounds in the blood and represents in humans the final product of the metabolism of purines, a substance that is difficult to dissolve in water. The majority of it must be excreted through urine, as 20% of it is filtered through the kidneys (Salih) [28]. The formation of uric acid depends on the extent to which the food contains nucleoproteins, as well as on the extent to which the food

contains free purine bases, as is the case in tea and coffee, as well as on the process of destruction that occurs in the cells of the body, Its level in the blood increases due to a decrease in the percentage of renal filtration of uric acid as a result of renal failure as well as in the case of lytic anemia and pernicious anemia as well as gout (Fiedman@eta) [29]

Abstract. In this study, the compound 4,4'-((1E,1'E)-(methylenebis(4,1-phenylene))bis (diazene-2,1-diyl))bis (naphthalen-1-ol) synthesized by reaction of 4,4'-Diaminodiphenylmethane with Alpha-naphthol. This compound was identified by using an element C.H.N analyzer, Infra-Red spectrum, Ultraviolet and Visible spectrum, and GC-Mass spectrometry. We used olive peels to adsorb the synthesized dye from an ethanol solution. The results obtained showed that olive peel has a good adsorption on the bis-azo dye. Temperature and pH effect were studied under multiple conditions. The result showed that the adsorption increased with temperature increasing, and adsorption efficiency according to pH as 7<4<9. Theoretical treatment was studied in gas phase for molecular mechanics and semi-empirical computations using the hyper chem8 program. Dipole moment, formation heat and binding energy were done via the methods (PM_3 and ZINDO/S) at 25 ºC. Electrostatic potential of active sites were also studied for the newly synthesized bis-azo dye. Vibrational values were evaluate using PM_3 method, the theoretical frequencies obtained from the calculations were consistent with the experimental values. HOMO & LUMO (frontier orbitals) were studied by PM_3 method, electronic spectrum was also studied using ZINDO/S method and compared with experimental spectrums. The results obtained were closely related between the theoretical and experimental spectrum.

Keywords: Bis-azo, Olive peel, Adsorption, Theoretical study.

1.Introduction

More than one million tons of dyes are produced annually, 60-70% of them are azo dyes. The use of dyes has increased over the years, and widely used in various industries such as textiles, paint, paper, cosmetics, pharmaceuticals, printing, and foodstuffs [1]. Dyes are one of the main pollutants [2-4]. A literature survey identified adsorption as a potential technique for purifying wastewater from dyes. Adsorption is the most preferred method for treating liquid waste in textile industry compared to other available physical, biological and chemical methods, due to its simple, flexible design and ease of use [5]. Some side products may be produced from the adsorption process, some of which may be beneficial or at least non-toxic, The adsorption process is also considered to involve lower operating costs. Moreover, it has no environmental problems, don't produce any sludge and produce high quality treated water. Although adsorption is an excellent dye removal technique, it has significant limitations to its application due to the limited availability of low-cost adsorbents [6,7]. One of the most commonly used adsorbent is activated carbon, as it is characterized by its high surface area and great adsorption capacity. Due to the high cost and lack of reusability of activated carbon, the need to explore new adsorbents with low cost, reusable, biodegradable and the possibility of regeneration, as well as the high efficiency of removing dyes, has increased. Many adsorbents have been implemented to adsorb dyes from wastewater with low cost and high efficiency, most of them are natural and

modified clays, modified agricultural by-products, bagasse, chitosan ash, industrial waste, coconut pulp, charcoal, peat and neem leaves [8, 9]. The cost of adsorbents is usually unstable and frequently changing depending on the changes in prices in the markets, and it varies greatly according to the manufacturing companies, even if they contain exactly the same material. The material chosen for a specific application should preferably be less expensive and more suited to specifications to achieve its intended use. The variation and diversity of adsorbents and the expansion in their spread and manufacture make the selection process difficult [10]. In the present work, a new dye was synthesized and its adsorbent effects on olive peels were identified, along with the theoretical study of some properties of the synthesized dye.

2.Experimental

2.1. Chemicals and Instruments

The materials and solvents that used were supplied by Sigma Aldrich, Fluka, and BDH. C.H.N elementals were measured by EM - 017. FT-IR spectra were recorded on an FT-IR—8400S plus spectrometer operating from (4000—400 cm^{-1}) in KBr pellets. UV—Visible spectra were recorded by UV—1800 PC Shimadzu, Al-Muthanna University, Semawa, Iraq. The GC-Mass spectra were recorded on at 70 eV using Agilent technologies mass selective detector 5973 watt work in the department of chemistry, Technology Shareef University, Tehran, Iran.

2.2.Preparation of (MBN) compound

The compound of 4,4'-((1E,1'E)-(methylenebis(4,1-phenylene))bis (diimide -2,1-diyl))bis (naphthalen-1-ol) (MBN) diazotized by following the method described in literature [11], 4,4'-Diaminodi phenylmethane (0.01mol) was dissolved in conc. HCl (3 mL) and (10 mL) of distilled water, after that the mixture cooled in an ice bath, after the temperature reached less than 5 °C, (10 mL) of cooled solution of (0.01 mole) sodium nitrite was added dropwise to keep the temperature below 5 °C for 15 minutes. After that, the reaction mixture was added to an alkaline solution of (0.02 mole) alpha-naphthol slowly and left for 20 minutes, the reaction mixture irradiated with a microwave at 700 W for 5 minutes, after the reaction was completed, the precipitate was collected by filtration, washed with distilled water and dried**.** Physical data of MBN are described in Table 1.

Table1. Physical data of MBN compound

Color	melting point (°C)	yield %	m.wt (g/mol)	Found (calc.)%		
				C	H	N
Dark red	232-234	90	508.57	78.51 (77.93)	4.82 (4.76)	10.30 (11.02)

2.3. Olive peel surface preparation

A surface of olive peel used as an adsorbent was prepared from fresh olives picked and cut into small pieces, washed several times with distilled water to remove dust, dried in the air and grinded into a fine powder, then washed the powder with distilled water and making sure that the impurities were removed and then dried in an oven at a temperature of 60 °C for two hours.

2.4.Preparation of Stock solution

A stock aqueous solution of the synthesized bis-azo dye was prepared at a concentration of 125 ppm by dissolving 125 mg of the dye in 1000 mL of ethanol. Using UV-visible spectrophotometer for determining the maximum absorbance wavelength of MBN at 250-700 nm. To plot the standard curve, several concentrations of MBN dye were prepared from (2-10 ppm), which were used to measure the different dye concentrations in ethanolic solution.

2.5.Study pH effect on Adsorption of MBN

0.1N of hydrochloric HCl and 0.1N of NaOH was added to different concentrations of MBN dye to justify pH, to study the effect of pH changing on adsorption efficiency of MBN dye on 0.05 g of the powdered olive

peel. The mixture stirred at 5 °C for one hour, MBN dye concentrations were determined by measuring the absorbance at wavelength of 488.00 nm of the solution.

2.6.Study the temperature effect on the bis-azo compound adsorption

A volume solutions of 10 mL were used with different concentrations with pH 7 of the MBN dye which was added to 0.05 g of olive peel. The mixture stirred for one hour to be exposed to the same temperature at 298, 308, 318 K, MBN dye concentrations were also determined by measuring the absorbance at wavelength of 488.00 nm of the solution.

3. Results and Discussion

3.1. Synthesis of MBN dye.

MBN was prepared according to the following Scheme:

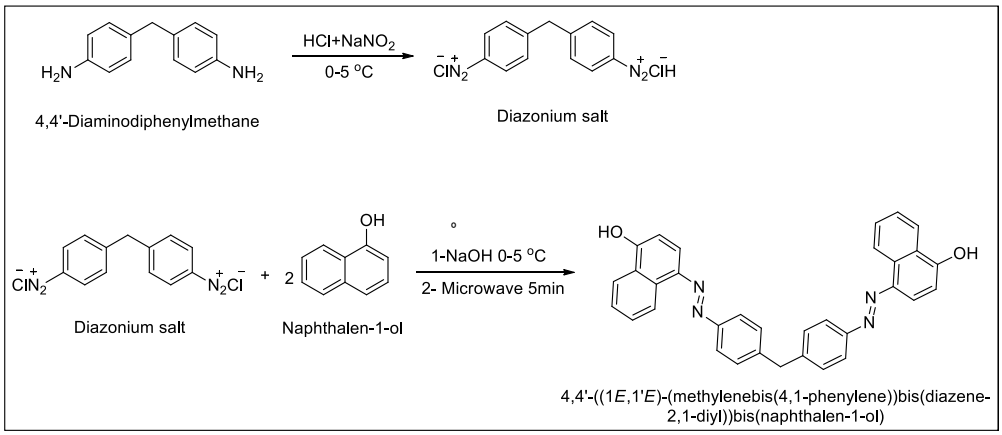

Figure 1. scheme for the synthesis route of MBN compound

The prepared compound was characterized by FT-IR spectroscopy, GC-Mass spectrometry and C.H.N. analysis.

3.2.Spectroscopic Studies:

3.2.1.Infrared Spectral Study:

FT-IR spectrum of MBN showed the disappearance of NH_2 stretching bands at 3354 cm^{-1} and appearance of broad peak for phenolic OH at 3444 cm^{-1}. FT-IR spectrum also showed the appearance of strong peaks at 1618 and 1498 cm^{-1} for C=C and N=N groups, respectively (Figure 2) [12,13].

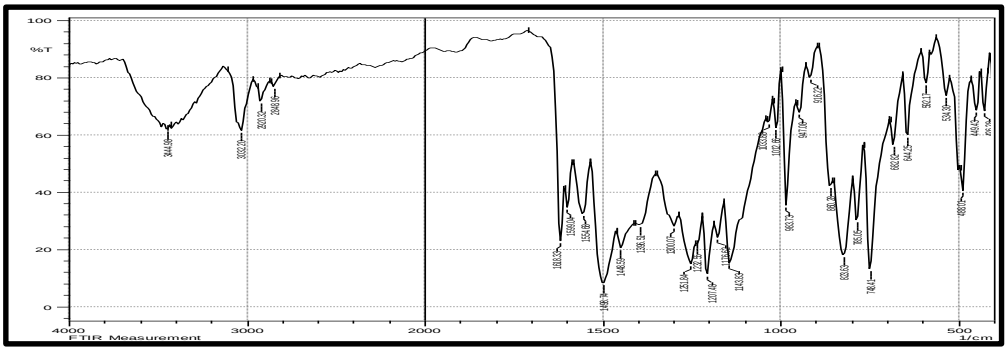

Figure 2.FTIR spectrum of MBN compound

Table 2. FT-IR spectra of MBN compound.

N=N	C=C	C-H aromatic	O-H

1498 s	1618 s	3032 m	3444 b

Where: m: medium, s: strong and b: broad

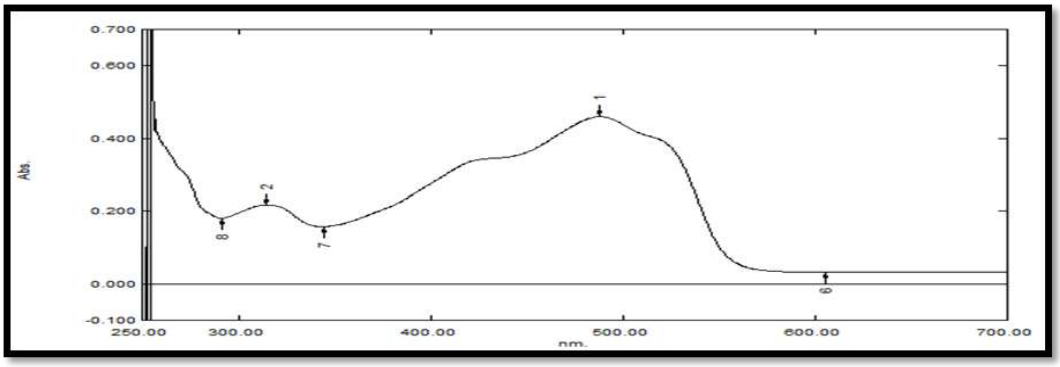

Figure 3 . UV-Visible spectrum of MBN compound

3.2.2.UV–Vis spectral data for MBN compound:

The azo functional group (-N=N-) usually absorb at the wavelength range from (350 - 370) nm [13]. The electronic spectrum of MBN compound exhibits transitions at (488, 314.5 and 253) nm respectively, these bands probably belong to n-π * and π-π* transition of N=N group [14].

3.2.3.Analysis of mass spectrum:

The mass spectrum of MBN compound showed the molecular ion peak at m/z = 508(R%55), the important fragmentation peaks shown at m/z = 466(R%1), m/z = 367(R%5), m/z = 353(R%20), m/z =337(R%10), m/z = 171(R%15), m/z = 157(R%5), m/z = 143(R%100), m/z =129(R%10), m/z = 115(R%50), as shown in 'Figure 4'.

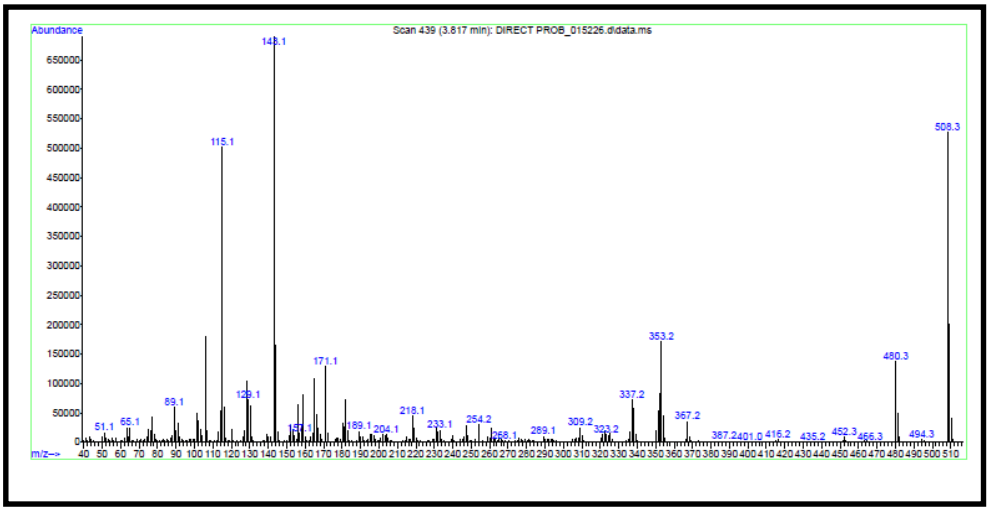

Figure 4 . Mass spectrum of MBN compound

3.3.Study of Adsorption of MBN compound

The study of adsorption of MBN on the surface olive peel at temperature 298 K was calculated and the amount of absorbent material drawn against equilibrium concentration to give the general form of isotherm adsorption

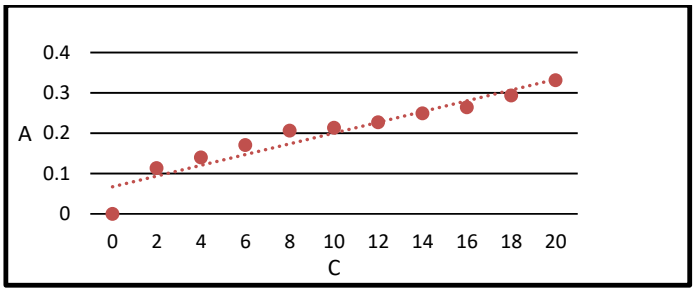

Figure 5 . The amount of adsorbent material against concentration

3.3.1.Effect of Temperature

The effect of temperature on the adsorption of synthesized MBN dye at different temperatures, which are 298, 308 and 318 K was studied at a constant pH. The temperature changes showed an obvious change in the efficiency of dye adsorption on the olive peel, it was found that the adsorption of MBN increases with increasing the temperature, so the reaction is endothermic [15], as it shown in Figure 6.

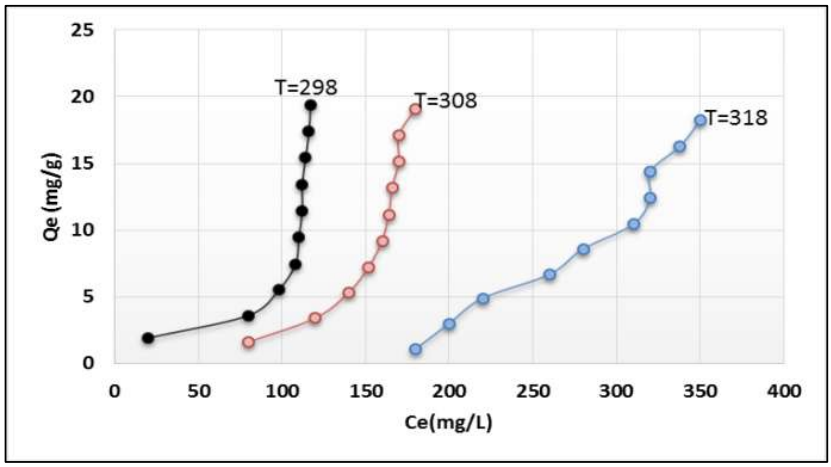

Figure 6. Adsorption of MBN on olive peel at different temperatures

3.3.2.The Effect of Initial pH

The effect of changing pH on the efficiency of adsorption of the dye on the surface of the olive peels was studied at different pH ranges (4 – 9) by adding acidic or basic solutions, it was found that the adsorption efficiency decreases when the pH is reduced, reaching its highest level at 9 PH value to decrease and reach its lowest levels at 4 pH value and this change can be explained by the fact that at basic medium the efficiency of adsorption increases because positive charges have a tendency to bond with the surface greater than the association with the solvent molecules [16], as shown in Figure 7.

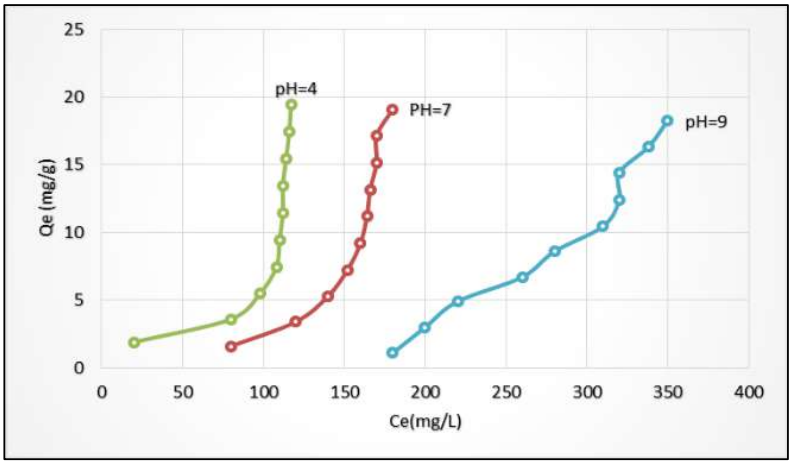

Figure 7. Adsorption of MBN on olive peel at different pH values

3.4.Theoretical Studies

3.4.1.Energies and Dipole Moment

The study of energetic theoretically could predict the occurrence of molecular processes or not. Low energy systems are the most stable in all computational chemistry techniques, so their molecular structure is compatible with the structure with the minimum energy [17]. Dipole moment was used to measure the charge density of the dye. The accuracy of the overall distribution of electrons in the molecule is difficult to assess because it contains all of the multiple dipole moments. In this study, standard enthalpy of formation (ΔH_f^o), dipole moment (μ) and binding energy (ΔE_b) of MBN compound were calculated theoretically by PM_3 method and HOMO & LUMO (frontier orbitals) were calculated also by using PM_3 method.

Table 3. Formation, binding energies and dipole moment for MBN dye

ΔH°_f (KJ.mol^{-1})	ΔE_b (KJ.mol^{-1})	μ (debye)	HOMO	LUMO	ΔE_{gab} (KJ.mol^{-1})
-61922.91	-93139.47	4.54	-8.54	-0.85	7.69

3.4.2.Theoretical Vibration Frequencies

PM_3 method was used to evaluate vibrational frequencies of MBN compound following literature [18]. The theoretical spectra from the semi-empirical computation help explain peaks of the experimental spectrum of MBN. The most characteristic calculated vibrational frequencies were chosen for the bis-azo dye assignment. The theoretical wave number of the synthesized dye showed some differences against experimental values, and these differences are mostly acceptable in computational chemistry.

Table 4. Theoretical and experimental frequencies in cm^{-1} of MBN compound

C=C	N=N	C-H	O-H
1684.65*	1508.60*	3084.92*	3144.36*
1618.33**	1498.74**	3032.20**	3444.98**
(3.9)***	(0.6)***	(1.7)***	(9.6) ***

Where:

* : Theoretical value

** : Experimental value

***: Error %

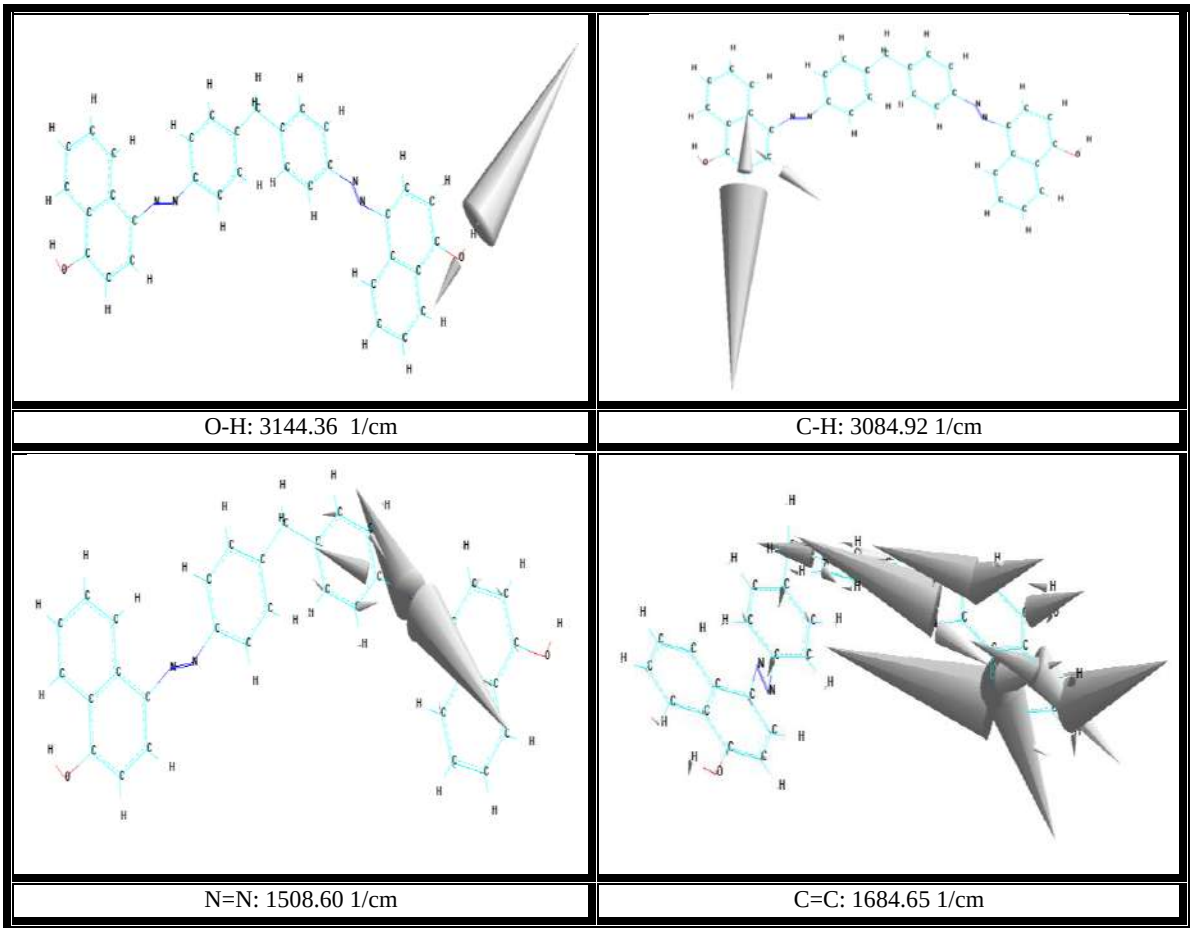

Figure 8. Theoretical vibrational frequencies of MBN compound

3.4.3.Theoretical UV-Spectrum

Theoretical electronic data of MBN dye was evaluated by ZINDO / S method, the results showed that there is high acceptable between the experimental and theoretical data.

Table 5. Theoretical and experimental electronic data of MBN compound

Transitions	Theoretical	Experimental
n→π*	355.05 nm	488.00 nm
π→π*	338.73 nm	314.50 nm
π→π*	271.89 nm	253.00 nm

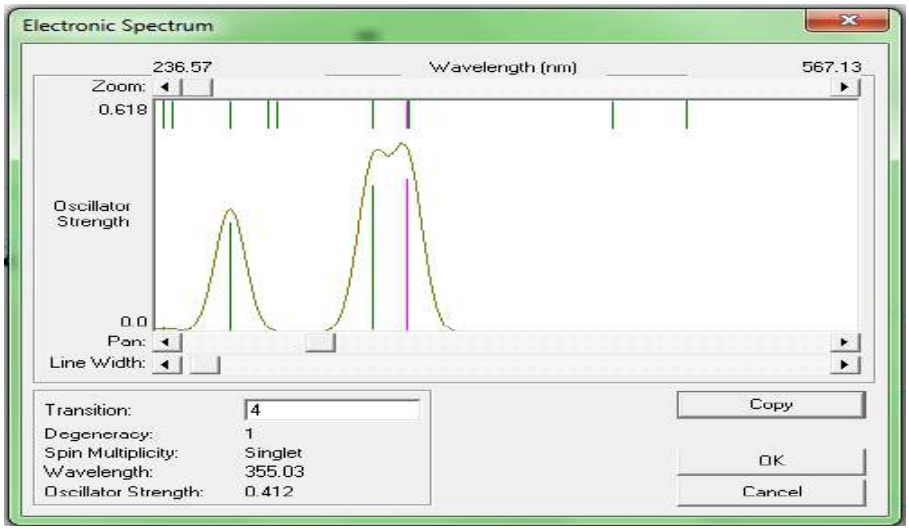

Figure 9. Theoretical electronic spectrum of MBN compound.

4.Conclusion

1- The results showed the ability of olive peels to adsorb the synthesized dye with high efficiency under normal conditions of temperature and pH.
2- Adsorption efficiency of MBN dye on olive peel increases with the increasing of temperature as it follows: 298<308<318 K.
3- Adsorption efficiency of MBN dye on olive peel according to pH values, increases in basic and decreases in acidic mediums as it follows: 4<7<9 pH values.
4- The theoretical results of formation and binding energies showed that the synthesized dye was a stable compound.
5- MBN dye structure was confirmed by the experimental spectra and found that it is almost similar with the theoretical results calculated by PM_3 and ZINDO / S methods.
6- Active sites of MBN dye were evaluated theoretically using semi-empirical methods.

Absract. Cobalt and vanadium complexes with (E)-2-(2-hydroxy-3-methoxybenzylidene)hydrazine-1-carboxamide were synthesized. The ligand was structurally characterized by FTIR, ^{1}HNMR and ^{13}CNMR spectroscopy. The interaction activity of ligand and complexes was investigated with DNA by spectroscopical and physical methods. The results showed an intercalative binding between the synthesized compounds and DNA.

1.Introduction

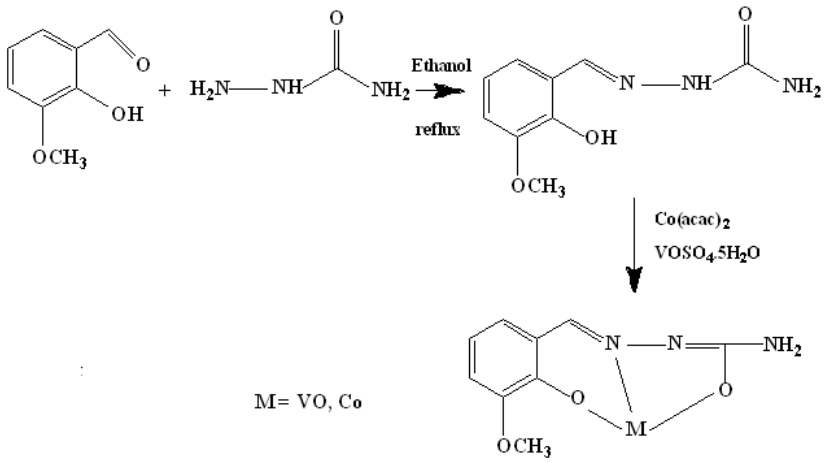
Sulfur and nitrogen donor ligands have received particular attention as one of the essential fields in coordination chemistry. Semicarbazones are among the main nitrogen/oxygen compounds which are provide variable binding modes, structural variety and biological applications [1-3]. The atoms coordination modes allow flexibility to semicarbazone ligands to coordinate with the metal ion that giving one or multi-nuclear complexes [4-7]. Semicarbazone metal complexes show perfect stability that can support the biological activity, reduces the toxicity and become a dependable source for creating novel biologically active compounds [8, 9].

Cobalt and vanadium are essential elements in biological systems [10]. The presence of cobalt in vitamin B12 makes it a regulator for the DNA synthesis. Cobalt uses as a supplement of the B12 vitamin due to it participates in the coenzyme of this vitamin [11]. In the other hand, vanadium complexes are described as therapeutic agents and promising drugs against diabetes, cancer and parasitic diseases [12, 13].

DNA has an important role in the biological processes because of its responsibility about intelligence and directed synthesis of biomolecules of enzymes and proteins during duplication and reproduction for genetic intelligence in living cells. Metal complexes are reported an attractive binding sites with DNA [14, 15]. Three noncovalent binding modes are well known; electrostatic, groove and intercalation [16–18]. Transition metal complexes have been received the large part of attention to create new nonradioactive tests of DNA construction [19, 20], new curative agents capable to cleave DNA, and DNA-mediated electron transfer reactions [21-23].

The biological properties of semicarbazones depend on the way that the metal ion is coordinated which determines the lipophilic properties that are responsible on the rate of entry into the cell [24]. The reported studies revealed that the complexes are higher bioactivities, lower side effects and lower drug-resistance than that of free ligand [25]. This work has

described the synthesis, characterization and DNA binding of vanadium and cobalt complexes based on semicarbazone which are explaining in scheme 1.



Scheme 1. Ligand and complexes general synthetic procedure

2.Experimental

2.1.Material and Instruments

All chemicals were obtained from Sigma Aldrich and used without more purification. DNA was obtained from human blood. FTIR spectra were conducted on a Shimadzu (FTIR -8400S, Japan) spectrometer using KBr pellets. Energy dispersive X-ray spectrometry (EDX) were recorded at room temperature. Electronic spectra were recorded by UV-Vis double-beam spectrophotometer (Spectroscan-80D, England). ^{1}HNMR and ^{13}CNMR recorded spectra by using DMSO-d_6 as solvent on a BRUKER 500 MHz spectrometer.

2.2. Synthesis of (E)-2-(2-hydroxy-3-methoxybenzylidene) hydrazine-1-carboxamide

A solution of 3-methoxysalicylaldehyde in (15 ml) ethanol dissolving (0.3735 g , 2.25 mmol) adding to semicarbazide solution in (15 ml) ethanol dissolving (0.25 g, 2.25 mmol). The resulting yellow solution was stirring for 2h with refluxing, filtered the solution with washing the precipitate by ethanol, then left to dried. Yield: 85%, mp:189-190 ˚C

2.3.Synthesis of vanadium complex

A solution of $VOSO_4$ $5H_2O$ (0.985 mmol, 0.25 g) dissolving in (20 ml) ethanol added to a solution of 3-methoxy-2 hydroxybenzaldehyde hydrazinecarboamide in (20 ml) ethanol dissolving (0.985 mmol, 0.2195 g). The red solution for 2h was refluxed, with filtration, by ethanol washing the precipitate, then left to dried. Yield: 80%, mp: 234-236 ˚C

2.4.Synthesis of cobalt complex

A solution of $Co(acac)_2$ in (20 ml) ethanol dissolving (0.25 g, 1.00 mmol) has been added to a solution of 3-methoxy-2- hydroxybenzaldehyde hydrazinecarboamide in (20 ml) ethanol dissolving (0.2195 g, 0.985 mmol) . The brown solution for 2 h was refluxed with filtration, and washed the precipitate with ethanol , then left to dried. Yield: 77%, mp: 243-245 ˚C

2.5.DNA binding assay

The DNA binding was performed in NaCl buffer (pH= 7.2), 6.3 mM Tris-HCl/50 mM. We prepared DNA stock solution in 6.3 mM Tris-HCl/50 mM of (pH= 7.2) buffer NaCl by dissolving a suitable amount of DNA at room temperature. For 48 h the product was stored in the refrigerator. A DNA buffered solution showed two UV absorbance at (260 and 280) nm a

ca.1.9: 1, ratio indicating the DNA was free of protein. The concentration of DNA was determined by the UV absorbance at 260 nm by using known molar absorption coefficient (6600 $M^{-1}cm^{-1}$) value [26], the reference (Tris/HCl buffer solution) was scanned from 230 nm to 600 nm.

measurements viscosity were achieved using a Cannon Manning Semi-Micro viscometer which is immersed in a water bath a thermostatic at 37 ^{0} C. By using digital stopwatch flow times were conducted manually. Calculating values viscosity from the observing the flow time DNA-containing solutions (t) using (t_0) for correcting the solvent mixture , $\eta = t - t_0$. The data viscosity were presented as $(\eta / \eta_0)^{1/3}$ versus [complex]/[DNA] where η and η_0 are the complex viscosity in presence of DNA and the viscosity of DNA alone respectively [27].

3.Results and Discussion

V(IV) and Co(II) complexes were synthesized with salicylaldehyde derivative based on semicarbazones. The complexes and ligand are strongly soluble in DMSO, air-stable, and strongly stable in aqueous solutions. UV and ^{1}H NMR spectra recording after preparation, (3, 30) days and 3 months, showing a high stability at room temperature.

The ligand showed^{1}H NMR , FTIR , and ^{13}C NMR spectra. In FTIR, the band of 3351 cm^{-1} to 3451 cm^{-1} due to υ (N–H) stretching, bands at about 3146 cm^{-1} corresponding to υ (O – H) group, ligand band at about 1585 cm^{-1} is due to υ (C=N) group, the bands at about 1600 cm^{-1} to 1612 cm^{-1} attributed to υ (C=N-N-C). band at about 1550 cm^{-1} to 1559 cm^{-1} is assigned to the stretching frequency of the phenolic bond (C – O). The chelation of semicarbazone ligand can easily be detected by monitoring the ligand position bands which are shifted to low or high energy upon complexation. The stretching phenolic(C–O) band has upward shifted to appeared in the region 1560-1568 cm^{-1}. In both complexes, υ (C=N) underwent a change in intensity and frequency, caused by complexation and downshifted to higher frequency to appeared in the region (1580 cm^{-1}). In ^{1}H NMR spectrum 'Figure 1 '.The signal appeared at (3.80) ppm attributed to the CH_3 protons of CH_3O group. doublet signals at (6.91) ppm and (7.34) ppm are due to the aromatic protons 4 and 6, respectively. The triplet signal at (6.74) ppm is due to the aromatic proton 5. a singlet signal emerged at 8.16 ppm is attributed to the proton of CH=N group. The broad signal emerged at (6.37) ppm is due to the NH_2 protons, whereas, the singlet signal emerged at (10.18) ppm is due to OH proton. In ^{13}C NMR spectrum, the carbon of the CH_3 group is appeared at 56.30 ppm, Figure 2. The signals in the range 112.65 ppm to 145.76 ppm are due to the aromatic carbons and the signals at 148.32 and 157.04 ppm are due to the carbons of (C=N) and (C=O), respectively.

The complexes were identified by the energy dispersive X-ray spectrometry (EDX) which confirmed that the ligands were successfully chelated with Co and V, Figure 3.

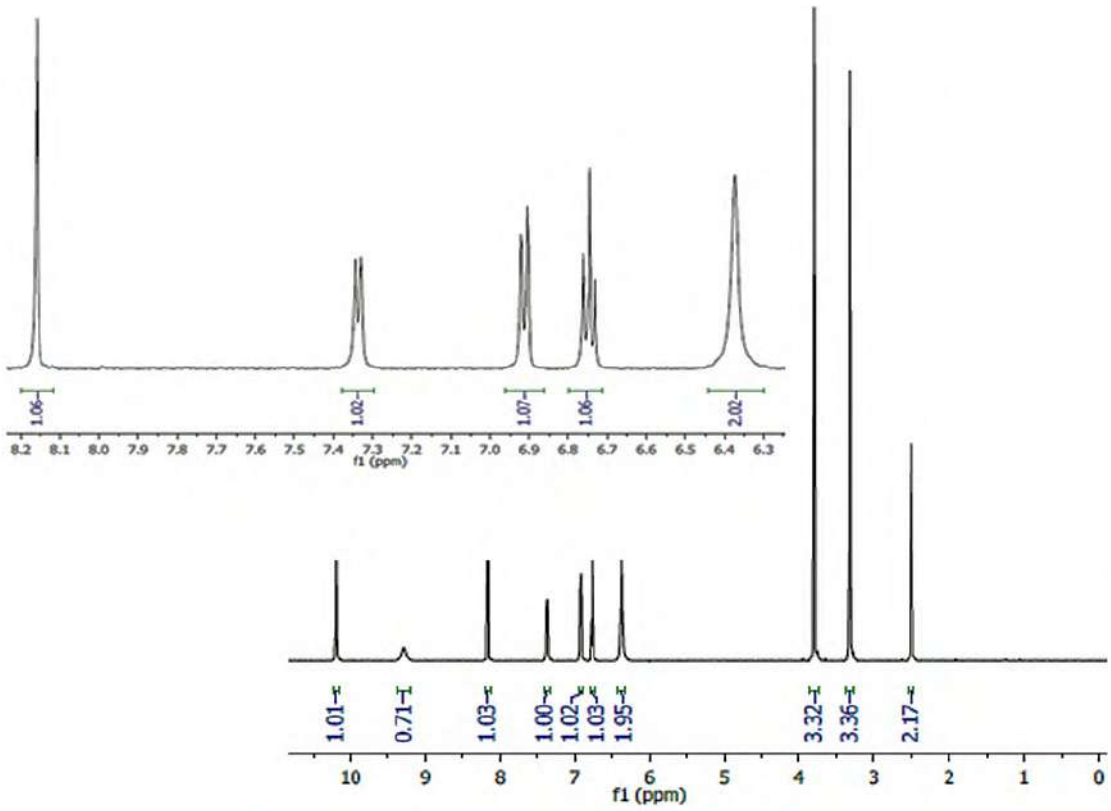


Figure 1. [1]HNMR spectrum of ligand.

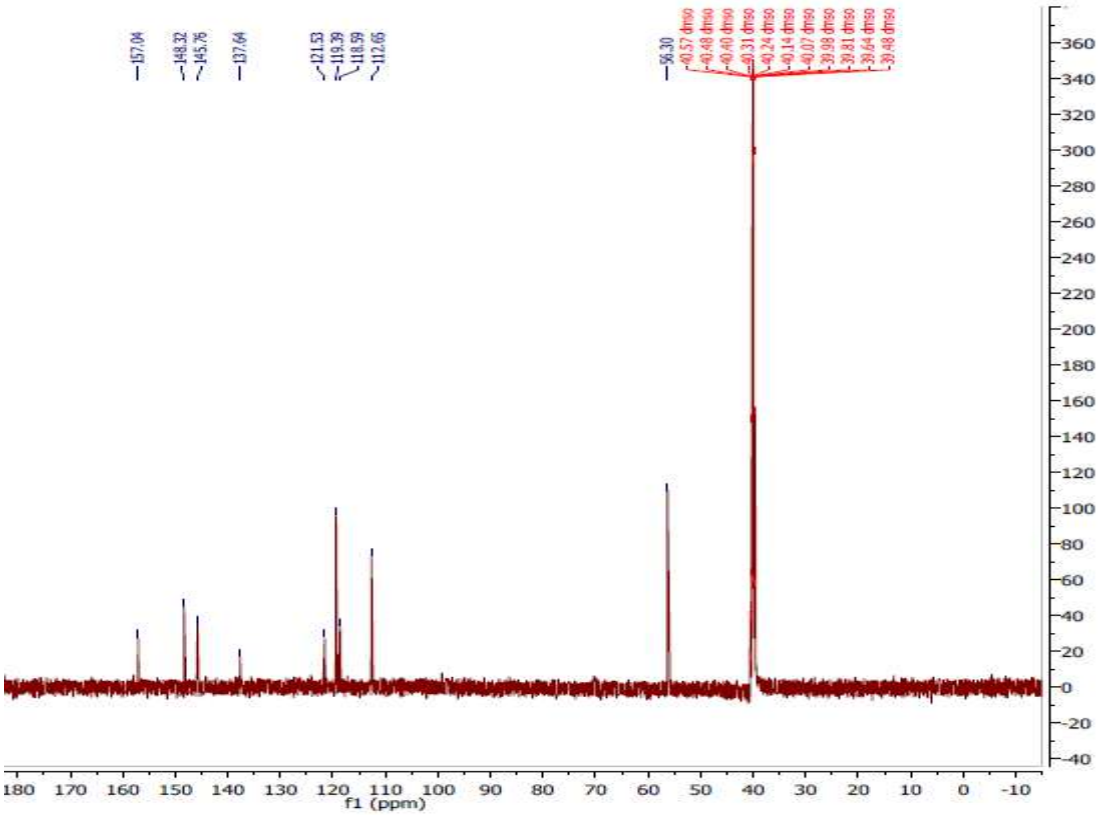

Figure 2. [13]CNMR spectrum of ligand.

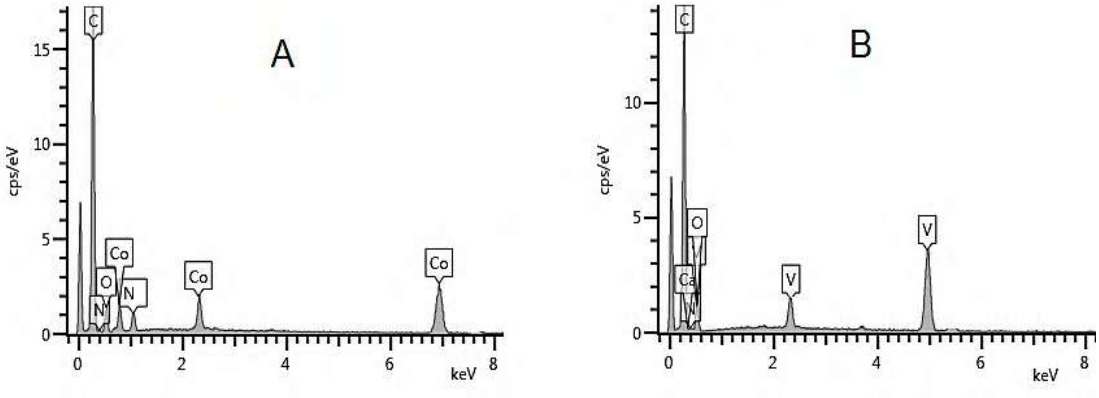

Figure 3. EDX analysis of cobalt complex (A) and vanadium complex (B).

3.1.Interaction with the DNA

3.1.1. studies of Electronic absorption

The electronic absorptions result studies are shown in (Figure 4). Ligand is exhibits two band absorptions at (245 nm and 352 nm) are attributed to transitions π-$\pi^*$and n- π^*, respectively. In addition, the complexes exhibited new bands at 403 nm and 670 nm are attributed to d-d transitions for the vanadium and cobalt complexes, sequentively. The π-π^* absorption bands is chosen to track the DNA interaction with complexes and ligands . spectroscopic titrations revealed that the increased amounts of (DNA) are lead to decreasing in absorptions intensity (hypochromism) of the complexes and their ligands, Figure 4. This spectral behavior are suggests DNA intercalative binding, since lead to the hypochromism in spectral bands [28, 29].

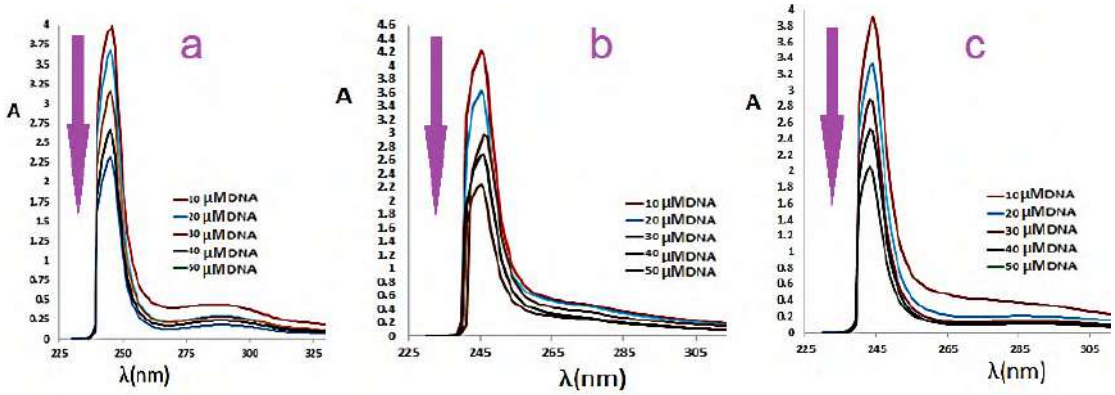

Figure 4. UV spectra of ligand (a) and its complex with cobalt (b) and vanadium (c). The arrows show the absorbance changes with DNA amounts .

3.1.2.Viscosity studies

Viscosity is one of the most important experiment that can be utilized to explain binding of compounds modes to DNA . . The results showed increases viscosity with increases amounts of ligand or complexes, Figure 5. These results have confirmed the intercalation of the compounds into DNA because the intercalation leads an stiffing and extension helix of DNA which consequently guide to increases viscosity of DNA solutions [30].

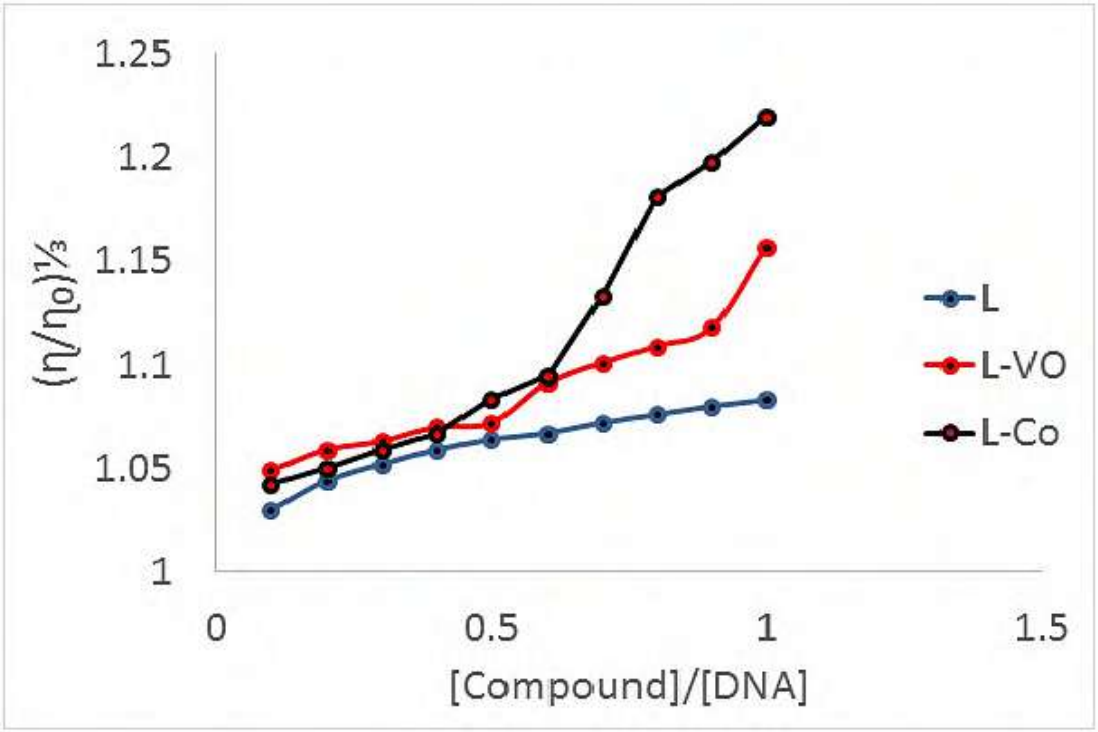

Fig. 5. Ligands and complexes viscometric results at 37 °C.

4.CONCLUSION

Two complexes of cobalt and vanadium with (E)-2-(2-hydroxy-3-methoxybenzylidene)hydrazine-1-carboxamid ligand were synthesized. The compounds were characterized by FTIR, ^{1}HNMR, ^{13}CNMR and EDX techniques. The interaction between the compounds and DNA was investigated. The results of UV–Vis spectroscopy and viscosity measurement showed a hypochromic shift and an intercalative mode. The obtained results have offering a promising therapeutic reagent for cancerous diseases.

Assessment The Suitable of The Groundwater for Civil uses in Kakhirta Village, Al-Ayadiyah Subdistrict, Iraq

Assessment The Suitable of The Groundwater for Civil uses in Kakhirta Village, Al-Ayadiyah Subdistrict, Iraq

Mohammed Hazim Sabry Al-Mashhadany

College of Education for Pure Sciences ,University of Mosul, Iraq

E-mail: mohammedhazemm@uomosul.edu.iq

Abstract. The current research describes the application of the water quality index (WQI) based on the collection of 50 samples of water sample for 10 wells for five months in the village of Kakhirta in Al-Ayadiyah subdistrict, northwest of Nineveh Governorate. The model was applied using 13 parameters (pH, TDS (total dissolved salts), DO (dissolved oxygen), T.A (Total Alkaline), Cl, Ca, Na, Mg, K, PO_4, SO_4, TPC (Total Plate Count), and F. Colif. (Faecal coliform) depending on the results obtained from the model. The groundwater quality ranged between (218 - 765), which indicates deterioration in water quality due to the high numbers of bacteria TPC and F. Colif., as well as the high total alkaline T.A and hypoxia in the water more the recommended limits for drinking water.

1.Introduction

Water enters the soil naturally because of the hydrological cycle of water in nature. The quality of groundwater changes during its movement inside the soil and its cohesion with rocks, as the water interacts with some of its constituent elements and melts from them and deposits others according to the quality of the rocks, the quality of water and the nature of its movement[1]. As a result of natural factors, it is very little compared to the pollution that occurs from human intervention, as human activity affects water quality in one way or another on water quality, and humans have a direct and indirect influence in changing the quality and quantity of groundwater[2].

Groundwater is one of the most important parts of water resources as it constitutes 71.7% of the world's drinkable water. Groundwater contains calcium, magnesium, and sodium salts. in high concentrations to make this water hardness due to its exposure to soluble substances in geological formations in addition to the salts transported in it [3]. The tremendous development in the development of agricultural and animal fields and the establishment of industrial and population gatherings around the wells have increased their pollution problems and have become a health threat to the consumers of these wells' water[4].

The influence of sewage and industrial waste through the soil into the water layers is a source of danger for groundwater pollution and deterioration of its quality, which made it more exposure to contamination[5]. Therefore, the current study aimed to know the quality of groundwater by collecting groundwater samples for ten wells in the village of Kakhirta, analyzing them, and then determining their suitability for drinking water purposes Depending on the standard parameters applicable internationally.

Many researchers have been studied the qualitative characteristics of groundwater in various regions of Iraq, Al-Shanona and others[6] have studied the water wells of Abu Maria village of Tal Afar district to determine its suitability for drinking and household uses, The results of the study showed a high concentration of salts, as the total hardness concentration reached 2020 mg. l^{-1}, and sulfates

reached 2136 mg. l^{-1}. The results also showed a decrease in WQI that water was of very poor quality for drinking and is not suitable for household uses according to the classification. Al-Saffawi[7] also studied the quality of the groundwater in the Al-Mahlabiah sub-district northwest of the city of Mosul, to evaluate it for drinking purposes. The results of the study reached a high concentration of some measured characteristics, especially solid dissolved salts and calcium ions. (3390, 673, 2271) mg. l^{-1}, respectively, which will affect the values of the Water Quality Index, this indicates that 83% of the studied water samples are of poor class after applying the Canadian model[7], and this is attributed to the geological formations that the water passes through, It requires some simple treatments, such as slow freezing and melting, to improve its quality before using it for drinking.
Jaafar and others[8] assessed the quality of water wells in the Rashidiya area, north of the city of Mosul, for drinking and domestic use, as water samples were collected from ten wells scattered in the study area for bacteriological and chemical examinations using the log. model to Evaluation the quality of well water using 11 parameters, the results of the Water Quality Index indicated that all well water is not suitable for domestic use and drinking this deterioration because of bacterial contamination. (Total number of TPC and F. coliform bacteria), high salt concentration, total hardness, and sulfate ions.

1.1.Geology of the study area

The region consists of the formation of the Fat´ha (the middle Miocene), the sediments of this formation were characterized by being periodic and containing different stones such as limestone. This formation's thickness ranges from (64-818) m. The containment of this formation on a large number of cracks and fractures filled with sand made it have a high capacity on the storage of groundwater, but its containment of gypsum in large quantities had a negative impact on the quality of the water contained within it, as the dissolution of the elements of limestone rocks in the water makes them rich in magnesium and calcium compounds[9,10].

1.2.Description of the study area

The study area included the selection of 10 wells in the village of Kakhirta, affiliated to Al-Ayadiyah subdistrict in Nineveh governorate, in the area Trapped between latitudes (36˚55´06´´) and (36˚55´90´´) to the north and between longitudes (42˚34´45´´) and (42˚35´01´´) to the east (Table 1, 'Figure 1')). This choice came because this village does not contain stations to purify drinking water, and the people depend on well water[11].

Table 1. Coordinates, Altitude, and depth of the studied wells

Well	E	N	Altitude (m)	Depth (m)
1	42˚34´88´´	36˚55´90´´	406	45
2	42˚34´71´´	36˚55´87´´	406	61
3	42˚34´93´´	36˚55´73´´	407	40
4	42˚34´45´´	36˚55´68´´	406	35
5	42˚34´59´´	36˚55´45´´	407	50
6	42˚34´95´´	36˚55´60´´	407	63
7	42˚35´01´´	36˚55´34´´	407	38
8	42˚34´68´´	36˚55´31´´	407	55
9	42˚34´70´´	36˚55´12´´	407	67
10	42˚35´00´´	36˚55´06´´	407	43

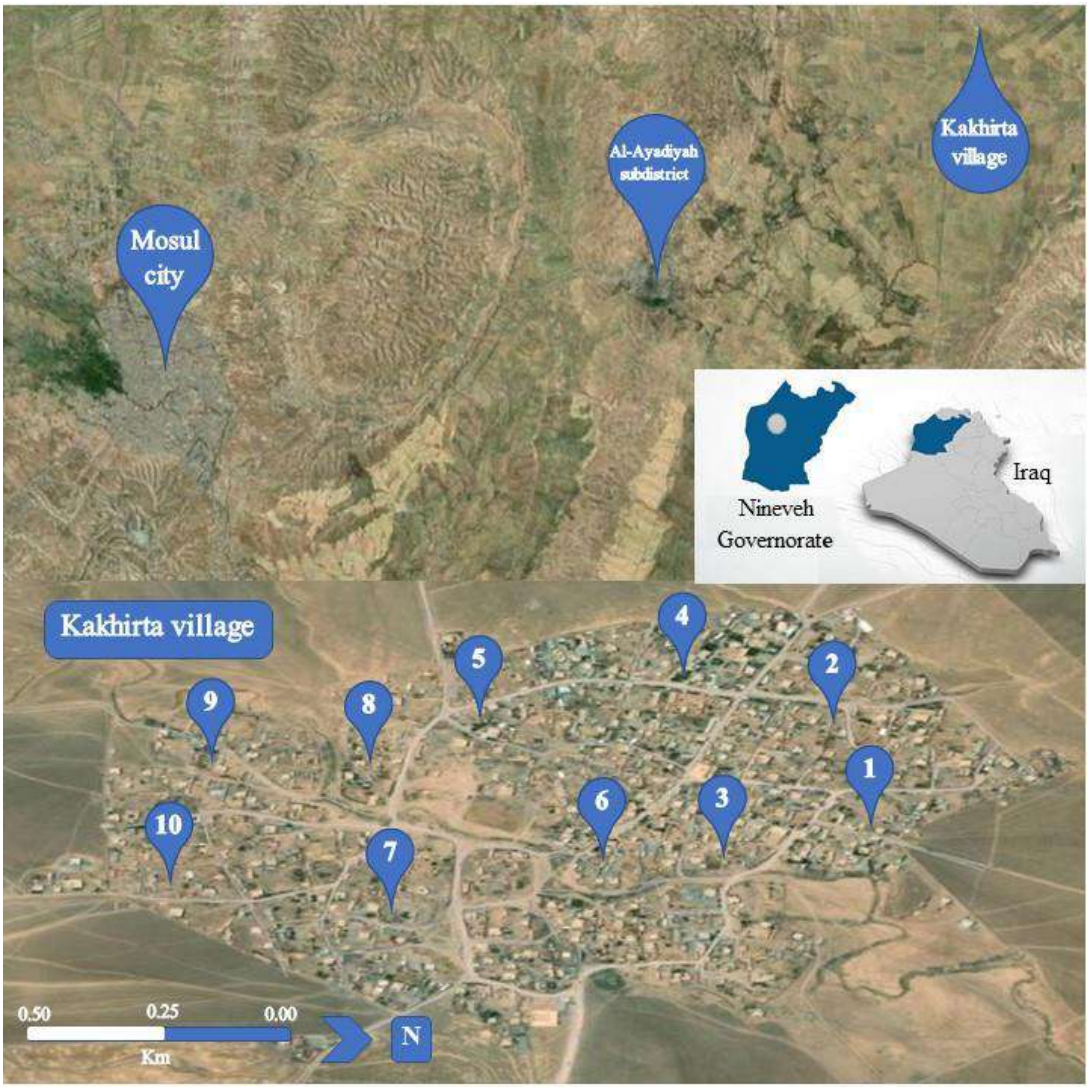

Figure 1. Map of Kakhirta village in Nineveh governorate showing the studied wells

2.Materials and Methods

In the study, 50 water samples were collected from ten wells spread all over Kakhirta village using cleaned polyethylene bottles, and homogenized with each a sample before Filling. As for oxygen, samples were collected from them Water using special bottles installed in the field by Addition of a solution of manganese sulfate (Winkler A) and Alkaline iodide azide solution (Winkler B), as in Bacteriological examination samples and sterile vials used and samples were kept out of light Container until reaching the laboratory. It measures the pH of water and TDS values using the field device and, in the lab, every variable like O_2, TA, phosphate, Sulphate, Na, Ca, K, Cl, Mg, TDS, TPC, and F. colif. were measured. Based on international standard methods[12.13]. The following devices were used in the analyzes: spectrophotometer, flame photometer, pH meter, TDS meter, and turbidity meters.

2.1.WQI calculation

Several variables have been selected that have an impact on the use of drinking water for their use in finding the quality of water for drinking purposes. These variables pH, O_2, TDS, T.A, Ca, Mg, Cl, Na, K, PO_4, SO_4, TPC, and F. Colif. And has been computed using the following equation[14-17]:

$$K = 1/\sum_{i=1}^{n} \frac{1}{S.TDS} + \frac{1}{S.O_2} + + \quad (1)$$

$$Wn = K / Si \quad (2)$$

$$qn = 100 \times [Vn - Vi] / [Si - Vi] \quad (3)$$

$$WQI = \sum qn \times Wn / \sum Wn \quad (4)$$

Where to:

K: proportionality constant., Wn weight value for each property., Si: permissible normal concentration as seen in the Table 2, qn: consistency ranking for each parameter., Vn: calculated value., Vi: ideal values.

The WQI values are categorized into five categories: excellent quality water (IWQI 0-25), good (IWQI 26-50), poor (IWQI 51-75), very poor (IWQI 76-100), and Unfit for drinking (IWQI> 100)[18-20].

Table 2. standard values and Wn for parameters

parameters	Standard limit (Si)	Wn

3.Results and Discussion

The health concerns associated with the chemical components of drinking water differ from those associated with microbial contamination and primarily stem from the ability of these chemical components to cause harm to health after long periods of drinking the water. Chemical composition of water can lead to health problems as a result of a single exposure, except for their effects through accidental, widespread contamination of the drinking water supply. Moreover, experience shows that in many such incidents, the water becomes unfit for drinking as a result of the unacceptable taste, smell, and appearance[21].

The most common and widespread health risk associated with drinking water is biological contamination, the effects of which mean that great attention must always be paid for monitoring. Priority needs to be given to improve and develop drinking water supplies, which represent the greatest public health risk[22].

The pH values recorded in the study were moderate and within the permissible limits for drinking water, which ranged between (7.01 – 7.76) as in table (3), due to the distance of its water from the direct air changes that caused the dissolution of carbon dioxide in the water. In addition to the high regulatory capacity of hard and Alkaline water rich in bicarbonate, which resists change in pH[23].

The results shown in Table 3 indicated a decrease in the concentration of DO in well water, as 50% of the studied samples were less than the standard permissible limits for drinking water, which ranged between (2.40-8) mg. l^{-1}, and the reason for the decrease in values is The percentage of oxygen saturation decreases due to the high salinity, as well as the lack of contact of water wells with the air. The great deficiency of this factor has a very negative impact on the aquatic ecosystem, as it leads to an increase in the activity of anaerobic microorganisms and changing the interaction paths for organic materials to produce substances harmful to the aquatic environment, and this explains for us the

emission of unpleasant odors from some water wells in the study area as shown in the equations The following[24].

Table 3 shown that all values of TDS in the groundwater of wells were within the permissible limits except for well No. (8) whose values exceeded 1000 mg. l^{-1}. This is because the concentration of total dissolved salts in groundwater depends on the type of rocks and soils that are in contact with them, and on the period that the contact process, movement, and source of groundwater take[25].

The results of the T.A in the water of the study wells did not come within the standard specifications for drinking and for all wells, which means ranged between (248 - 444) mg. l^{-1}. The high T.A of well water in the current study shown in Table 3 is due to alkaline bicarbonate, due to its abundance and resulting from the dissolution of lime materials, which is the main source for it[26]. High concentrations of the alkaline of drinking water reduce the secretion of gastric juice (inhibit the action of the enzyme pepsin), which results in an imbalance in the digestive process, vomiting, and nausea, as well as some research indicates delayed growth and weight loss[27].

High concentrations of sodium ions in drinking water lead to health problems for heart and kidney disease[28]. The results of the levels of sodium and potassium concentrations in this study were within the standard specifications for drinking water, which ranged between (48 - 97) mg. l^{-1} and (2.20 – 9.2) mg. l^{-1} except for well No. 2, 8, and 10 for sodium, and well No. 5 and 7 for potassium which exceeded the permissible limits for drinking.

Chlorides enter the human digestive system through drinking water and their taste is unpalatable if it exceeds its limits and also affects the osmotic pressure of the person. The concentration of chloride ions in groundwater depends on the type of rocks and geological layers in which the groundwater passes[27] and since 90% of the study wells found that the chloride ion is within the standard specifications of drinking water, which did not exceed 200 mg. l^{-1} except for well No. (8.)

The results of the calcium and magnesium ion concentration mean in well water was not within the drinking water standard specifications, which ranged between (80 - 129) mg. l^{-1} and (55 - 87) mg. l^{-1} respectively. The presence of dolomite and calcite rocks in the Fat´ha layer was attributed to the high values of ionic concentration in the study area[9].

The sulfate ion present in the groundwater and formed as a result of the dissolution and Disintegration of gypsum and anhydrite rocks. High concentrations of sulfates in drinking water produce a noticeable taste and can also degrade the piping system[29]. The recommended upper limit is 400 mg. l^{-1} in water intended for human use, and the values of the studied well water ranged between (80-880) mg.l^{-1} where 50% of the well water was outside the recommended limits for drinking, the high concentrations of sulfates in the groundwater in the research area are attributed to the presence of mucin deposits that contain gypsum and limestone[9], as in the Table 4.

As for phosphate ions PO_4, studies indicate that it is non-toxic to humans and animals unless it is present in high levels, which may cause digestive problems. The results in table (4) showed a decrease in the content of phosphate ions in the studied well water, which ranged between (0.00 - 1.54) mg. l^{-1}. It is also noted that the phosphate concentrations decreased compared to the negative ions studied, which is due to the ability to precipitate phosphate in the form of calcium phosphate in addition to its adsorption by surfaces mud minutes, which reduces its transfer to the water environment, and the frequent use of phosphate fertilizers and detergents is the main source of phosphates in groundwater, and in general, the concentration of phosphate ions is within the permissible limits for drinking[30].

* 10^2 cell. ml^{-1}

Water is contaminated with microbes as a result of the infiltration of human or animal waste into it. This bacterial contamination leads to an increase in infectious diseases. It is one of the most important types of bacteria that are considered evidence of water pollution with F. colif. bacteria, which is one of the causes of disease, foremost among which is diarrheal diseases that kill approximately 5500 people around the world, most of them children under the age of five[31]. Through the results of the detection of TPC and F. Colif bacteria and their comparison with standard specifications, whose rates ranged between (231-935) 10^2 cell. ml^{-1} and (1-122) 10^2 cell. ml^{-1}, it appears that all well water is not suitable for drinking, which means contamination of groundwater with samples of sewage or leakage in septic tanks for the study area[7].

3.1.WQI

The WQI model was applied on 13 parameters as shown in Table 2 to evaluate the water of the studied wells for drinking and household uses, and the results are shown in Table 5 indicate that the values of WQI ranged between (218 - 765), When comparing the results of water classification, we found that 100% of the groundwater of the study area was of unfit for drinking quality for drinking and household uses, and this deterioration was mainly due to the studied standards exceeding the permissible limits according to the standard specifications, especially oxygen and TPC, which affects the high (qn×Wn) values. Which is directly proportional to the WQI values.

Table 5. Results of overall WQI calculation with corresponding water quality status Wells

4.Conclusions

The study has concluded the following:

1. The TDS was suitable for drinking water for all well water except for Well No. 8.
2. The T.A is above the permissible limits for drinking water for all wells.
3. Low DO values up to 50% of well water at standard specifications.
4. A large increase to TPC for all well water is considered one of the most influential parameters in the results that all well water is not suitable for drinking and household uses.
5. The potential health consequences of bacterial contamination must be of great importance and not be tolerated.

Abstract. The corrosion inhibition effect of a new furan derivative (furan-2-ylmethyl sulfanyl acetic acid furan-2-ylmethylenehydrazide) on mild steel in 1.0 M HCl was investigated using corrosion potential (ECORR) and potentiodynamic polarization. The obtained results indicated that the new furan derivative (furan-2-ylmethyl sulfanyl acetic acid furan-2-ylmethylenehydrazide) (FSFD) has a promising inhibitive effects on the corrosion of mild steel in 1.0 M HCl across all of the conditions examined. The density functional theory (DFT) study was performed on the new furan derivative (FSFD) at the B3LYP/6-311G (d,p) basis set level to explore the relation between their inhibition efficiency and molecular electronic structure. The final experimental results showed that FSFD act as a good corrosion inhibitor in the acidic solution for mild steel which is in agreement with the results of the theoretical study.

Keywords: Furan derivative, FSFD, Mild Steel, Corrosion inhibitor.

1. Introduction

Corrosion is a fundamental property of metals and alloys in an acidic or saline solution. Studies on corrosion represent a growing field due to substantial financial losses in various sectors and require extensive efforts to limit its impact [1-3]. Recent years have witnessed a growing academic interest in studies on inhibitor corrosion in many ways. Corrosion inhibitor is an increasingly important area particularly in industria [4-6]. Recent years have shown interest in using organic compounds containing sulfur, oxygen, and nitrogen atoms to inhibit corrosion process [7-9]. Organic compounds with heteroatoms are among the most widely used in inhibitor corrosion due to the effect of the polar groups and Pi-electrons on the iron surface and minimizing the effect of corrosion [10-11]. In this work, we used a new furan derivative FSFD with molecular formula ($C_{12}O_3N_2SH_{12}$) as show in Figure 1. FSFD was synthesized and characterized by Luma S.A. [12]. A new furan derivative was applied as corrosion inhibitor by investigated in the mild steel in acidic solution (1.0 M HCl) with different concentrations using electrochemical measurements and theoretical treatment using Gaussian 05 in two media (vacuum and ethanol solvent).

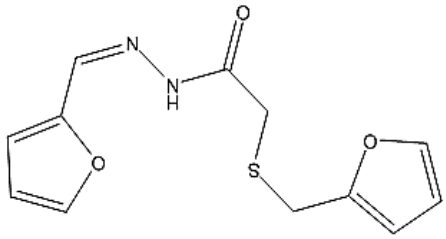

Figure 1. Structure of (furan-2-ylmethyl sulfanyl acetic acid furan-2-ylmethylenehydrazide)

2. Experimental

2.1 Preparation of carbon steel sample

Mild steel which has the configuration percentages as shown in Table 1 was used.

Table 1. Structure of carbon steel [13].

Metal	Amount	Metal	Amount
Fe%	99.579	P%	0.002
S%	0.0154	C%	0.03
Cu%	0.065	Mo%	0.002
Mn%	288	C%	0.0199
Zn%	99.989	V%	0.0005

The sample of mild steel was subjected to surface cleaning by absolute ethanol and drying in acetone. The specimen material was fabricated in circular samples with dimensions of 2.5 cm in diameter and used as working electrode.

2.2 Preparation solutions

2.2.1 Blank solution

Corrosive solution (1.0 M HCl) was prepared. Dilution of analytical grade 35.4% HCl with purified water up of to 1 liter. Blank solution consisted of 990 ml of 1.0 M HCl and completed to 1 L with 10 ml ethanol solvent.

2.2.2 Corrosion Inhibitor FSFD solution

Three different concentrations (100, 200, 300 ppm) were prepared by dissolving FSFD powder in the ethanol solvent and transferred to a volumetric flask of 10 ml.

2.3 Corrosion Potential (ECORR) Measurements

The electrochemical system consisting of a potentiostate, three electrodes, with a controlled computer and standard corrosion cell was used. The thermostat was among the most widely, used to control the temperature of (1.0 M HCl) which flows through the external vessel at 30 ^{o}C. Figure 2 shows the corrosion cell, and the three electrodes were:

1-The first is the reference electrodes which based on its potential consist of AgCl, Ag, KCl, and the outer solution filled with the prepared hydrochloric acid solution (1.0 M HCl). The reference electrode, a lugging tube placed at the distance 2mm from working electrode.

2- The second electrode is auxiliary consists of high purity platinum rod with 0.6 mm in diameter and 10 cm in length.
3- The third is working electrode (mild steel) which was mounted in the working electrode load with 1 cm2 surface area the opening uncovered to the acidic solution.

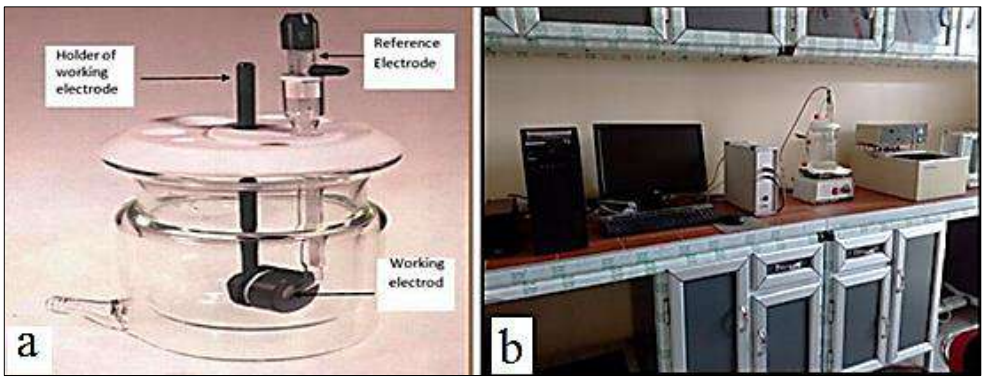

Figure 2. (a) The corrosion cell and the three electrodes.
(b) Experimental set up.

2.4 Experimental Procedure

The corrosion rate calculation protocol was carried out in compliance with the following steps:

1- One liter of corrosive media has been applied to the corrosion cell (see paragraph 2.3).
2- The temperature of the solution has been raised to the desired value with the use of the circulator of the water bath.
3- The first programmed step in this measurement is the open-circuit potential and the polarization curve starts at an open-circuit potential of approximately ± 200 mV from the open-circuit.
4- Measurements of corrosion for mild steel were assessed at 1.0 M. HCl with potentiostatic and blank solution followed by an inhibitor at different concentrations.
5- Corrosion current density (I mA) and corrosion potential (E mV) are calculated from the polarization curve as seen in Table (2) and in Figures (3-5).

3. Results and Discussion

3.1 Potentiostatic Polarization Measurement

In order to investigate the effects of electronic structure of FSFD compound as inhibitor corrosion, the theoretical study was conducted for FSFD compound [14]. The potentiostatic polarization curves for mild steel without and with FSFD immersed in 1.0 M HCl solution at temperatures range 303K are show in Figures 3, 4, 5 and the results are listed in Table 2.

Table 2. Polarization parameters for different concentrations of the FSFD at mild steel in acidic solution at 303 K.

Conc (ppm)	-Ecorr.(Mv)	Icorr.(µA.cm^{-2})	-bc (mv/Dec)	ba (mV/Dec)	W(Lg.m^{-2}.d^{-1})	P(Lmm.y^{-1})	Rp(Ω.cm^{2})	IE%	CR (mpy)
0	490.1	872.24	87.5	100.2	12.45	3.44	23	0	403
100	467.1	410.46	86.4	88.1	6.99	1.98	46	53	190
200	476.5	234.66	49.5	87.6	3.67	1.54	59	73	108
300	448.8	201.15	79.8	72.0	1.74	0.99	82	77	92

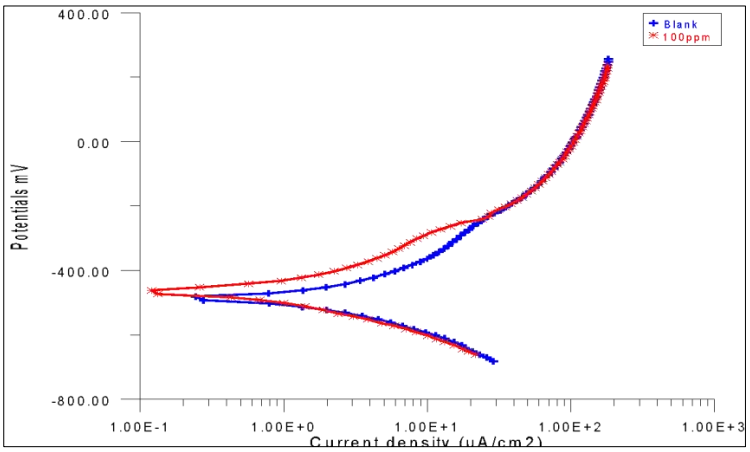

Figure 3. Potentioatatic Polarization curves for uncoated and coated mild steel with 100pp of FSFD in 1.0 M HCl Solution at 303 K.

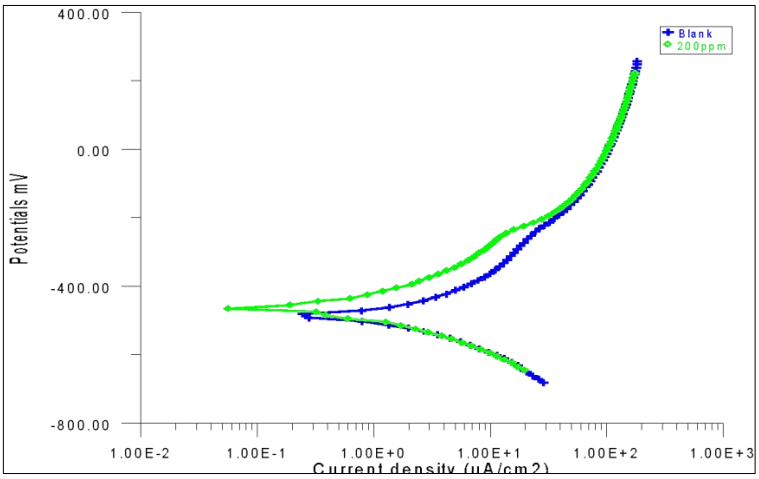

Figure 4. Potentioatatic Polarization curves for uncoated and coated mild steel with 200ppm of FSFD in 1.0 M HCl Solution at 303 K.

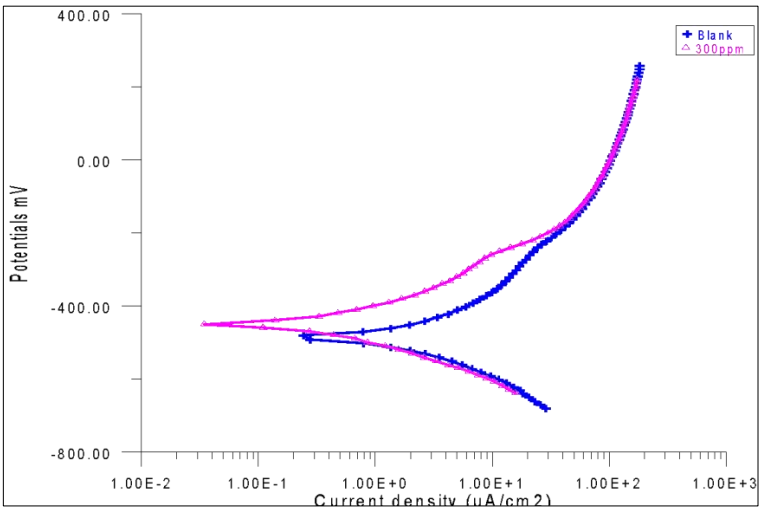

Figure 5. Potentioatatic Polarization curves for uncoated and coated mild steel with 300ppm of FSFD in 1.0 M HCl Solution at 303 K.

Values of corrosion potentials Ecorr, corrosion current densities icorr, cathodic and anodic Tafel slopes bc and ba. Rp polarization resistance which determination by equation (1), CR corrosion rate determination by equation. (2), the inhibition efficiency of FSFD can calculated from equation (3),

$$R_P = \left(\frac{B}{icorr}\right) \quad (1)$$

$$R_P = \frac{\beta a\, \beta c}{2.303\,(\beta a + \beta c)icorr}$$

$$CR = 0.13\left(\frac{e}{\rho}\right) icorr \quad (2)$$

e: Chemical equivalent

p: density of mild steel

$$I(\%) = \left(\frac{i\,corr - iinh\,corr}{i\,corr}\right) \times 100 \quad (3)$$

where $icorr$ and $i_{inh}corr$ are referred to the corrosion current density without and with the addition of the inhibitor, respectively.

Result shows that corrosion current density were decreased with increased the concentration of the **FSFD** compound and the inhibition efficiency increased due to the **FSFD** effect on the anodic and cathodic the electrochemical corrosion reaction because **FSFD** contain heteroatoms like nitrogen, sulfur and oxygen atoms as well as lone pairs of electrons present on N, S and O atoms and the planarity are the important structural features that rule to adsorption of these molecules onto the surface of the iron and prevent the continued corrosion [15-16].

3.2 Computational study

3.2.1. Molecular geometry

All the work on the computer was carried out using Gaussian-05 series of programs at the DFT and (B3LYP)/ 6-311G (d, p) basis set level as so to explore the connection among their inhibition efficiency and molecular electronic structure of a new furan derivative (furan-2-ylmethyl sulfanyl acetic acid furan-2- ylmethylenehydrazide) (FSFD) in ethanol and without solvent (vacuum) as seen in Figure 6. The computational structural parameters such as bond length and dihedral angles were calculated by ChemDraw of Mopac program (ver. 10) as shown in Tables 3 and 4.

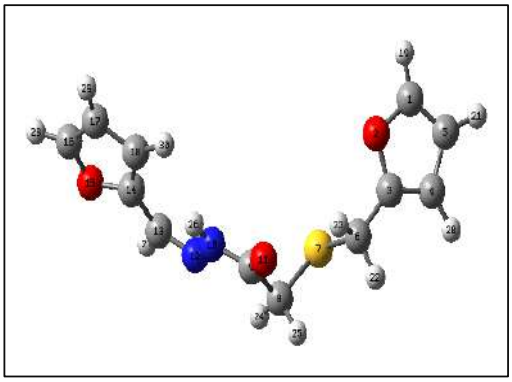

Figure 6. Optimized molecular structure of FSFD compound.

3.2.2 Calculation of the main quantum parameters

The quantum chemical properties such as total energy, energy gap (ΔE_{gap}), softness (S), dipole moment (μ), hardness (η), E_{HOMO} (highest occupied molecular orbital energy), E_{LUMO} (lowest unoccupied molecular orbital energy), ionization energy (I), the absolute electronegativity (χ), the fractions of electrons transferred (ΔN), the electrophilicity index (ω), and electron affinity (A) were completed using (DFT) at the (B3LYP) / 6-311G (d, p) basis set as shown in Table 5. Quantum chemical parameters were estimated by using the following equations (1-7):

$I = - E_{HOMO}$ (1)

$A = - E_{LUMO}$ (2)

$\eta = \frac{I-A}{2}$ (3)

$\chi = \frac{I+A}{2}$ (4)

$S = \frac{1}{\eta}$ (5)

$N = \frac{\chi_{Fe} - \chi_{inh}}{[2(\eta_{Fe}+\eta_{inh})]}$ (6)

$\omega = \frac{\chi^2}{2\eta}$ (7)

Table 5. Quantum chemical parameters for inhibitor FSFD calculated using DFT / B3LYP/ 6-311G (d,p) in ethanol and vacuum solvent.

Parameters	Ethanol solvent	Vacuum
Total Energy (eV)	-32599.730	- 32599.395
E_{HOMO} (eV)	- 6.286	- 6.122
E_{LUMO} (eV)	-1.793	-1.793
ΔE_{gap} (eV)	4.493	4.329
μ (Debye)	3.5493	2.8168
I (eV)	6.286	6.122
A (eV)	1.793	1.793
η (eV)	2.247	2.165
ω (eV)	3.631	3.618
χ (eV)	4.0395	3.958
S $(eV)^{-1}$	0.445	0.462
ΔN (eV)	0.658	0.703

Table 5 shows the theoretical data for FSFD. It is obvious that the values of HOMO energy was increased in ethanol than in vacuum, the HOMO energy is often associated with the electron donating ability of the molecule. So inhibitor with high value of HOMO energy have a tendency to donate electrons to appropriate acceptor with low empty molecular orbital energy. The decrease in the E_{LUMO} value leads to higher inhibitory efficiency due capability of the FSFD compound to accept electrons from metal iron.

The ΔE_{gap} is an important parameter that should be considered. When the energy gap value decreases the reactivity of molecular system increases [17]. Moreover, the ΔE_{gap} is a part of the reactivity of the inhibitor molecule towards the adsorption on the metal surface.

As well as, the dipole moment (μ) is the maximum parameter that could be applied to describe the polarity of a molecule [18]. Where an increase in the dipole moment of the molecules leads to an increase in the inhibition efficiency. The inhibitor FSFD has 3.5493 Debye which reflects the increase of the reactivity more than the media without solvent. The electron density distributions, molecular optimization of the frontier molecular orbitals, highest occupied molecular orbital energy and lowest unoccupied molecular orbital energy of the inhibitor FSFD in ethanol solvent and vacuum are presented in Figure (7).

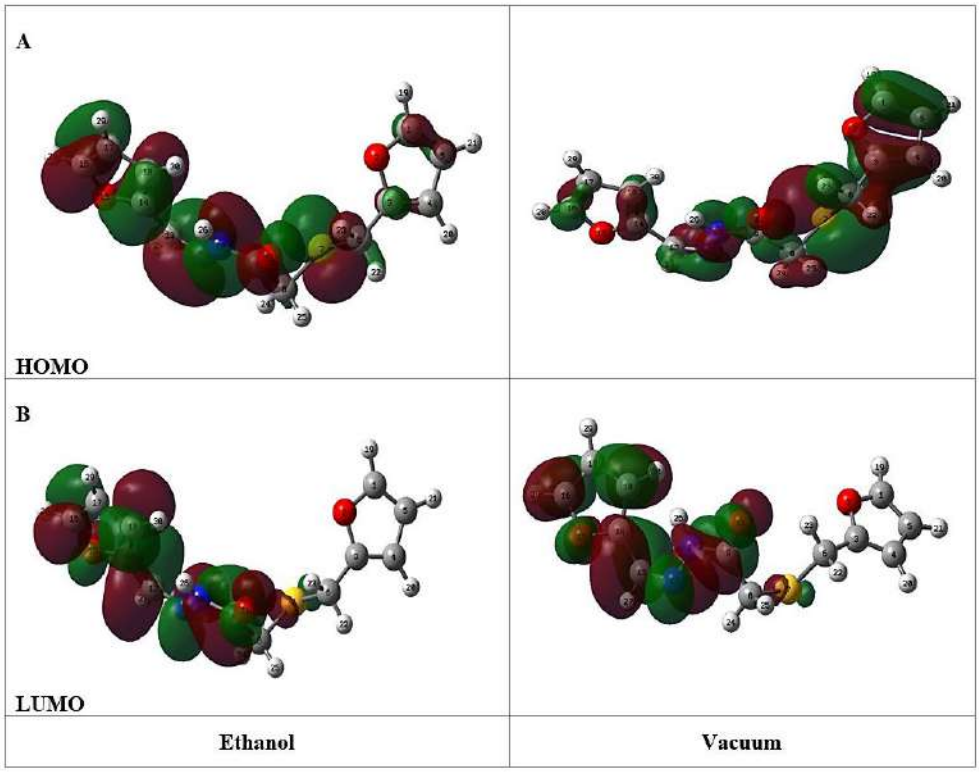

Figure 7 .**(A) HOMO** in ethanol solvent and vacuum and **(B) LUMO** in ethanol solvent and vacuum of the inhibitor FSFD using DFT / B3LYP / 6-311 G (d, p).

Molecular orbitals HOMO shows that the electronic density is totally centered on the heteroatoms oxygen, nitrogen, sulfur and the furan ring, the LUMO present an important electronic density distributed over most of molecule. This result agrees with the distribution of the Mulliken charges and the direction of the polar direction (moment) are presented in Figure 8 and listed in Table 6.

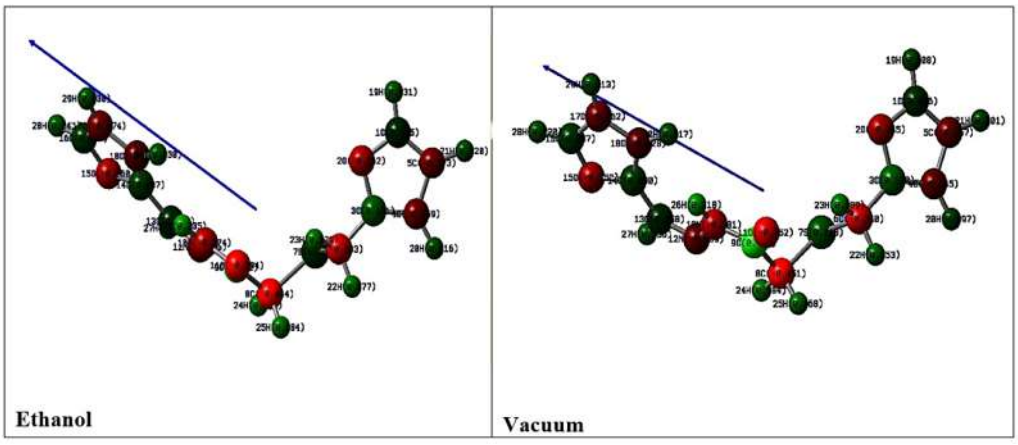

Figure 8. Mulliken charge distribution (MCD) of the FSFD inhibitor.

*Ethanol solvent, **Vacuum

Figure 8 and Table 6 display Mulliken charge distribution values. It can be realized that the some C atoms and heteroatoms, N, O, S have maximum charge intensity. The large electronic intensity regions are mostly the sites that electrophiles can attack through [19]. Thus, some C atoms, S, O and N are the active cores that easily the atom gives away its electrons to the unoccupied orbital of the metal [20]. Several reports have shown that some heteroatoms with more negatively charged is the more it can be hold as a thin film on the mild steel surface through the donor-acceptor style reaction [21].

4. Conclusions

A new synthesized furan derivative FSFD was investigated using electrochemical measurements and quantum chemical calculations as corrosion inhibition. Experimental results exhibited good corrosion inhibition impact on iron metal surface with maximum inhibition efficiencies of 77% in acidic solution (1.0 M) at 303 K. The contribution of theoretical results has been to confirm with the experimental results.

Abstract. The objective of the present work was to establish the antimicrobial activity of four species of Melaleuca (i.e. Melaleuca leucandron, Melaleuca armillaris, Melaleuca linarifolia, & Melaleuca ericifolia) methanolic extracts and five species of Syzygium (i.e., Syzygium samaragense, Syzygium jambos, Syzygium gratum, Syzygium paniculatum & Syzygium malaccense). To research the chemical composition of the most promising extracts, as well. The antimicrobial activity was evaluated against four pathogenic microbial strains, namely Staphylococcus aureus, Escherichia coli, Candida albicans and Aspergillus niger, the antioxidant activity was evaluated by 2,2'-diphenyl-1-picrylhydrazyl radical (DPPH), while the chemical composition was calculated by gas chromatography coupled to a mass spectrometry method (GC/MS). For the genus of Melaleuca, S. After therapy, aureus pathogens were inhibited with their methanolic extracts with an 8.0-20.0 mm range of inhibition zones, E. Coli with a 0.0-21.0 mm inhibition zone size, C. Albicans with an inhibition zone size of 9.0-18.0 mm, and A. Niger with an inhibition zone scale of 0.0-15.0 mm. Whereas, for the genus Syzygium, S. After treatment with their methanolic extracts, aureus pathogens were inhibited with a 10.0-20.0 mm range of inhibition zones, E. Coli, with an inhibition zone size of 0.0-14.0 mm, C. Albicans with an inhibition zone size of 0.0-21.0 mm, and A. Niger with a range of inhibition zones of 0.0-9.0 mm. The IC50 values in the DPPH assay ranged from 34.60 to 60.97µg/ml for the species Melaleuca. The IC50 values for the Syzygium species ranged from 29.81 to 52.95µg/ml compared to 7.35µg/ml for the normal ascorbic acid. GC/MS research showed that Syzygium gratum's methanolic extract consists of 39 compounds comprising 99.08 percent, with Veridiflorol (7.16 percent) and 2-methyl, 3-Hexanone being the main compounds (5.74 percent). While Melaleuca armillaris' methanolic extract consists of 30 compounds comprising 97.66%, with Veridiflorol (18.36%) and Globulolol compounds being the key compounds (12.57 percent).

Keywords: Myrtaceae; *Melaleuca* sp.; *Syzygium* sp.; Antimicrobial, DPPH, GC/MS.

1. Introduction:

The resistance to the presence of antibiotics by pathogenic microbial strains remains a major challenge. Infectious diseases caused by bacterial and fungal infections are, however, known to be a great health concern. Microbial resistance to antimicrobial agents has increased dramatically recently, so it is very important to look for alternative antimicrobial agents from natural sources, such as plants or herbs, in order to address this challenge[1,2]. A variety of plant, fungal and marine extracts have therefore been screened for their antimicrobial activity [3-12]. In addition, due to their biomedical properties against microbes, plants develop a high diversity of secondary metabolites with a prominent role for defense against predators and microbial pathogens[13.[

During normal oxygen metabolism, reactive oxygen species (ROS) are produced as secondary products. The over-production of such organisms, including DNA, proteins, and lipids, contributes to damage to essential cells and tissues in the human body. This phenomenon is considered to be associated with oxidative stress and is associated with chronic diseases such as cancer, coronary artery disease, hypertension, and diabetes[14-20.[

Involved in the Myrtales Order, the Myrtaceae family has approximately 130 genera and approximately 3800-5800 species, primarily tropical and subtropical, concentrated in the Neotropics and Australia[21]. The Melaleuca L. genus. (Myrtaceae) primarily occurs in Australia and contains around 250 species. The most common chemical constituents of this genus are essential oils[22], as well as flavonoids[23, 24], phenolic acids[25] and tannins[25, 26.[

In addition, the genus Syzygium (Myrtaceae) includes around 1200-1800 species, especially flowering plants. Species of this genus are widely distributed in Africa and Southeast Asia[27, 28]. The efficacy of Syzygium species against various bacterial strain types has been demonstrated in several studies [29, 30]. In the various Syzygium species, numerous groups of secondary metabolites have been identified, including flavonoids[31], proanthocyanidins[32], chalcons[33], and phenolic acids[34, 31]. In this context, the chemical profiles, antimicrobial activities and antioxidant activities of some species of Melaleuca and Syzygium grown in Egypt have been described in the current study.

2. Materials and Methods:

2.1. Plants materials

Fresh leaves of four *Melaleuca* (i.e., *Melaleuca leucandron*, *Melaleuca armillaris*, *Melaleuca linarifolia*, and *Melaleuca ericifolia*) and five *Syzygium* (i.e., *Syzygium samaragense*, *Syzygium jambos*, *Syzygium gratum*, *Syzygium paniculatum* and *Syzygium malaccense*) species were collected from different locations including; Zoo Garden, El-Orman Garden and Mazhar Botanical Garden, Giza, Egypt during April, 2019. The plant was taxonomically identified by Dr. Tearse Labib, Department of Flora and Taxonomy, El-Orman Botanical Garden, Giza, Egypt.

2.2. Extraction

The dried leaves were grinded and extracted with methanol (50 gm for each plant sample) at room temperature for four days (8×500 ml). The combined extracts were filtered evaporated under vacuum until becoming dry at 40°C.

2.3. In vitro antimicrobial evaluation

The antimicrobial activities were evaluated by using disc agar plate assay against four different pathogenic microbial strains, *Staphylococcus aureus*, *Escherichia coli*, *Candida albicans* and *Aspergillus niger* according to the reported procedures [35,36]. Neomycin (100 µg/disc) and Cyclohexamide (100 µg/disc) were used as antibacterial and antifungal standards, respectively

2.4. Antiradical activity:

The antiradical action of the tested samples was evaluated according to the reported methodology illustrated by [37], briefly different dilutions of each sample (2 ml) were added to (2 ml) solution of 0.1 mmol/l 2,2'-diphenyl-1-picrylhydrazyl radical (DPPH). An equal amount of methanol and DPPH were acted as a regulator. After 20 min of incubation at 37^{o}C in the dark, the absorbance was registered at 517 nm. The test was accomplished in triplicate. The antiradical action was estimated and the SC_{50} (concentration of analyte needed to sweep fifty percent of the

radical) value was calculated. The reduction in the absorbance of DPPH solution reveals an increase of the DPPH radical masking potential. The DPPH radical scavenging activity was estimated according to the following equation:

$$\% \text{ DPPH radical scavenging activity} = [(1- A_{sample} / A_{control})] \times 100 \quad (1)$$

Where A_{sample} and $A_{control}$ are the absorbance of the sample and control.

2.5. GC/MS analysis

GC/MS investigation of the most active samples was carried out according to the reported procedures [7], using a Thermo Scientific, Trace GC Ultra/ISQ Single Quadrupole MS,TG-5MS fused silica capillary column (30 m, 0.251 mm, 0.1 mm film thickness). For GC/MS detection, an electron ionization system with ionization energy of 70 eV was used, Helium gas was used as the carrier gas at a constant flow rate of 1ml/min. The injector and MS transfer line temperature was set at 280°C. The oven temperature was programmed to an initial temperature of 50°C (hold 2 min) to 150 °C at an increasing rate of 7°C/min. then to 270 at an increasing rate of 5°C/min (hold 2 min) then to 310°C as a final temperature at an increasing rate of 3.5°C/min (hold 10 min). The quantification of all the identified components was investigated using a percent relative peak area. A tentative identification of the compounds was performed based on the comparison of the irrelative retention time and mass spectra with those of the NIST, WILLY library data of the GC/MS system.

3. Results and Discussion:

3.1. In vitro evaluation of the antimicrobial activities of Melaleuca species

Table 1 and 'Figure 1' show the results linked to antimicrobial inhibition zones of methanolic leaf extracts of four Melaleuca species against four pathogenic microbial strains. The areas of inhibition for M. It was between 10 and 20 mm of leucandron. While, because of M. There were between 8 and 18 mm of armillaris, for M. There were between 8 and 15 mm of linarifolia, and for M. There were 8 and 21 mm of ericifolia. The microbial strains which are most susceptible to the M. S. was leucandron extract. S. Aureus, as well as A. Niger, with 20 and 15 mm inhibition areas, respectively. While, the most vulnerable microbial strains to the M. The extract from Armillaris was C. Albicans with an 18 mm inhibition zone. The most potent activity for M. was also reported. Against E ericifolia. 21 mm coli with an inhibition zone. To date, very few studies in the literature describe the antimicrobial activity of extracts of the Melaleuca species, but the most frequently published papers deal with the antimicrobial activity of their essential oils.

Antimicrobial activity of the extract of M. crude leaf. Five microbial strains were tested against Quinquenervia. The 10 mg concentration inhibition zones were 13.4 mm against S. Aureus, against B 11.5 mm. 14.1 mm against E, cereus. Coli, and any action against C is registered. S. and Albicans. [38]. Typhimurium

Antibacterial activity of the leaves and flowers of M methanolic extracts. Eight pathogens, namely Staphylococcus aureus, Escherichia coli, Bacillus cereus, Staphylococcus epidermidis, Salmonella typhimurium, Klebsiella pneumoniae, Streptococcus pneumoniae, and Pasteurella multocida, have been tested against cajuputi. The extracts showed activity against bacterial strains of Gram+ve; B. 6.33 mm/12.33 mm (leaves/flowers) cereus, S. 12.33 mm/ 12.33 mm (leaves/flowers) of aureus, and S. Epidermidis 13.66 mm/ 17.33 mm (leaves/flowers), while no activity against Gram-negative bacterial strains has been reported[39]. In addition, a recent analysis has discovered that the aqueous extract of M. Alternifolia grown in Australia demonstrated antimicrobial activity with a MIC of 0.25 mg/ml against P. aeruginosa [40].

Table 1. The antimicrobial activity of the methanolic extracts of four *Melaleuca* species using four pathogenic microbes

Sample	Clear zone (φmm)			
	S. aureus	***E. coli***	***C. albicans***	***A. niger***
M. leucandron	20	0	10	15
M. armillaris	8	0	18	9
M. linarifolia	10	15	11	8
M. ericifolia	8	21	9	0

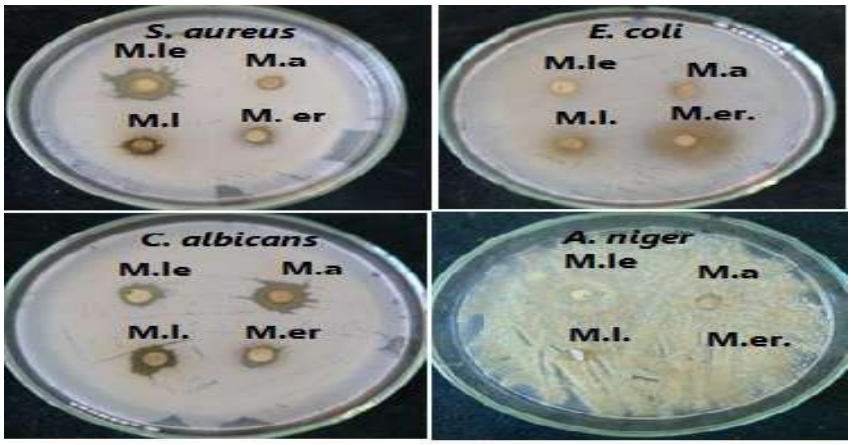

Figure 1. Antimicrobial inhibition zones of the methanolic extracts of four *Melaleuca* species against four pathogenic microbes. M.le: *Melaleuca leucandron*; M.a: *Melaleuca armillaris*; M.l: *Melaleuca linarifolia*; M.er: *Melaleuca ericifolia*.

3.2. In vitro evaluation of the antimicrobial activities of Syzygium species

The methanolic extracts from the leaves of five *Syzygium* species were subjected to *in vitro* antimicrobial activity test against four pathogenic microbial strains, i.e., *S. aureus*, *E. coli*, *C. albicans*, and *A. niger*. Results presented in Table 2 and‘Figure 2’ revealed the antimicrobial activity of these extracts. It has been found that *S. jambos* and *S. paniculatum* showed a remarkable activity against all test microbes except the fungus. However, *S. jambos* showed almost the highest antimicrobial activity against *S. aureus* (20 mm), *E. coli* (8 mm), *C. albicans* (21 mm), and *A. niger* (7 mm). Our findings are in agreement with some extent with several previous studies [41-42].

A present study has reported that the inhibition zones of *S. polyanthum* leaves extract against There were 7.00 mm, 9.33 mm, 9.67 mm, 7.00 mm, 6.67 mm, 9.33 mm, 6.67 mm, 8.33 mm, and 6.67 mm of foodborne pathogens on E. For coli, K. Pneumoniasis, L. P. aeruginosa, monocytogenes, P. mirabilis, S. With aureus, S. Typhimurium, V. cholerae and, respectively, V. parahaemolyticus[42]. In addition, the acetone bark extract of Syzygium cordatum showed an inhibition zone diameter of 22 mm for Staphylococcus aureus, 19 mm for Bacillus subtilis and 18 mm for each of Enterococcus fecalis, Enterobacter cloacae and Proteus mirabilis[43.[

Interestingly, a previous study showed that the extract of hydroalcoholic leaves from S. Cumini demonstrated antimicrobial activity against six microbial pathogenic strains, viz., S. Mutans, S. Mutans Yeah. Oralis, S. From Parasanguis, S. For salivarius, S. L and sp. Casei with 15 mm, 15 mm, 19 mm, 13.5 mm, 15.5 mm and 15.5 mm inhibition zones respectively [44]. The antimicrobial activity was evaluated for the different solvent extracts of Syzygium alternifolium leaves. The inhibition zones ranged between 4-8 mm (Staphylococcus aureus), 4-7 mm (Escherichia coli), 3-15 mm (Staphylococcus aureus), and 3-15 mm (Escherichia coli),

respectively. (*Pseudomonas aeruginosa*), 3-9 mm (*Candida albicans*), 5-10 mm (*Pencillium notatum*), and 2-6 mm (*Enterococcus*) [45].
The antimicrobial activity of the hydroalcoholic extract of *Syzygium cumini* leaves was evaluated via agar diffusion method. The inhibition zones were 12.0 mm, 14.7 mm, 9.7 mm, 8.7 mm, 10.0 mm, 9.0 mm, and 8.3 mm against *Candida albicans*, *Candida krusei*, *Enterococcus faecalis*, *Kocuria rhizophila*, *Pseudomonas aeruginosa*, *Staphylococcus aureus*, *Shigella flexneri*, respectively [46].

The ethanol extracts of the fruits and seeds parts of *Syzygium samaragense* were evaluated for their antimicrobial activities against certain clinical isolates, the inhibition zones were 16 mm fruits, 25 mm seeds, 10 mm fruits, 18 mm seeds, 11 mm fruits, 23 mm seeds, and 9 mm fruits, 21 mm seeds, respectively against *S. aureus*, *S. typhi*, *P. aeruginosa* and *E. coli*. While, the aqueous extracts showed low antimicrobial activities with inhibition zones of 7 mm fruits, 11 mm seeds, 0 mm fruits, 9 mm seeds, 0 mm fruits, 10 mm seeds, and 0 mm fruits, 9 mm seeds, respectively against *S. aureus*, *S. typhi*, *P. aeruginosa* and *E. coli* [47].
In accordance with a recent study, the aqueous methanol extract (85% MeOH) of *Syzygium jambos* leaves grown in Egypt showed antimicrobial activity against four microbial strains with inhibition ones of 13.5 mm, 11.0 mm, 13.5 mm, and 11.5 mm, respectively for *Staphylococcus aureus*, *Methicillin-resistant Staphylococcus aureus*, *Pseudomonas aeruginosa* and *Candida albicans* [41].

Table 2. The antimicrobial activity of the methanolic extracts of five *Syzygium* species using four pathogenic microbes

Sample	**Clear zone (φmm)**			
	S. aureus	***E. coli***	***C. albicans***	***A. niger***

S. paniculatum	12	13	8	9
S. malaccense	13	9	12	0

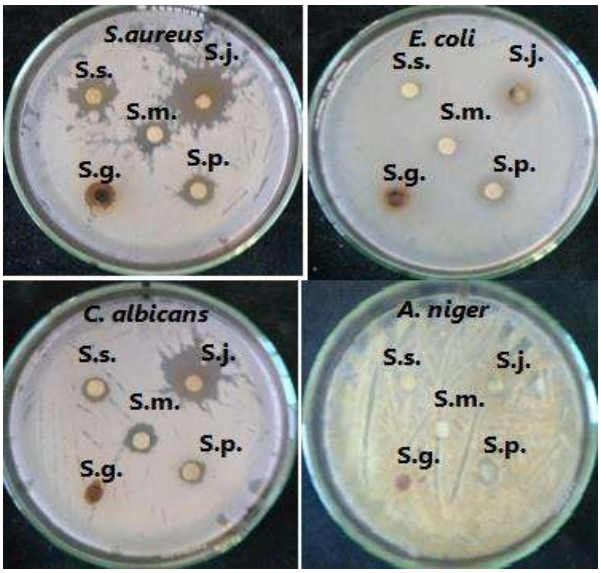

Figure 2. Antimicrobial inhibition zones of the methanolic extracts of five *Syzygium* species against four pathogenic microbes. S.s.: *Syzygium samaragense*; S.j.: *Syzygium jambos*; S.g.: *Syzygium gratum*; S.p.: *Syzygium paniculatum*; S.m.: *Syzygium malaccense*.

3.3. DPPH free radical scavenging biochemical activity

The DPPH free radical masking properties of the crude methanolic extracts of four *Melaleuca* and five *Syzygium* species are reported in Table 3. For *Melaleuca* species, the IC_{50} values for the tested extracts ranged from 34.60 to 60.79 µg/ml compared to ascorbic acid with IC_{50} equal to 7.35 µg/ml. The results are in the order: *Melaleuca armillaris* (IC_{50}: 34.60 µg/ml) > *Melaleuca ericifolia* (IC_{50}: 49.92 µg/ml) > *Melaleuca linarifolia* (IC_{50}: 59.54 µg/ml) > *Melaleuca leucandron* (IC_{50}: 60.97 µg/ml). While for *Syzygium* species, the *Syzygium gratum* extract showed the highest antioxidant activity with IC_{50} value of 29.81µg/ml, followed by *Syzygium paniculatum* (IC_{50}: 40.95 µg/ml), *Syzygium samaragense* (IC_{50}: 41.50 µg/ml), *Syzygium jambos* (IC_{50}: 48.13 µg/ml), and *Syzygium malaccense* (IC_{50}: 52.95 µg/ml), respectively, compared to ascorbic acid with IC_{50} equal to 7.35 µg/ml.

In this regard, a recent study dealt with the DPPH antiradical activity of the methanolic extracts of the leaves parts of seven *Syzygium* species from Indonesia has suggested that IC_{50} values were in the order; *S. jambos* (7.90 µg/ml), *S. malaccences* (10.77 µg/ml), *S. samarangense* (13.85 µg/ml), *S. cumini* (16.91µg/ml), *S. aqueum* (20.24 µg/ml), *S. aromaticum* (21.51 µg/ml), and *S. polyanthum* (26.03 µg/ml). The obtained results were matched to some extent with our current findings [48].

IC_{50} values of DPPH free radical scavenging activities of *M. leucadendron* solvents extracts were 5.1, 55.7, 4.8 and 60.0 µg/ml, respectively for methanol, chloroform, butanol and water extracts [49]. Also, free radical masking antioxidant activity of the methanolic extract of the leaves part of *Melaleuca leucadendra* from Indonesia was evaluated and IC_{50} value was 22.46 µg/ml [48]. The methanolic extract from flowers and leaves parts of *Melaleuca cajuputi* were evaluated for their DPPH free radical scavenging antioxidant activity, the leaves extract showed a higher scavenging activity with IC_{50} value of 10 µg/ml, while the flower extract showed an IC_{50} value of 25 µg/ml [50, 57]. Also, the Inhibition percent's of DPPH radical by the aqueous leaves extract of *Syzygium cumini* were 62.23%, 82.6%, and 87.13% at 100, 150 and 200 µg/ml, respectively. While, for the ethanolic extract 6%, 9%, and 25% were 100, 150 and 200 µg/ml, respectively [51]. IC_{50} values of DPPH free radical scavenging activities of aqueous and methanolic extracts of *S. cumini* were 24.77, and 9.97 µg/ml, respectively for aqueous and methanolic extracts [52].

Table 3. DPPH free radical scavenging activity of the methanolic extracts of four *Melaleuca* and five *Syzygium* species

Sample	DPPH free radical scavenging activity SC_{50} (μg/ml)[a]
Melaleuca leucandron	60.97 ± 0.59
Melaleuca armillaris	34.60 ± 0.15
Melaleuca linarifolia	59.54 ± 0.38
Melaleuca ericifolia	49.92 ± 0.13
Syzygium samaragense	41.50 ± 0.36
Syzygium jambos	48.13 ± 0.24
Syzygium gratum	29.81± 0.27
Syzygium paniculatum	40.95 ± 0.17
Syzygium malaccense	52.95 ± 0.20
Ascorbic acid	7.35 ± 0.47

[a]SC_{50}: concentration in μg/ml required for scavenging the DPPH radical (100 μg/ml) by 50 %, it was calculated by probit-graphic interpolation for ten concentration levels.

3.4.GC/MS analysis of the methanolic extract of Syzygium gratum

GC/MS analysis of the methanolic extract of *Syzygium gratum* comprises 39 ingredients. The overall peak areas of the identified components constitutes 99.08 %, the prospects of the chemical skeletons of the identified components are recorded in table (4): The main biochemical compounds are Veridiflorol $C_{15}H_{26}O$ (7.16%), 2-methyl, 3-Hexanone $C_7H_{14}O$ (5.74%), Pentadecanoic acid, 14-methyl-, methyl ester $C_{17}H_{34}O_2$ (4.98%), Nonadecane $C_{19}H_{40}$ (4.77%), 2,6,10,15-tetramethyl, and Heptadecane $C_{21}H_{44}$ (4.12%), collectively represented 26.77 % of the total peak areas ‘Figure 3’. The identification was accomplished using computer search user-generated reference libraries, incorporating mass spectra [53-55]. Peaks were examined by single-ion chromatographic reconstruction to confirm their homogeneity. Occasionally, when identical spectra have not been found, only the structural type of the isomer component was proposed on the bases of its mass spectral fragmentation. Reference compounds were co-chromatographed when possible to confirm GC retention times. 3-Piperidinamine, 1-ethyl-, N-[3-[n-aziridyl]propylidene]-3-methylaminopropylamine, Carbamic acid, hydroxy-, ethyl ester, and 3-Oxabicyclo[3.3.0]octan-2-one,7-methylene were detected by GC/MS analysis as major constituents in the methanolic extract of *Syzygium calophyllifolium* [56].

3.5. GC/MS investigation of the methanolic extract of Melaleuca armillaris

The GC/MS study of Melaleuca armillaris methanolic extract consists of 30 ingredients. Table 5 shows the prospects of the chemical skeletons of the identified components in the overall peak areas of the identified components: the main biochemical compounds are Veridiflorol C15H26O (18.36 percent), Globulol C15H26O (12.57 percent), (+) spathulenol C15H24O (7.53 percent), Cyclopropa[c,d]pentalene-1,3-dione, hexahydro-4(2-methyl-2-propenyl)-2,2,4-t. The identification was achieved by using user-generated reference libraries for computer search, integrating mass spectra[53-55]. Ethanone, 4H-1-Benzopyran-4-one, 1,4-Naphthalenedione, Alpha.-Tetralone, Caryophyllene Bicyclo,[7.2.0]undec-4ene, 1H-Cycloprop[e]azulen-7-ol, 2-Naphthalenemethano, Squalene, and Stigmast-5-en-3-ol[57] were detected by GC/MS study of the methanolic extract of Melaleuca cajuputi grown in Malaysia.

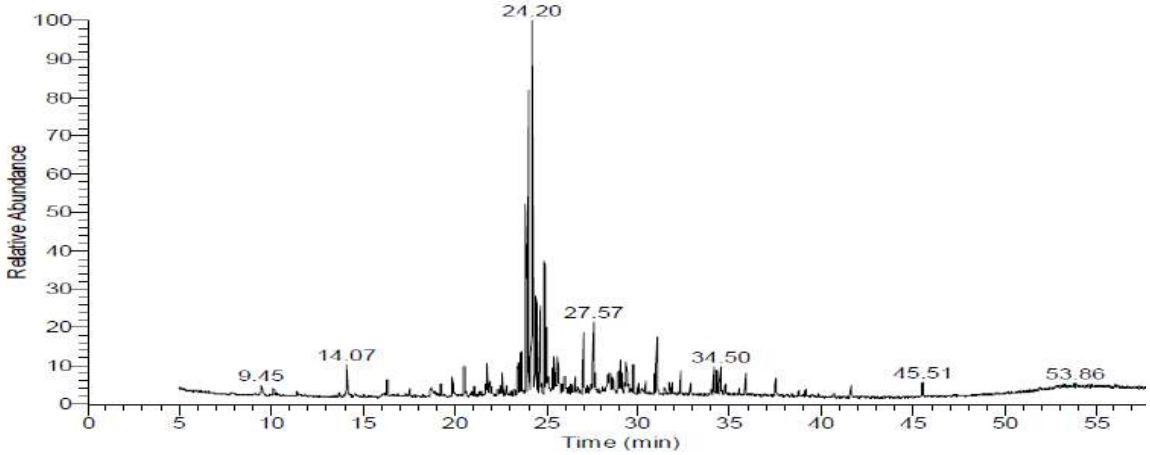

Figure 4. GC/MS profile of the methanolic extract of *Melaleuca armillaris*.

Table 5. GC/MS investigation of the methanolic extract of *Melaleuca armillaris*

Peak No.	R_t (min.)	M.W.	M.F.	Area %	Identified compounds
1	14.07	154	$C_{10}H_{18}O$	1.62	3-Cyclohexene-1-methanol, à,à,4-trimethyl
2	19.85	178	$C_{11}H_{14}O_2$	1.10	2-Butanone,4-(4-methoxyphenyl)-

Abstract. This paper is summarized with one of the applications of adsorption behavior; A UV-Vis method has been applied to survey the isotherm of adsorption. Results for experimental showed the applicability of Langmuir equation. The effect of temperature on the adsorption of cobalt (II) Complex by bentonite surface was studied. The results shown that the amount of adsorption was formed to increase, such as the temperature increase (Endothermic process). Cobalt (II) Complex has adsorption studies by bentonite surface at different pH values (1.6-10); these studies displayed an increase in adsorption with increasing pH.
ΔG, ΔH, and ΔS thermodynamic functions of the cobalt (II) Complex for their adsorption have been calculated.

Keywords: Adsorption, Langmuir , cobalt (II) Complex, ethanol, bentonite.

1. Introduction

Heavy metals have a high effect on plants, animals, and public health. Heavy metals are also more toxic than other metals [1]. Harmfulness of heavy metals is a part of being dangerous for living organisms when overdoing the particular limits. The existence of heavy metals in nature may be influence biodegraded, producing health problems for animals, plants, and humans [2,3].

Inorganic waste of the industries always has heavy metals like Co, Ni, Cu, Zn, and Cd, etc., which tend to collect in the chain for food [4]. That is related to their high solubility in the aquatic medium, as well as; toxic metals can be adsorbed by living organism. When these metals come into the food chain for one time which it may be concentrate and collect in the human body [5].

The removal of toxic metals, like cobalt, from wastewater, is fundamental and good for human health and the environment. Sharp effects of acute cobalt injuring on humans life which can contain (asthmatic symptoms and harm for heart, thyroid, and liver). At higher concentrations of (cobalt), it

may be too caused (genetic mutations in living cells), accenting the requirement for increasing consciousness of the problems related to cobalt toxicity [6].

The removal processes of metal, such as adsorption, it is too important. This process is inexpensive, simple, and more active than the other techniques, like (solvent extraction, electrolytic processes, chemical precipitation, ion-exchange, membrane separation, reverse osmosis, or biological systems) [7]. The molecule formula of bentonite is ($Mg_2Al_{10}Si_{24}O_{60}(OH)_{12}$[Na, Ca]), [8].

In this paper, we have examined the probability of the adsorption of various concentrations of cobalt (II) complex on to (bentonite) clay surface in various (pH solution), and the various temperature was studied.

2. Materials & Methods

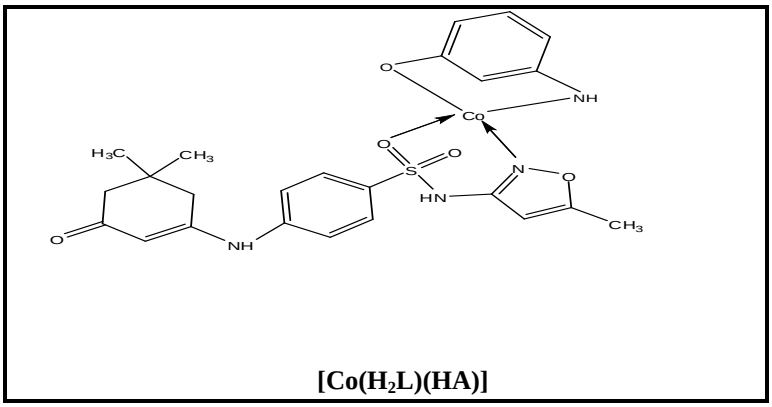
2.1. Synthesis:

2.1.1. Synthesis of the ligand [(H_2L)[4-(5,5-dimethyl-3-oxocyclohex-1-enylamino)-N-(5-methylisoxazol-3-yl) benzene sulfonamide].

The preparation of the ligand (H_2L) was carried out according to the published procedure in literature [9], by fusing of sulfamethoxazole and dimedone at (140) ºC for 1/2 hour.

2.1.2.Synthesis of cobalt (II) Complex [Co(H_2L)(HA)]

The metal solution of $CoCl_2.6H_2O$ (0.061g,0.26mmole) was dissolved in (10) ml ethanol, and it was stirred for ten minutes. The H_2L ligand solution (0.1g, 0.026mmole) in (10) ml ethanol after accustomed for pH=8 using few drops of KOH solution was added to the metal solution. Finally, a solution of 3-amino phenol(HA) (0.03g,0.027mmole) in (10) ml ethanol was also added to the above metal solution. These results of the mixture were heated under reflux for (3) hrs. After that, the mixture was filtered. However, the precipitate was washed with an extra of ethanol and dried at room temperature for twenty-four hours. A bluish-green solid was acquired. Weight (0.13 g), yield (93.5%), m.p (>350 C°) dec. The synthesis route of the complex is shown in Figure 1. The microanalysis of results for the complex and some of its physical properties is given in Table 1.



[Co(H_2L)(HA)]

Figure 1. A proposed structure of cobalt (II) Complex

Empirical Formula	M.wt	Color	M.P (°C)	M Found, (Calc)%	Yield %	Λ_m S.cm^2 (molar^{-1})
[Co(H_2L)(HA)]	556.52	Bluish green	112	9.98 , (10.59)	93.5	17.02

M.P= melting point, Calc=calculated, M.wt = molecular weight,

2.2. Preparation of Clay Powder:

Bentonite clay sample having the (montmorillonite mineral). It was used as an adsorbent; it was obtained from (The General Company for Geological Survey and Mining, Baghdad, Iraq). Bentonite dried in an oven for 4 hours at 200ºC. The clay was ground and sieved by using (0.75 mesh). The results are listed in Table 2.

Table 2. the chemical analysis of bentonite

Constituent	SiO_2	Al_2O_3	CaO	Fe_2O_3	MgO	Na_2O	So_3	Losson ignition
Wt %	(54.66)	(14.65)	(4.77)	(4.88)	(6)	0.65	1.2	13.06

2.3. Preparation of Solutions:

2.3.1.Standard Stock Solution of cobalt (II) Complex solution (100 mg/L)

A standard stock solution of cobalt (II) Complex (100mg/L) was prepared by dissolving (0.01g) of [Co(H_2L)(HA)]in (3mL) of ethanol. The volumetric flask (100mL) was completed to the mark with an ethanol solvent.

2.3.2.Calibration Curve:

Cobalt (II) Complex solution of different concentration was prepared as mentioned in (3-4) by serial dilution absorbance values of these solutions were measured at the specified (λ_{max} = 477 nm) value for cobalt (II) Complex and plotted versus the concentration values as in Figure (2). These results were treated by (Least Square method). Concentration (2.5-100 mg / L) that obeys Beer- Lambert's law was then used in subsequent quantitative estimation of the concentration. Quantities of cobalt (II) Complex adsorbed were determined by Visb-spectrophotometric technique.

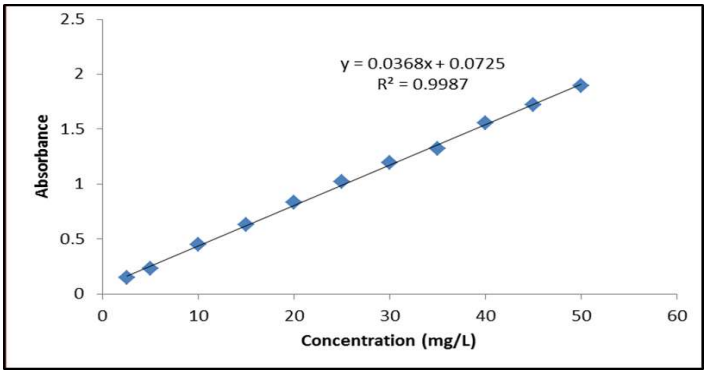

Figure 2, Calibration curve of cobalt (II) Complex solution

3. Results and Discussion

The synthesized cobalt (II) Complex [Co(H2L)(HA)] has been characterized by FT-IR, (C.H.N), UV-Vis spectroscopic methods[10-12]**.** [IR spectra of complex exhibited bands with convenient shifts due to complex figuration table (3) and (U.V-Vis) spectrum for the complex, Table 4 and Figure3.

3.1.Effect of shaking time on equilibrium adsorption system

The time that is sufficient for the adsorption operation to reach equilibrium at 25 C°, $C_\circ$ = 50 mg /L and Particle size = 75 µm has been studied. Table (5) shown the time intervals needed for each pair of adsorbent – adsorbant to attain equilibrium.

Table 5. Equilibrium time for each adsorbent –adsorbant pair

C_o (mg/L)	Time (minute)	C_e (mg/L)	Equilibrium Time (minute)

3.2.Adsorption of cobalt (II) Complex $[Co(H_2L)(HA)]$

The adsorption cobalt (II) Complex from ethanol solution on bentonite has been studied initially at room temperature (25)C° as well as at (10,37.5 and 50) C°**.** Table 6 shown the related results by the first concentration of cobalt (II) Complex, the equilibrium concentration (C_e), and the quantity adsorbed on clay (Q_e).The results shown an increase in adsorptive capacities of the clay as the concentration of cobalt(II) Complex Increased until reaching a limited value [13].

3.3.Adsorption Isotherm

In figure (4) the general shape of cobalt (II) Complex adsorption isotherms, when (Q_e) is a function to (C_e) among (10- 50 C^o)]**.** The isotherm of cobalt (II) Complex on bentonite consistent with shape (L_1- type) on (Giles classification). The isotherm of the mentioned system obeyed Langmuire equation leading to the assumption of high adsorption affinity between the cobalt (II) Complex and the clay surface in addition to the formation of one adsorption layer of cobalt (II) Complex on the clay surface[14]. The data of experimental adsorption were applied to both the empirical Freundlich equation and the theoretical Longmuir isotherm equation]. These results indicated the applicability of Longmuir isotherm as shown by the linear relationship of (C_e / Q_e) versus (C_e), Figure (5). The Langmuir constant empirical values (Qmax) (maximum adsorption capacity), (Ka) (energy of adsorption), and correlation coefficients of cobalt(II) Complex by bentonite surface was obtained from the linear equation at different temperatures. The values are summarized in Table 7. The results showed that the maximum adsorption capacity (Qmax) of cobalt(II) Complex by bentonite (increased when temperature increase), showing that (Qmax) enhanced at higher (T). The energy of adsorption (Ka) is enhanced (10 and 25 C^o) more than (37.5 and 50 C^o) by bentonite surface.[15-16].

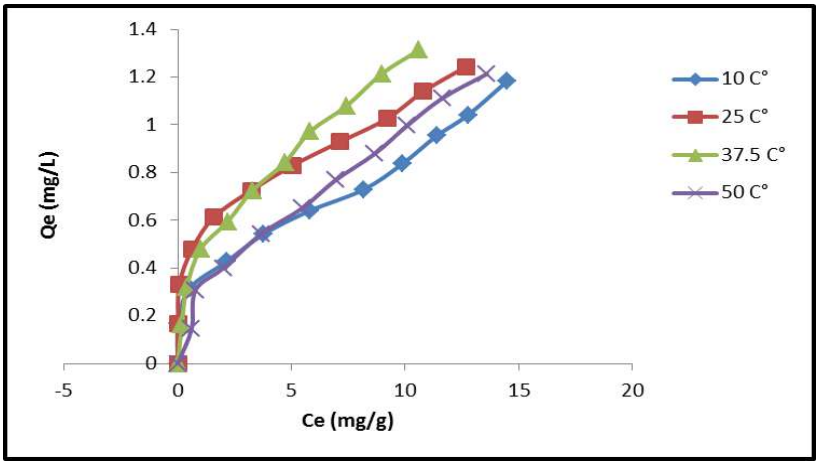

Figure 4. Adsorption isotherm of cobalt (II) Complex on bentonite surface at various T

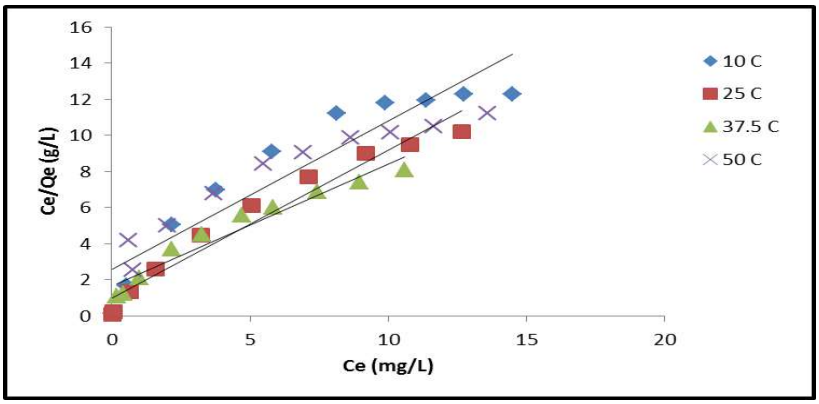

Figure 5. the linear form of Langmuir isotherm of cobalt (II) Complex on bentonite surface at different temperatures

Table 7. the Longmuir constant empirical values and the correlation coefficients for the adsorption of cobalt (II) Complex by bentonite surface at different temperature

Temperature (°C)	Q_{max} (mg/g)	Ka (L/g)	R^2

25.0	1.2235	0.8288	0.9586
37.5	1.4830	0.4087	0.9468
50.0	1.6246	0.1598	0.9034

3.4.Effect of temperature on adsorption

The effect of temperature on the adsorption extent of cobalt (II) Complex by bentonite has been studied. Table (6) and Figure (4) illustrate data and general shapes of cobalt (II) Complex adsorption at (10, 25, 37.5, and 50 C°). The results showed an increase in the amount of cobalt (II) Complex adsorbed by bentonite with increasing temperature.Hence the adsorption process appeared endothermic. This means the interaction between bentonite and the cobalt (II) Complex requires appreciable energy in order to take place [17].Endothermic cobalt (II) Complex uptake may also be explained as a result of probable (absorption process), in which the ions diffuse inside the crystal lattice of the clay and (the diffusing speed increase with increasing of temperature). (This behavior referred to the absorption process, which means that the absorption process may come accompanied by an adsorption process) [18]. It can also explain the increase in the amount of cobalt (II) Complex adsorbed by bentonite with increasing temperatures according to the effect of temperature on the weak bonds between the

clay platelets. Bentonite is consist of three platelets of aluminum –silicate connect to one another by weak bonds, so the increase in the temperature may be broken these weak bonds that lead to a change in the geometry of the pore of the clay, causing an increase in adsorption extent as a result of an increase in surface area of the clay [13].The study of the temperature effect on adsorption of cobalt (II) Complex by bentonite will help in evaluating the basic thermodynamic function Free energy (ΔG), Enthalpy (ΔH), and Entropy (ΔS) of the adsorption process.

The change in free energy (ΔG^o) could be determined from the equation [19].

$$\Delta G^o = -RT\ln K \quad (1)$$

Where

ΔG^o : the standard free energy of change ($K.J.mole^{-1}$).

R: the gas constant ($8.314\ J.mol^{-1}.deg^{-1}$).

K: the thermodynamic equilibrium constant [20].

$$K = \frac{Q_e(mg/g)}{C_e(mg/g)} \quad (2)$$

Xm: the maximum value of the equilibrium concentration (Ce) (mg of adsorbate per liter of solution).

Ce: the equilibrium concentration of the adsorbate expressed in (mg) per one liter of solution

Q_e : the quantities adsorbed on bentonite

The heat of adsorption (ΔH^o) may be obtained from the equation [20].

$$\ln k = \frac{-\Delta H}{RT} + \text{Constant} \quad (3)$$

The change in entropies (ΔS^o) was calculated from the Gibbs equation:

$$\Delta G^o = \Delta H^o - T\Delta S^o \quad (4)$$

Table (8) gives K values at different temperatures plotting (lnK) versus (1/T) should produce a straight line with a slop = (-ΔH/R) as shown in Figure (6).Table (9) shown the basic thermodynamic values of cobalt (II) Complex adsorption by bentonite surface at different temperatures.[The positive values of (ΔH^o) indicate the endothermic nature of the process while the positive (ΔS^o) corresponds to increase the disorder of the system increase, the negative values of (ΔG^o) confirm the feasibility of the process and the spontaneous nature of sorption][8].

Table 8. effect of temperature on the thermodynamic equilibrium constant for adsorption of cobalt (II) Complex by bentonite surface

-10.3335		+ 39.2860

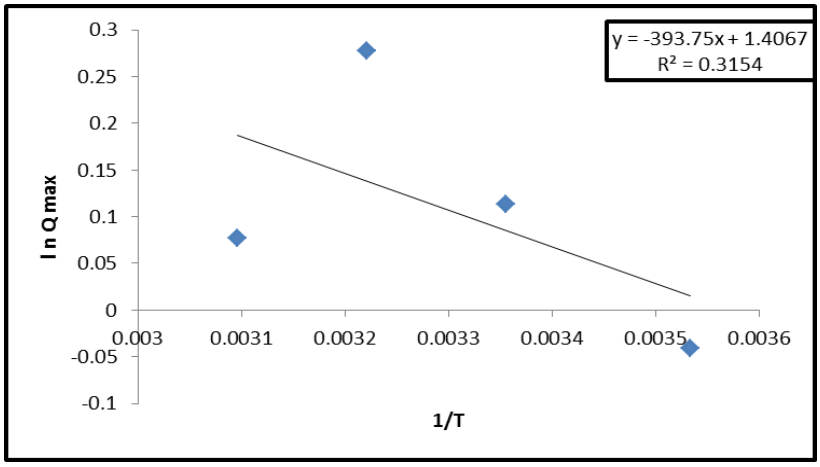

Figure 6 . plot of ln K against reciprocal absolute temperature for adsorption of cobalt (II) Complex by bentonite surface

3.5.Effect of pH on the adsorption

The effect of pH on the adsorption of cobalt (II) Complex with the clay (bentonite) in different media (pH =1.6-10) has been studied using a fixed concentration at 25 C^{o} . Figure (7) (demonstrate the influence of pH on the adsorption).

The results showed an (increase in adsorption quantities of cobalt (II) Complex on clay surface with increasing pH values of the solution).The amount of absorbent material is low in the acid medium and then increases in the base medium. This was due to the fact that the complex was unstable in the strong acid circles. The complex tends to decompose and thus reduces the amount of adsorption. In the base medium, the complex was stable, and thus the amount of adsorption increases (the surface becomes saturated) [13].

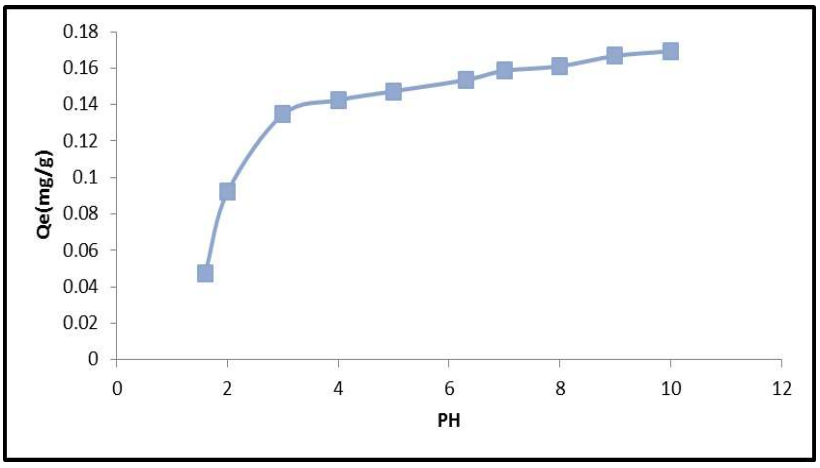

Figure 7 . Effect of pH on adsorption of cobalt (II) Complex by bentonite surface at 25 ^{o}C

Abstract. Heterocyclic azo compound 2-(8-quinolyl azo)-4,6-dimethyl phenol as a primary ligand and imidazole molecule as a secondary ligand in the basic medium were prepared with novel mixed ligand complexes of Hg(II), Mn(II), Ni(II), Co(II) and Cu(II) ions, these compounds were characterized by Mass, 1HNMR, IR, UV-Vis, Magnetic susbtibility and Molar Conductivity, which suggested octahedral conductivity. Free ligands and five mixed ligand complexes of Hg(II), Mn(II), Ni(II), Co(II) and Cu(II) metal ions with a general formula of [M(L1)(L2)2Cl] against eight pathogenic multidrug resistance bacteria, six G-ve bacteria (Pr. mirabilis, S. typhi, E. coli, P. aeroginosa, A. baumanii and K. pneumoniae) and two G+ve bacteria (E. faecalis and S. aureus) were capable of antimicrobial efficacy. The findings show that free ligands have had stronger antibacterial activity on S. Bacterial isolation of typhi and P. aeroginosa relative to other isolates. As for the effectiveness of metal complexes, compared to G+ve bacteria, they usually have a large antibacterial effect on G-ve bacteria, whereas the Hg(II) ion complex has a higher antibacterial effect on most bacterial isolates compared to other metal complexes. Compared with other metal complexes, Mn (II) ion complexes demonstrated poorer antibacterial activity..

Key words: Imidazole, azo, mixed ligand complexes, MDR bacteria, biological activity.

1.Introduction :

In recent years, researchers have seen an interesting increase in the preparation of mixed ligand complexes, especially in the biological fields**[1].** These complexes contained high bioavailability ligands that prove their value, such as the imidazole molecule, known to be included in the structure of several biological systems such as histidine, in addition to its anti-bacterial and antifungal activity, imidazole was considered a monodintate ligand that coordinated through nitrogen number with various metal ions (3) [**2-4] .**

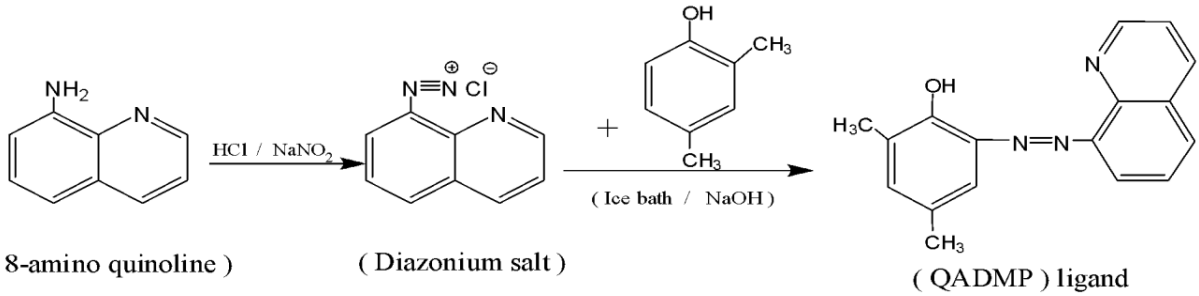
In several areas, such as quantitative, qualitative and biological research, Azo compounds have demonstrated their potential and significance**[5.6].** They were characterized by their stability and sensitivity, and also showed their skill in the field of coordination chemistry, especially heterocyclic azo ligands that are considered to be a remarkable form of quinoline compounds that act as di and tridentate ligands**[2,7.8].**

A global issue that threatens our ability to kill common infectious diseases is resistance to antimicrobial agents. It occurs naturally over time through genetic alterations or can occur in lower growth due to the

liveliness of unkilled bacteria [**9].** The guidelines recommended by the WHO are to prevent infections and prevent the prevalence of resistance, pathway resistant bacteria, to increase the use of current antibiotics and to promote the emergence of new antibiotics and to develop new diagnostic tests for resistant bacteria in order to avoid lethal diseases due to antibiotic-resistant bacteria. While several studies have been conducted in recent years to tackle multidrug-resistant microorganisms, further advances are still required to develop new and effective molecules in order to extend the antibiotic treatment options**[10].**
The goal of this study is to prepare new mixed ligand complexes by primarily using azo quinoline ligand and imidazole molecule as secondary ligand with five divalent ions Mn(II), Co(II), Ni(II), Cu(II) and Hg(II) than by testing their biological activity against eight pathogenic bacteria isolated from different clinical specimens that are multi-drug resistance.

2.Instruments and chemicals :
AB SCIEX 3200 QTRAP Mass Analyzer reported mass spectrum, while Shimadzu UV-1650 UV-Vis Spectrophotometer, Japan, and IR spectra performed electronic spectra on Shimadzu FTIR8400 by KBr disk in the region (400-4000) cm-1, Costech ECS Elemental 4010 measured element analysis, and 720(WTW) measured molar conductivity, 1HNMR spectra in the DMM spectra.

2.1. Main Ligand (QADMP) Preparation and Complexes:
The primary ligand (QADMP) was prepared by diazonation of 8-amino quinoline with 4,6-dimethyl phenol in the presence of (NaNO2) and hydrochloric acid at temperatures between (0-5)oC [11] as shown in scheme (1), while the complexes of metal ions were prepared by mixing (10) mmol of each metal ion chloride with (10) mmol of (QADMP) (L1) and (20) mmol of each metal ion chloride with (10) mmol of (M:L1:L2) (1:1:2) Table 1 describes the percentage of complexes and some of their physicochemical properties.



Scheme 1. Preparation reaction of primary ligand (QADMP)

2.2.Biological Activity
2.2.1.Collection and diagnosis of bacterial isolates:

The following multidrug resistance pathogenic bacterial isolates (MDR): six grams of bacteria (Proteus mirabilis, Salmonella typhi, Escherichia coli, Pseudomonas aeroginosa, Acinetobacter baumanii and Klebsiella pneumoniae) and two grams of bacteria (Staphyllococcus aureus and Enterococcus faecalis) were isolated from various clinical samples, such as burns, stools, synovial fluids, wounds, vomit, A variety of morphological as well as biochemical tests were used to diagnose isolates **[12],** which were later recently verified using the Vitek-2 compact system GP and GN card automatic bacterial recognition instrument. BHI broth supplemented with (15 percent) glycerol at (-20 °C) was stored on all bacterial isolates. On BHIA, the isolates were sub-cultivated and incubated for 24 hours at 37 ° C before use.

2.2.2.Preparation of ligands (L1) ,(L2), and the Complexes Concentrations:
The concentrations below were utilized in the biological activity test:
1- Free ligands concentrations: (0.02) gram of the powder of every ligands (L1) and (L2) has been dissolved in (1) ml of DMSO to yield (20) mg/ml concentration.
2- Mixed ligand complexes concentrations: (0.02) gram of powder of every mixed ligand complexes of the studied ions were dissolved in (1) ml of DMSO to yield concentration (20) mg/ml.

2.2.3.Antibacterial activity experimental

The preparation of bacterial suspensions was as Ramalivhana, *et al*. **[13]** explained. Agar well diffusion method was utilized to evaluate free ligand and mixed ligand ion complexes antibacterial activity versus bacterial isolates **[14] ..** MHA medium was utilized to evaluate the biological activity of free ligand and mixed ligand complexes of ions versus bacterial isolates.

2.2.4.Agar well diffusion assay

Bacterial isolate suspensions were prepared to match the normal 0.5 McFarland. Distribution of 100 µl of the BHIB bacterial suspension using the micropipette on the surfaces of the MHA layer. Wells were punctured using a sterile cork borer on all the culture plates. One of the wells was perforation in the center of the plate, adding 100 µl of Gentamicin as a positive control; adding 100µl of DMSO as a negative control in the other well; adding 100µl of free ligand and mixed ligand ion complexes alone, adding five wells to the [M(L1)(L2)2]Cl complexes in the residual wells. Then the cultivation plates were incubated at 37 ° C for 24 h. The clear inhibition zone around wells has been measured in mm. Testing was performed in triplicate **[15]** .

3.Results and Discussion

Mass spectra of the (QADMP) (L_1) show molecular peak at m/z= 277.26 which is agreed with the molecular weight of the free ligand , mass fragmentation take two paths the first one started by losing (N_2) molecule at (250.24) that represented the mother peak , while the second path started by cleavage (-N=N-) bond to give two peaks at (m/z = 144.19) and (m/z=137.17) that due to the fragments which have molecular formula ($C_9H_8N_2$) and ($C_8H_{11}NO$) respectively , molecular peak in mass spectrum of Ni(II) complex appeared at m/z = 508.46 which was concerted with molecular weight of this complex the initial fragmentation was started by berk Cl^- ion from it , as shown in Figures 1 , 2 and schemes 2 , 3 **:**

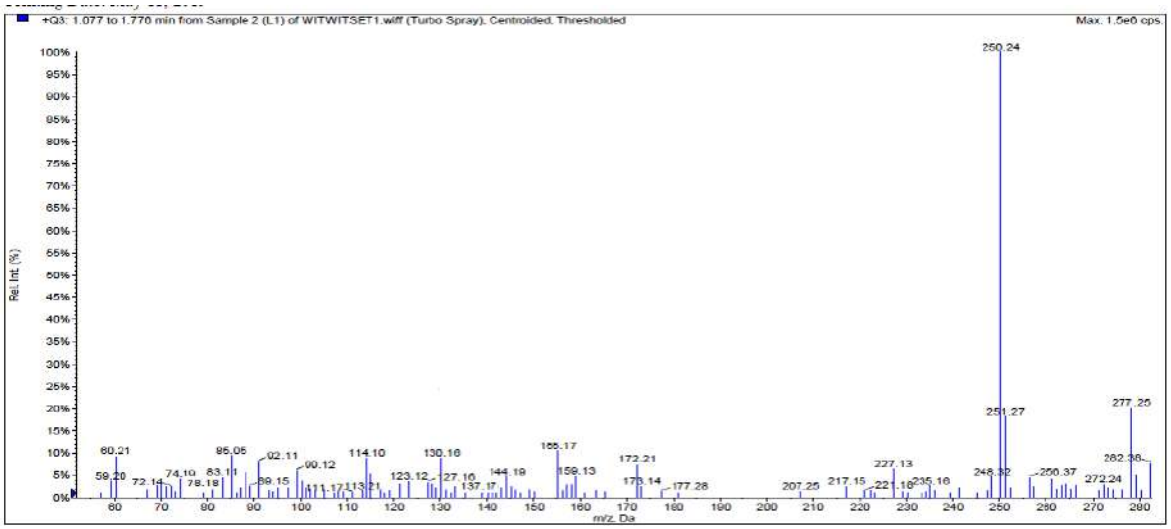

Figure 1. Mass spectrum of (QADMP) ligand

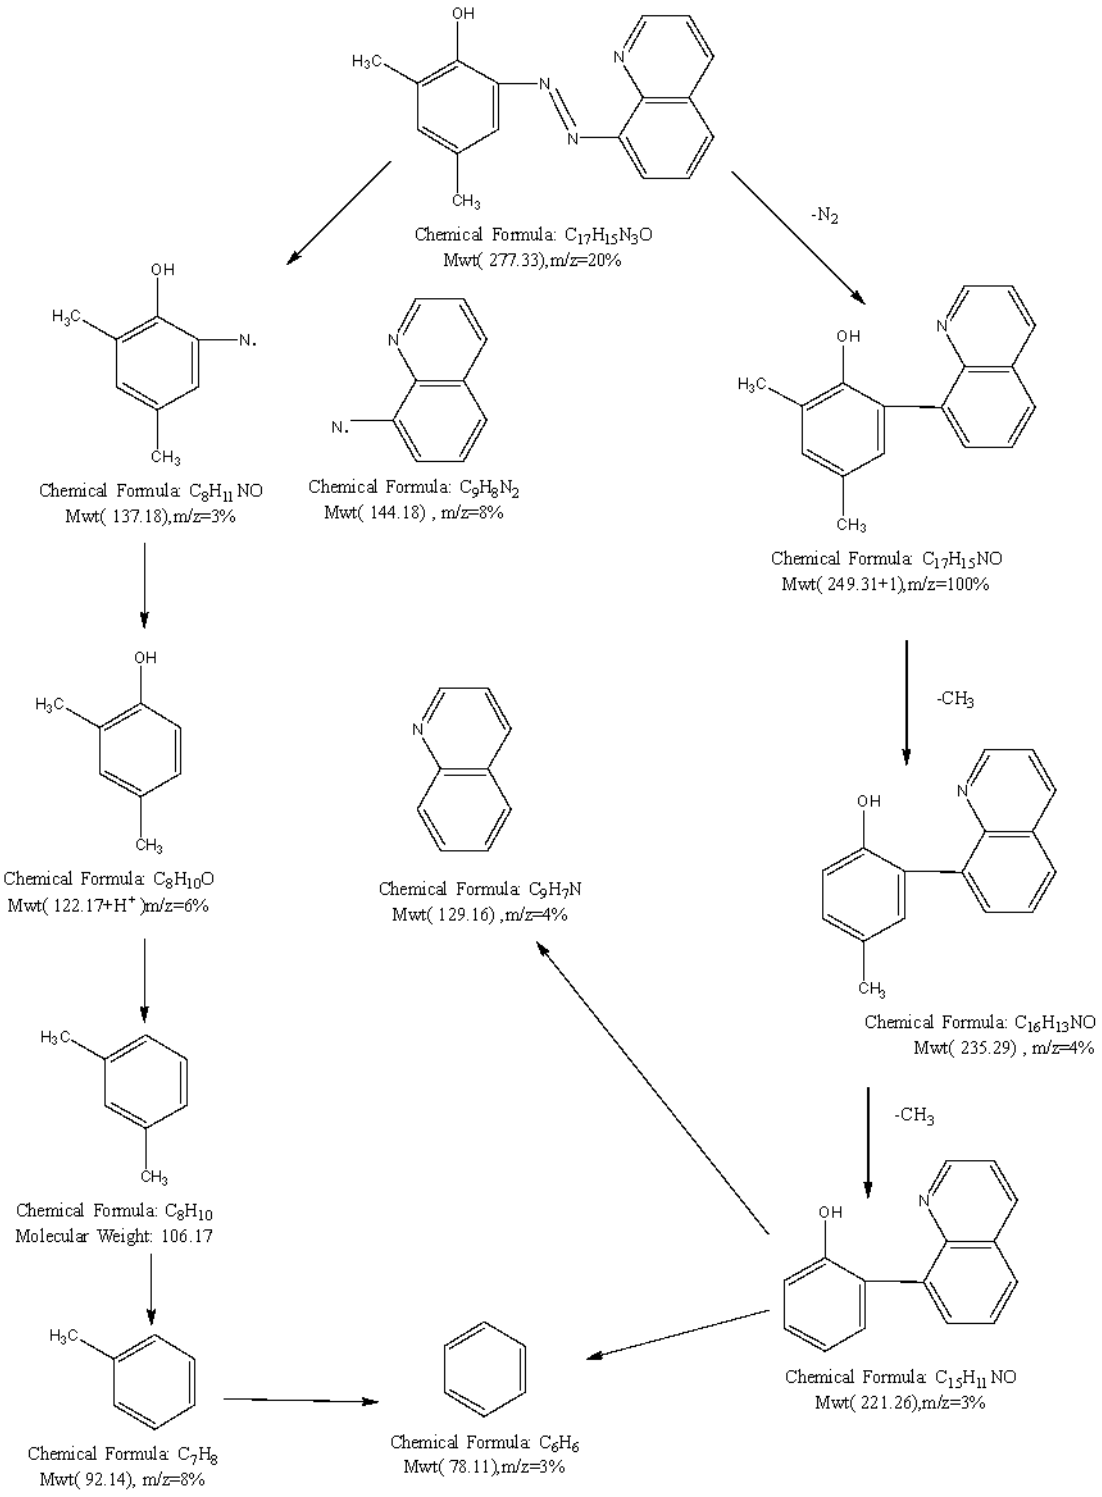

Scheme 2. Mass fragmentation of (QADMP) ligand

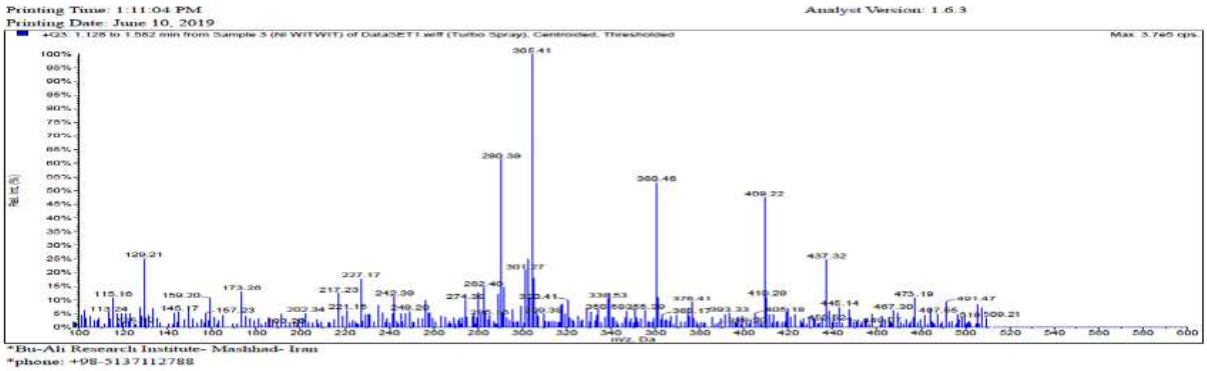

Figure 2. Mass Spectrum of Nickel (II) Complex

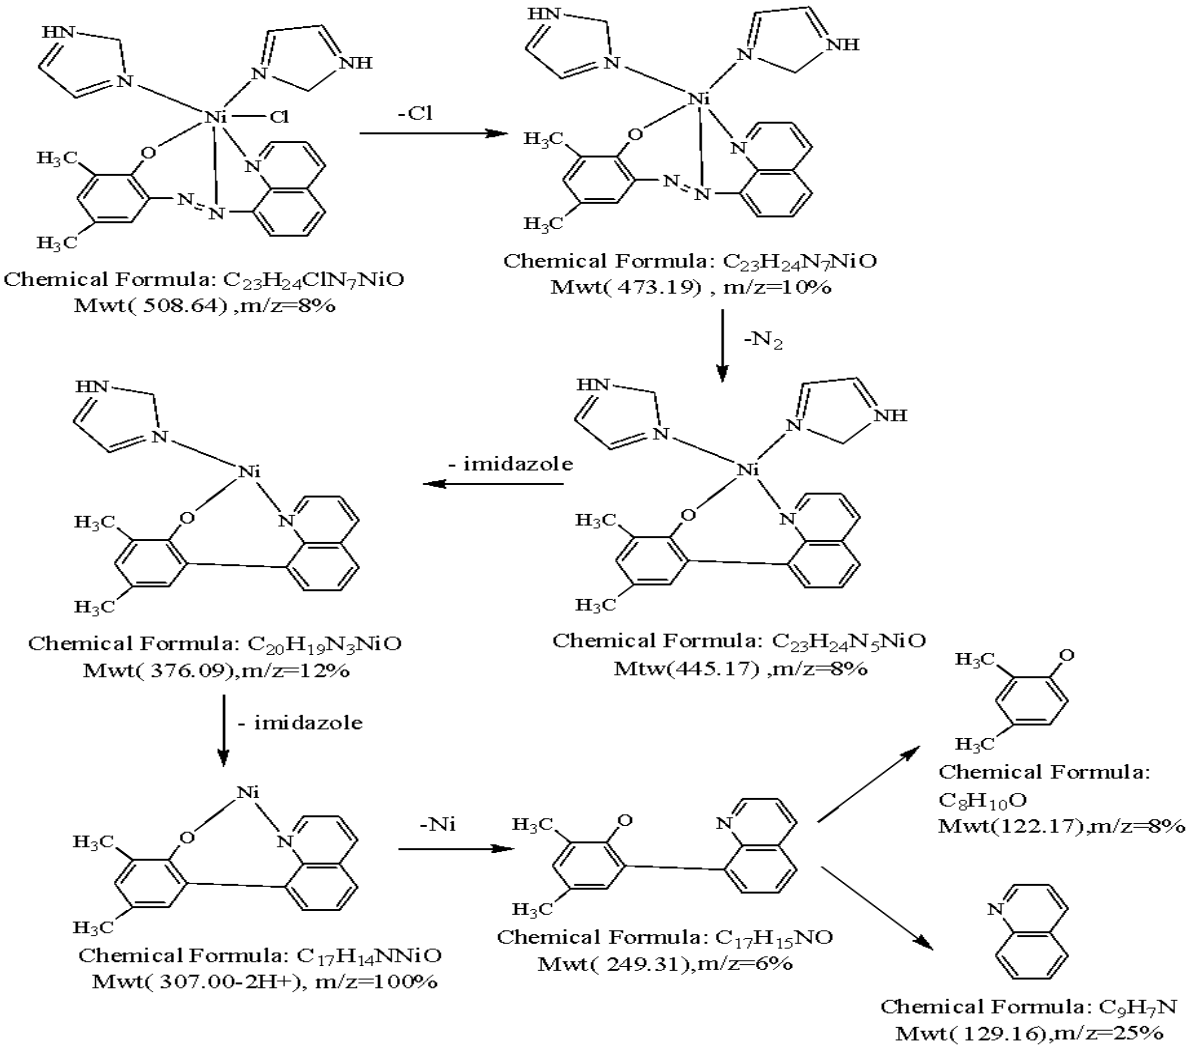

Scheme 3. Mass fragmentation of Ni(II) Complex

1HNMR spectra of primary ligand (QADMP) in DMSO solvent showed two singlet peaks at (2.46) ppm , and (2.62) ppm due to the protons of methyl groups (-CH3) , singlet peak at (5.58) ppm of (-OH) [11], while the peaks of aromatic protons appeared between (6.87-7.64) ppm **[16]** , Some changes found in 1HNMR spectra of Hg(II) complex a singlet peaks at (1.36) and (12.36) ppm for (H2) , and (H1) protons of imidazole ring appeared and absence of (-OH) peak as a result of it's coordination with metal ion after deprotonation , as shown in Figures (3 , 4 ') .

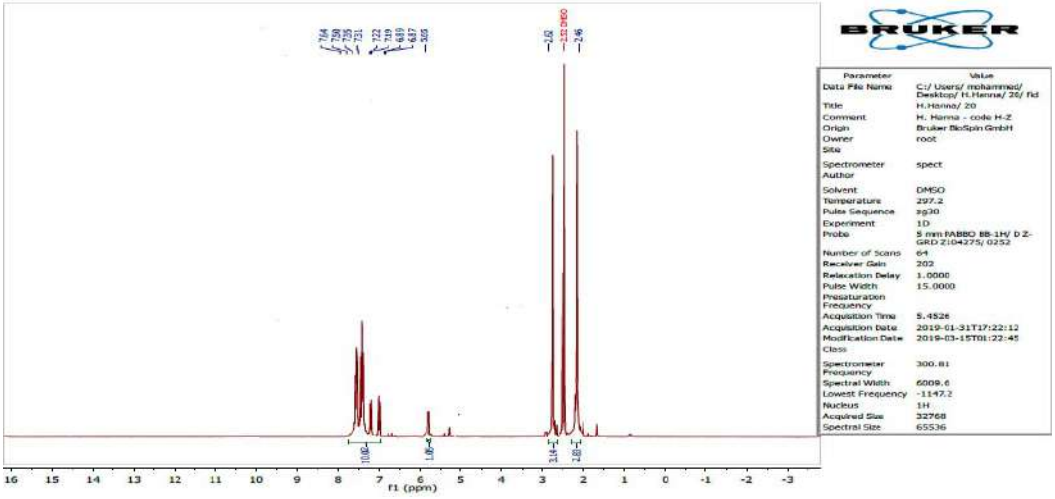

Figure 3 . [1]HNMR Spectra of primary ligand (QAMPD) in DMSO

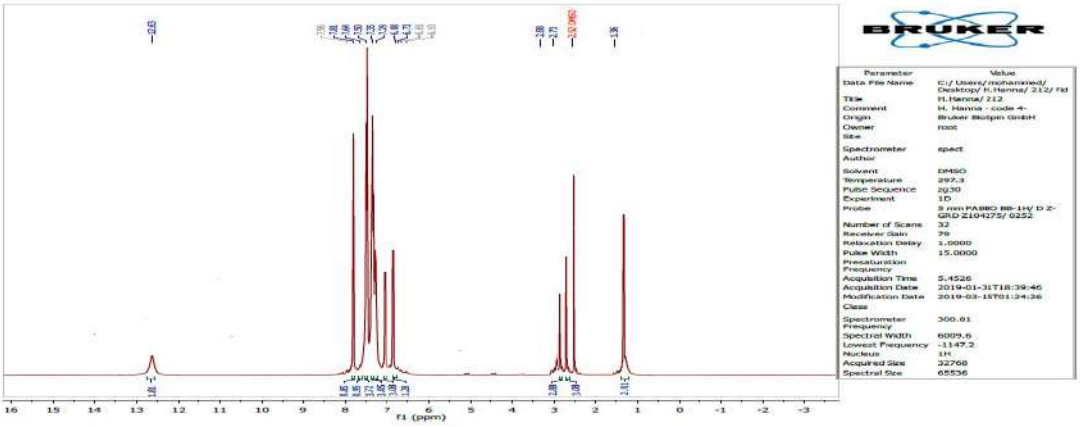

Figure 4. [1]HNMR Spectra of Hg (II) complex in DMSO

IR spectrum of free ligand (QADMP) (L_1) showed the v(C-O) [17] of phenolic group at (1265) cm^- which was shifted to lower wave numbers in the complexes , also the change in position and intensity of this bond in plane and out of plane was appeared in the complexes , these changes give an indicating of participation of (-OH) group after deprotonation in coordination process . The wave number in (1498)cm^- in (L_1) spectra due to *ν*(C-N=N-C) group [18] also shifted to lower wave numbers in the complexes which was indicted the coordination of this ligand through one of nitrogen atoms of azo group with each of metal ions , also the *ν* (C=N) of imidazole (L_2) [19] at (1541) cm^- showed red shift in the complexes that considered as an evidence for coordination of this ligand by (N3) atom , New peaks were appeared in the complexes refers to *ν*(M-O) and *ν*(M-N) considered as additional proof of the coordination of the two ligands , as shown in Table 2 .

Table 2. IR wavenumber (cm^{-}) values of free ligands and their complexes

Compound	*v*(C=N) imidazole	*v*(C=N) Quinoline	*v*(C-N=N-C)	*v*(C-O) Phenolic	*v* (C-O) phenolic In plane	*v*(C-O) phenolic Out of plane	v(M-O)	v(M-N)

UV-Vis. Spectra of (QADMP) (L1) in ethanol shows three bands at (219,226,266) nm due to (π –π*) transitions of the aromatic rings , Intra charge transfer , and one band in (375) nm for (n-π*) transitions all of these bands appears red shift in the complexes spectra as a result of coordination , the values are explained in the 'Figures 5-7 ' and Table 3.

Conductivity measurements of the complexes in (DMSO) solvent showed the non-ionic character [20] , also it was observed that the silver chloride salt was not deposited when added when adding drops of silver nitrate solution to solution of soluble complexes in ethanol and (DMSO) solvents confirming the absence of chloride ion outside the coordination sphere . Magnetic susbtibility showed that the complexes of Mn(II) , Co(II) , Ni(II) , and Cu(II) have octahedral geometry with high spin values while the complex of Hg(II) is diamagnetic due to absence of single electrons in the electronic configuration as shown in Table 3.

From the results presented suggested that the complexes have octahedral geometry where the primary ligand (QADMP) coordinated with each metal ion as a tridentate from oxygen atom of hydroxyl group after deprotonation, one nitrogen atom of azo group , and nitrogen atom of quinoline ring while the secondary ligand (imidazole) coordinated through nitrogen atom number (3) of heterocyclic ring., as shown in **'**Figure 8 '**.**

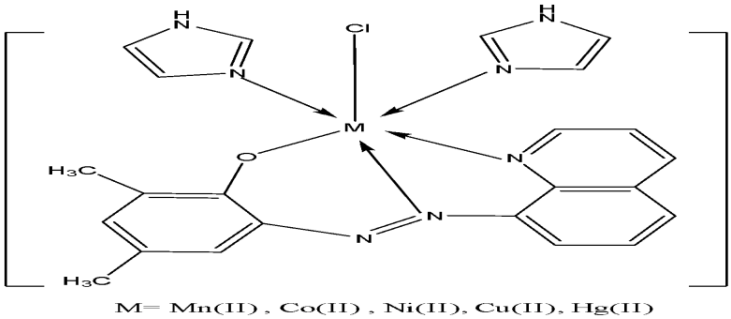

Figure 8. Suggested general formula of the mix ligand complexes

3.1.Antibacterial efficiency of free ligand and ligand complexes:

The ability of antibacterial efficiency of free ligand (QADMP) (L1) and five mixed ligand complexes of studied ions which have a general structure [M(L1)(L2)2Cl] to each ion toward eight MDR bacteria, two G +ve bacteria (E. faecalis and S. aureus) and six G –ve bacteria (Pr. mirabilis, S. typhi, E. coli, P. aeroginosa, A. baumanii and K. pneumoniae) were evaluated by the present or absence of inhibition zone around the holes. The results of the antibacterial effectiveness of various ingredients in solutions are listed in Table, and Figure. The study proves that free ligand is best at killing the bacteria Staphylococcus. typhi and P. aeroginosa isolates were better than the other isolates.

As for the efficacy of the metal complexes, they typically have a strong antibacterial efficacy on G-ve bacteria comparison to G +ve bacteria, whereas Hg (II) ion complexes had greater biological efficacy on most bacterial isolates than other metal complexes while Mn (II) ion complex had weaker antibacterial efficacy comparing to other metal complexes Table (5). The results in this paper conflict with the result of [2] that found the complexes to have strong antibacterial activity against gram-negative bacteria.The free ligand (L_1) showed high antibacterial efficiency on *S. typhi* and *P. aeroginosa* than other mixed ligand complexes of ions. Hg (II) ion complexes had higher biological efficacy on *E. faecalis*, *S. aureus* , *Pr. mirabilis, E. coli, A. baumanii* and *K. pneumonia*.

Preliminary studies of antimicrobial activity showed which the azo dye containing 1,3,4- benzothiozole moiety had a possible antibacterial efficacy [21].

The improvement of antimicrobial efficacy of the free ligand might be related to transient metal chelation along with it. Complicated reduction of metal ion polarity by ligand coordination and increased lipophilicity of the metals [22] . This makes it easy for the novel prepared complex to penetrate the bacterial lipoid cell membrane and inhibit its growing.

Some studies showed the potential of methyl nitro imidazole to reduce the growth of G-ve bacteria including *K. pneumoniae, Proteus merablis*, *E. coli and P. auroginosa* in addition to reducing effects on G+ve bacteria. This ligand could release free radicals which destroy and kill bacteria [23] .

In addition, the azo compounds are reported to have a variety of biological functions, including nucleic acid inhibition, protein synthesis, nitrogen fixation and carcinogenesis [24]. Azo derivatives and their metal combinations are too extremely essential pigments for artificial leather and vinyl polymers [25]. They are the strong pharmaceutical agents with adaptable therapeutic efficiency such as antimicrobial [26-29] efficiency, DNA, RNA, and protein synthesis, nitrogen fixation, and cancer [30].

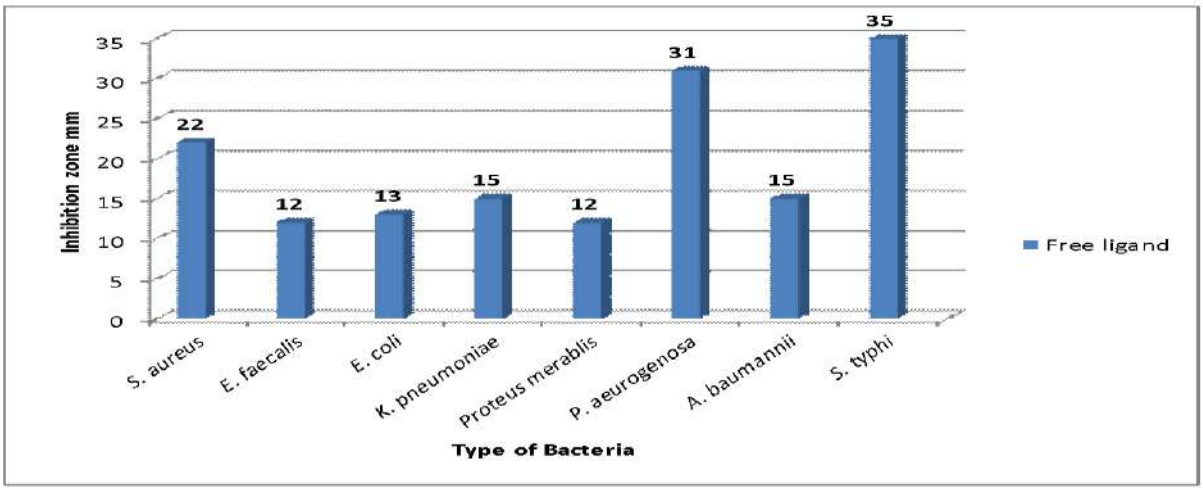

Figure 9 : Comparison of inhibition zone measurement (mm) of free ligand (QADMP) (L_1) against multidrug resistance bacteria**.**

Table 4 Inhibition zone measurements (antibacterial activity) of free ligand against multidrug resistance bacteria

Type of bacteria	Inhibition zone(mm) [Free ligand (L_1)]

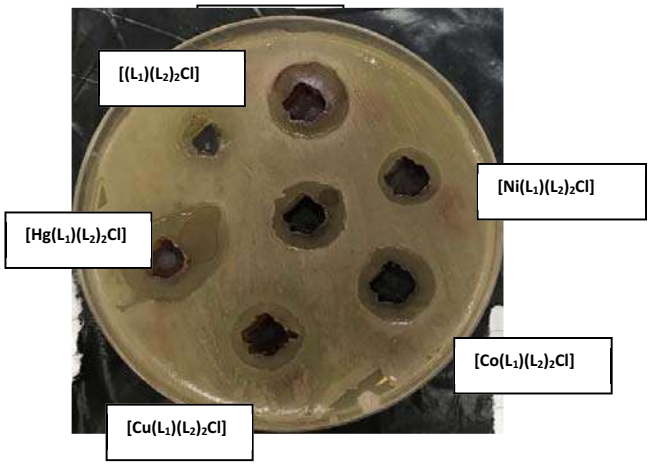

Figure 10. Antibiogram pattern of free ligand and five mixed ligand complexes of Hg(II), Mn(II), Ni(II), Co(II) and Cu(II) ions against *Acinetobacter baumannii*.

4.Conclusions :

For primary azo ligand (QADMP) (L1) and imidazole molecule (L2) as a secondary molecule with a general formula [M(L1) (L2)2Cl] and octahedral geometry, new mixed ligand complexes of Mn(II), Co(II), Ni(II), Cu(II) and Hg(II) have been prepared. Biologically active molecules possessing antimicrobial properties are proposed in this study. These new complexes of free and mixed ligands show essential antimicrobial activities. A strong antimicrobial efficacy of azo dye with 1,3,4-thiadiazole moiety was shown in preparatory antimicrobial activity studies. Therefore, it can be concluded that this new class of compounds certainly provides a greater promise to discover a potent antimicrobial agent.

Abstract: New blend material membranes as fibers produced by electrospinning technology and these membranes were characterized and evaluated their properties in this research. Polyacrynitrile polymer mixed physically with polystyrene to produce the blend membranes. FTIR confirm the occurrence of polymeric blends by establishing the absence of new chemical reactions occurs. The hydrophobicity of the membrane was reduced by increase the PAN percent in the blend. Field emission scanning electron microscopy used to study the morphologies of the membranes and illustrated the average diameters of produced fibers which found about 1.68-0.73 µm. The average pore size found about 1.28 – 0.31 µm for blend membranes. The result showed an increasing in fibers diameter and pore size with increasing of the PAN percent while the membranes porosity still high percentage about 98%.

KeyWords: Blend materials, Electrospinning technique, FE-SEM, Polyacrnitrile.

1. Introduction:

Polymeric blends are a member of a class of materials similar to alloys in metals; where at least two polymers were mixed together in order to produce a new material that has various properties [1]. Reason of blending include the formation of new with low cost materials, development materials with wide range properties, increasing their performance, Adjusting the composition of materials, and conceder as recyclable method for polymeric scrap [2, 3].

Polyacrylonitrile is a thermoplastic polymer with useful properties such as good strength and modulus of elasticity with thermal stability [4]. Polyacrylonitrile prepared as films, fibers, foams, and other forms and the polyacrylonitrile have a significant property that related to absorb of toxic metal ions [5]. Polystyrene is also a human synthesis polymeric material, with properties such as transparent to light, stiff and have high modulus. It has wide range applications and considered an economic polymer with high volume production. Blend formation from polystyrene and polyacrylonitrile have present good dispersion with thermal stability, and superior physical properties [6].Electrospinning technology consider adaptable and effectively method for producing polymeric fibers with wide range of diameters from nano to micro scale [7]. Electrospinning had been used to produce fibers since 1934 and applied for various polymeric materials and composites [8]. Electrospun fibers membrane have

3D structure with high specific surface and surface roughness, produced membranes have special fields application such as sensors [9], filters [10], solar cells [11], catalysts [12], tissues [13], hydrophobicity surfaces [14],etc. Also the electrospinning had special features like low cost, high production rate, high degree of flexibility that provide a good control on the membranes, so controlling on formed fibers properties like membrane morphology, degree of homogeneity, porosity percent, structure type (hollow, parallel, network fibers) by changing the process parameters [15].The present work for produce new blend materials from polystyrene and polyacrynitrile in different ratios using electrospinning technique and produced the blend in the form of nano, submicron fibers diameter from polystyrene/polyacrynitrile. This approach will provide to prepare the samples with relatively high surface area and low cost.

2. Experimental Part:

2.1. Materials that used in this study were:

2.1.1. Polystyrene with molecular weight of Mw = 250,000 gm/mol purchased from (Sigma Aldrich, USA). N,N-dimethylformamide purchased from (Central Drug House (P) Ltd, India). Polyacrylonitrile with molecular weight of Mw = 150,000 gm/mol purchased from (MACKLIN, Chine).

2.1.2. Polystyrene Solution preparation was done by solving polystyrene (Mw=250000, USA) in dimethylformamide by stirring for 2 hours at ambient temperature to form 20 wt. % PS solution. Polyacrylonitrile Solution preparation was done by solving polyacrylonitrile (Mw=1500000, China) in dimethylformamide by stirring for 1 hour at ambient temperature to form 10 wt. % PAN solution.

2.1.3. Polystyrene solution at a concentration of (20 %) and polyacrylonitrile solution at a concentration of (10 %) were mixed to produce blends as follows: The PAN solution was added to PS solution in ratio (1:9, 2:8, 3:7 and 4:6), then mixed together by using magnetic stir the both solutions under laboratory temperature for 30 minutes to form a good dispersion solution.

2.1.4. Electrospinning process was done by (Bio-electrospinning/ Electrospray system ESB-200, South Korea) [16]. The prepared blend solutions were feeding over a needle (diameter = 0.7mm) using a syringe (10 ml). The power supply was fixed to a syringe needle tip and the collector. Where the operating parameters of electrospinning device were: 20 KV voltage, 1 ml/hour flow rate, 15 cm distance between electrodes and 2 hour operating time at ambient temperature with (25-30%) humidity, these parameters will be fixed for all following solutions.

2.2. Characterization

2.2.1. FE-SEM (Model: MIRA 3-XMU) was used to obtain the morphology of electrospinning membranes. The fibrous membranes were cutting into small piece then coating with a thin layer of gold by sputtering. The fibers diameter and distribution of the electrospinning membranes were carried by the FE-SEM images using the Auto CAD 2010 software.

2.2.2. EDX spectroscopy analysis was done using FE-SEM device, used X-rays to emit from electrospinning membranes surface during bombing by electrons to investigate the basic constitution of membranes.

2.2.3. FT-IR Spectroscopy device (Model: BRUKER, TENSOR-27) for elecrospinning membranes were done using wavenumber ranging from 4000 cm^{-1} to 400 cm^{-1} in order to sure of the blending concept happened.

2.2.4. Wettability of the electrospinning membranes surface was measured in the term of contact angle (type: CAM 110, Germany) at ambient conditions. Contact angle was measuring by drop method. A liquid droplet (5 µL volume) was dropping on the membranes and measured in all sides then takes the average value, contact angle take the average of five values at different positions on the surface.

3. Results and Discussion:

3.1. Field Emission Scanning electron microscopy:

'Figure 1'. Presented the morphology of the 20wt.% polystyrene electrospinning film and showed a bead structure because of an uncompleted stretching in polymer chains that result broken of polymeric solutions as droplets in elecrospinning process [17].

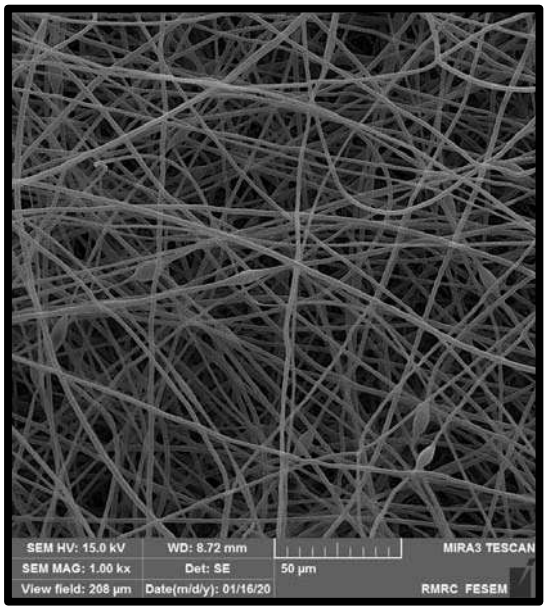

Figure 1. FE-SEM images for 20% polystyrene membrane

'Figure 2'. Illustrated the analysis of FE-SEM image, and showed the average fibers diameter, pores size and their distributions, also some fibers diameter might appear in micron scale due to fast solution feeding that occur in the beginning of the electrospinning. 20% wt. polystyrene has chosen to produce the electrospun composite membranes because it's easy to spin in electrospinning and present thin and smooth fibers, high porosity and surface area.

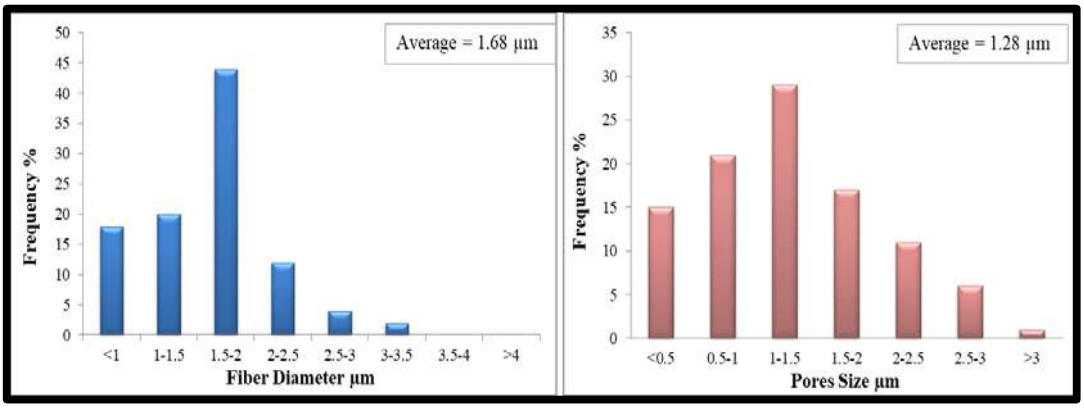

Figure 2. Illustrated (A) fiber diameter distributions (B) pores size distributions for 20% polystyrene

'Figure 3'. Showed the morphology of the electrospun PS/PAN membranes and presents a significant reducing in beads formation with increasing the incorporation of polyacrylonitrile in the polystyrene polymers, predominantly due to that the expansion of polyacrylonitrile results in a higher electric charge density on the surface of ejected jet conveyed by electrospinning [18].

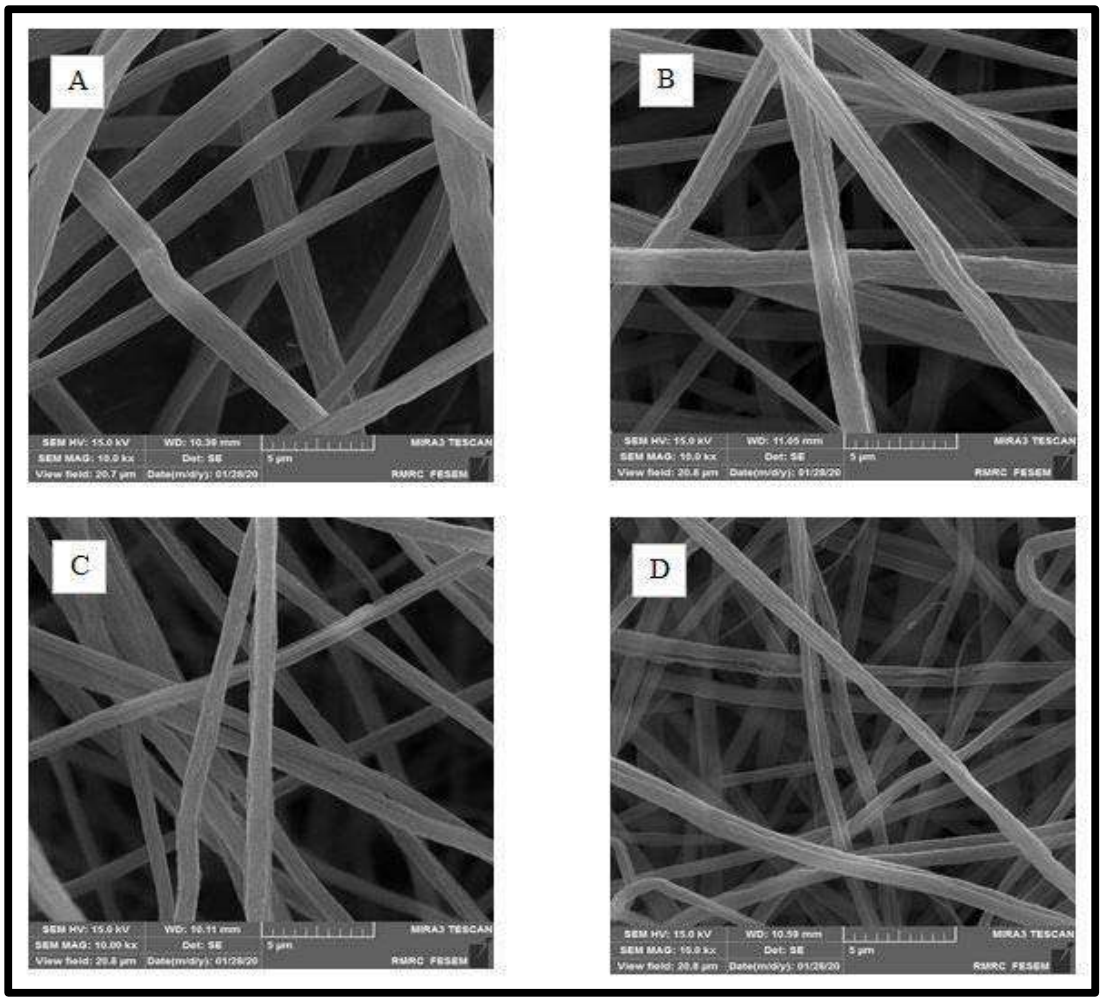

Figure 3. FE-SEM images for polystyrene membranes with different PAN concentration (10, 20, 30 and 40%) respectively

High solution surface tension and viscosity are not encouraging to ejected, while the repulsive force encouraging the droplets to eject. When used a small force the feeding of the jet decrease, while the jet split increased [19]. PAN solution works to obstruct droplets splitting, so resulting to produce in thinner fibers with small pore size as shown in 'figure 4'.

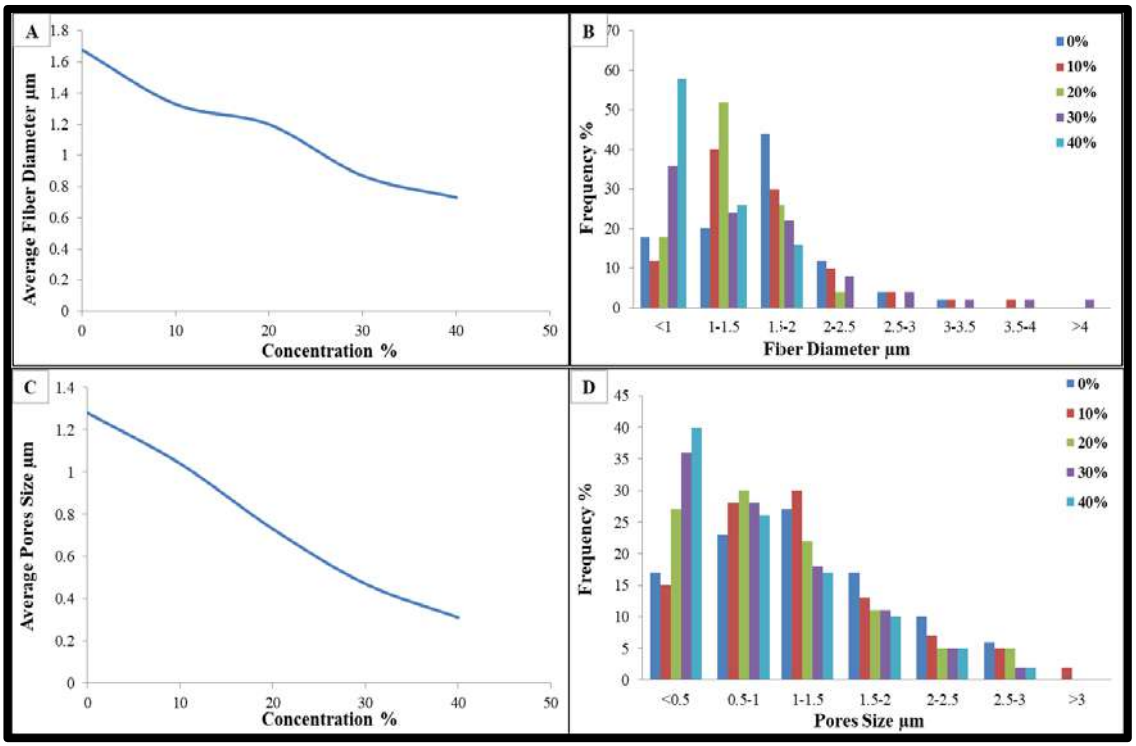

Figure 4. Illustrated the effect PAN concentration on fiber diameter, fiber diameter distribution, pores size and pores size Distribution

This result concurs with Li Peng [20], who illustrated that when increase the PAN concentration in other polymeric material will lead to raise viscosity and conductivity of solutions. And explain the effect of repulsive forces when its consider main factor, cause reducing in fiber diameters with increased the PAN concentrations.

3.2 Energy Dispersive X-ray spectroscopy

Figure 5. Showed the EDX chart for 20% wt. polystyrene electrospinning membrane and present the composition of the membrane that formed basically from carbon and oxygen, confirming founds of carbon in fiber structure besides to find gold due to coat process .

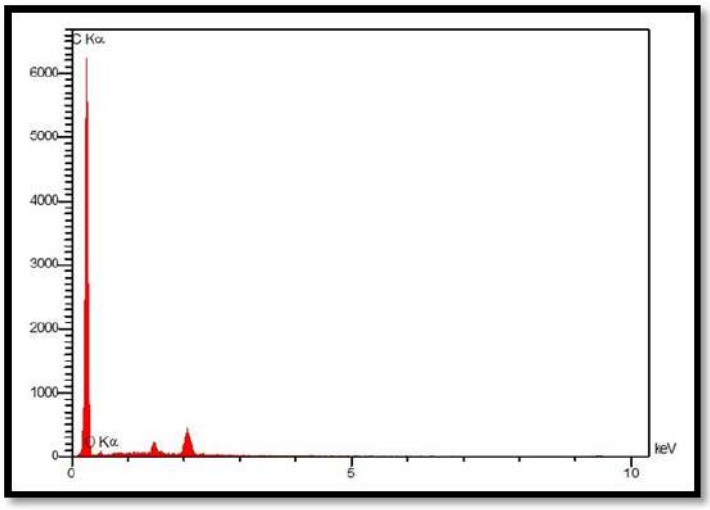

Figure 5. EDX for 20% polystyrene electrospun membrane

'Figure 6'. Illustrated the EDX spectrum for polystyrene with (10, 20, 30 and 40%) PAN membranes which suggest that the chemical composition consists mainly from mainly carbon and oxygen, confirming founds of carbon in fiber structure due to chemical composition of polyacrynitrile besides to gold due to coat process.

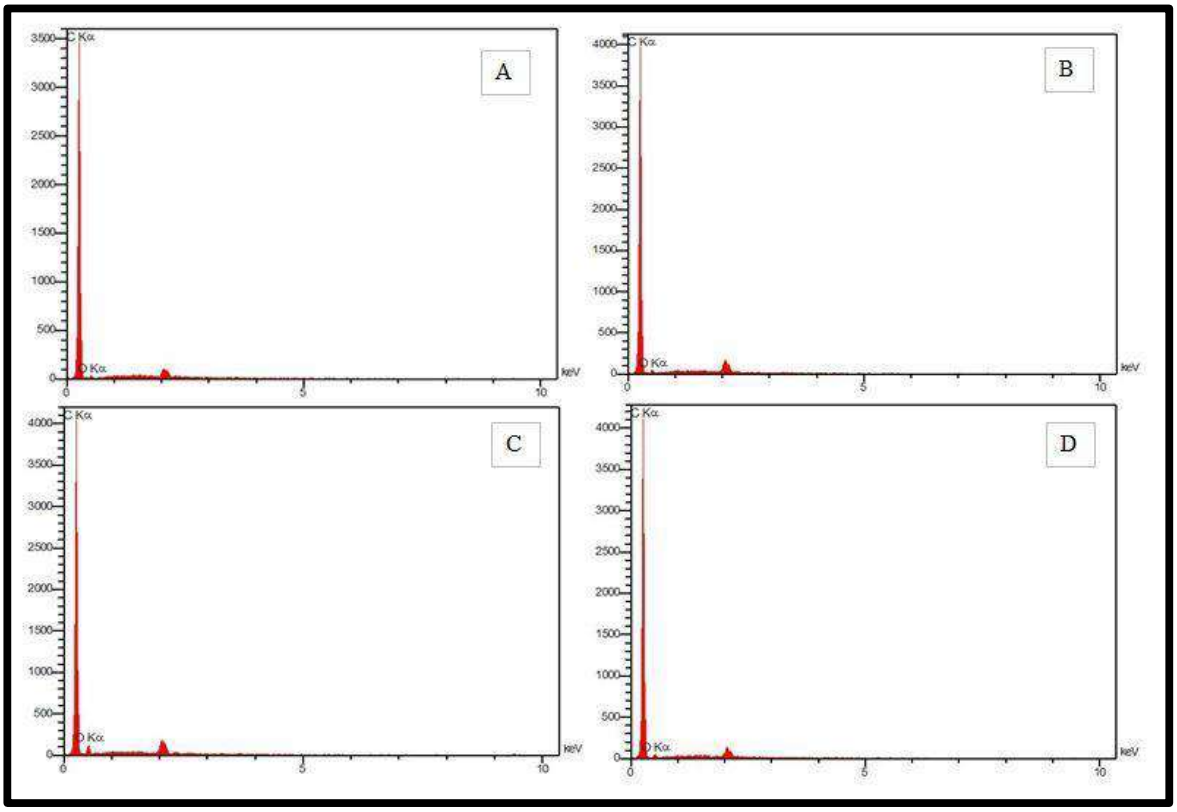

Figure 6. EDX for polystyrene membranes with different PAN concentration (10, 20, 30 and 40%) respectively

3.3 Fourier Transform Infrared Spectroscopy

'Figure 7'. showed FTIR spectra for polystyrene 20% concentration electrospinning films with the principle peaks. The peaks at the wavenumbers of 3082.44 and 3025.74 related to aromatic C-H bond, while the peaks at the wavenumbers of 1601.23, 1492.73, and 1451.83 related to aromatic C=C bond, these peaks represent the benzene ring. The peaks at the wavenumbers of 753.69 and 696.43 related to C-H bond out-of-plane and indicate that benzene ring has only one substituent side, also there are peaks at the wavenumbers of 2921.77 and 2850.39 caused by existing of methylene group. All the peaks agreed with Noor M. Jalal [21].

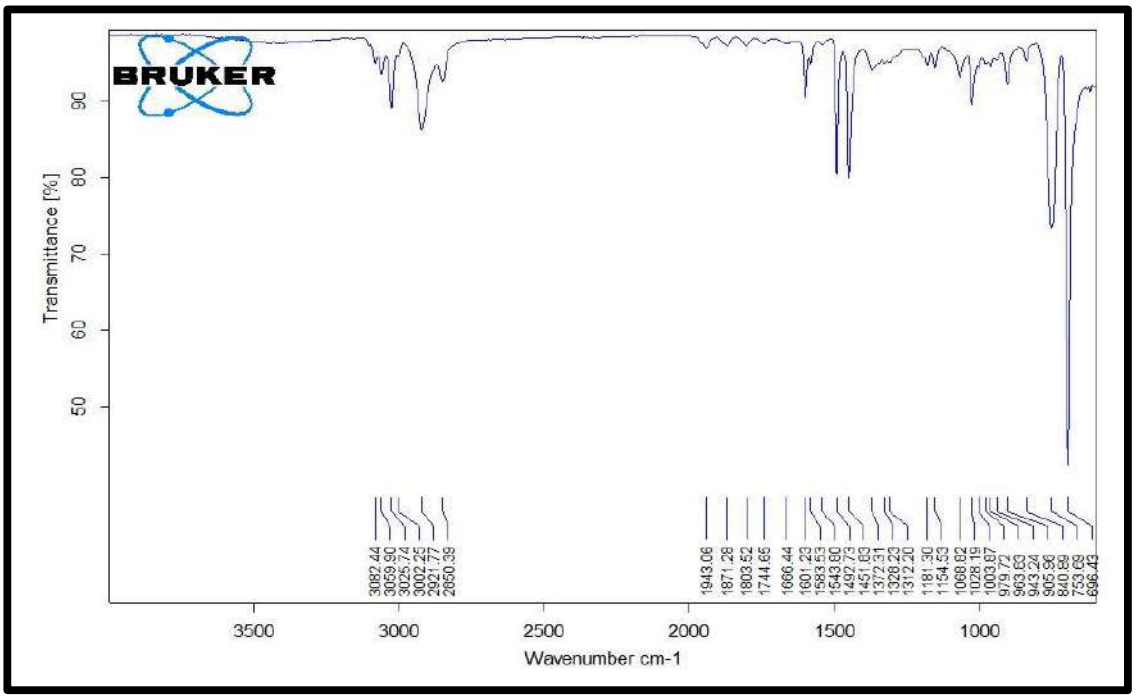

Figure 7. FTIR for 20 % polystyrene membranes

'Figure 8'. presents the (FTIR) spectrum of polystyrene and polystyrene with (10, 20, 30 and 40%) PAN. The presence of generally small decease in intensity in C-H Aromatic ring and CH_2 of methylene bonds peaks followed by increasing the intensity until reach high intensity in C-H out-of-plane bonds peaks as compare to the FTIR spectrum polystyrene electrospinning membrane when decrease in the infrared wavelength. While, there is a new (C≡N stretching of nitrile) bonds was formed in (2243.5 cm^{-1}) where in 20% polystyrene membrane not formed that represent the side group of polyacrynitrile. This result agreed with Pan Wi [22], who present the peaks of polystyrene and polyacrynitrile and notice the absence in effect of the two polymers that caused to lack in intermolecular interaction.

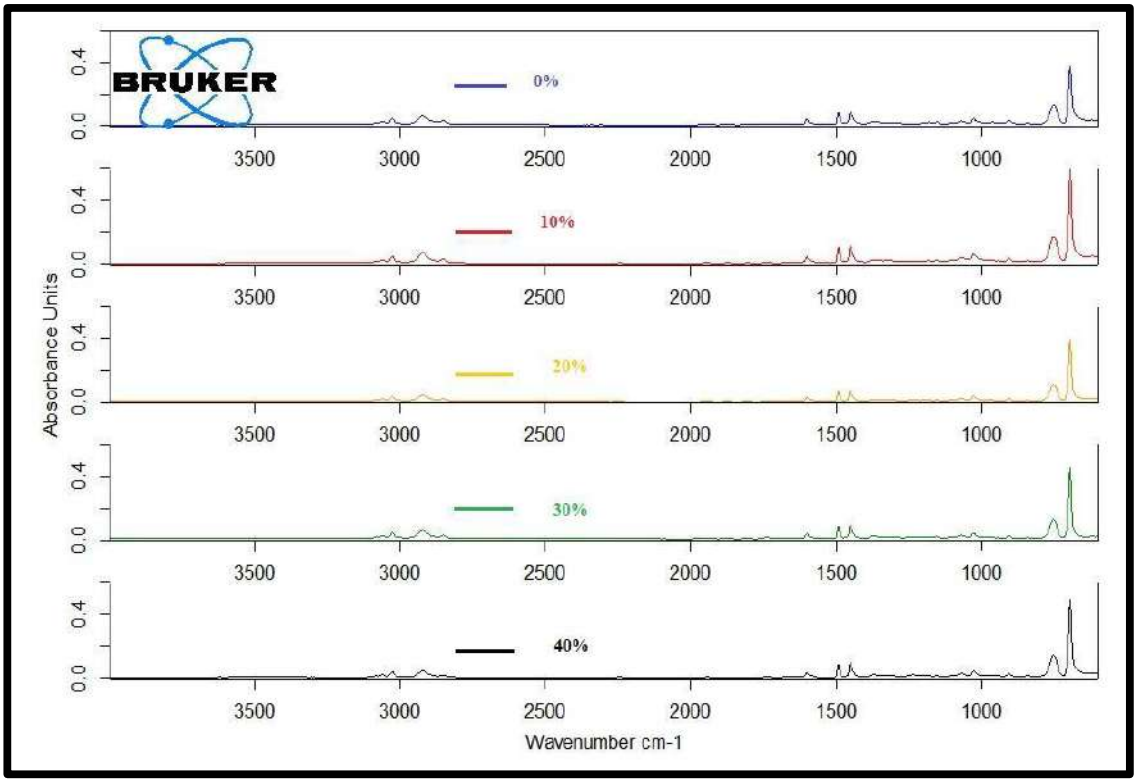

Figure 8. FTIR for polystyrene membranes with different PAN concentration (10, 20, 30 and 40%) respectively

3.4 Contact Angle Measurement

'Figure 9'. showed the effect of increase PAN concentration in 20 % polystyrene on water contact angle which observed the increased from 128° to 106° as the PAN concentration increased due to the polyacrylnitrile hydrophobic nature with contact angle about 80 to 90 for pure membranes, that cause to reduce the hydrophobicity for polystyrene [23].

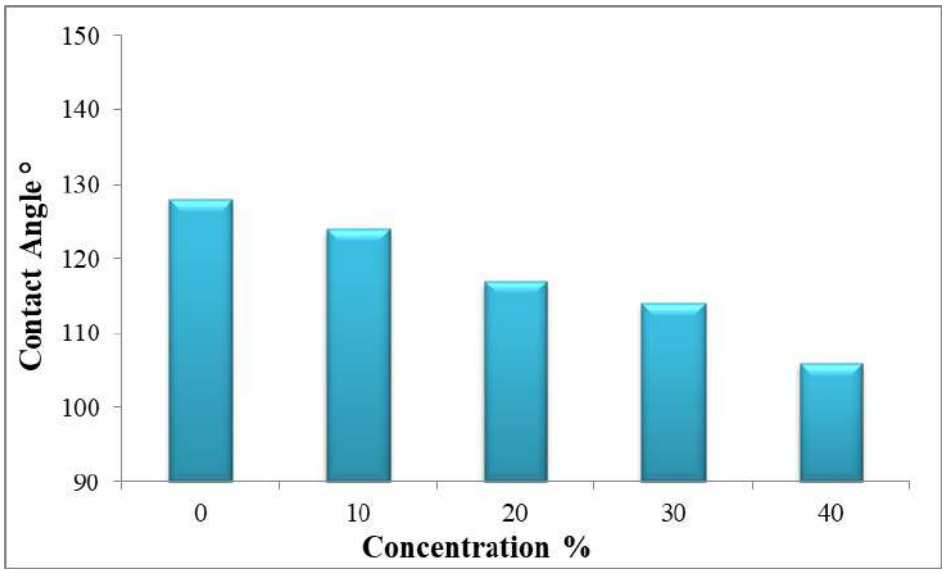

Figure 9. Illustrated the effect of PAN concentrations on the contact angle

4 Conclusions

electrospinning method used for preparing polymeric blends from polystyrene with polyacrylonitrile in form of micro/nano-fibers. FE-SEM used to characterize the morphological changes and the reducing in fibers diameter with increasing of PAN concentrations. FTIR approved the blend concept by there is no chemical reaction occurred. Also observed a decreasing in membranes wettability with increasing of PAN concentrations since the polyacrylonitrile has hydrophobic properties but lower than polystyrene hydrophobicity.

Evaluation of Ceruloplasmin ferroxidase activity and lipid profiles in patients with Valvular heart diseases

Evaluation of Ceruloplasmin ferroxidase activity and lipid profiles in patients with Valvular heart diseases

Abstract. One of the major health problems causing defects or damage to one or more of the four heart valves [aortic, mitral, pulmonary, and tricuspid] is valvular heart disease [VHD]; it occurs due to congenital abnormalities or acquired pathology. It is a defect that results in weak heart valves and is therefore unable to function as precise pathways of the blood. The aim of the current study was to evaluate the ferroxidase activity of ceruloplasmin (Cp) and the lipid profile of valvular heart disease patients in sera. Ninety subjects were included in this study and 60 patients with HDV were divided into two subgroups according to the affected valve: 33 patients with aortic valve disease (AV) and 27 patients with mitral valve disease (MV group). In addition, 30 healthy individuals were registered in all groups as control(C) group Serum copper (Cu), total protein (TP), activity and specific activity of ferroxidase Cp, and lipid profile were measured. The results showed that there was a highly significant increase in patient (AV & MV) groups compared to the C group in activity, specific Cp and Cu activity levels. In addition, compared to the C group, triglyceride (TG) and very low density lipoprotein (VLDL) levels showed a highly significant increase in the AV and MV groups. No significant differences were found between patients and control groups in TP, Total Cholesterol (TC), Low Density Lipoprotein Cholesterol (LDL-C) & High Density Lipoprotein Cholesterol (HDL-C) levels. Likewise, for all parameters, there were no significant differences between the AV and MV groups. In conclusion, the high serum level of Cu and the activity of Cp ferroxidase may be considered to be a risk factor for VHD.

Keywords: Heart valve disease, Ceruloplasmin, copper, lipid profile

1. Introduction

Valvular heart disease (VHD) is a pathological situation correlated with heart valves. The affected valve may be inefficient to close fully, led to not opening and closing of the heart properly, this allows an amount of blood to leak backward. Also, this may happen due to the stiffened, thickened or fused leaflets causing the improper opening of the valve [1]. Valves that are involved in VHD, including: on the left (aortic and mitral) and the right (pulmonary and tricuspid) [2].

VHD can evolve before birth or acquired during the life due to some infection such as: a rheumatic fever; while acquired VHD is more common. Sometimes the reason is unknown, but often the valves structure changes as a result of mineral deposits, either all over it or its surrounding tissues [3].

Unfortunately, all functional disorders of heart valves may not lead directly to specific symptoms. The injured may remain undetected the disease for a long period of time that may extend to years. Because the disease is not discovered and neglected, the heart will suffer from real damage and thus all fuse disorders are a rotational burden on the heart and eventually lead to heart failure [4].

Ceruloplasmin (Cp) [EC 1.16.3.1, Ferroxidase; Iron (II): O2 oxidoreductase] can be defined as the major blue copper containing glycoprotein which has a molecular weight of 132 kDa. It is consists of a single polypeptide chain of (1046) amino acid residues with carbohydrate content (between 7% and 8%). Essentially, Cp is synthesized and secreted by the liver as well as its expression was also found in numerous organs such as: heart, lung, kidney, brain and lymphocytes [5].
Ceruloplasmin, the multifunctional copper containing enzyme, possesses significant functions such ferroxidase activity, oxidase activity, transport, mobilization, and homeostasis of copper, serum antioxidant, and endogenous modulator of the inflammatory response [6,7]. Interestingly, the copper (Cu) in Cp plays an important role in iron oxidation before it is transported to the plasma. In recent years, it has become increasingly evident that the essential metal plays critical roles in a wide range of physiological processes, Fe, Zn, Mn, and Cu. Remarkably, Cu importance is apparent in human physiology [8].
Lipid profile is about tests group which are often requested together to determine the heart disease risk. Therefore, these tests are considered good indicators which someone is possible to have a heart attack or stroke due to blockage of blood vessels or arteries hardening. It is typically comprises: [9] (i) total cholesterol [TC] that strongly associated with progression of heart disease [10]; (ii) High density lipoprotein-cholesterol [HDL-C] which is also known as good cholesterol, and its function to protect from atherosclerosis [11]; (iii) Triglycerides [TG] are a form of bloodstream fat that derived from glycerol and fatty acids [12]. It has several functions, such: an excellent insulation material which forms a layer around the body that conserves heat and converts toxic excess of the sugars required for brain functions [13]; (iv) Low density lipoprotein-cholesterol [LDL-C] which is also called bad cholesterol, and its Cholesterol-rich lipoproteins that result from the breakdown and removal of TG from intermediate-density lipoproteins. However, elevated LDL-C levels in blood increase the risk of artery and heart disease [14].
Thus, the current study aims to determine the Cp ferroxidase activity, Cu level and evaluate the lipid profile parameters in sera of Iraqi patients with VHD.

2. Materials and Methods

2.1 Topics for Research

This research enrolled participants who attended the Baghdad, Iraq, Ibn Al-Bitar Center for Cardiac Surgery. Group 1 consists of 33 aortic valve (AV) patients (17 male and 16 female) with an age (55.5±13.3 years) and BMI (28.73±6.26) kg/m2. Ninety individuals were classified into three classes. Group 2: consists of 27 patients with mitral valve (MV) (10 male and 17 female) aged (53.81±10.00 years) and BMI (28.99±4.01) kg/m2 respectively. Group 3: a control group (C) composed of 30 healthy individuals (16 male and 14 female) with age (46.63 ± 8.79 years) and BMI (28.35 ± 3.79) kg/m2. Patients with diabetes, kidney and liver disorders were the criterion for exclusion. The body mass index (BMI) was measured in kilograms by weight, divided into square meters by length.
The study protocol was accepted by the College of Sciences/ University of Baghdad Ethical Committee.

2.2. Samples

In the plane tube, blood samples (10 ml) were obtained from all participant (patient and control) groups. The tubes were left at room temperature for coagulation for 10 minutes. The blood samples were then centrifuged at 4000 rpm for 10 min. The serum was isolated, aliquoted and processed for analysis at (-20 ° C).

2.3 Cp Activity of ferroxidase and Total protein levels

The Cp (U/L) ferroxidase activity was calculated using the Erel[15] process. Results at a wavelength of 600 nm were measured using the Colorimetric method and absorbance. Using a total protein reagent kit (AGAPPE, Switzerland), serum total protein levels (g/dl) were calculated by observing a Biuret reaction to determine the basic activity of Cp ferroxidase. The basic Cp activity was expressed in protein U per g[6].

2.4 Copper concentration determination in serum

A direct colorimetric assay kit (LTA, Milano, Italy) without sample deproteinization[16] was used to evaluate copper in serum. The 3,5-DiBr-PAESA chromogen reacts with cupric ions (Cu2+Cu+) and forms a blue-violet compound. The absorbance was then measured at a wavelength of 580 nm. The strength of the color is proportional to the sample concentration of Cu.

2.5 Lipid Profile Determination

For quantitative in vitro diagnostic measurements, serum total cholesterol (TC) was calculated using the colorimetric method Cholesterol Oxidase Phenol 4-Amino antipyrine peroxidase {CHOD-PAP} method [17], whereas triglycerides (TG) levels were assessed using the GPO-PAP enzyme assay [17,18]. A two-step assay was used to estimate HDL-C: (1) precipitation and then (2) enzymatic determination [17]. Using Friedwald's formula[19], serum LDL-C and VLDL levels were calculated.

2.6 Review of Statistics

SPSS version 21 (One-Way ANOVA) performed data analysis in this study, where the difference is considered to be highly significant at P<0.001, meaningful at P<0.05 and non-significant at P>0.05. The data is expressed as mean ± norm (mean ± SD) variance.

P>0.05. The data is expressed as mean ± norm (mean ± SD) variance.

3. Results

The mean ± SD of age, gender and BMI for all AV, MV & C groups is shown in Table 1. There was a large difference in age between patients (AV & MV) and control (p<0.05), as shown in Table (1). In addition, there were no substantial variations (P>0.05) in BMI between the patients and the control groups.

Table 1. Age, gender and BMI of all studied groups**.**

Parameters		Groups C (n=30)	AV (n=33)	MV (n=27)
Age (years)		46.63±8.79	55.50±13.3*	53.81±10.0*
Gender	Male (%)	16 (53.3%)	17 (51.5%)	10 (37.0%)
	Female (%)	14 (46.6%)	16 (48.4%)	17 (70.8%)
BMI (Kg/m^2)		28.35±3.79	28.73±6.26	28.99±4.01

* p<0.05, ** p<0.001

Table 2 presents the Cp ferroxidase function, TP and Cp specific activity in both patients (AV & MV) and C groups. Cp activity and specific activity were found to be highly significant changes in the AV and MV groups relative to the C group (p<0.001), although no significant differences between AV and MV were observed. The findings, meanwhile, showed no major differences in TP levels in all the groups examined.

Table 2. Mean values ± SD of total protein, Cp ferroxidase and specific activities in the serum of patients and control groups.

Parameters	***Groups***		
	C n=30	***AV n=33***	***MV n = 27***
Cp ferroxidase activity (U/L)	836.53± 50.11	1735.59 ± 101.61**	1735.33± 75.95**

Total protein (g/dl)	6.380 ± 0.449	6.685 ± 0.988	6.815 ± 0.769
Cp specific activity (U/g)	13.179 ± 1.245	26.50 ± 4.101**	25.763 ± 2.99**
Cu µg/dl	113.7±17.871	182.4±17.609**	190.8±13.771**

* $p<0.05$, ** $p<0.001$

In addition, the serum Cu concentration of both patient groups (AV & MV) showed a highly significant increase ($p<0.001$) relative to the C group, while there were no significant differences between AV and MV.

Comparing the two patient groups (AV&MV) with the C group in Table 3, the findings showed that there was a highly significant increase in TG and VLDL levels ($p<0.001$) in the patient group relative to the C group. Furthermore, the findings in Table 3 showed no substantial differences ($p>0.05$) in the levels of TC, LDL-C and HDL-C in the AV and MV groups with respect to the C group. The findings also showed no major variations in all parameters between the AV and MV classes (TC, TG, HDL-C, LDL-C and VLDL).

Table 3. Mean values ± SD of lipid profiles parameters levels in the serum of patients and control groups.

Parameters	*Groups*		
	C *n=30*	*AV* *n=33*	*MV* *n = 27*
TC (mg/dl)	176.33±17.91	178.74±16.77	185.44±15.83
TG (mg/dl)	118.6±19.13	178.9±16.44**	185.44±12.87**
HDL-C (mg/dl)	46.57±6.35	47.82±6.35	48.96±4.71
LDL-C (mg/dl)	106.0±17.29	97.72±13.14	99.41±18.43
VLDL (mg/dl)	23.72±3.83	35.79±3.21**	37.07±2.57**

* $p<0.05$, ** $p<0.001$

4. Discussion

Ceruloplasmin (Cp) is a human serum protein that holds about 95% of the total Cu plasma in healthy individuals. It is synthesized in the liver [95% in the hepatocyte], but other forms of cells, such as astrocytes, monocytes, and sertoli, are also formed [20]. A number of studies on several forms of cardiovascular diseases [CVD] have reported a near link between increasing serum Cp and an increased risk of myocardial infarction (MI), arteriosclerosis, angina and coronary artery disease (CAD) [21-23], while there are few studies on Cp in rheumatic patients and VHD [20]. This is the first research, to the best of our knowledge, to deal with the relationship between Cp and VHD activity, which showed that Cp ferroxidase activity was significantly elevated in patients with VHD. A previous study carried out in children with acute rheumatic fever documented elevated levels of Cp at the time of diagnosis [24]. Similarly, Petelenz et al. also revealed that Cp levels were significantly increased relative to safe controls in acquired VHD patients [25].

Ceruloplasmin (Cp) is the most enzymatic contributor to the antioxidant protection of human plasma, which acts as an antioxidant through various mechanisms, such as: inhibition of iron-dependent lipid peroxidation and formation of hydroxyl radical [OH] from hydrogen peroxide through its involvement in

ferroxidase, reaction and scavenging of H2O2 and superoxide anion, and inhibition of copper-induced lipid peroxidation

Unfortunately, there is no clear explanation of the function and status of Cp in cardiovascular pathophysiology. One of the mechanisms shown by Cp to have major oxidase activities, including the ability to catalytically consume NO through NO oxidase activity, resulting in decreased bioavailability of NO plasma as well as enhancing oxidation of low-density lipoprotein [22, 27]. NO also plays an important role in heart contraction and alteration in the secretion of endogenous NO may lead to heart failure (HF)[22,28]. The key proatherogenic role of oxidized low-density lipoprotein in the arterial wall, however, is that reduced NO bioavailability promotes endothelial dysfunction, which also leads to atherosclerosis[22]. In vitro and in vivo studies in humans with aceruloplasminemia showed a decrease in the activity of plasma NO oxidase following Cp immunodepletion [27,29]. Thus, via increased NO oxidase activity, high Cp levels can decrease the available NO in the heart; then leading to increased oxidative stress (OS) causes further dysfunction, which would explain the correlation between higher Cp levels and heart disease incidents.

Essentially, Cu, which plays a vital role in the oxidant/antioxidant, is one of the significant trace elements for humans. Cu dyshomeostasis can result in cardiovascular disease (CVD). Several studies therefore support the possibility that high Cu levels can increase the risk of CVD [30]. The current study showed a higher than safe control level of Cu in VHD. In particular, there are no studies in the literature to examine the degree of Cu in VHD; we compared our findings with other forms of CVD, however. In a study conducted in patients with HF, serum Cu levels were found to be higher than in healthy individuals, finding an important correlation between high serum Cu and HF [31]. It is also increasingly recognized that Cu is an important mediator in MI, CAD and atherosclerosis development and progression [30,32].

In addition, the high serum Cu in VHD is likely to represent a highly significant increase in Cp, which binds approximately 95% of the serum's circulating Cu [33]. Cp has also been shown to have many functions in the transportation of Cu, coagulation, angiogenesis, oxidant stress defense, and iron homeostasis. In addition, Cp oxidizes the {ferroxidase function} of Fe2+ to Fe3+ to be connected to transferrin, exerts the activity of antioxidant glutathione peroxidase, and scavenges reactive oxygen species {ROS}. It is also likely to be mainly involved in iron-mediated free radical injury protection [34,35].

Several studies have shown several parallels between atherosclerosis and calcific aortic stenosis (CAS) histopathologic features [36-38]. Atherosclerosis risk factors and CAS also interfere; one of them is dyslipidemia [39,40]. In AV and MV situations, as well as controls, the lipid profile was carried out in the present analysis. The findings showed a highly significant rise in the amount of TG in patients as opposed to controls. This result is in line with Peltier et al.[41], who documented higher levels of TG in patients with CAS. Another study carried out in patients with VHD showed that the amount of TG in patients was substantially higher compared to normal individuals. Hypertriglyceridemia is therefore caused by excess TG in the blood, and elevated TG in the blood has been linked to atherosclerosis[14]. Mean TC, HDL-C and LDL-C levels in this sample, meanwhile, showed no substantial difference in both patients and control groups. Our findings are consistent with the results of previous studies by Afaq et al. and Ortlepp et al. [42,43]. In comparison to the other studies reported by Peltier et al. who found that there was a rise in TC level (hypercholesteremia) in patients with CAS[41] and Hasan et al. who found that there were significantly higher LDL-C and TC levels, while significantly lower HDL-C levels were observed in patients with VHD compared with normal individuals [14]. Regarding the level of LDL-C, our research was in line with the study which showed insignificant levels of LDL-C between patients with calcific valvular heart disease and controls [44].

5. Conclusion

There is no research that discusses the enzymatic behavior of Cp in patients with VHD to date by reviewing the literature. The current findings concluded that changes in Cp ferroxidase activity and Cu levels were found to be highly important in groups of VHD patients and could be used as risk factors for disease prognosis and diagnosis. The Cp value can also be used as an independent biomarker related to

the level of VHD. For all factors, except for triglycerides (TG), there were no variations in the lipid profile that could be used as a predictor for predicting the early occurrence of VHD

Abstract To regeneration of oils which are used in cars engines to lubricate its moving parts, and to get rid of highly contaminants which must be separated to reuse the engine oils. In the column chromatography, the waste oil was treaded as mobile phase (eluent) with petroleum ether (40-60ºC), while the red mud (alhuor) is a stationary phase for adsorbed the impurities. The effect of the new method using deepeutectic solvent (DESs Reline) as a kind of ionic liquids to help extract impurities by adsorption (choline chloride and urea). Moreover, some thermal and physicochemical properties like density, thermal and electrical conductivity, ash percentages, viscosity, specific gravity and pH values were determined. Values were determ.using TGA for blank oil for comparison and differential scanning calorimetric analyses (DSC).

Keywords: Reline, oils ,choline chloride, physicochemical properties, waste oils

1.Introduction

Enormous amount of cars oils is considered as destructive waste into the environment in Mosul (the main city in Nenavah/ Iraq), and discarding of used oil in Tigris river, which produces complications not only the water contamination (the only source of people drinking in the area) but also destructive to river life. One gallon of engine oil approximately pollute a million gallon of water including plants [1]. Waste oil used in cars engines to lubricate the moving parts of engine, but it picks up highly contaminants compounds which must be separated in order to reuse the engine oil [2]. So to prevent undesirable properties in engine oil, many additives are used. The laboratory recycling of waste oils depends on the procedures of the refining and chemicals used in these procedures and depend on the type of used oil also, in this paper we will use deep fusion solvent which is a new method (DESs) as a kind of ionic liquid is used to help extract impurities by adsorption. Deep eutectic solvents (DESs) are extensively recognized as a novel type of ionic liquids (ILs) since they share many features and properties with ILs. Deep eutectic solvents (DESs) and ILs have been used mutually in the literature though it is essential to indicate that these are really two different types of solvent [3]. DESs are formed from a eutectic mixture of Lewis or Brønsted acids and bases which can include anionic and/or cationic species; in disparity, ILs are formed from systems composed primarily of one type of discrete anion and cation. It is explain here that the chemical properties of DESs and ILS suggest

application areas which are significantly different although the physical properties of DESs are similar to other ILS [4]. The investigation into DESs has intensified in this decade, eversince the possible for new chemical knowledges was grasped, they have recommended that choline chloride based DESs and Bronsted-Loury acid (hydrogen donor) were effective to remove free glycerol from palm-oil [5]. This waste oil can be distilled into diesel fuel or marine fuel in a process similar to oil re-refining, but without the final hydrotreating process [6]. Paul [7] define the used oil re-refining as the process of restoring used oil to new oil by removing chemical impurities and heavy metals using reclaimed waste lubricating by hydro treating after washing with a polyglycol ether [8]. In 1998, Al-Khazraji used different thermally activated clays which gave best results of reclaiming of used lubricating oils when they were treated with diluted hydrochloric acid [9]. In current work it is the first time to use ionic liquid type of DESs (Reline) in recycle process of oil re-refining, which was only used by modelling and simulation of CO_2 removal from model shale gas along with the physicochemical properties of DES**s**, which were employed for the modelling and simulation of CO_2 removal studies [10].

2. Materials and Methods

Iraqi Red mud (alhuor), Petroleum ether 40-60 ^{O}C, Urea, Choline chloride and Engine oil (new) and used.

2.1 Instruments

The instruments used are electrical conductivity, Weiss – Techn. Werk Statlen, WTW). LBR and pH meter, Philips. TGA and DSC analysis were done by scanning TGA using Horizontal balance and carried out using Mettler-Toledo TGA/ DSC star system in pottery (silica) crucibles at temperatures ranging from (25 to 600◦C) with heating rate of (20◦C/min) under air atmosphere.

2.2 Preparation of choline chloride – urea DESs (Reline)

A mixture of choline chloride (1 mole) and urea (2 mole) is heated and stirred at 80-100 °C until a clear solution is beginning to form[11]. The product was cooled and used without any purification. The freezing point of the product is 12ºC [12].

2.3 Activation of red mud (Al-Khazraji,1998)

The red mud is grinding very well, then it is washed in a sink with water for many times. The resulting mud is draying in microwave oven, then grinding again and is saved in 80 mesh size save. The resulting particles are washed with water, heated in oven at (100 – 120 ºC) and then heated in another oven at (600- 800ºC).

2.4 Setting the column chromatography

A column was packed with the red mud (absorbent)(about 30 gm) into a cylindrical glass with size (2*30 cm) [13]. The base of the tube contains a glass wool pad to grip the solid phase in place. A solution of oil (20ml.) and DESs (Reline) in petroleum ether (50ml.) ‘Table 1’ was added. Then, the used oil was eluted from the top of the column and 90% of the mixture solvent (64ml. was received from the tap control. This is a simple laboratory column which runs by gravity flow which can be increased by extending the solvent (petroleum ether) filled column above the top of the stationary phase or decreased by the stopcock controls’ Figure 1’.

Table 1. The amounts of DESs (Reline) used.

Sample No.	Type of oil	Weight of DESs (Reline) (gm)
1	fresh	-------
2	fresh	1.5
3	fresh	2.5
4	fresh	3.5
5	regenerated	-------
6	Regenerated	1.5
7	Regenerated	2.5
8	Regenerated	3.5

Table 2. DSC results for analyzed with(without)DESs (Reline) oil samples (which isolated from oxygen).

Sample No.	DSC Results (°C)	
	Exothermic peaks	Endothermic peaks
5	275	313
6	282	328
7	290	328
8	294	340

3. Results and Discussion

The reaction of quaternary ammonium salt choline chloride and urea is atom efficient since all the atoms present in the starting materials are incorporated in the products DESs (Reline), as in equation 1, the preparation of DES in ethanol [14].

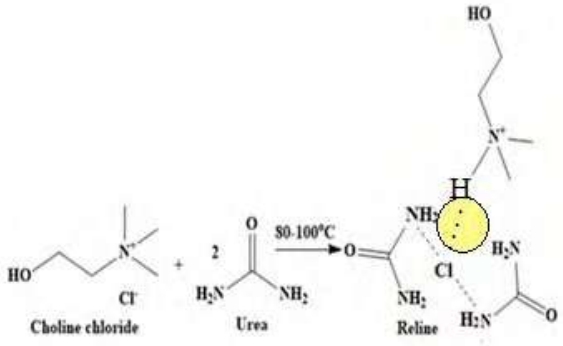

Figure 1. Preparation of DESs (Reline)

While red mud is a stationary phase for adsorbed the impurities, mobile phase (eluent) is petroleum ether (40-60ºC) because it is a solvent used to move the recycle oil through the column. It is selected for two reasons. First, it's retention factor value of approximately 0.2 - 0.3 for diminish the time and the amount of eluent to run the chromatography, and the latter is the different impurities in the used oil can be separated effectively. Chromatography is an important characteristic that affects the oil's ability to transfer heat from the engine is its thermal properties, the increasing of the values of thermal conductivity (k) of recycle oil samples (5-8) (which is the measure of their abilities to conduct heat) to 35.83211267×10^5 cal.cm^{-2}.sec^{-1} for sample No (8) of the highest amount of Reline (3.5 gm) than that of standard (new) oil $33.73493976 * 10^5$ cal.cm^{-2}.sec^{-1}. Also, specific heats of recycle oil samples (5-8) were only less than the unused samples 1-4 by only less than 0.03ºC cm^{-3}(25ºC) 'Table 3'the oil transfers heat more efficiently, the higher the thermal conductivity and specific heat**[15]**

Table 3. The Physical properties of the new and used oil:

Sample No.	Density (gm .cm^{-2})	Thermal conductivity (cal.cm^{-2}.sec^{-1}. ^{o}C *10^{5})	Electrical Conductivity (Ohm.cm^{-1} *10^{8})	Ash content %	Viscosity Poise (25^{O}C)	Specific heat ^{o}C. cm^{3} (25^{O}C)	pH
1	0.830	33.73493976	0.65	0.18	3.1428	0.50049	6.51
2	0.826	33.88000	0.66	0.0	3.233	0.498078	6.89
3	0.8.6	34.72069479	0.85	0.0	3.210	0.486018	6.59
4	0.81	34.45923457	0.75	0.0	2.998	0.48843	6.98
5	0.8.5	34.763822609	1.08	1.23	2.778	0.485415	8.14
6	0.784	35.69500000	0.93	1.03	2.861	0.472752	8.10
7	0.798	35.06877193	0.92	0.39	2.911	0.481194	6.91
8	0.781	35.83211267	0.82	0.54	2.678	0.470943	6.70

Heat transfer happens at a lesser degree in sample (5) of low thermal conductivity than in other samples (6-8) of high thermal conductivity. For instance, samples typically have high thermal conductivity and are very efficient at conducting heat. Sample No. 7 had the best neutralizing value of pH = 6.91 of all other regenerated samples. The acidity of engine oils favorites the neutral pH. The polar nature of DESs (Reline) has therefore shown to decrease the electrical conductivity of waste oil 0.26-0.15-ohm cm$^{-1,}$ Also, as amount of DESs (Reline), the polar nature increases from 1.5-2.5 gm as viscosity increase from 2.861 to 2.911 Poise, more viscosity means thicker the oil (at higher temperatures, thick oils have more renitence to shearing and losing film strength and these best values indicate that the regenerated oils show minimum contamination). These results come with agreement of ash content percentage which is also 0.39% for sample (7) which is the best oil purity (ash content is very important factors).. Specific gravity in cal. / gm °C. Thermal gravimetric analysis (TGA) is measure the change in weight during heating or cooling, it studies of recycle samples show that sample No (5) without DESs (Reline) and sample No. (6) with 1.5 gm verifies less stability at 279^{o}C and 281^{o}C, respectively, with only 10% of weight loss at these temperatures as shown in 'Figure 2' and 'Figure 3'. The same study indicates that samples (7 and 8) of only (1.5 and 2.5 gm) DESs respectively, 'Figure 4' and 'Figure 5' verified more stability at 300^{O}C with only 10% of weight loss at this temperature.

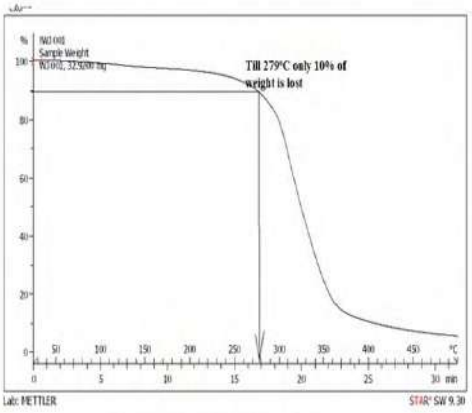

Figure 2. TGA of Sample (5)

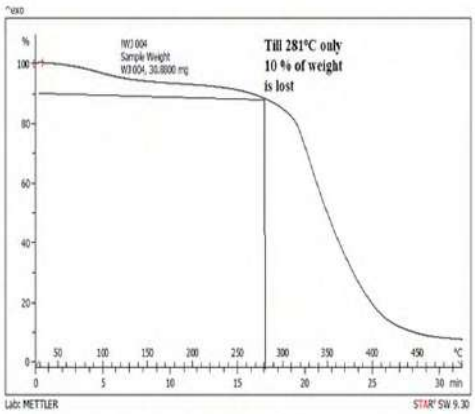

Figure 3. TGA of Sample (6)

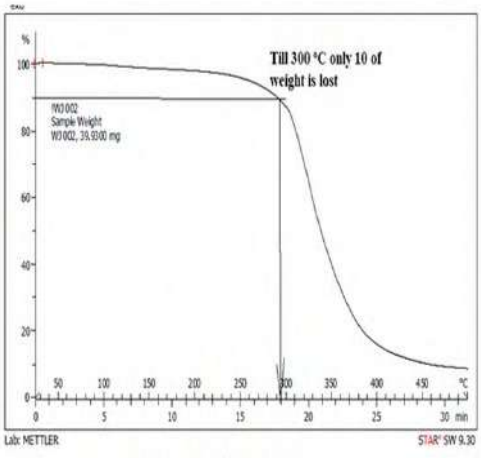

Figure 4 . TGA of Sample (7)

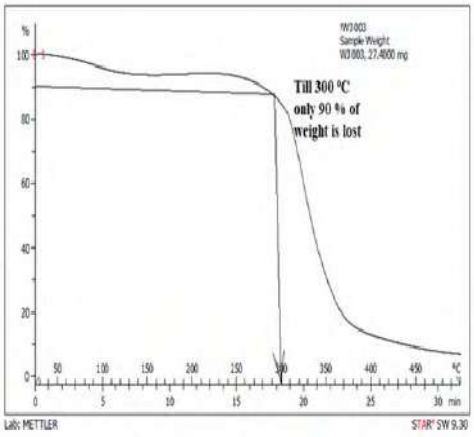

Figure 5 . TGA of Sample (8)

Similar to TGA, differential scanning calorimetric analyses (DSC) are valid tools in the study of the thermal and oxidative stability of drying oils [16]. DSC analysis can be fit for the estimate the sample stability and the calculation of the film formation (the very first stages) since oil layers have been painted out. The differential scanning calorimetry (DSC) is measuring the absorbed or released heat during heating or cooling. The DSC data shows Table 2, 'Figure5-8' an exothermic and endothermic peaks and the decreases in the heat generation is due to decreasing of unburned impurities (such as aromatic hydrocarbons) in the recycle oil. the maximum amount of DESs with sample No (8) gives larger peak of endothermic heat 340^{o}C[17].The results of these regenerated samples, Sample No(7) of (2.5gm) of DESs (Reline) gives the best result.

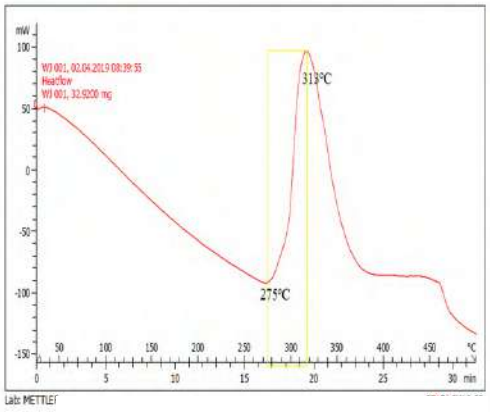

Figure 6. DSC of Sample No. (5)

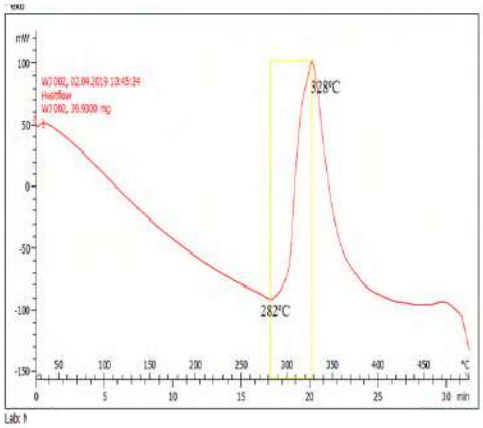

Figure 7. DSC of Sample No. (6)

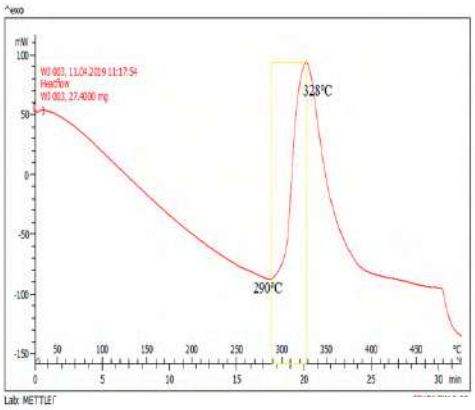

Figure 8. DSC of Sample No. (7)

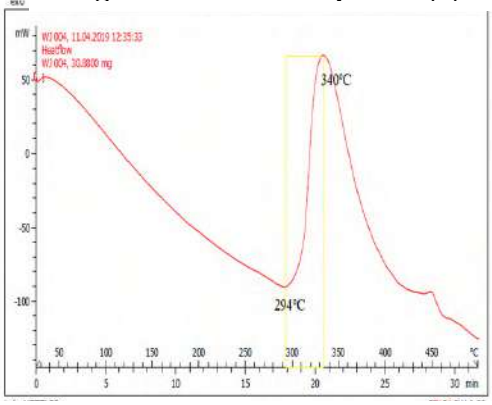

Figure 9. DSC of Sample No. (8)

4. Conclusion

The methodology presented in this work wass succeeded in the removal of waste materials and thus regenerate most properties of the engine lubricating synthetic oil for its reuse. This was achieved by using column chromatography, the waste oil was treated as mobile phase (eluent) with petroleum ether (40-60ºC), while the red mud is a stationary phase for adsorbed the impurities. The effect of this new method of using deep-eutectic solvent (DESs Reline) as a kind of ionic liquids to help extract impurities by adsorption (choline chloride and urea). Moreover, sample No (7) of (2.5gm) of DESs (Reline) showed the best result.

Abstract: The equivalent conductivities of proline in water, methanol were studied in the temperature range of 288.15 to 313.15 K at 5 K intervals, in mixtures of methanol and water at percentages of10 %, 20%, 30%, 40% and, 50% of methanol at 37°C. The experimental data were treated by the Lee-Wheaton conductivity equation of unsymmetrical electrolytes (1:2) (1 molecule of metal with 2 molecules of ligand) derived to calculate the conductivity parameters, equivalent conductance at infinite dilution Λ_o, ionic conductivity, association constant Ka and the main distance between ions in solution(R) at best fit values of ($\sigma\Lambda$). Thermodynamic quantities for the ion-association reaction (ΔG^o, ΔH^o and ΔS^o) have been also measured. The results of the analysis showed that the ions of the complex can be separated by solvent molecules (SSIP). The values of Ka, Λ_o and R were found to be different from one solvent to another depending on the interactions in the solution. Furthermore, the chemical structure of the Proline-Mn complex was optimized by using of Gaussian interface version 16.0 program of chem3D to optimiz the features of complex molecule. The suggested statistical model possesses only two parameters with excellent values of the square regression coefficient (r^2) and cross-validation (q^2) are equal to 0.999 and 0.994, respectively, which refers to the perfect relationship between Ka value and the physical properties of the solvent.

Keywords: Proline Complex, Electrical Conductivities, Lee-Wheaton equation, Thermodynamic parameter, Gaussian program, Semi-empirical.

1. Introduction:

Proline (Pro), composed of an amino group and a carboxylic acid, is an amino acid. It is the only amino acid with a secondary alpha-amino group that naturally exists, which explains its more basic character with respect to many other alpha-amino acids. Pro and its derivative in organic reaction are also used as asymmetric catalysts. It is an osmoprotectant and is also used in many biotechnological and medicinal applications [1]. The biological function of several transition metals with mixed amino acid complexes have been revealed, putting them in many biochemical processes [2–5]. Pro has been estimated in different ways such as HPLC [6-8], flow-injection analysis [9], kinetic study [10], capillary electrophoresis [11] in addition to theoretical study [12,13]. The complexes of amino acids

with metals are interesting to be studied by electrical methods especially by conductivity methods. For example, the Tyrosine conductivity has been studied in aqueous solutions at 310.16 K, also Co(II)-, Mn(II)-, Ni(II)-, Fe(II)-prepared tyrosine complexes to form [Ni(tyr)3]Cl2, [Co(tyr)3]Cl2, [Fe(tyr)3]Cl2, and [Mn(tyr)3]Cl2 complexes at various temperatures. Numerous complexes of Co(II), Ni(II) and Fe(II) with different ligands of amino acids (e.g. Glycine, Histidine, Cysteine and Arginine) were prepared and diagnosed using various techniques and then studying their electrochemical conductivity in several solvents [14-15].

The electrical conductivity of solutions depends on the nature of the solute and solvent. For a solvent, the main parameter is the dielectric constant [16]. It is interest to study the effect of temperature and solvent on the electrical conductivity of complexes [17]. In this study, Molar conductivities of dilute solutions for the complex: Mn(II)(Proline) in water, methanol and mixture of them were measured in the temperature range (288.15 - 313.15 K). The ionic molar conductivity (Λ), association constant (Ka) and distance parameter (R), were determined by treating experimental data with Lee-Wheaton conductivity equation.

Hence, the ion-association thermodynamic quantities (ΔG^{o}, ΔH^{o} and ΔS^{o}) are a very useful study of intermolecular interactions, geometric influences of solutions structural, thermo-physical and bulk properties. The study of the transport properties (conductance, viscosity,density and ionic mobility) of electrolytes in aqueous and partly aqueous media, It provides us more detail about ion-ion and ion-solvent interactions in these solutions especially from thermodynamic point of view [18,19].

All Computational Details using semi-empirical methods with the Gaussian'09 software package were carried out. Semi-empirical approaches adopt what are sometimes referred to as empirical techniques where there is no clear using of the two-electron component of the Hamiltonian. Roald Hoffmann suggested the expanded Huckel approach for all valence electron systems. Chem 3D ultra-program were used for a graphic presentation, and to optimized using semi empirical quantum chemical computation [20].

2. Experimental

The Mn(II) complex with proline was prepared by mixing 0.001mole (0.1258g) of $MnCl_2.4H_2O$ in 25ml of conductivity water, its conductivity was equal (2μS), with 0.003 mole (0.3439g) of the proline in 25 ml of conductivity water and refluxed for two hours. On cooling, the complex was precipitated. Magnetic electronic spectra, IR measurement were used to investigate composition of complex [21]. Conductivity water was prepared by redistilling water three times with the addition of 1.5g/L KmnO4 and 0.05g/L KOH [22]. A general method eas used for measuring the conductivity of the electrolytes. The conductivity cell was washed , dried and then weighted empty and kept at a constant temperature (± 0.1ºC) using a water circulating ultra thermostat . A certain amount of solution was injected into the conductivity cell and the conductivity of solution was measured by (WTW) Inolab (740) computerized conductivity meter. Another known amount of solution was injected by a syringe (1ml) and the measurement was repeated. Generally about (15) addition have been made by weighting the amount for each one.

2.1.Computational details

Theoretical calculations were carried out using GAUSSIAN 09 package software implemented on a Lenovo-PC computer with a 2.6 GHz processor. Initial estimation of the structural geometry of the prolin complex was obtained by a molecular mechanic methods (MM2, MD), and for further optimization of geometry, we used the AM1 then PM3 method**.** Finally, Statistical analysis of the experimental results was performed, using Minitab software release 14.1 to find a mathematical equation that describe the relationship between the Ka and the important solvent properties (dielectric constant and viscosity) of the mix methanol and water at different percentages.

3. RESULTS AND DISCISSION

3.1. Molecular Geometry Optimization

Geometry optimization was carried out to determine the best atomic arrangement that makes the molecule more stable. Optimized geometrical parameters such as bond lengths and bond angles and dihedral angles of proline-Mn(II) complex were calculated by semi empirical methods using

parameter PM3[23].The optimized structures with atom labeling and number labeling of complex are shown in Figure 1.

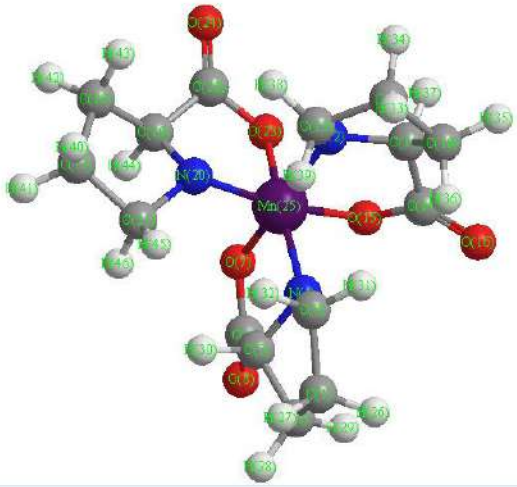

Figure 1. Semi-empirical-calculated optimized structure (at PM3 level of theory) of Proline-Mn complex

After minimizing the energy, the molecule will be in minimum energy level (more stable), then was determine the internal coordinates of atoms of the complex molecule as shown in the Table 1. After that measured the Huckel charge, from the Huckel charge measurement on each atom of complex molecule, we can deduce that the manganese atom have the largest amount of charge, followed by the three nitrogen atoms.

Table 1. PM3-calculated bond lengths and angles between all atoms of the complex molecule.

3.2 Conductivity analysis

The equivalent conductivity ($\Lambda_{equiv.}$) at each concentration of each electrolyte solution was calculated by the following equation:

$$(\Lambda_{equiv.}) = 1000\sigma / C1C2 \quad (1)$$

Where σ is the specific conductance obtained experimentally, C1 and C2 are the equivalent concentration of 2:1 and 1:1 electrolytes used respectively[24]. Table 2a, 2b,and 2c shows the values of the equivalent conductivity and concentrations of the two electrolytes salts (2:1) determined experimentally. The Kohlrausch equations was used to discover types of electrolyte through plot the relation between equivalent conductivity against the square root of concentration [25] at different temperature (288.16 -313.16 K) and different solvent (water ,methanol, and their mixtures) as shown in the Figures 2a, 2b and 2c.

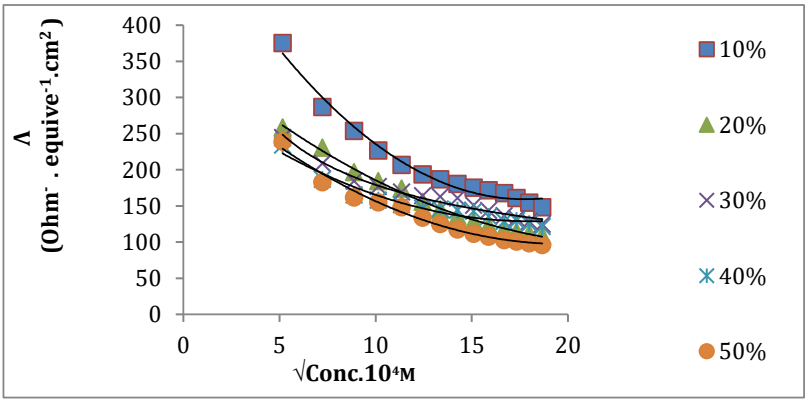

Figure 2c. The relation between the square root of concentration and Equivalent conductance of $[Mn(pro)_3]Cl_2$ at different percentage of methanol in water

Figures 2a and 2b show the relations between (Λ) and concentration (√c) for the studied complex at different temperatures. Gave a curved line, these relationships which indicate that complex of amino acid was weakly associated in different solvents and temperatures [26]. Moreover, Figure 2c shows the relation between (Λ) and the square root of concentration (√c) for the studied complex at different percentages of methanol to water which also gave a curve line. The Lee-Wheaton equation (LW) for unsymmetrical electrolytes is used for analyses of the conductance data for mixed electrolyte solutions using a computer program (AM1).
The theoretical equivalent conductance is given by the following equation.

$$\Lambda e_{quiv.} = \Sigma |Zi| \, mi \, \lambda i / \Sigma Cn \qquad (2)$$

Where Zi is the charge, mi: molar concentration, λi: equivalent conductivity for each

ionic species present in the solution and Cn is the stoichiometric equivalent concentration of electrolyte species n. It was found earlier that Ka and λ°s value for single ion and for ion-pair are constant from one system to another for symmetrical, asymmetrical and mixed electrolytes by using LW equation[27].The input data of the computer program (AM1) are: solvent parameters (T, D, η), charges Zi and limiting conductivities λ°i for each ionic species. $K_{association}$ for each ion association equilibrium as shown in tables (3a, 3b and 3c); for mixture as an example and the experimental data which are the stoichiometric concentration of the two electrolytes solution within the experimentally determined equivalent conductivities calculated from equation (1). The computer program (AM1) calculated the minimum standard deviation σs(Λ) between $\Lambda_{equiv.}$ (found experimentally) using equation (1) and $\Lambda_{equiv.}$ (Calculated by using equation (2) as

$$\sigma s(\Lambda) = (\Lambda e_{quiv.} - \Lambda_{experi.})^3 \ldots\ldots\ldots (3)$$

at the appropriate (R) values (R: the overall distance parameter), where R is only the variable parameter, for each set of the data of each experiment done[28]. Tables 3a, 3b and, 3c show the results of proline complex analysis in water and methanol at different temperatures and at mixtures.

10	52	122	5.5	0.209
20	71	120	7.9	0.21
30	92	91	7.2	0.161
40	110	82	8.1	0.112
50	132	62	8.2	0.169

It is noted that the Ka values of complex increase with increasing temperature because the electronic density of the solvent decrease, associations will decrease that the solvent molecules will be attracted and thus ion association increase. The results of distance parameter R show that complexes electrolytes form solvent separated ion pairs (R is between 4-8) these high values of R indicated that cations and anions are separated by many solvent molecules since the association was high with increased temperatures [29]. The values of σΛ give an indication of good best-fit values [30].

3.3 Calculation of the thermodynamic parameters (ΔH, ΔG, ΔS)

Thermodynamic functions of proline complex were estimated through the value of the equilibrium constant at different temperatures by the Vant-Hoff equation. ΔH values were calculated from the relation between lnKa against 1/T as shown in Figures 3a and 3b. The relation gives a straight line for complex solutions [31] .

$$\ln Ka = -\frac{\Delta H}{RT} + C \qquad (4)$$

While ΔS values were calculated from the equation :

$$\Delta G = \Delta H - T\,\Delta S \qquad (5)$$

and ΔG from the equation :

$$\Delta G = -R\,T\,\ln Ka \qquad (6)$$

The values of thermodynamic parameters (ΔH, ΔG, ΔS) shows in Table (4a and 4b)

Table 4a. Thermodynamic parameters of $[Mn(pro)_3]Cl_2$ in water.

T (K)	ΔS (J.mol-1.K-1)	ΔG (KJ.mol-1)	ΔH (KJ.mol-1)	Ln ka
288.16	28.26	-8.1444	-5.59	3.401
293.16	26.74	-7.84163		3.219
298.16	35.54	-10.5963		4.277
303.16	37.58	-11.3917		4.522
308.16	36.62	-11.2850		4.407
313.16	39.93	-12.5021		4.804

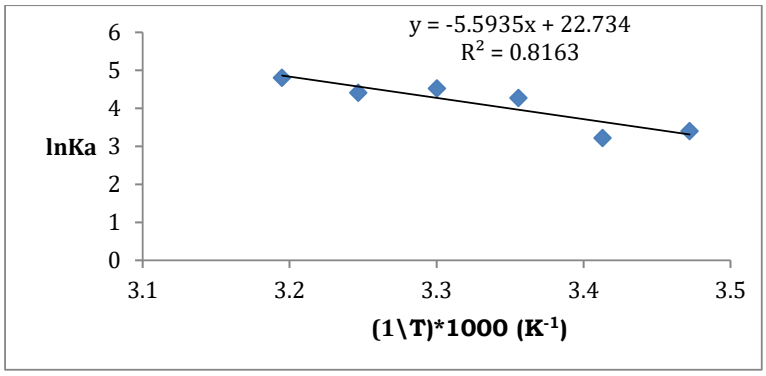

Figure 3a. The relation between the ln Ka &1/T of $[Mn(pro)_3]Cl_2$ in water.

Table 4b. Thermodynamic parameters of $[Mn(pro)_3]Cl_2$ in methanol.

T (K)	ΔS (J.mol-1.K^{-1})	ΔG (KJ.mol^{-1})	ΔH (KJ.mol^{-1})	Ln ka
288.16	28.8	-8.299	-3.41	3.466
293.16	31.26	-9.163		3.761
298.16	32.68	-9.742		3.932
303.16	34.57	-10.48		4.159
308.16	35.55	-10.95		4.277
313.16	36.83	-11.53		4.431

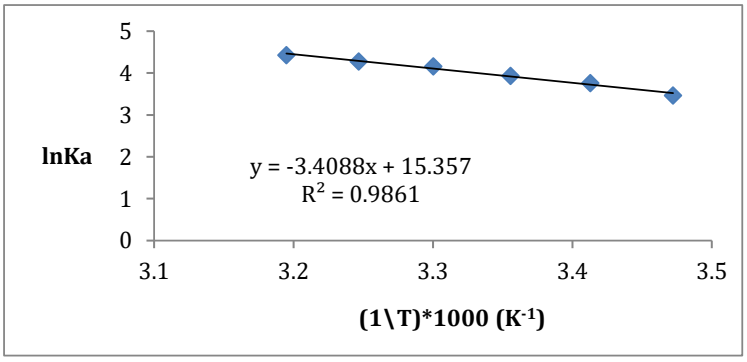

Figure 3b. The relation between the ln Ka &1/T of $[Mn(pro)_3]Cl_2$ in methanol

The values of ΔH (enthalpy of association) were negative(exothermic) which show that the operation was hydration, while ΔG (Gibbs free energy) had negative values which depend upon the kind of ions and in agreement with the relation, which means that the reaction was spontaneous towards the association and the values of ΔS were also positive (increase the random with increase the temperature) [32].

3.4 Statistical analysis

After completing the analysis of conductivity results and determining the Ka and R, the statistical analysis used to find the relationship between the parameters by suggesting an intensive model that is nearly close to accurate mathematical methods with excellent regression parameters. Thus, the first descriptor was selected in accordance with the simple correlation between the Ka and the adjusted parameters as exhibited in Table 5. Below the model equation (eq.7), which was obtained by multiple

linear regression, with r^2 and q^2 equal to 0.999 and 0.994 respectively. The suggested model can be used to predict the Ka value from the dielectric constant and viscosity of solvents before experiments.

Ka = 531 - 0.6 dielectric const. - 65472 Viscosity (7)

Table (5):physical parameters and Ka in different mixture solvents

% MeOH	Ka	Viscosity (Poise)	Density (g/cm^3)	Dielectric Const.	R (A°)	Λ° (Ohm^{-1}. $equive^{-1}$ .cm^2)

4.Conclusions:

The present work reports conductivity data for proline-Mn solutions in water, methanol at different temperatures and in mixtures of methanol in water, which were measured by assisting the lee-Wheaton equation at the best fit values of standard deviled (σ Λ) for analyzing the data of unsymmetrical electrolytes included. The values of conductivity parameters such as association constant Ka, Λo, and distance parameter R, were differ from one solvent to another depending on dielectric constant and viscosity and interactions in solution. An indication of the above can be said that the electrophoretic effect or asymmetric effect. The Affected Ka values were in the following order [mixture> methanol> water], due to the difference in the density, viscosity and, dielectric constant which decreases with the increase of alcohol content. Consequently, increased intermolecular interaction and ionic hydration between the methanol and water molecules are responsible for the decrease in density which is in coherence with the available literature values. Therefore, the mixture results are better than those of methanol or water alone. Also, from theoretical results, the effect of the solvent property upon the Ka is in matching with the experimental results.

Abstract. The aim of this study was estimation the concentration of heavy and trace element in blood samples for autism spectrum disorder *material and method*: sixty patients with autism participated in the present study, all of these patients are registered in an autism center in Basrah province(Iraq). At the same time, 30 healthy children contributed in the study as a control group. The heavy levels were estimated and trace elements (chromium , zinc, selenium, copper, lead, mercury and iron) in the patient and control groups by used energy dispersive X-ray spectroscopy (EDS). The basic principle should appear in the X-rays emitted by the different energies coming from the sample at the same time as a beam of an electron is moving its factors. *Conclusion*: The results showed that there was no significant difference between patients and the control group in all trace elements except zinc. On the other hand, the study showed that there was no significant change between male and female in all levels of trace elements except selenium.

Key words: Trace elements , Autism Spectrum Disorder ,Energy dispersive X-ray spectroscopy.

1. Introduction

Autism spectrum disorder is a disorder that affects children at an early age, characterized by difficulty in communicating with others, slow speech, aggression and isolation, the causes of which are unknown [1]. Hereditary and ecological reasons were involved within the disease [2]. Trace elements are existing in several forms in the nature, and these elements are actual necessary for the body to achieve different functions, where this elements acting as cofactors for various enzymes. Serum iron level showed correlation with oxidative stress markers in several disease such as beta thalassemia major [3]. On the other hand, the scientist was explained the effect of some elements in function of more glands which was that effect on the some hormones [4]. In addition, the researchers have shown that the high level concentration of some trace elements consider an important factors for increase oxidative stress [5]. Researchers have also shown that there is a significant relationship between trace elements and genetic factors, as a result of this relationship, oxidative stress is impaired [6]. In addition ,the researchers explained the relationship of iron with oxidative stress and consequently the effect of oxidative stress on glands and production of hormones, which in turn regulate the vital activities of the human body [6].Despite the importance of these elements in the human function, an increase in their concentrations in the blood is considered toxic, On the other hand, any lack of concentration causes a defect in many life processes studies have proven a correlation between the accumulation of heavy elements in the blood and memory impairment [7], Mental disorders. In addition, the researcher explained the effect of trace elements including iron, on the oxidation of fats and consequently its negative effect

on oxidative stress and on steroid hormones and neurons [7,8], neurological and behavioral abnormalities and neurotoxicity [9-12].

Objective: The aim of the current study was to compare the level of trace elements in patients with autism and control group.

2. Subject and Method

Sixty patients with autism were contributed in this study. Their ages were between 3 and 6 years. These patients are listed at a specialized autism center in Basrah province (Iraq). Blood sample was taken from them after the agreement of their parents. To estimate the concentration of trace elements, a technique was used energy dispersive X-ray spectroscopy (EDS). Primary precept needs to have an appearance at of released X-rays of different energies coming from the sample at the similar time as a beam of electron moves its factors. The amount and composition of metal nanoparticles can without difficulty be identified from the floor of the given sample [13].

3. Statistical Analysis

The data collated after biochemical analysis were subjected to statistical calculation using statistical software (Megastat). The mean, standard deviation of mean and F-distribution test were obtained. Critical value or test of probability less than 0.05 ($p< 0.05$) was regarded significant and microsoft excel (2010) and Minitab v. 14 was also used**.**

4. Result and discussion

Table 1. shows the level of chromium , zinc, selenium, copper, lead, mercury and iron for autism patients and their control group .

Table 1. level of chromium , zinc, selenium, copper, lead, mercury and iron for autism spectrum disorder and their control group.

Parameter	Patients	Control	P-value
Chromium ng/mL	2230.4 ± 1796.2	2745.7 ± 1497.7	0.155214
Zinc ng/mL	24072.3 ± 7359.8	33952.3 ± 15533.7	0.002182*
Selenium ng/mL	23297.6 ± 9813.8	27441.9 ± 8833.4	0.047508*
Copper ng/mL	26818.4 ± 11359	29626.3 ± 8657.2	0.196874
Lead ng/mL	65012.9 ± 23703.6	64568.5 ± 17341.9	0.919859
Mercury ng/mL	48341.8 ± 10280.1	48309.3 ± 8753.8	0.98759
Iron ng/mL	4686.3 ± 4059	6827.2 ± 6169	0.092182

The results in Table 1 show there is no significant change in all trace elements($p>0.05$) except zinc and selenium which have a significant decrease ($p\leq0.05$). These results are consistent with study of Knutson & Mitchell(2019), Where they studied the effect of trace elements on neurons in vitro they found that the effect of these trace elements very little except when the concentration of a very high level. On the other hand, Knutson & Mitchell explained that zinc is the most important elements that affect the function of neurons and brain [14].

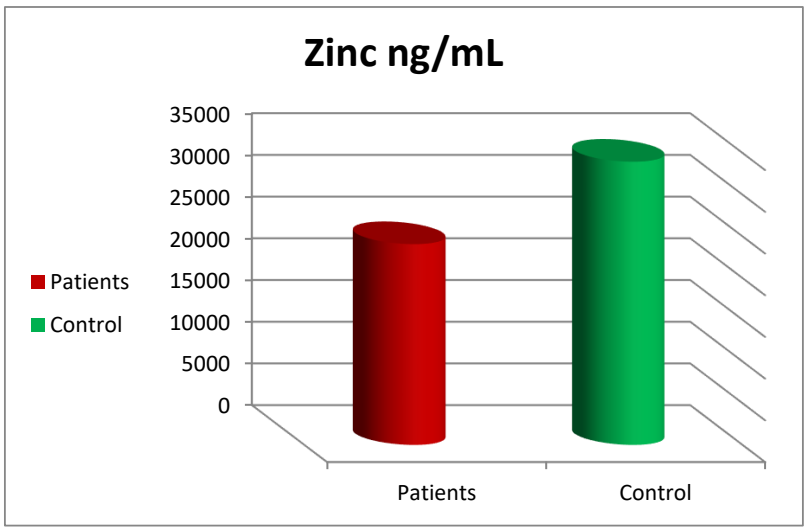

Figure 1. The level of zinc in autism patients and control group

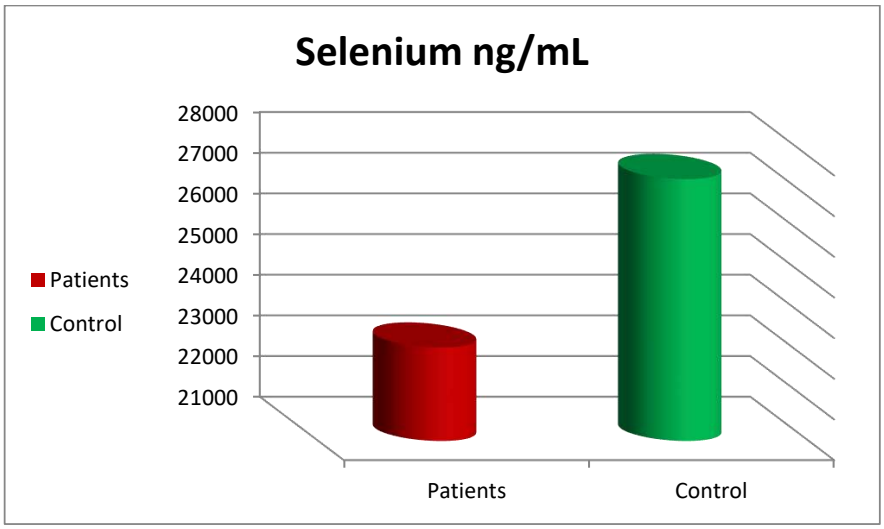

Figure 2. The level of selenium in autism patients and control group

In the other hand, the results showed non –significant change in chromium, Copper, lead, mercury and iron in ASD samples as compare control group. These results are consistent with a study of (14),which they proved that that most trace elements have a normal level in autism patients.

Table 2. level of chromium , zinc, selenium, copper, lead, mercury and iron in male with autism spectrum disorder **.**

Parameter	Patients/Male	Control/Male	P-value
Chromium (ng/mL)	2315.8±1812.2	2763.4±1567.1	0.351
Zinc (ng/mL)	24769.4±7134.5	38385.4±12591.3	0.0004*

Selenium (ng/mL)	25019.4±9905.7	25926.4±7658.5	0.709
Copper (ng/mL)	26951.4±11296.1	29020.4±9736.5	0.487
Lead (ng/mL)	66515.4±23227.6	67736.1±5143	0.751
Mercury (ng/mL)	47558.7±11956.6	50246.5±3309.5	0.192
Iron (ng/mL)	4623.4±4145.4	7767.9±6580.2	0.081

The results refers to no significant change in male with ASD for all parameters($p>0.05$) except zinc($p\leq0.05$).

Table 3. level of chromium , zinc, selenium, copper, lead, mercury and iron in female with autism spectrum disorder .

Parameter	Patients/Female	Control/Female	P-value
Chromium (ng/mL)	2046.2±1795.8	2722.6±1464.9	0.251941
Zinc (ng/mL)	22568±7806.3	28155.1±17535.5	0.297741
Selenium (ng/mL)	19582.3±8735.8	29423.7±10142	0.009*
Copper (ng/mL)	26531.5±11799.9	30418.6±7316	0.259
Lead (ng/mL)	61771±25029.7	60426.2±25665.6	0.884
Mercury (ng/mL)	50031.6±4929.1	45776.2±12582.5	0.265
Iron (ng/mL)	4822.1±3973.3	5597.1±5598.6	0.672

The results refers to no significant change in female with ASD for all parameters ($p>0.05$) except selenium($p\leq0.05$).

Table 4. Comparison between male and female with autism spectrum disorder for level of chromium , zinc, selenium, copper, lead, mercury and iron.

Parameter	Male	Female	P-value
Chromium (ng/mL)	2315.8±1812.2	2046.2±1795.8	0.593
Zinc (ng/mL)	24769.4±7134.5	22568±7806.3	0.304
Selenium (ng/mL)	25019.4±9905.7	19582.3±8735.8	0.038*
Copper (ng/mL)	26951.4±11296.1	26531.5±11799.9	0.897
Lead (ng/mL)	66515.4±23227.6	61771±25029.7	0.489
Mercury (ng/mL)	47558.7±11956.6	50031.6±4929.1	0.262

Iron (ng/mL)	4623.4±4145.4	4822.1±3973.3	0.859

The results in Table 4 have shown there is no significant change between male and female with ASD for all parameters ($p>0.05$) except selenium($p\leq0.05$). Pfaender, *et al*., 2017 compared the current results with his findings and show that the most of the trace elements have a high level for the comparison group such as such as copper, mercury, lead, and others suffered from a decrease in their level such as iron, selenium and zinc the contradiction between this research and current research. The research group measured these trace elements during the sampling of hair and nails for ASD, while the current research took blood samples only, knowing that trace elements are more stable in tissues than in blood due to the persistence of heavy elements in those tissues. The second reason is the environmental and regional variances between the two researches, where environmental pollution plays an important role in the levels of trace elements in individuals. At the same time, the size of pollution varies from region to another [15]. Researchers have proven that the level of zinc in men is higher than the level of zinc in women, as zinc is affected by many factors, the most important of which is BMI, TG, Metabolic Syndrome, and since autistic people suffer from problems in absorption and metabolism. It also suffers from the variation in zinc levels between men and women[16]. The results in Figure 2 and Figure 3 do not show any change in the levels of trace elements which were listed in this figure in male and female. (Baker.,2016) The difference that occurs in the levels of trace elements is not affected by gender, but it is affected by the environment in which the person lives as there is no difference between men and women in the concentrations of trace elements. There is a difference in the concentrations of these elements between male and female because of the geographical environment in which the person lives, this explains the results of the current research. Differential expression of a big range of genes has proven to correlate with blood degrees of lead and mercury in children with ASD (2). High blood concentration of mercury in the course of diverse developmental tiers consequent to genetically decreased capacity to excrete mercury is shown to reason immunological, neurological and behavioral abnormalities very much like the ones seen in ASDs [17]. The chance of an aggregate of genetic and environmental elements specifically exposure to metals inside the etiology of ASDs. Therefore, appears to be sturdy and cannot be omitted because of the large environmental. Cadmium is a xenobiotic of high toxicity. It has neurotoxic, hepatotoxic, mutagenic, carcinogenic and teratogenic effects (it is protected with the aid of the international agency for research on cancer IARC into the group 1 of sellers of a showed carcinogenic impact on humans). Moreover, Cd impairs metabolism of Ca, Mg, Fe, Zn, Se and Cu, which causes morphological and functional modifications specially organs[18]. Cd is absorbed into a human body in particular via the digestive tract and respiratory gadget. As regards Cd in meals within the digestive tract, it's miles absorbed in approximately 6% in adults and up to 60% in kids [18]. Although Zn may be an environmental pollutant in addition to the cause of sideroblastic anemia in instances of excessive exposure, it's miles an vital trace element for human beings. Zn is vital in the synthesis of nucleic acids, cell replication in addition to tissue boom and repair, particularly in toddlers. Zinc deficiency negatively affects immunity, neuropathy, and difficulty in wound healing [19]. Zn also deficiency effects in excessive absorption of poisonous metals together with Cd and Pb, and enhances the formation of their deposits inside the body. Deficiency of Zn and Mg blended with an extended burden of poisonous metals may additionally play the main epigenetic position inside the pathogenesis of sicknesses from the autism spectrum [20]. Apart from the Mg deficiency, a number of autistic kids additionally show that the deficiency of Zn and Ca. Moreover, a courting among the deficiency of Zn and Mg were found. Every fourth baby suffers from the deficiency of each factors concurrently [19]. Most of the research concerned with studying the effect of selenium on autism disorder on children proves that the level of selenium decreases significantly in autistic children and this supports the current results of the current research. As for the high level of selenium in boys more than that of girls, there are no clear and compelling physiological reasons that explain the reason for the difference, but

perhaps the reason is due to the special care enjoyed by boys but not girls.cFor example, give them some nutritional supplement that contains trace elements important to treat the autism [21].

5. Conclusion

It can be concluded from this study that the levels of trace elements such as chromium ,copper, lead, mercury, selenium and iron are normal in children with autism spectrum disorders. While the level of zinc is significantly lower in patients compared to the control group. Also concluded no significant change between male and female in all levels of trace elements except selenium which showed a significant decrease in female patients compared to male patients.

Abstract. By condensation of benzaldehyde with thiourea in absolute ethanol in the presence of glacial acetic acid as a catalyst, the Schiff base(1-benzylidenethiourea)[I] was synthesized by synthesis of 4-(3-benzylidenethioureido)-4-thioxobut-2-enoic acid compound[II] by reaction of maleic anhydride with schiff base [I] in DMF. When treating compound [II] with ammonium persulfate (NH4)2S2O8 (APS) as an ethanol initiator to obtain polymer [III], compound [III] reacted to polymer [IV] with SOCl2 in benzene. Sulfamethizole, celecoxib, salbutamol, 4-aminoantipyrine to yield polymers [V-VIII], compound [IV] reaction with different drugs. Spectral evidence established the structure of synthesized compounds: FTIR and 1HNMR, UV-Vis Spectroscopy and Elemental Analysis (C.H.N-S) . These synthesized derivatives [V-VIII] were tested for their antibacterial activity against Bacillus subtilis (G+) and Escherichia coli (G-) by agar well diffusion process, and the results showed that all polymers had a greater diameter of the growth inhibition region. This may be relative to the presence of sulfamethizole medication, maleimide group and Schiff bases, Polymer[V] demonstrated excellent inhibition against Bacillus subtilisa and E.coli.

Keyword : Schiff base , Antibacterial activity, Salbutamol , Celecoxib , Maleimide , sulfamethizole.

1. Introduction

Schiff bases are a group of compounds containing (-HC=N-) formed from condensing products of aromatic aldehydes or primary amine ketones [1]. Schiff bases are commonly used in various fields, such as medical chemistry [2], antibacterial, antiviral, pharmacological, antioxidant and cancer activities [3-5]. In addition, the Schiff base enhances the biopolymer's stability[6]. A generic formula, $H_2C_2(CO)_2NH$, has maleimide compounds. The name 'maleimide' derives from the maleic acid and imide combination [7]. Maleimides are an essential type of heterocyclic compounds contained in natural products[8] and are used in organic and medicinal chemistry[9]. In pharmaceutical products with biological specific functions, such as antibacterial, anticancer, antitumor, tuberculostatic activity, anti-microbial, antiviral and antigenic activities, maleimides have important significance [10,11]. In order to be able to use multiple macromolecule systems, such as thermostability materials[12], self-healing systems[13], click reactions[14] and antibody-drug conjugates[15], Chemistry's

Maleimide[MI] has acquired a senior interest in both polymer and biological sciences. The structure of the alpha,β-unsaturated imide allows Maleimide to be extremely versatile. First, the two carbonyl groups have hydrogen bonding interaction power that can be used to modify the behavior of polymerization[16]. The feasibility of preparing higher and thermally stable polymers[17] is the copolymerization of maleimides with Schiff base supply. In addition to the process ability of maleimide polymer, flexible units within the polymer backbone can also be increased.

2. Experimental

Materials : *All chemicals supplied from Merck and Aldrich.*

Techniques : FTIR spectra recorded using KBr , discs on a 8400s Shimadzu spectrophotometer and FTIR spectrophotometer , Shimadzo [Ir prestige-21] . ^{1}HNMR spectra carried out by : Bruker , ultra shield 300 MHz , : Switzerland and are reported in ppm.

2.1.Synthetic Procedures:

2.1.1.Preparation of Schiff base[1-benzylidenethiourea] [I] [18]*:*

This compound was prepared from the reaction of benzeldehyde [1.06 g. , 0.01 mol] with thiourea [0.76 g. , 0.01 mol] in (30 ml.) ethanol and [3]drops of glacial acetic acid , the mixture refluxing at 70°C for 12h. . The course of the reaction was followed up using a technique TLC. When the reaction was completion , separated as yellow-colored product which was filtered , dried and recrystallized by methanol . Yield 85% ; m.p[129-131]^{0}C. Elemental Analysis , Calcd : C% = 58.53; H% = 4.87; N% = 17.07; S%= 19.51 , Found: C% = 58.67; H% = 4.98 ; N% =17.27 S% = 18.98.

2.1.2.Synthesis of 4-[3-benzylidenethioureido]-4-thioxobut-2-enoic acid[II] [19]

Mix Maleic anhydride [0.98 g. , 0.01mol] and [1.64 g. , 0.01mol] Schiff base [I] in 25ml DMF then refluxed about 4hr. , the viscous result washed with diethyl ether and then dried at room temperature. Yield 73% ; m.p[198-200]^{o}C**.** Elemental Analysis , Calcd : C% =54.96 ; H% = 3.81; N% = 10.68 ; S% = 12.21
Found: C% = 55.99 ; H% =3.90 ; N% =10.15; S% = 12.87

2.1.3.Synthesis of polymer[III] [20] *:*

[0.27g ,0.001mol] of compound [II] was mixed with (0.22gm) of ammonium per sulfate [APS] as initiator of polymerization in (15 ml.) of ethanol . The mixture stirring for 2-3 hrs at room temperature , then refluxed about 12hr. Filtered , washed with cold EtOH absolute , dried and recrystallized with ethanol to gave the required product [III].

2.1.4.Synthesis of polymer[IV] [21]

0.01 mol of compound [III] mixed with 0.01mol of thionyl chloride in 25ml. of dry benzene and reflux for (6hr) The Amount of $SOCl_2$ and benzene separated under vacuum after cooling.

2.1.5.*Synthesis of polymers [V-VIII]* [22]

A mixture [0.01mol] of compound [IV] and [0.01 mol] of drug [sulfamethizole or celecoxib or salbutamol or 4-aminoantipyrine] in 20 ml. of DMF . The mixture refluxed about 3 hr. Filtered , wash with ethanol absolute , dried and recrystallized from EtOH to gave the required product[V-VIII].

3. Result and Discussion

-1benzylidenethiourea[I] was prepared to give good yield to compound[I] by reaction of benzaldehyde with thiourea in absolute ethanol. FTIR and 1HNMR spectroscopy were used to identify this Schiff base [I]. The FTIR spectra, Fig.(1) shown at (1647)cm-1 appearance band refers to the azomethine group and two (3325,3149)cm-1 appearance bands attributable to NH2 . 1HNMR (DMSO) spectrum, Fig.(2) showed a signal at δ(2.11) ppm attributable to the NH2 group, a sharp singlet at δ(8.1) ppm for one proton attributed to CH=N and several signals for aromatic protons at δ(7.32-7.83) ppm. Compound [II] produces maleic anhydrides with Schiff base [I] in DMF from the reaction. FTIR spectroscopy detected the compound

[II]. 3400-2400 (OH), 3184 (NH) group, 3041 (C-H arom.) group, 1739 (C=O) of carboxylic acid, 1654(C=O-NH), 1641(C=N), 1591(C=C)Aromatic and 1126(C=S). FTIR absorption[a,cm-1]: Polymer [III] was synthesized with ethanol using ammonium per sulfate (APS) as the initiator via the reaction compound [II]. The stretching band referred to the O-H of the COOH moiety in the area (3406-2800)cm-1, the stretching band of the N-H group appeared at (3170) cm-1-, 3007 (C-H arom.)-, 2941,2856 (C-H aliph.) and the stretching band to (C=O) for COOH appeared at 1735cm-1.

In order to achieve transformation to a new function group, acid chloride was considered a very active intermediate, so we aimed at synthesizing compound[IV] by reaction compound[III] with thionyl chloride, the acid chloride[IV]formed as residue was used in the next reaction without further purification. Polymers [V-VIII] is synthesized with drugs (sulfamethizole or celecoxib or salbutamol or 4-aminoantipyrine) from the reacted polymer [IV] . FT-IR spectrum for compound [VII], acyl chloride absorption band disappearance and absorption band appearance at (1729) cm-1 refer to (C=O-O), N-H group stretch band appeared at (3214) cm-1 and OH, C=O-NH and C=N stretch bands appeared at(3438), (1687), (1630) cm-1 respectively. 1H NMR (δ ppm): sharp singlet signal at δ (1.17) refers to nine C(CH3)3 protons, signal at δ (2.01) due to proton NH of [NH-C(CH3)3] group, -CH=CH chemical shift disappears and shows chemical shift at δ (2.73-2.98) due to-[CH-CH]n-, doublet signal at (3.17-3.40) connected to CH2 proton and triplet signal at δ(4.47) due to CH proton signals at δ(5.65),(5.77) due to proton CH2O and (5.77) Compound FT-IR spectrum [VIII] (200, cm-1): reveals the current absorption band due to amide (C=O) in the area (1687)cm-1 and absorption band disappearance due to acyl chloride. A signal at δ (2.73) due to protons of [C[CH3]] group, -CH=CH chemical shift disappears and shows chemical shift at δ (2.98-3.23) ppm due to-(CH-CH)n-, signal at δ(3.45) refer to protons of [N(CH3)] group, signal at δ(6.02) refer to proton of (NH-C=O) group, multiple signals at δ(6.91-7.25) attributable to aromatic protons, signal at δ(7.97) attributable to CH=N, multiple signals at δ(6.91-7.25) The UV-Vis compound spectrum[VII,VIII] displays the peaks of absorption at(280-332), (290-2320) that can be attributed to(π-π*) and (n-π*).

4. Biological Activity:

The polymers [V-VIII] were tested by the agar well diffusion method (Barry, 1977) for their antibacterial activity against Bacillus subtilis [G+] and Escherichia coli [G-] (in vitro), the standard drug used to compare the synthesized polymers with penicillin (50µg / ml) . The results showed that the growth inhibition zone diameter of all polymers was higher. Compound[V] demonstrated strong inhibition against Bacillus subtilisa and E.coli, which may be linked to the existence of the drug sulfamethizole, since this drug is a sulfonamide-derived antibacterial. It is effective against a wide variety of gram-negative and gram-positive bacteria as an antibiotic. The polymer[V] also includes Maleimide group and Schiff bases that have strong antibacterial activity.

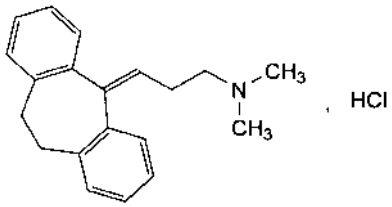
Abstract . This paper uses the potentiometric method to evaluate (amitriptyline hydrochloride, AM) by creating selective electrodes for AM drugs with the active ingredient (Ammonium Reinackate, AR) using a plasticizer (Dibutyl phthalate, DBP). The results showed that for (Coated Wire Electrode (CWE)) and Coated Graphite Electrode (CGE) respectively, the Nernstian slope of the prepared Am-AR-DBP electrodes is (57.293, 58.803 mV / decade). With a pH range of (4-7) and a concentration range of 1 ?? 10 ?? ^(-6)-1 ?? 10 ?? ^(-1) M for both electrodes, the upper and lower limit of detection for the Am-AR-DBP CGE is 0.2042M, 4.8 ?? 10 ?? ^(-7) M, and the upper and lower limit of detection for the Am-AR-DBP CWE electrode is 0.2051M, 4.91 ?? 10^(-7) M, respectively. The response time ranges from 20-83 sec, 14-76 sec for CWE and CGE electrodes respectively. For the CWE electrode, the age of the electrodes is 26 days, and for the CGE electrode, 42 days. The research included calculating the selectivity with the presence of interferers of these electrodes where the K(i,j)^pot values for all ions were less than 1. In the estimation of the drug Amitriptyline Hydrochloride in the pharmaceutical preparation (Amitriptyline tablets), the manufactured electrodes were used by following the direct process, the standard method of additions, the possible titration method and the homogeneity of the material sample, as well as the drug was estimated in urine and blood plasma with a recovery of not less than 100.57 for urine and 99.46 f for urine.

Keywords :Amitriptyline hydrochloride, Ion selective electrodes, Coated Wire Electrod; Coated Graphite Electrode, Ion pair.

1. Introduction:

Electrochemical sensors are one of the smallest chemical tools that can give instant and direct information when a specific compound or ion is present in complex samples. Among the different classes of chemical sensors, ion selective electrodes used in potential sensors are one of the most widely used. Potential detection by ion selective electrodes (ISEs) provide several advantages over other analysis methods such as speed, ease of operation, simple instrumentation, relatively fast response, wide dynamic range, reasonable selectivity, and low cost [1]. A selective electrode is generally known as a chemical sensor capable of converting the activity of a particular ion dissolved in a solution into an electrical potential that can be measured with a voltmeter or pH meter [2,3] The formula for amtriptyline hydrochloride is [4]



The molecular formula [4] is $C_{20}H_{23}N$, HCl, and its molecular weight is 313.9 g / mol, and the scientific name for the drug [5] is

3-(10,11-Dihydro-5H-dibenzo[a,d][7]annulen-5-ylidene)-N,Ndimethyl propan -1- amine hydrochloride.It is in the form of white powder or colorless crystals, easily dissolved in water, alcohol, and dichloromethane [6]. Amitriptyline hydrochloride is used to treat mental / mood problems such as depression. It may help improve mood and feelings of well-being, relieve anxiety and tension, aid in a better sleep, and increase the patient's energy level. This medication belongs to a class of drugs called tricyclic antidepressants[7]. Due to the medical importance of this drug, it has been determined by many different analytical methods, such as spectroscopy [8,9], HPLC [10,11], (RP-HPLC) [12], Voltmeter technology[13], and gas Liquid chromatography [14], capillary electrophoresis method [15], LC-MS technique [16], liquid chromatography [17], flow injection technique [18], thin-layer chromatography [19], fluorometry (20), and atomic absorption spectroscopy [21]. In this study, several selective electrodes were manufactured for the determination of Amitriptyline hydrochloride in its pure form, in its pharmaceutical preparations, and in biological fluids. Two types of electrodes were prepared (Coated Graphite Electrode (CGE) and Coated Wire Electrode (CWE).

2. Experimental Section

2.1. Apparatus

Jenway 3310 pH Meter, HANNA Instruments pH Meter 211, calomel electrode Swiss source, JENWAY Hot Plate with Stirrer-Germany, C.H.N Perkin Elmer USA 2400 Series II element analyzer.

2.2. Materials and Reagents

All chemicals used were of a high degree of purity and supplied by SDI, BDH, and Fluka

1.solution of Amitriptyline hydrochloride, AM 10^{-1} M.

Prepared the standard solution of Amitriptyline hydrochloride at a concentration of 10^{-1} M by dissolving 3.1390 grams in deionized distilled water using a 100 mL volumetric flask and complete the volume with deionic distilled water to the mark and the other standard solutions (10^{-2}-10^{-8}) M were prepared by dilution With deionized distilled water.

2.3 .Ammonium reinackate solution, AR 10^{-1} M.

Prepared the solution by dissolving 3.5444 g of the substance in a 100 mL volumetric flask and complete the volume with deionized distilled water to the mark.

2.4 Hydrochloric acid at a concentration of approx 0.1 M.

0.8 mL of concentrated hydrochloric acid (12 N) was transferred by a graduated pipette to a 100 mL volumetric flask containing 50 mL deionized distilled water and the volume was completed with deionized distilled water to the mark.

2.5 Sodium hydroxide at a concentration of approx 0.1 M.

Dissolved 0.4 g of the substance in a 100 mL volumetric flask and complete the volume with deionized distilled water to the mark.

2.6 Amitriptyline Tabletes preparation solution 25 mg.

Ten tablets containing 0.25 g of the basic substance Amitriptyline hydrochloride developed by the State Medicines and Medical Supplies Company of Samarra were crushed in an agate mortar and 1,025 grams was the average weight of one tablet. When 1,2867 g of the pharmaceutical preparation was taken and then dissolved with an ultrasonic system in deionized distilled water with Shake to ensure full dissolution and filtered with Whatman filter paper, the filtrate was then diluted in a 100 mL volumetric flask and the volume was

completed with deionized distilled water to the mark, so the result was a solution with a concentration of 10-2 M and a concentration of 100 mL.

2.7 Biological fluid solutions (urine, blood plasma) 0.01 M

In a stopper test tube, 4.5 mL of human plasma or urine were Then added, 0.5 mL was added at a concentration of 0.1 M amtriptyline hydrochloride, and the tube was shaken for 1 minute. Other solutions of different concentrations were prepared by dilution with deionized distilled water.

2.8 Preparation of the ion-pair

The ion pair was prepared by combining 10 ml of AM drug solution at 10-1 M concentration with 10 ml of AR solution at 10-1 M concentration with stirring to form a light red AM-AR precipitate, then the precipitate was filtered and washed several times with deionized distilled water and left for two days at the temperature of the laboratory until dehydration and the precipitate was dehydrated and washed several times with deionized distilled water (1).

Table 1. Element Analysis for the AM-AR ion pair

Element analysis	AM-AR		
	%C	%H	%N
Found	43.24	5.38	16.76
Calculated	43.13	5.43	16.75
Formula	$[C_{20}H_{24}NCl][C_4H_{10}CrN_7S_4].H_2O$		

2.9. Preparation of the Electrodes

2.9.1. Coated Graphite Electrode (CGE)

Through a series of preliminary experiments, the selective membrane was prepared by mixing its components according to weight ratios, which gave the best membranes in terms of the nature of the membrane and its response according to the following: The coated graphite electrode was prepared by encapsulating a pure carbon rod (5.5 cm in length, 8 mm in diameter) with a tight polyethylene tube. A mixture consisting of (10% AM-AR, 30% PVC, 60% DBP as plasticizer) was prepared. And then dissolve the mixture in (5 ml) of THF, which is considered a good solvent and adhesive, and then continue stirring until we get a thick solution at a volume of 2-3 ml of the mixture. 1cm of the uncoated graphite rod was immersed (5) times each immersion for 10 seconds, between each immersion and another (2-3) minutes, then left in the air for an hour to dry. The electrode was immersed in a 1×10^{-2} M solution of amtriptyline hydrochloride for different periods, then the other end of the coated carbon rod was connected with an insulated copper wire and connected to a Potentiometer recorder [22].

2.9.2. Coated Wire Electrode (CWE)

Via a series of preliminary experiments, the selective membrane was prepared by mixing its components according to the weight ratios given by the best membranes in terms of the nature of the membrane and its reaction according to the following: when the silver wire was washed with nitric acid, rinsed with distilled water, dried with acetone, and then left to dry. The silver wire should be insulated well (8 cm long and 2 mm in diameter). We leave the silver wire 1 cm from both ends exposed and uninsulated. A mixture was prepared consisting of (10% AM-AR, 30% PVC, 60% DBP as plasticizer). And then dissolve the mixture into (5 ml) THF, which is known to be a strong solvent and adhesive, and then continue stirring until 2-3 ml of the mixture has a thick solution. 1 cm of unwrapped silver wire (5) was submerged every 10 seconds between each dip and another (2-3) minutes, then left in the air to dry for an hour. For different times, the electrode was submerged in an amtriptyline hydrochloride solution of 1 ?? 10^(-2) M, then the other end of the silver wire was attached to the potentiometer recorder[23].

3. Results and Discussion

3.1. Study the optimal components of (CWE, CGE)

In a 50 ml glass beaker, the AM-AR electrode (CWE, CGE) was immersed with a calomel electrode, and the potential difference was recorded for the pharmaceutical solutions at concentrations of 10^{-8} - 10^{-1} M and a corresponding graph of (-) the logarithm of the solutions concentration and the results are shown in Table (2). Solutions concentrations that are less than 1×10^{-6} M did not show a linear response in the (CWE, CGE) electrodes and were therefore neglected in the subsequent experiments. Two types of electrodes were prepared, CWE and CGE, with different proportions. The electrode (No. 1) is the best AM-AR-DBP CGE electrode, with the Nirnste slope being about 58.62 mV.decade^{-1}, and the electrode (No. 4) the best Am-AR-DBP CWE electrode, where the Nirnesty slope gives about 56.85mV.decade-1 , This can be seen from Table (2). The properties and specifications of these selective electrodes that are manufactured for the medicinal substance have been studied according to the following Table (2):

Table 2. Improvement of CWE and CGE electrode components

Electrode No.	PVC (%)	plasticizer (%)	Am-AR (%)	Slope $\frac{mV}{decade}$	Linear range M	R^2
			AM-AR-DBP, CGE			
1	**30**	**60**	**10**	**58.62**	**1×10^{-6} - 1×10^{-1}**	**0.9998**
2	30	63	7	53.29	1×10^{-6} - 1×10^{-1}	0.9951
3	30	65	5	52.22	1×10^{-6} - 1×10^{-1}	0.9876
			AM-AR-DBP, CWE			
10	**30**	**60**	**10**	**56.85**	**1×10^{-6} - 1×10^{-1}**	**0.9996**
11	30	63	7	54.66	1×10^{-6} - 1×10^{-1}	0.9991
12	30	65	5	53.91	1×10^{-6} - 1×10^{-1}	0.9993

3.2 Effect of pH

In order to research the effect of the pH on the electrode's potential response, the potential was determined by adding NaOH or HCl to a constant concentration of 1 ?? 10 ?? ^(-4) M of amtriptyline hydrochloride solution and to different pH values ranging from (1-10). As a function of pH in Fig., the potential shift was plotted. 1. The results indicated that the potential of the electrode is constant between the pH (4-7). In this range, no interference from hydrogen ions or hydroxyl ions was observed. Fluctuations in the potential value at a pH of more than 7 can be due to the formation of soluble and insoluble complexes with hydroxyl ions in the solution of the medication amtriptyline hydrochloride. As for the fluctuations at a pH below 4, it is likely to be due to the partial protonation of the formed complex. The results of this research are shown in Figure 5 (1).

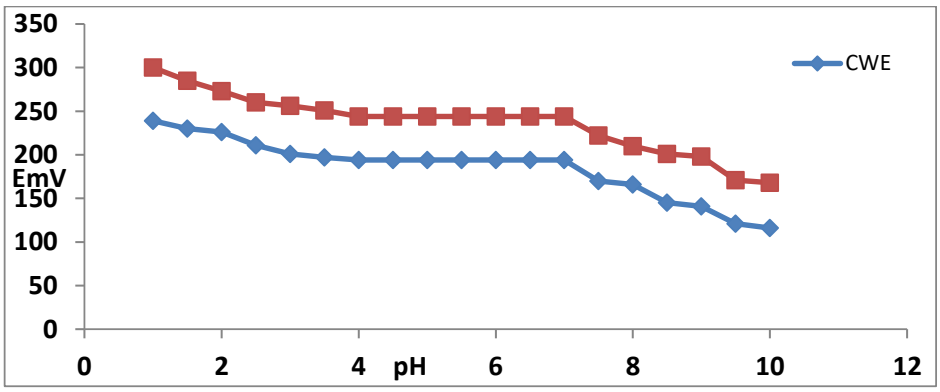


Figure 1. Effect of pH on the potential response of AM-AR-DBP Electrodes

3.3. Effect of Temperature

The potential change was measured by changing the temperature of the solution from (5-85) C for a concentration of 1×10^{-4} M, and the relationship between the temperature and the measured potential difference was plotted, and it was found that the best temperature range in which the electrodes would operate is between (10-50) ºC for (CWE, CGE) electrodes. which was used in the subsequent experiments, and the results are shown in Fig. 2. It shows a significant increase in the potential difference values at higher temperatures, which can be attributed to the increase in the movement of drug solution particles inside and outside the electrode. The temperature that is less than 5 °C was neglected due to the freezing of the solution, as the phenomenon of water anomalies occurs at a temperature of 4 °C, so the surface of the solution becomes freezing, preventing the electrode from performing its work, which makes measuring the potential difference of the solution at a temperature less than 5 °C is not possible.

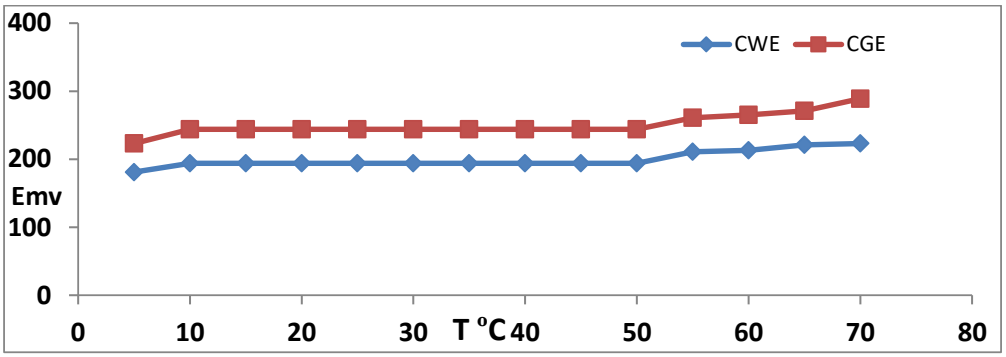

Figure 2. Effect of Temperature on the potential response of AM-AR-DBP Electrodes

3.4. Effect of electrode immersion time on electrode performance

The effect of submerging the AM-AR-DBP electrodes in a 1×10^{-2} M solution of Amitriptyline hydrochloride was studied for different periods by measuring and following the slope values until the readings stabilized and the highest value of the Nernstatic slope was obtained. The slope values reached their maximum values for the prepared AM-AR-DBP electrodes (58.62, 56.85) mV / (decade) after continuous immersion for (12, 24 hours) CWE and CGE electrodes respectively.

3.5. Calibration Curve and Detection limit

After determining the optimal conditions of the pH and temperature in several experiments, a calibration curve was drawn, and it is evident in Figure 3 how linear the calibration curve is. The upper and lower detection limit of the prepared AM-AR-DBP electrodes were calculated and the upper and lower detection limit of the CGE electrode was 0.2042M, 4.8×10^{-7} M respectively, and the upper and lower detection limit of the CWE electrode was 0.2051M, 4.91×10^{-7} M respectively.

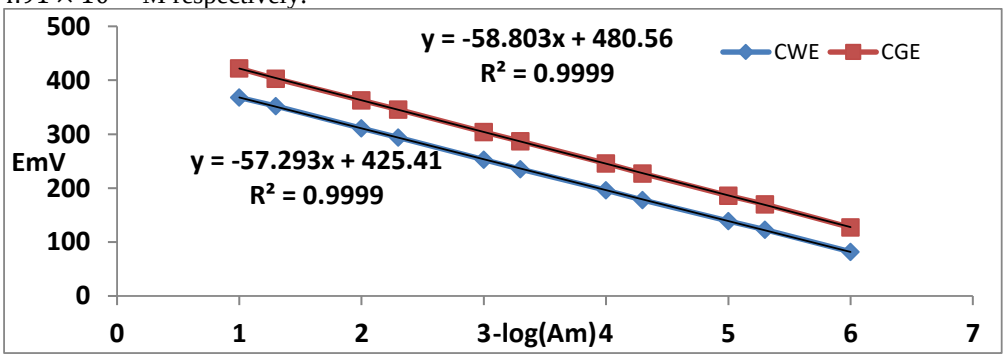

Figure 3. calibration curve of AM-AR-DBP Electrodes

3.6.Precision and accuracy

After drawing the calibration curve for the AM-AR-DBP electrodes, precision and accuracy were studied by calculating the potential of different drug concentrations to be tested within the linear range of the calibration curve for (7) consecutive readings and at the optimal selected conditions, and the results are shown in the Table (3).

Table 3. Precision and accuracy of results for AM-AR-DBP electrodes

Sample	Taken [AM] M	Found [AM] M	%Recovery	%RE
CGE	1×10^{-1}	1.0095×10^{-1}	100.95	0.95

Variance		1.311		
%RE		- 0.2083		
%RSD		1.1473		

In addition to good recovery and relative error values, Table (3) shows a value for the relative standard deviation of the AM-AR-DBP electrodes which are 2.0183% and 1.1473% for the CGE and CWE electrodes respectively for the concentrations selected from the calibration curve. These results indicate that the prepared electrodes can be used. To estimate the drug with high accuracy and Precision.

3.7. Response Time

The Response Time of the electrodes was studied by immersing the electrode in the solution of the drug to be analyzed at concentrations of 10^{-6}-10^{-1} M and measuring the potential difference for each solution and determining the response time and the results are shown in Figure (4) and it is clear that the response time of the prepared AM-AR-DBP electrodes ranges Between 20-83 seconds, 14-76 seconds for CWE and CGE electrodes respectively.

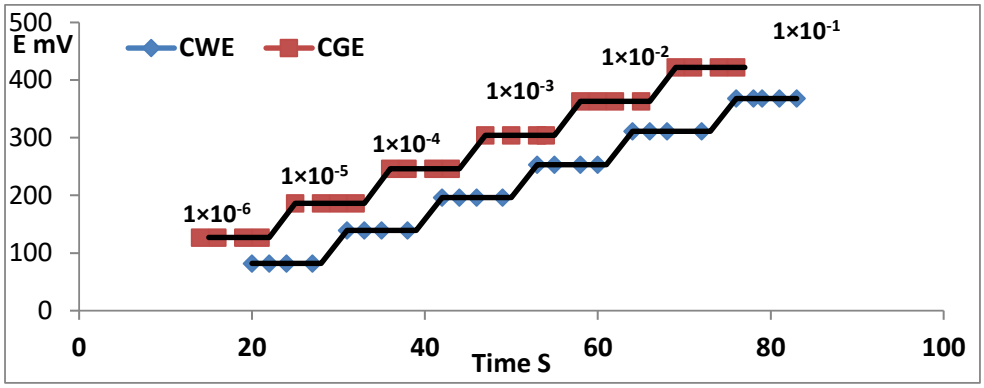

Figure 4. Response Time of AM-AR-DBP Electrodes

3.8. Study the life time of the Electrode

The lifetime of the AM-AR-DBP electrode was calculated by repeating the calibration two or three times a week for each prepared electrode, with Nernstatic slope follow-up values, as no deviation or decrease in Nernstatic slope was observed for 26 days, 42 for CWE and CGE electrodes, respectively. After that, a negative deflection was shown by the electrodes. In general, the explanation for the end of the electrode's existence could be due to the leakage of the electrode material (the active substance).

3.9. Selectivity

The electrodes showed high selectivity in the direction of the drug without the potential being affected by the interfering ions selected through the selectivity coefficient values that are less than one and shown in Table (4). The selectivity was measured by the separate solutions method [24], where the potential of the drug solution was measured at a concentration of 1×10^{-3} M without adding the interfering ion (E_i), then the potential of the interfering ion solution was measured at a concentration of 1×10^{-3} M Alone (E_j).

Table 4. selectivity coefficient values

the interfering ion $\mathbf{1 \times 10^{-3}}$ M	Selectivity coefficient values $K_{i,j}^{pot}$	
	AM-AR-DBP	
	CWE	CGE
Na^{1+}	5.001×10^{-1}	4.444×10^{-1}

$NH_4{}^{1+}$	4.099×10^{-1}	3.911×10^{-1}
Ba^{2+}	4.111×10^{-3}	5.998×10^{-3}
Ca^{2+}	9.0012×10^{-3}	60333×10^{-3}
Mg^{2+}	4.111×10^{-3}	7.321×10^{-3}
Cl^{1-}	9.678×10^{-2}	8.008×10^{-2}
Br^{1-}	6.321×10^{-2}	7.191×10^{-2}
I^{1-}	3.665×10^{-2}	2.900×10^{-2}
$NO_3{}^{-1}$	2.988×10^{-2}	3.434×10^{-2}
$CO_3{}^{1-}$	4.432×10^{-2}	8.801×10^{-2}
$SO_4{}^{2-}$	2.200×10^{-2}	3.120×10^{-2}
Glucose	1.922×10^{-3}	2.222×10^{-3}
Fructose	8.004×10^{-3}	6.990×10^{-3}
Starch	7.777×10^{-3}	5.000×10^{-3}

3.10. Robustness and Ruggedness

The robustness of the analytical method used for the AM-AR-DBP electrodes prepared for both types CWE and CGE was examined by using ethanol as a solvent instead of water in the preparation of drug solutions for the concentration range $1 \times 10^{-6} - 1 \times 10^{-1}$ M. As for the rigidity of the method, it was studied by using another Potentiometer recorder (HANNA Instruments 211 pH Meter) with changing the laboratory used, and the results are shown in Table (5).

Table 5. Robustness and Ruggedness of the analytical method used for AM-AR-DBP electrodes

Parameter	Robustness	
	CGE	CWE
%Mean ± SD	101.015 ± 2.3942	101.2466 ± 2.0018
n	6	6
Variance	5.7324	4.0072
%RE	1.0150	1.2466
%RSD	2.3701	1.9771

Parameter	Ruggedness	
	CGE	CWE
%Mean ± SD	100.01 ± 1.6865	99.800 ± 1.6015
n	6	6
Variance	2.8445	2.5648
%RE	0.0100	-0.2000
%RSD	1.6863	1.6047

3.11. Applications of drug Amitriptyline hydrochloride in pharmaceutical preparations

3.11.1. The direct method

The drug was estimated in the pharmaceutical formulation, Amitriptyline tablets, using the prepared AM-AR-DBP electrodes, and the results are shown in Table (6).

Table 6. Estimating the drug by the direct method

Sample AM-AR-DBP	Taken [AM] M	Found [AM] M	%Recovery	%RE	%RSD*
CWE	5×10^{-2}	5.0261×10^{-2}	100.522	0.522	0.2548
	5×10^{-3}	5.0857×10^{-3}	101.71	1.714	0.3042
CGE	5×10^{-2}	4.9891×10^{-2}	99.7827	- 0.217	0.1565
	5×10^{-3}	4.9508×10^{-3}	99.0160	-0.984	0.3175

The good recovery values using the prepared AM-AR-DBP electrodes and the relative standard deviation values for the CWE, CGE electrodes confirm that the estimation using these electrodes is of high Precision and accuracy.

3.11.2. Standard Additions Method

The calibration curves for the standard additions method of AM on the pharmaceutical preparation Amitriptyline tablets of the prepared AM-AR-DBP electrodes are shown in Fig. (5). Depending on the straight-line equation and when y = 0, x = -2.0064 for the CWE electrode and x = -2.0247 for the CGE electrode, it represents the volume of the standard solution Vs with a concentration of 1×10^{-3}M, and using the relationship:

$C\ V = -V_s\ X$

Since C = concentration of the pharmaceutical preparation solution (required), V = volume of Amitriptyline tablet preparation solution = 10 ml, X = standard solution concentration of the pure drug additive = 1×10^{-3}M, Vs = volume of standard solution Of the drug.

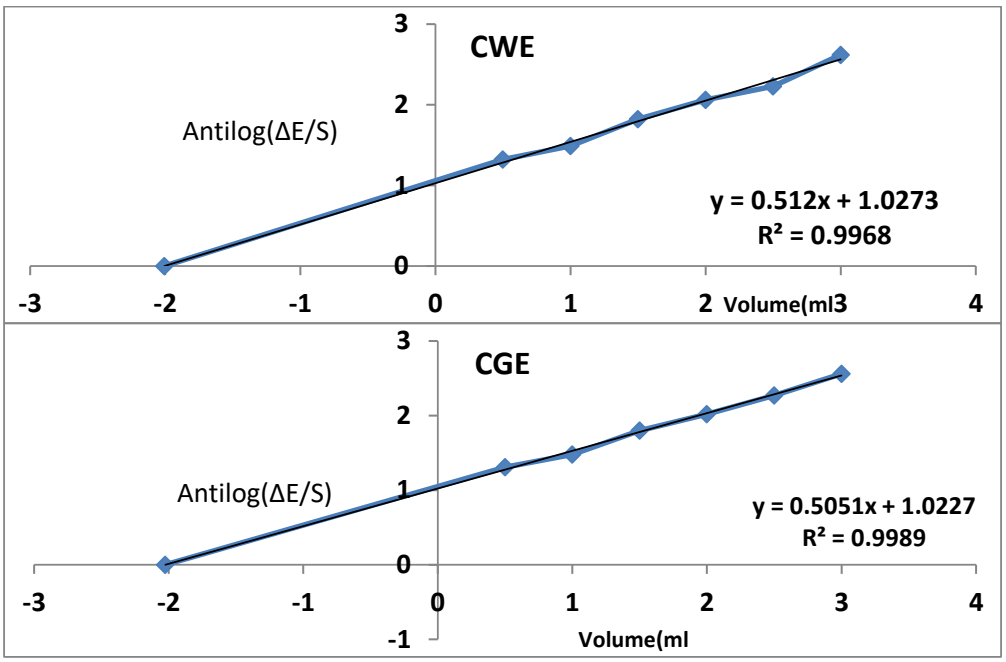

Figure 5. Standard Additions Curves for Estimation of AM in (Amitriptyline Tablet) using the prepared AM-AR-DBP electrodes.

Table 7. Estimating the drug by the Standard Additions method

Sample AM-AR-DBP	Taken [AM] M	Found [AM] M	%Recovery	%RE
CWE	2×10^{-4}	2.0064×10^{-4}	100.32	0.32
CGE	2×10^{-4}	2.0247×10^{-4}	101.23	1.23

The recovery values of the amitriptyline hydrochloride concentration using AM-AR-DBP electrodes prepared after application for the pharmaceutical preparation of amitriptyline tablets are shown in Table (7). We infer from these good results of recovery values and relative error that the electrodes developed and used in the determination of amitriptyline hydrochloride in the amitriptyline tablet pharmaceutical preparation are electrodes that give good precision results.

3.11.3. potentiometric titration method

The drug was estimated in the pharmaceutical preparation amitriptyline tablets using the prepared AM-AR-DBP electrodes and the results are shown in Table (8) after the graph of the values of the potential of the solution AM, its concentration 1×10^{-3} M and its volume of 10 ml against the titrant solution AR Its concentration is 1×10^{-3} M, and the end point is defined as a bisection of the steeply sloping portion of the curve which is analogous to the inverse of the letter S.

Table 8 . Estimating the drug by the potentiometric titration method

Sample AM-AR-DBP	Taken [AM] M	Found [AM] M	%Mean* ± SD	%Recovery	%RE	%RSD
CWE	1×10^{-3}	1.0083×10^{-3}	100.83 ±2.5000	100.83	0.83	2.4794
CGE	1×10^{-3}	1.0027×10^{-3}	100.27± 2.6352	100.27	0.27	2.6281

Average of nine potential readings *

3.11.4. Study the homogeneity of content

The drug was measured using the prepared AM-AR-DBP electrodes in the pharmaceutical formulation, amitriptyline tablets, and the results are shown in the table (9). After a series of bakers had been prepared and one tablet was dissolved in 100 ml of deionized distilled water in each baker, then the potential was measured and the concentration of the solution was determined by the calibration curve.

Table 9. Estimating the drug by the homogeneity of content method

Sample AM-AR-DBP	Taken [AM] M	Found [AM] M	%Recovery*	%RE
CWE	7.9643×10^{-4}	7.8595×10^{-4}	98.6800	-1.32
CGE	7.9643×10^{-4}	8.0068×10^{-4}	100.5341	0.5341

Average of six potential readings *

3.11.5. Determination of drug in urine and blood plasma

amitriptyline hydrochloride was estimated in urine and blood plasma in the pharmaceutical formulation Amitriptyline tablets using AM-AR-DBP electrodes prepared and the results are shown in Table (10).

Table 10 . Estimating the drug in urine and blood plasma

Sample Urine AM-AR-DBP	Taken [AM] M	Found* [AM] M	%Recovery	%RE
CWE	2×10^{-3}	2.0179×10^{-3}	100.89	0.89
CGE	2×10^{-3}	2.0115×10^{-3}	100.57	0.57
Sample Urine AM-AR-DBP	Taken [AM] M	Found* [AM] M	%Recovery*	%RE
CWE	2×10^{-3}	1.9945×10^{-3}	99.7274	-0.2725
CGE	2×10^{-3}	1.9892×10^{-3}	99.4600	- 0.5399

Average of seven potential readings *

4. Conclusion

In the presence of DBP as a plasticizer, Ion-selective electrodes consisting of an electrically active material resulting from the interaction of AM with AR were produced. A linear response range (10-6-10-1 M) with a slope equal to (57.293, 58.803 mV / decade) was achieved by the prepared AM-AR-DBP electrodes. The CGE electrode's upper and lower detection limit was 0.2042M, 4.8 ?? 10 ?? ^(-7) M, and the CWE electrode's upper and lower detection limit was 0.2051M, 4.91 ?? 10^(-7) M. For both CWE and CGE electrodes, the lifetime of the electrodes was (26 days, 42 days). This new technique has been shown to be highly accurate and successfully applied to pharmaceutical preparation (Amitriptyline tablets), urine and plasma blood.

Influence of ultrasonic pre-treatment on Pyrolysis and Combustion of Sewage Sludge by TG

Influence of ultrasonic pre-treatment on Pyrolysis and Combustion of Sewage Sludge by TG

Ruaa O. Taha [1,*] and Farah Ali Mohammed[2]

University of Technology, Department of chemical engineering, Baghdad, Iraq.

[1]E-mail: rtosse581@gmail.com

Abstract. The combustion and pyrolysis processes of sewage sludge were studied in the current report. Two kinds of sewage sludge(SS) were used, SS the sewage sludge was not treated, while SS-U90KHz the ultrasonic bath pre-treated sewage sludge with a frequency of 90KHz was not treated. Wastewater treatment plants are the origins of waste sludge. Analyses were performed roughly and finally. Thermogravimetric research analyzed the thermal behaviour of the analysed sewage bucket (TGA). The samples were heated at a constant rate of 25 to 800 Celsius by air (combustion) and nitrogen flow (pyrolysis). For sludges which have been investigated. In the TG/DTG curves, comparable thermal profiles were available. All of the TG/curves DTG's were divided into three periods. At the same time, during the combustion stage, the sewage sludge decomposition occurred in the 180-580 0C range. The pyrolysis procedure took place at a lower rate, but less weight loss..

1. Introduction

Wastewater sludge is a by-product of wastewater treatment comprising organic compounds, microorganisms and harmful substances, including heavy metals[1], weakly biodegradable organic compounds, microbes, viruses, pharmaceuticals and dioxins that are not easily disposable[2,3]. At least 20 metals are dangerous and half of them are released into the atmosphere to the point of posing a danger to public health[4]. When the waste sludge is treated, a number of operations are performed which rapidly decompose the concentrations of organic materials. The safe removal of wastewater sludge is one of the world's greatest environmental issues [5]. As sludge has a relatively high "calorific value," it is particularly fascinating to have energetic processing technologies, including thermal pyrolysis and combustion. The main advantages of combustion are the decreasing volumes provided by the centimeters relative to the initial commodities. This waste can be transformed by combustion into heat energy [6]. On the other hand, pyrolysis is a promising technique that makes it a valuable fuel that can be developed for the manufacture of fuels of a different sort, such as oil and gas[7]. Since most of the hazardous components are partially stored in the monkey[8], it seems that this process is less polluting than combustion. Like gas produced by the gasification of waste [9]. Coal combustion is a value for gaseous gas filtered pyrolysis as well as an understanding of the process of sludge pyrolysis is a first step in developing our combustion knowledge during the time of explosive combustion. Other methods have been followed[10], and sludge has been used in compound adsorbents[11,12,13] for the extraction of poisons such as NO2 and SH2. The sludge is, in other words, still very useful. Sewage sludge pyrolysis studies and documents have been released. Pyrolysis and drying methods were examined by Kasakura and Hiraoka, taking into account the economies of various choices. Seggiani et al.[14] studied the decomposition of four wastewater sludge sites, showing that sewage sludge pyrolysis was prone to small quantities of organic salt and to the decomposition of two different reactions. An significant research method for the biomass

conversion of electricity[15] has been the alteration of multiple wastewater treatment plant sludge (WWTP) to modify the fuel properties of sludge and its actions during pyrolysis and combustion using ultrasound waves as pre-treatment[15]. This will build up energy through cavitation and then quickly discharge the energy through the immediate collapse of a cavitation bubble, which will break up the chemical connection and kill the interface constraints of the multi-phase system and increase the heat and mass flow[16]. About Subhedar et.al. [17] clarified some of the multiple findings of lignocellulose ultrasound. In certain cases, the ultrasound had a remarkable capacity to sever the chemical bonds of the biomass materials, allowing it to eliminate compounds of interest such as cellulose, hemicellulose or lignin. This research is being carried out to compare two samples of sandstone with pyrolysis and combustion in drainage plants. In pyrolysis and sludge combustion, TG results were achieved in N2 and O2 atmospheres in the 25 800C temperature range of the ultrasonic wave 90 K Hz. Compared to other papers, the research carried out in this study is relevant for both of the two activities found, as it analyzes pyrolysis and combustion for the same sludge form.

2. Material and Techniques

2.1 Sample collection

The samples of sewage sludge have been taken from a factory of treating waste water plant (Al– Rustumiya, Baghdad, Iraq).

2.2 Techniques

2.2.1. Prior-treating Techniques

An ultrasonic bath processor was used to treat (100 g) of sewage sludge powder which melted, scattered in a good way with 200 millilitres of filtered water, after that the mix sample settled in ultrasonic bath for 1 hr at 180 W power and exposed to 90 KHz frequency at steady temperature 80°C. as a final point, the mixture has been gathered by using filtrating sucked and drained off at one hundred and five°C for twenty-four hr.

2.2.2.Using TGA analysing Device for High Temperature Decomposition:

SS and SS-U90KHz samples have been analysed utilizing an analyser of thermal properties (Linseis STA PT1000) for creating thermo-graphs in a flowing of nitrogen and oxygen . the specimen has been put under a heat rate of 10°C per minute. the primary sample weight has been nearly at (seven – ten) milligrams for every single run, besides the losing in weight data have been noticed at a degree of heat constant reach to 800 degrees.

3. Results and Discussion

In the inert atmosphere (pyrolysis) and in the oxidative atmosphere (combustion), the experimental variations in weight fraction vs. temperature were established in active runs at a temperature of 10 ° C min-1 as shown in 'Figure. 1 'for two samples of SS and SS-90KHz, define the following differences.

Table 1: Approximate and ultimate analysis for SS and SS – U90KHz samples.

	SS	**SS-U90 KHz**
Humidity (wt%)	3.9	4.1
Volatile matter (wt%)	53.9	65.9
Fixed carbon (wt%)	2.9	8.8
Ash content (wt%)	45.3	30.0
C total (wt%)	26.42	40.56
H (wt%)	3.9	5.5
O (wt%)	26.0	28.3
N (wt%)	3.10	6.65
S total (wt%)	0.71	1.25

3.1 Pyrolysis results on thermographer and derivative thermogravimetry TG/DTG analysis

Sludge pyrolyzing is an inert thermal method, where organic material is subject to a sequence of complicated reactions, causing explosive production and organic condensation, which eventually contribute to the formation of carbon dioxide. The processes of devolatilization of sludge follow.

Sludge ---------- volatile material (H2, CO, CO2, H2O, CxHy, etc) + Char

Directed thermogravimetry (DTG) of the samples of sludge pyrolysis confirmed a paralyse of sludge elements (biodegradable organic and bacterial substances and nondegradable substances) at two peaks partly overlapping or one peak and one shoulder of 180, 550 C. Specimens for sludges pyrolysis derivative thermogravimetry (DTG) A pyrolysis of sludges explained a top and a shoulder between 180 and 550 C. Two primary periods in this temperature range were regarded: (a) The bulk of reactive pyrolysis was considered for the first cycle (from around 180 to 385 C). Components (organic material biodegradable) were collected along with less reactive partial pyrolysis of the (bacterial components, the pyrolysis of which was initiated further at higher temperatures. (b) Less reactive portion (most usually bacterial) pyrolysis [18] was carried out in the second era (385-550 C). In addition, a light char devolatilization (secondary pyrolysis) causing the breakdown of the C-C terminal bonds in a concentrated organic composition in the char was detected at temperatures greater than 550 C. The end was observed. Other scientists [19,20,21] suggested that the above devolatilization has risen due to the non-biodegradable pyrolysis of the material. Moisture loss along with certain volatiles at temperatures below 200 C The high temperature was between 90 ^{0}C and 97 ^{0}C because of the lack of humidity. In Table 2 for pyrolysis and burning, the percentages of weight loss for each stage are shown to compare the weight loss of pyrolysis between these two methods, and to remember the ultrasound effect of pyrolysis and combustion. The lost weight is referred to in the same foundation for each sludge. The pyrolysis data thus contains a char production as a weight loss percentage. The profile and the two contrasting peaks vary from the sample of SS-U90KHz ‘Figure 1’ Due to ultrasound waves breaking up the chemical bond and disrupt the interface constraint of the multi-phase device, and boost heating and mass transfer, SS samples loss mass lower (36.2 wt. percent) than SS-U90KHz (59.1 wt. percent) If soaked samples were applied to the bath, biomass would well, resulting in lower crystallinity and a higher surface area, which increased structural interruption, moreover the lignin-carbohydrate bond decreased, lowering lignin percentage and digestibility of cellulose greater than previously during longer periods of treatment [22, 23, 24].

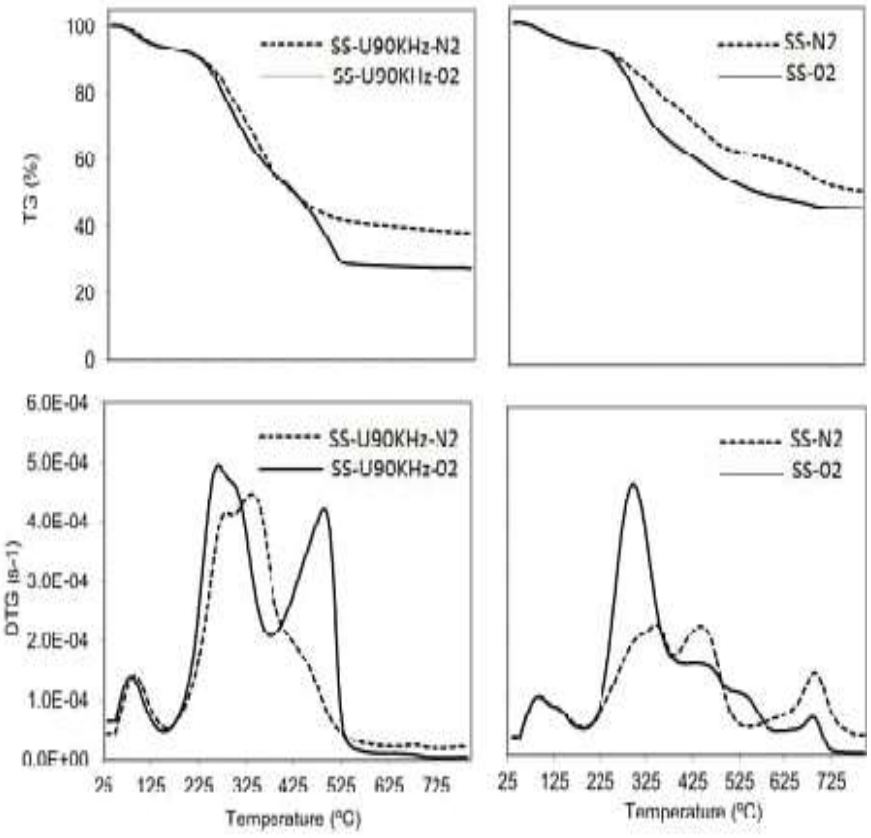

Figure 1. Comparison between pyrolysis and combustion sketch (TG and DTG) of SS and SS-U90KHz.

3.2 Combustion results on thermographmetry and Derivative thermogravimetry TG/DTG analysis

The combustion of sludge is a complicated process that occurs in many phases. A pyrolysis loop begins the combustion process along with a fuel gas and a solid cargo. The gas generated burn when it comes to O2. Finally, the expanding O2 oxidizes the char. The reactions involved during combustion are the following:
Pyrolysis period: Sludge ---------- volatile material (H2, CO, CO2, H2O, CxHy, etc) + char

Volatile combustion: volatile material + O2 ---------CO2 + H2O

Char combustion: char + O2 --------CO2

These partly agree with the reactions observed in Table 2 during each cycle. The SS sludge's combustion sketch was different from that of the SS-U90KHz batch, similar to the DTG combustion sketches of pyrolysis 'Figure 1' consisting of two partly overlapping peaks between 180 and 550 C of approximately SS-90KHz. For SS sludge and the plateau, one top and two shoulders of 200 and 600C can be found due to carbonate decomposition at 685 C. Eventually, the sludge combustion cycle was divided into three main stages. Two sub-periods were seen for SS in the second cycle and only carbon decomposition was used in the third cycle in the combustion of the SS sample. Table 2 displays the percentages of weight loss during sludge sample combustion during different times.
In the first step, in contrast to the pyrolysis analysis of combustion and pyrolysis profiles of SS-U90KHz sludge, the DTG combustion profile was similar in nature. On the other hand, several differences in DTG combustion may be noted in the case of pyrolysis (table 2). The

first combustion cycle deteriorated in relation to pyrolysis. A lower peak temperature and high mass velocity loss were exhibited in the resulting DTG combustion peak. Data in Table 2 indicate that during the initial combustion process, only a volatile part of that formed in the first and second pyrolysis cycles was burnt (70.9 percent). This implies that the process of devolatilization/volatile combustion overlapped and lasted in the 2nd century. Starting from the 2nd one. A plateau loss (differing from the shoulder of the pyrolysis skirt) was confirmed by the combustion profile. Mass losses occurred on the 2nd table according to the results of Table 2 due to both the combustion of the chariot and the end of the devolatilization/volatile combustion process of the portion of bacterial matter initiated in the first stage of the SS-U90KHz sludge. The SS-U90KHz was 27.9 percent through instability / combustion and 15.2 percent through carbohydrate combustion.

For SS burning, first. A period between 200 C and 375 C was identified, with a single limit of about 59.5 Wt percent weight loss, which was greater than that obtained in pyrolysis (36.2 Wt percent). The drawing identified two small shoulders between 375 C and 600 C associated with the combustion of carbohydrates in the 2nd century. The shoulders were 3 to 515 centimeters by 70 centimeters and 5 to 600 centimeters by 515 centimeters. Beginning with the seventh. With a high of 685 C, the weight loss was 7.0Wt percent (See Table 2) due to the carbon division between 60C and 800 C. The rate of devolatilization/volatile combustion (59.5 percent wt) was high in the former, according to the data from Table 2. Compared to 66.8 percent and the Second Pyrolysis Stage of the SS, period of the first volatile produced. In the entire SS sludge combustion process, the following processes were also used: superficial water loss, decomposition and auto-gasification reactions, combustion of flux and carbon, and combustion of charcoal.

Table 2. wt% loss for both samples (SS and SSu90KHz) in each period in pyrolysis and combustion processes.

Sludge (period)	1st period	2nd period	3rd period	Char[a]
Pyrolysis				
SS (200-380-550-800 C°)	36.2	30.6	22.5	10.7
SS-u90KHz (180-385-550-800 C°)	59.1	19.6	4.3	17
Combustion				
SS (200-375-515-600-800 C°)	59.5	24[b] 9.5[c]	7.0	
SS-u90KHz (180-370-550-800 C°)	55.4	43.1	1.5	

[a] Char obtained also regard as a wt % loss.
[b] 1st sub period.
[c] 2nd sub period.

4. Conclusions

To evaluate the effect of sludge treatment on pyrolysis and combustion, thermographmetric analysis was used. First, two samples were used for waste sludge SS without treatment and the second was used as a pretreatment with a frequency of 90 KHz for SS-U90KHz using ultrasonic baths. The combustion and pyrolysis were considered for two forms of sewage sludge. there is Some variations were found between the drawings of the combustion and pyrolysis phase of sewage sludge samples generated by the chemical composition. Combustion under a controlled oxidizing atmosphere is a mechanism that turns any carbonaceous feed into a functional heating value gaseous substance, leaving solid remains behind. The only pyrolysis discrepancy that is done under the inert atmosphere. The main process of devolatilization associated with the degradation of protein and soluble polysaccharides occurred during pyrolysis between 200 and 550 C. The oxidation of the sample was over 500 C during combustion. The char oxidation switched to lower temperatures as the concentration of oxygen rose. We will note the influence of the presence of oxygen on thermal decomposition by comparing the combustion and pyrolysis DTG diagrams.

Abstract. The present study investigated the use of pretreated fish bone (PTFB) as a new surface, natural waste and low-cost adsorbent for the adsorption of Methyl green (MG, as model toxic basic dye) from aqueous solutions. The functional groups and surface morphology of the untreated fish bone (FB) and pretreated fish bone were characterized using Fourier transform infrared (FTIR), scanning electron microscopy (SEM) and Energy dispersive X-ray spectroscopy (EDS),respectively. The effect of operating parameters including contact time, pH, adsorbent dose, temperature, and inorganic salt was evaluated. Langmuir, Freundlich and Temkin adsorption isotherm models were studied and the results showed that the adsorption of basic dye followed Freundlich isotherm. Kinetic modeling of the data at different temperatures confirmed pseudo-second-order(P-2-O) model, along with calculated thermodynamic parameters depicted that the adsorption process is spontaneous and endothermic in nature. Diffusion studies suggested that intra-particle diffusion is not the singular rate-controlling factor. The results indicated that 92% of MG capable of being sequestered under optimum adsorption conditions: pH 10.64, adsorbent dose 0.1 g/L, and 60 min contact time. Finally, the results showed that the pretreated fish bone can be effectively used as a proper adsorbent for the adsorption of cationic dye from aqueous solutions.

Keywords: Fishbone, Methyl green, Temkin isotherm, Thermodynamic parameters,Intra-particle diffusion

1. Introduction

The pollution of water stands for a serious environmental problem for human and aquatic systems. Many applications such as printing, tanning, food, textile, and cosmetics industries typically employ biological molecules as dyes to color their products. It has been supposed that cationic dyes have been in general more toxicity levels as compared with anionic dyes [1]. Cationic (basic) dyes have typically employed in silk, nylon, acrylic and wool dyeing in textile production owing to noble solubility of synthetic dyes, and may be existing in trace quantities in built-up wastewaters. The existence of cationic dyes in aquatic streams averts light from water penetrating and has a passive influence on photosynthesis. Features like poisonousness and non-biodegradability stand for the consequence of complex dyes structures. Consequently, they represent against risk to environmental health and human. Therefore, the removal of cationic dye from aquatic system before discharging into water bodies is needed [2]. Methyl green (MC), a cationic dye, is one of the most frequently used dye stuff and it causes hazardous problems both water environments and human life.

Many treatment systems have been used for the removal of different kinds of dyes from aqueous solutions such as, flocculation [3], photocatalytic degradation [4], microbiological decomposition [5], fungus biosorbent [6], and adsorption [7].

Recently, adsorption method has been initiated as being economical and more effectual as compared with physical and chemical techniques. Its process has succeeded in eliminating organic and inorganic pollutants [8], as a result of being cost-effective, astraight forward process and simple design.

Recently, diverse adsorbent materials were employed for removing organic material and color. Naturally, cheap and in effect materials like agronomic materials, food manufacturing by-products and animal bones like fish bones were employed as adsorbents for the removal of organic and inorganic contaminates in recent times. Several economical absorbents in the literature were used for dyes removal including lignocellulosic material [9], sunflower seed hull [10], coconut coir [11], bauxite clay [12], and fish bone [13]. Bones have 70 % inorganic and 30 % organic phases by weight [14]. The hydroxyl apatite Ca10(PO4)6(OH)2 creates the foremost portion of inorganic phase and it is an effectual adsorption material as a result of its capability or removing completely charged contaminates based on ion exchange reacting with calcium ions on a bone surface [2].
The main objective of the present research is to use fish bone (FB) as new adsorbent and to study its capability for the adsorption of cationic dye from aqueous solutions. As a model dye, methyl green was selected for the adsorption analyses. In our current study, the surface categorization of PTFB will be examined using Fourier transform infrared (FTIR) , scanning electron microscopy (SEM) and Energy dispersive X-ray spectroscopy(EDS). Additionally, contact time of adsorption, adsorbent dose, temperature, pH, and salt effect parameters were investigated. The adsorption kinetic, isotherm behaviors were compared and the thermodynamic parameters were determined as well.

2. Experimental

2.1 Pretreatment of fish bones sorbent

Fish bones was collected from a local fish shops in Al-Kadhumyia city, Iraq. Firstly, the fish bones were washed for a number of times with hot purified water for removing the soluble and residue impurities from the bones. Then, the washed fish bones was dried up in the oven at 90 ºC and ground into fine powder by a mortar.

2.2. Pretreatment of fish bones sorbent

Fifteen gram of ground fish bones was treated with100 mL of 0.1 M aqueous solution of NaOH and stirred at room temperature for 4 hours. Then, 3g ofAl_2O_3 gradually added and stirred at room temperature for 5 hours. The treated fish bones were filtered, washed several time with distilled water, and then dried in an oven at 80ºC for 6 hours; milled and sieved in the size ≤75µm. Lastly, the treated fish bones powder was kept in the air tight container to be ready for a use.

2.3. Adsorption experimental method

Basic dye, Methyl green (MG), was employed without additional purification. The dye features and chemical structure are listed in Table 1. The stock solution was prepared by dissolving 1 g of dye in 1000 mL distilled water. The pH solution was adjusted to 7.42 for MG as optimum value obtained from the optimization study conducted in our previous study[15].NaOH (Merck) and HCl (Merck) have employed for adjusting the pH of the solutions. NaCl that have employed for studying the influence of mineral salt on dye removal has as well gotten from Merck. To examine the effect of temperature, 0.1 g of fish bones with 10mL MG dye solutions of known concentration (60-140mg.L^{-1}) in 100 mL Erlenmeyer flasks, shaken on a temperature-controlled shaker at 25, 35 and 45 ºC. After the equilibrium time elapsed, the suspension was centrifuged at 3000 rpm for 5 min., then filtered to be analyzed for MG concentration using UV–Vis spectrophotometer (double beam, T-80, England) at a maximum wavelength of 618 nm. The MG uptake loading capacity (mg/g) of fish bones for each concentration at equilibrium was determined as follows:

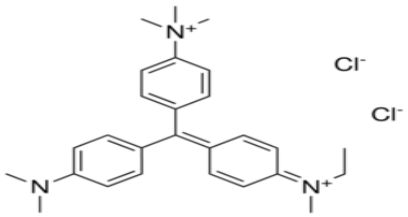
$$q_e = (C_o - C_e) \times V / W_t \quad (1)$$

Here, C_o and C_e (mg/L) are for the initial and equilibrium solution concentrations of MG, respectively, V (L) is for the volume of the dye solution, and W_t (g/L) represents the dose of used adsorbent. The MG removal percent was calculated for each run by the following equation:

$$R\% = (C_o - C_e)/C_o \times 100 \quad (2)$$

Table 1. Dye structure and characteristics.

IUPAC Name	Molecular Formula	Molecular Weight	Synonyms	color
[4-[[4-(dimethylamino)phenyl]-(4-dimethylazaniumylidenecyclohexa-2,5-dien-1-ylidene)methyl]phenyl]-trimethylazanium;dichloride	$C_{26}H_{33}N_3Cl_2$	458.471 g/mol	Basic Blue 20, Methyl green chloride	Blue-green



2.4. fish bondes Characterization

Characterization of the fish bones has investigated using scanning electron microscopy (T-SCAN Mira3 France) and Energy dispersive X-ray spectroscopy (EDS, Hitachi, Ltd., Tokyo, Japan)to investigate the surface morphology of fish bones. Fourier transform infrared (FTIR) analysis (Shimadzu 8400, Japan) in the scanning range of(4000–500 cm^{-1})was used to identify the functional groups of fish bones surface.

3. Results and Discussion

3.1. FTIR spectroscopy analysis

The FTIR analysis of untreated Fish bones and PTFB is given in (Figure 1.a,b). The band in 'Figure1a' observed at 3344.68 cm^{-1} can be assigned to the O–H stretching bond. The two bands at 2922.55 and 2852.81 cm^{-1} were attributed to the C-H stretching bond. The stretching band of C=O groups is placed at 1741.78 cm^{-1} [2]. The bands at 1020.38 and 960.58 cm^{-1} are related to vibrations of $–PO4^{-3}$ groups. The stretching mode of N=O is attributed to band at 1456.30 cm^{-1}. The band at 871.85 cm^{-1} is assigned to C-C stretching [16]. After treatment with NaOH and Al_2O_3 'Figure1 b', the band at 3344.68 cm^{-1} shifted and changed the intensity of this band at around 3473.91 cm^{-1}. The band at 981.80 cm^{-1} is assigned to Al–O bond vibrations. The bands at 848.71 and 642.32cm^{-1} are characteristics of vibrational modes of alumina O–Al–O bond [17].

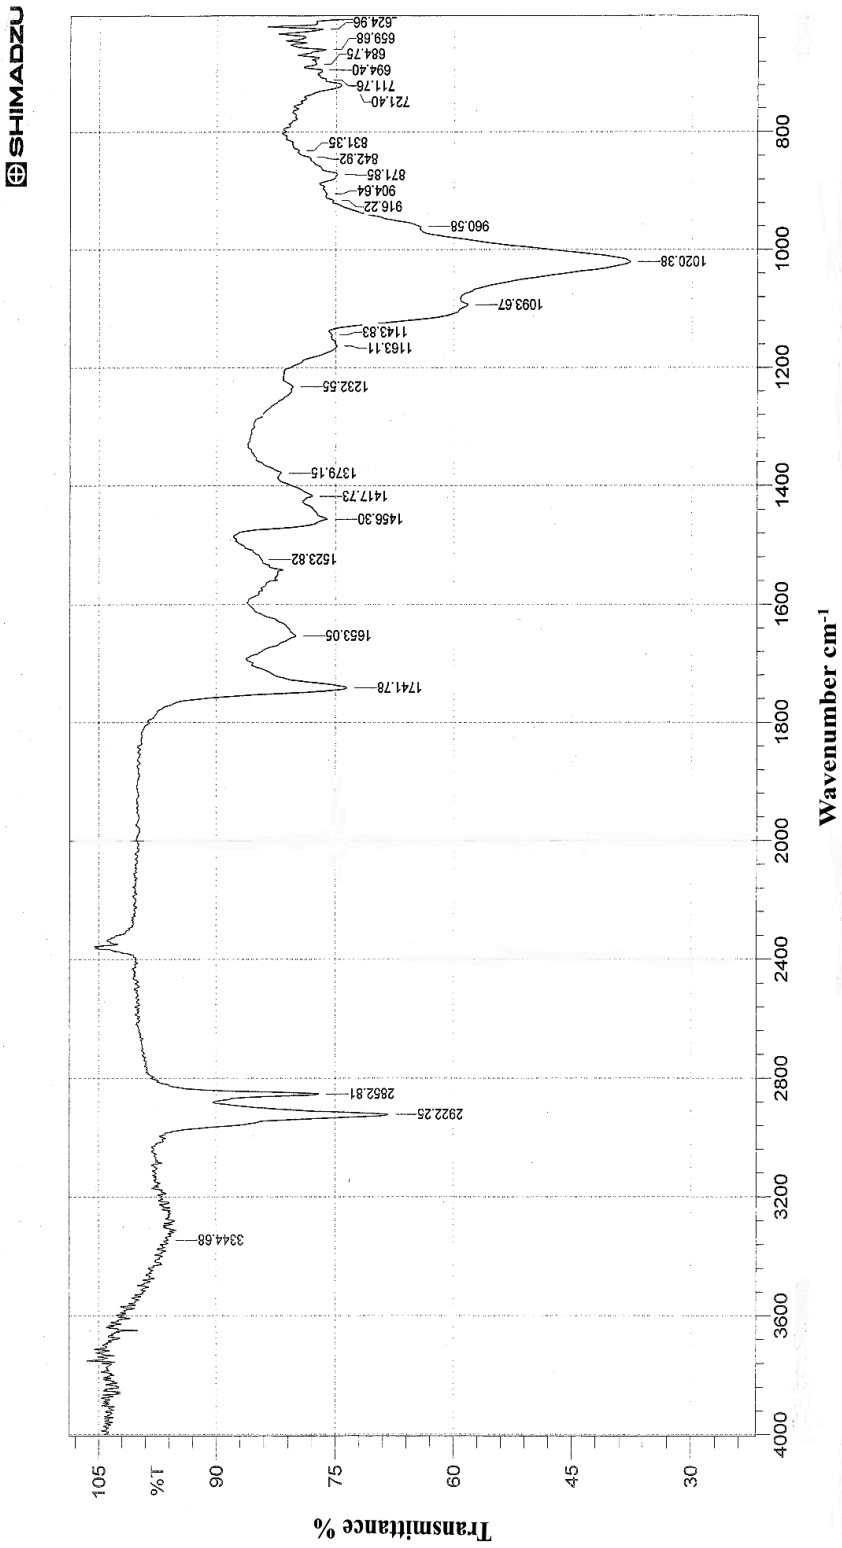


Figure 1 a. FTIR spectra of untreated fish bones surface (FB).

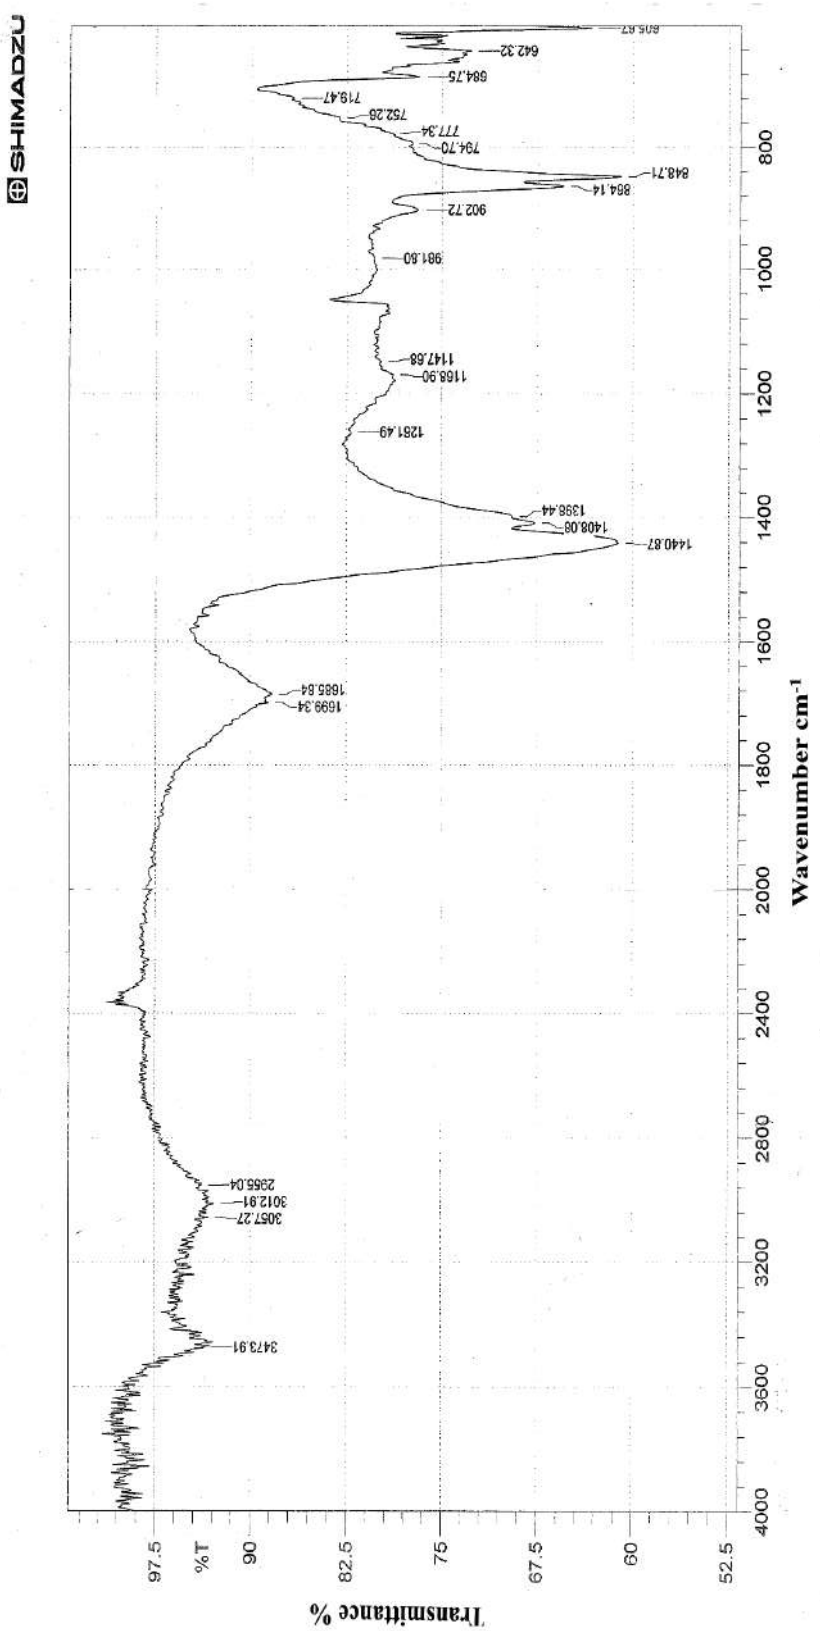

Figure 1b. FTIR spectra of pretreated fish bones surface (PTFB).

3.2. SEM analysis

The SEM images for characterizing fish bones surface before and after treatment are depicted in ʻFigure2 a,bʼ. Before treatment ʻFigure2aʼ, the fish bone shows a clean surface with several numbers heterogeneous pores and holes, which create a huge free surface area [2]. After treatment ʻFigure2bʼ, the morphology of fish bones has roughness surfaces and the distinct openings of pores as well enable the dye ions accessibility into the internal bones part [16,18].

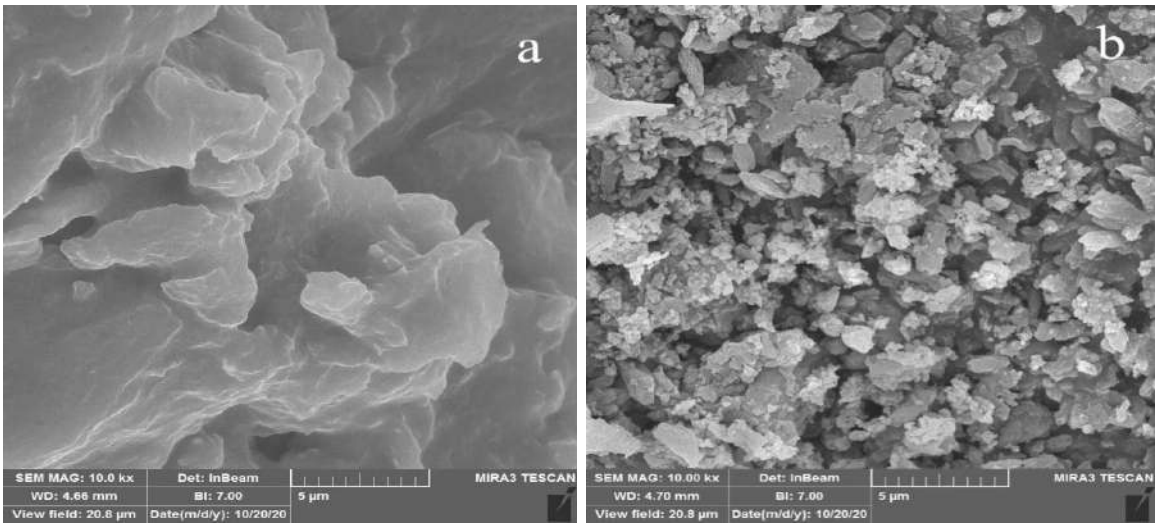

Figure 2.SEM images of fish bones surface(a) untreated FB (b) PTFB.

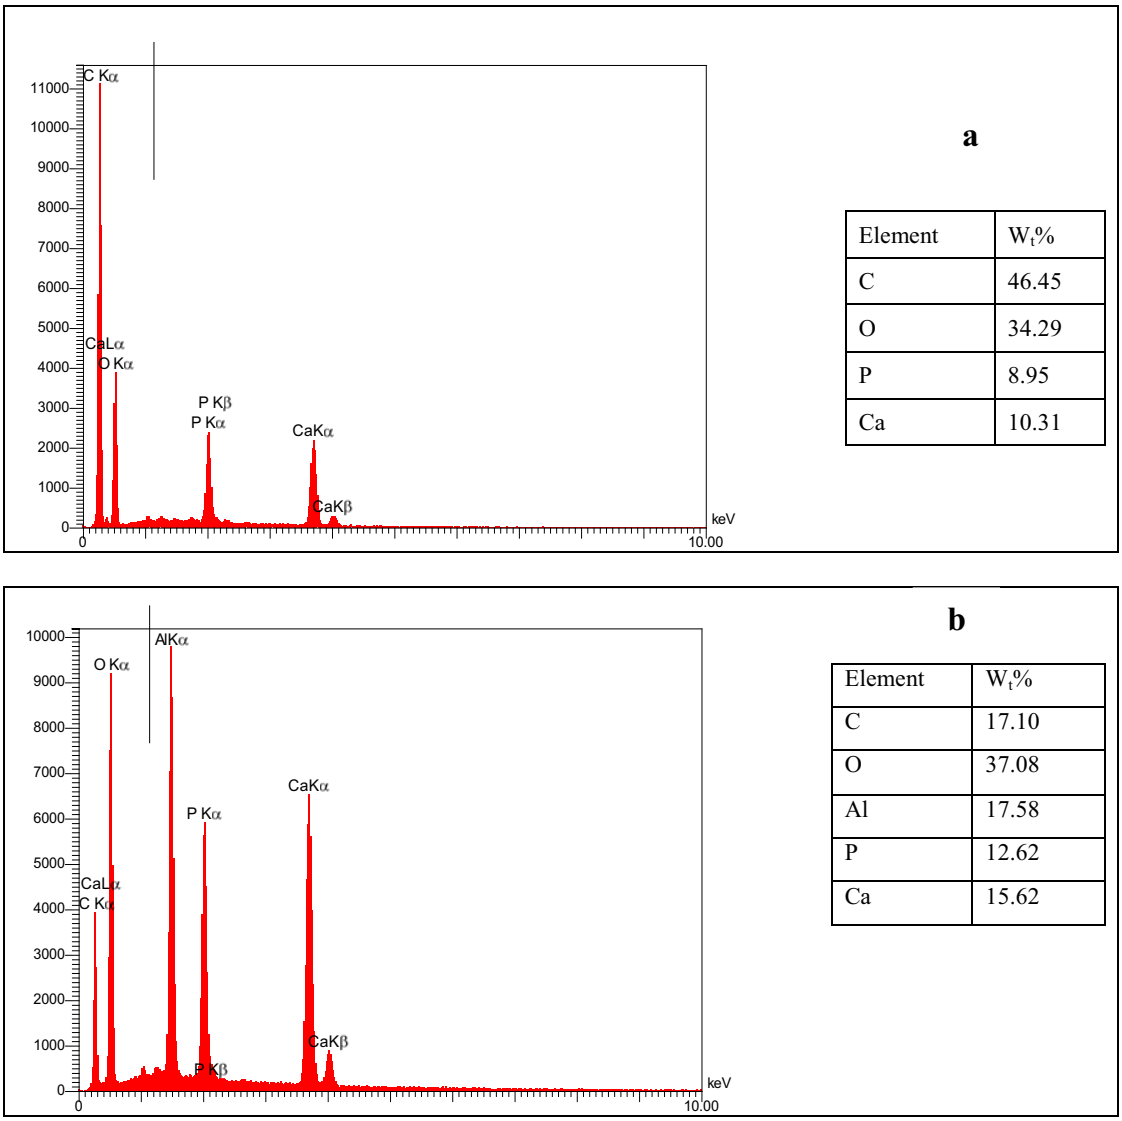
3.3. Elemental analysis

Elemental analysis of untreated FB and PTFB surfaces was examined by energy dispersive X-ray spectroscopy (EDS) analysis. Detailed composition of untreated FB and PTFB samples with EDS diagram is given in ʻFigure3a, bʼ. In the EDS spectrum ʻFigure 3 aʼ of untreated FB (C, O, Ca and P) were detected. The EDS spectrum after treatment with NaOH and Al_2O_3 revealed the existence of Al element (17.58 W_t%) of FB surface ʻFigure 3 bʼ. The content of O, P and Ca increased from 34.29 W_t%, 8.59 W_t% and 10.31 W_t% to 37.08 W_t%, 12.62 W_t% and 15.62 W_t%, respectively, while the content of C declined from 46.45 W_t% to 17.10 W_t%. It was an evident that most of Al is deposited on the fish bones surface.



Element	W_t%
C	46.45
O	34.29
P	8.95
Ca	10.31

Element	W_t%
C	17.10
O	37.08
Al	17.58
P	12.62
Ca	15.62

Figure 3. Energy dispersive X-ray analysis images and composition of fish bones surface (a) untreated FB (b) PTFB.

3.4. Effect of sorbent dose

Regulating the influence of adsorbent dose in experiments, one of the useful significant parameters influencing adsorption, have accomplished with a primary dye concentration of 80 mg/L and adsorbent dose in the interval 0.05-0.8g/L at 25º C. The experiment consequences have illustrated in'Figure4'. As the adsorbent dose has increased, the MG dye removal efficiencies have raised from 79.3% to 98.6 %. Actually, the amount of existing adsorption sites rises by raising the adsorbent dose and volume of pores wherever adsorption takes a place. Accordingly, the highly applicable adsorbent dose for MG dye removal has adjusted to 0.8 g/L[19]. Similar observations have been made earlier [20, 21].

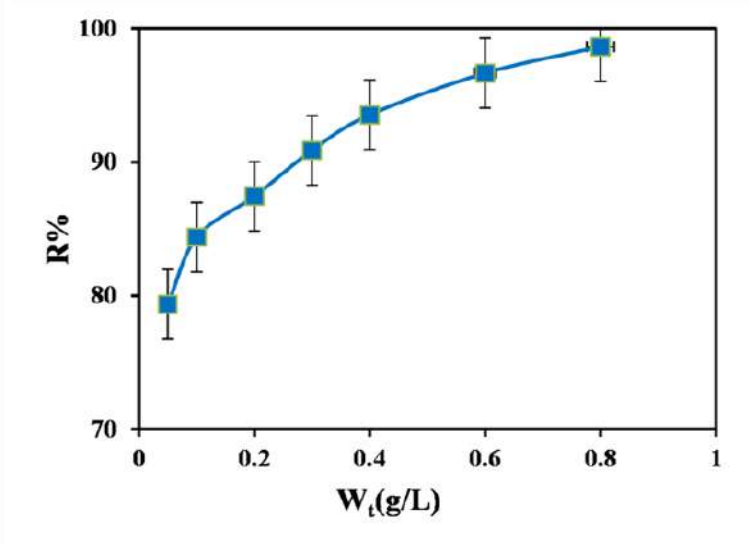


Figure 4. Effect of adsorbent dose on adsorption of MG onto PTFB surface(initial MG conc. 80 mg/L, pH 7.42 and 25 ºC).

3.5. Salt effect

The effect of inorganic salt (i.e. NaCl) on adsorption capacity of MG on PTFB surface is shown in Figure 5.The dye adsorption increased from 7.11 to 7.94 mg/g with the increasing NaCl concentration ranging from 0.1 to 0.3 M.This MG attachment to the solid can be regulated through electrostatic interactions increasing along with its adsorption capacity. The increased MG adsorption capacity under salt adding is based on the dye molecules aggregation generated by the salt ion actions, and this raises the adsorption capacity of dye onto PTFB surface [22].

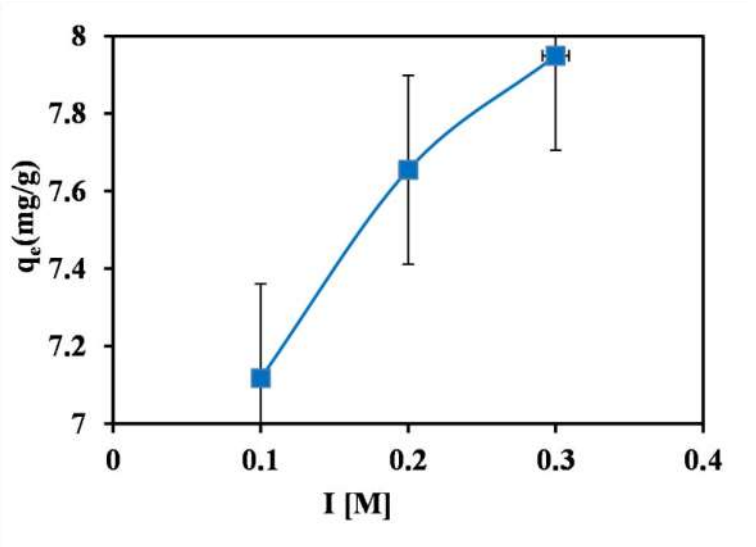

Figure 5. Effect of ionic strength on MG adsorption (initial MG conc. 80 mg/L, pH 7.42 and 25 ºC).

3.6. Effect of pH

The pH effect on MG adsorption by PTFB surface was studied at 25ºC, initial concentration of 80 mg/L and adsorbent dose of 0.1 g. To obtain the desired pH a few drops of 0.1 M NaOH or HCl was added. Figure6 explains the influence of pH on the adsorption of MG at pH range of 1.88–10.64. The dye removal was increased with increasing pH. The low value of dye removal at pH 1.88 is may be as a result of the protonation of functional groups that creates the adsorbent surface in more positive and investigate the repulsion among dye cations and adsorbent [2]. When the pH is increased, the amount of negatively charged sites on the surface of adsorbent surface increased and the removal percentage of MG as well rises. This might be due to the increasing in electrostatic attractions among the MG cation and the adsorbent's functional groups [23]. Related performance has stated by other scholars for the adsorbing basic dye in [24, 25].

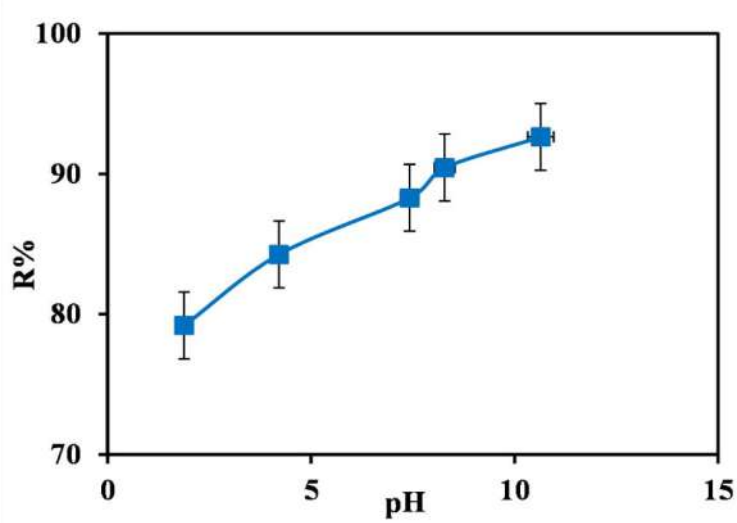

Figure 6. Effect of pH on MG adsorption(initial MG conc. 80 mg/L and 25ºC).

3.7. Kinetic modeling

A kinetics study of adsorption was necessary to investigate the effect of contact time. The resulting parameters of adsorption kinetic, as shown in 'Figure 7', after a contact time of 30min, there was no change in cationic dye (MG) adsorption capacity on PTFB surface. Thus, we selected 60 min as the best contact time for all the MG adsorption experiments on the adsorbent surface [26]. The rapid uptake of MG dye molecules from aqueous solution refers to the adsorption process efficiency. Moreover, it is evident that the adsorption capacity of PTFB surface increased rapidly with increasing of contact time due to the availability of active sites on the surface [27].

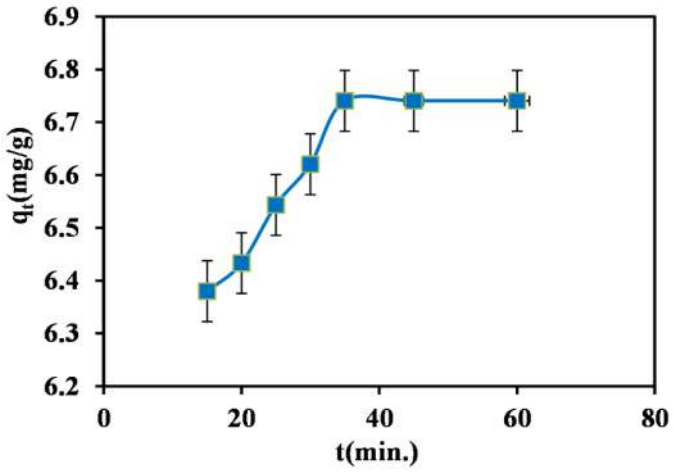

Figure 7. The effect of contact time of MG adsorption onto PTFB surface (initial MG conc. 80 mg/L, pH 7.42 and 25 ºC).

The adsorption process kinetics were studied using the pseudo-first-order (P -1-O)equation 3 [28], and the pseudo-second-order(P-2-O) equation 4 [29] models

$$\ln(q_e-q_t) = \ln q_e - k_1 t \quad (3)$$

$$\frac{t}{qt} = \frac{1}{k_2 q_t^2} + \frac{1}{q_e} t \quad (4)$$

Here, k_1(min^{-1}) and k_2 (g·mg^{-1}·min^{-1}) are the kinetic rate constants, respectively. q_e and q_t (mg/g) are the MG adsorbed concentrations at equilibrium and at time of adsorption t (min), respectively. The P -1-O constants ($k_1$and q_e) were calculated from slopes and intercepts as given in Figure 8a. P -2-O constants $k_2$and q_e were determined from the slopes and intercepts from 'Figure 8 b', respectively. The results of experimental data with the (P -1-O) and (P -2-O) for adsorption of MG onto PTFB have shown in Table2.Consequences indicated great correlation coefficient magnitudes by ranging (0.9999-0.9997) for system and a good agreement between ($q_e$cal.) and ($q_e$exp.) magnitudes specifying the applicability of the P-2-O kinetic model for PTFB system.[30].Related consequences have found in [31,32].

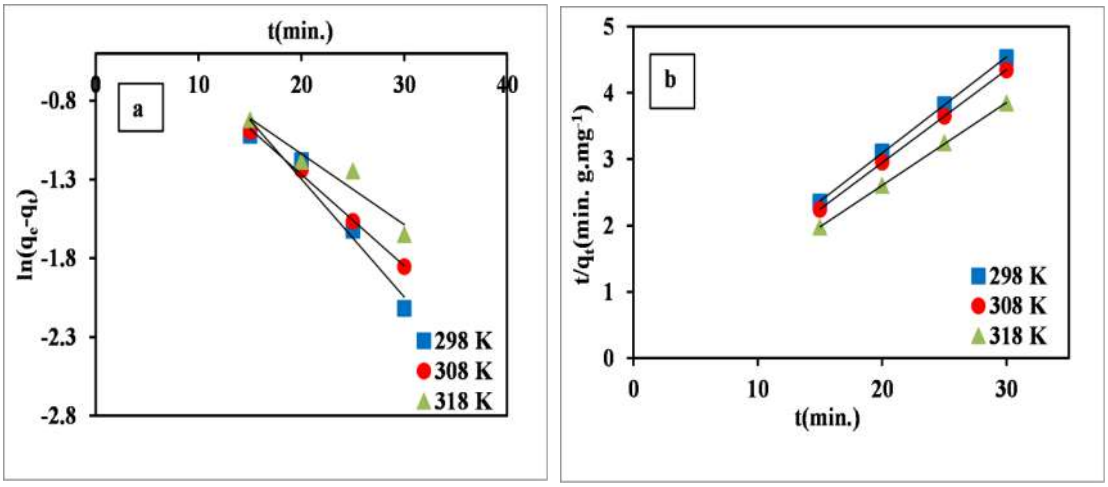

Figure 8. Pseudo-first order (a) and Pseudo-second order(b) kinetics for MG dye adsorption onto PTFB surface at different temperatures.

Table2. Kinetics parameters for the adsorption of MG onto PTFB surface (C_o= 80 mg/L).

Adsorbent	T(K)	Pseudo-first order				Pseudo-second order		
		K_1 (min^{-1})	$q_{e,exp}$ mg/g	$q_{e,calc}$ mg/g	R^2	K_2($g \cdot mg^{-1} \cdot min^{-1}$)	$q_{e,calc}$ mg/g	R^2
PTFB	298	0.0747	6.7381	0.5387	0.9578	0.1112	6.8965	0.9997
	308	0.0579	7.0686	2.6093	0.9970	0.1361	7.1428	0.9999
	318	0.0448	7.9889	2.4783	0.9266	0.1547	8.0000	0.9998

3.8. Kinetic model validity

The fitting and applicability of the isotherm model to the kinetic parameters have compared through judging from the R^2 magnitudes and the normalized standard deviation Δq_t (%) determined from equation 5. The normalized standard deviation, Δq_t (%) has employed for confirming the used kinetic model to refer to the adsorption process. It is given as:

$$\Delta q_t = 100 \frac{\sqrt{\sum(\frac{q_{exp}-q_{cal}}{q_{exp}})^2}}{n-1} \quad (5)$$

Where n is the data points number, q_{exp} and q_{cal} (mg/g) stand for the experimental and calculated adsorption capacity magnitudes. Lower magnitude of Δq_t specifies very well agreement between experimental and calculated data. The Δq_t magnitudes for p-2-O are 4.2666%, 3.3900% and 2.7166% at 25ºC, 35ºC and 45ºC, respectively. Thus, the pseudo-second-order kinetic model appears to be the best fitting model for adsorption of MG dye onto PTFB surface[33].

3.9. Adsorption mechanism

Adsorption kinetics can be typically controlled by various mechanisms. The highly general ones are based on the diffusion mechanisms that can be clarified by intraparticle diffusion model suggested by Weber and Morris [34]. Intraparticle diffusion model is given as

$$q_t = k_{id} t^{0.5} + I \quad (6)$$

k_{id}, the intra-particle diffusion rate constant (mg/g $min^{0.5}$) can be obtained from the slope of the linear plot of q_t versus $t^{1/2}$and I (mg/g) is a constant'Figure9'.The interceptions of plot reveals the boundary layer influence. Greater magnitudes of intercept means bigger contribution of surface sorption in the rate-controlling step. If the regression of q_t against $t^{0.5}$ is linear and passes through the origin, then intraparticle diffusion is the solitary rate-limiting step. In the case of linear plots at every concentration didn't pass through the origin, it shows that the intraparticle diffusion wasn't only rate controlling step [35]. The magnitudes of k_{id} and I and the resultant regression coefficients have recorded in Table 3.The magnitudes of K_{id} and I listed in Table3 explain that the constants I values are not zero. This specified that the intraparticle diffusion is not the only rate-limiting step but other process is feasibly be involved in the adsorbing process [8].

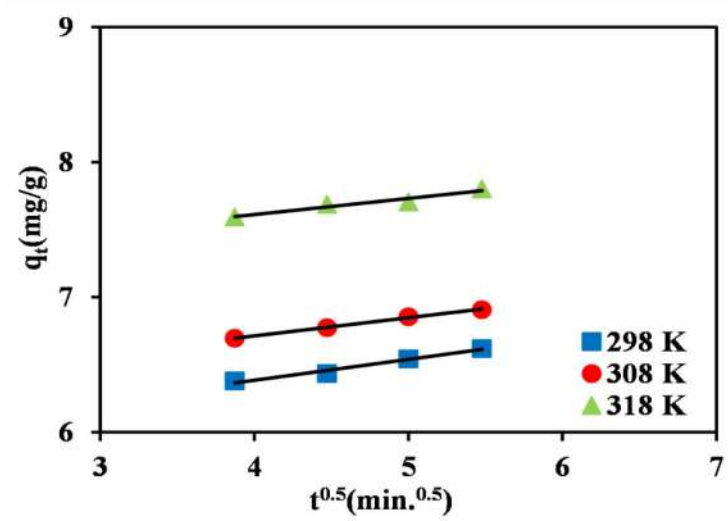

Figure 9. The intra-particle diffusion for MG dye adsorption onto PTFB surface at different temperatures.

Table 3.intraparticle diffusion rate constants for the adsorption of MG onto PTFB surface at different temperatures.

Adsorbent	T(K)	k_{id} (mg/g $min^{0.5}$)	I (mg/g)	R^2
PTFB	298	0.1548	5.7654	0.9747
	308	0.1347	6.1739	0.9969
	318	0.1187	7.1374	0.9435

3.10. Equilibrium study

For optimizing the design of adsorption system for the adsorbates adsorption, it is essential to create the most suitable correlation for the equilibrium curves. Diverse isotherm models have been reported to refer to the equilibrium features of adsorption. Several of these models are Langmuir, Freundlich, and Temkin models.

Langmuir isotherm is effective for monolayer adsorption. The linearized equation can be represented as follow [36]:

$$\frac{C_e}{q_e} = \frac{1}{K_L q_m} + \frac{C_e}{q_e} \quad (7)$$

Where, C_e(mg/L) is equilibrium concentration of MG in solution, q_m (mg/g) is the Langmuir monolayer adsorption capacity and K_L(L/mg) is Langmuir constant. q_m and K_L values can be determined from the slope and intercept of the linear plots of C_e/q_e against C_e.

The Freundlich isotherm model, which is frequently employed for describing non-specific adsorption, was employed to clarify the adsorption data. The linear form of the Freundlich equation as given as below [37]:

$$logq_e = logK_f + \frac{1}{n} loqC_e \quad (8)$$

Where, K_F is Freundlich coefficient related to adsorption capacity(mg/g) and n(related to adsorption intensity) were obtained from the values of slope and intercept of the plots of log q_e against log C_e

Regarding Temkin adsorption isotherm, the energy of adsorption is in a linear function of the surface coverage because of adsorbent-adsorbate interactions. Temkin isotherm equation has in general been adopted as [38]:

$$q_e = B\ ln\ lnA_T + B\ ln\ lnC_e \quad (9)$$

Where B = RT/b, b stands for Temkin constant and associated with heat of adsorption (J/mol), A represents Temkin isotherm constant (L/g), R for the gas constant (8.314 J/mol K), and *T* is the absolute temperature (K). The magnitudes of (B) and (A_T) can be determined from the slope and interception by the graph plotted between q_e and lnC_e.

The isotherm parameters for the three models are introduced in Table 4. In terms of R^2 values, Freundlich isotherm skwed the highest values for dye within the temperature range used.

Table 4. Isotherm parameters for MG adsorption onto PTFB surface.

Isotherm	298 K	308 K	318 K
Langmuir			
K_L(L/mg)	-0.0362	-0.0321	12.3456
q_m(mg/g)	-8.1967	-17.2413	13.5135
R^2	0.9751	0.9043	0.9930
Freundlich			
K_F	0.0492	0.2513	10.6340
1/n	1.9555	1.5170	1.0267
R^2	0.9919	0.9925	0.9952
Temkin			
B_T(J/mol)	15.6479	12.7073	1.3572
A_T(L/g)	0.1262	0.1969	2921.9310
R^2	0.9597	0.9683	0.9820

3.11. Thermodynamic analyses

The uptake of MG dye by the PTFB rises with raising the temperature ratifying the endothermic nature of the adsorption step. The variation in standard free energy (ΔG°), enthalpy (ΔH°) and entropy (ΔS°) of adsorption have computed by [39]

$$\Delta G^\circ = -RT \ln K^o \quad (10)$$

Where R is the gas constant ($8.314 J \cdot mol^{-1} K^{-1}$) and T is the absolute temperature.
The distribution adsorption coefficient (K_d) [40] is determined by the following equation:

$$K_d = \frac{C_o - C_e}{C_e} \times \frac{V}{W} \quad (11)$$

Where C_o is the initial MG concentration and C_e is the equilibrium MG concentration in (mg/L). V is the sample volume (mL) and W_t is the weight of the adsorbent (g/L).

The standard enthalpy change (ΔH°) and the standard entropy change (ΔS°) were calculating using equation 12:

$$\ln K^o = (\Delta S^o / R) - (\Delta H^o / RT) \quad (12)$$

The equilibrium constant (K^o) was determined by plotting $\ln K_d$ against C_e and extrapolating $C_e$to. The value of the intercept is that of $\ln K^o$ [12].

Thermodynamic parameters obtained are summarized in Table5. The negative values of ΔG° obtained reveal that the adsorption process is favorable and that it is spontaneous and is observed to decrease with increase in the temperature, signifying that the adsorption process of MG on PTFB surface is more advantageous under higher temperatures [41]. Positive magnitude of ΔH° indicates endothermic features of the adsorption process. The positive ΔS° magnitude for MG adsorption on PTFB indicates the randomness and reveals the affinity of adsorbent surface concerning MG[42].

Table5. Thermodynamic parameters for the adsorption of MG.

Adsorbent	T(K)	ΔG° (kJ.mol^{-1})	ΔH^{o} (kJ. mol^{-1})	ΔS^{o} (J. K^{-1}. mol^{-1})
PTFB	298	-13.3819	214.0082	757.5908
	308	-15.8513		
	318	-28.7596		

4. Conclusions

Fish bones, one of the most numerous fish-processing industry waste and natural products, were used for MG adsorption. With many specific advantages such as low- cost, availability, natural origin, and high adsorption capacity. In this study, the adsorption of basic dye (methyl green) from aqueous solutions was based on pretreated fish bone as a new adsorbent surface. Kinetic, isotherm, and thermodynamic parameters of the adsorption process were investigated. The resultant data of adsorption process are fitted in good manner to Freundlich isotherm. The second-order-model has been in highly agreed to the acquired results. The adsorption process has been spontaneous and endothermic in nature in relation to the negative and positive magnitudes of ΔG° and ΔH°, respectively. The influence of different parameters including, pH, contact time, temperature, inorganic salt and adsorbent dose was studied. The resultant has depicted that pretreated fish bones can be efficiently employed as a low-cost adsorbent for the adsorption of basic dyes from aqueous solutions and could contribute to the protection of the environment.

Abstract: The synthesis of ligands with N_2S_2 donor sets that include imine, an amide, thioether, thiolate moieties and their metal complexes were achieved. The new Schiff-base ligands; N-(2-((2,4-diphenyl-3-azabicyclo[3.3.1]nonan-9-ylidene)amino)ethyl)-2-((2-mercaptoethyl)thio)- acetamide (H_2L^1) and N-(2-((2,4-di-p-tolyl-3-azabicyclo[3.3.1]nonan-9-ylidene)amino)ethyl)-2-((2-mercaptoethyl)thio) acetamide (H_2L^2) were obtained from the reaction of amine precursors with 1,4-dithian-2-one in the presence of triethylamine as a base in the $CHCl_3$ medium. Complexes of the general formula $K_2[M(Ln)Cl_2]$, (where: M = Mn (II), Co(II) and Ni(II)) and [M(Ln)], (where: M = Cu(II), Zn(II) and Cd(II); n =1-2, expect $[Cu(HL^2)Cl]$) were isolated. The entity of ligands and complexes including their purity were confirmed using elemental microanalysis (C.H.N.S), atomic absorption (A.A), chloride content, conductivity measurement's, melting point and thermal analysis technique. The molecular structures were elucidated with FT-IR, UV-Vis, magnetic susceptibility, ^{1}H- and ^{13}C-NMR and mass spectroscopy. The synthesised compounds were evaluated for their activity against bacterial strains (G+ and G-) and fungi species. The tested compounds indicated that; the ligands have not shown any antimicrobial activity against *Escherichia coli*. The Cd(II) complexes, for ligands H_2L^1 and H_2L^2, display the higher antimicrobial activity, compared with the other complexes. The H_2L^1 and H_2L^2 have not shown any activity against *Candida albicans*. All complexes for ligands (H_2L^1 and H_2L^2) exhibited less activity against *Candida albicans*, compared with other types of fungi.

Keywords: Schiff-bases, N_2S_2 ligand system, Metal complexes, Structural characterisation, Biological activity.

1. Introduction

Compounds incorporate nitrogen and sulfur in their frameworks are a class of organic species that attracted a range of chemist researchers (organic, inorganic and bioinorganic chemists) [1]. The impact of these species on chemistry stimulated researches to investigate and implementing a range of synthetic protocols to increase yields and stability of these materials. These species have shown a range of potential applications, including their role as useful chelating agents for radio-metals of transition and representative elements [2]. They have also used as biomedical agents, in radiopharmaceutical [2], medicine [3] and as a mimic for bioactive molecules, in catalysis, analytical chemistry, coordination chemistry [4], environmental, materials and supramolecular chemistry [5]. Mannich-bases are an important organic species that pronounced a range of uses and applications in chemistry. Compounds derived from 2,4-bis(R-phenyl)-3-azabicyclo[3.3.1]nonan-9-one are interesting materials that used as organic reagents in the fabrication of natural-based blocks including the synthesis of

phenanthridine-based compounds [6,7]. Further, compounds include N_2S_2 systems are remarkable materials that played a part in the expansion of chemistry and nuclear medicine [8]. Thus, the formation of functionalised Mannich-bases with N, S atoms should be an important class of compounds. They provide a flexible *hard*/*soft* system, upon acting as a chelating ligand to the metal centre. In this work, we describe the synthesis and characterisation of two multidentate N_2S_2 heterocyclic ligands N-(2-((2,4-diphenyl-3-azabi cyclo[3.3.1] nonan-9-ylidene)amino)ethyl)-2-((2-mercapto ethyl)thio)acetamide (H_2L^1) and N-(2-((2,4-di-p-tolyl-3-azabicyclo[3.3.1]nonan-9-ylidene)amino)ethyl)-2-((2-mercapto ethyl)thio)acetamide (H_2L^2) and their metal complexes. The anti-bacterial and anti-fungi behaviour of ligands and their complexes were also investigated.

2. Experimental

2.1. Materials and methods

All reagents in this work were commercially available and used without further purification. 1,4-Dithian-2-one and ligands were obtained by a reported method [8,9].

2.2. Physical measurements

A Heraeus instrument (Vario EL) and a Perkin-Elmer 2400 Series-II analyser were used to obtain elemental analyses (C.H.N.S) at Materials Research Centre, Ministry for Science and Technology, Baghdad, IRAQ. Uncorrected melting points were recorded using an electro-thermal Stuart SMP40 apparatus. FT-IR spectra were measured as KBr discs using a Biotic 600 FT-IR spectrophotometer in the range 4000-400 cm^{-1} FTIR and as CsI discs in the range 4000-200 cm^{-1} on a Shimadzu 8400s FT-IR at College of Science, University of Baghdad. Electronic spectra were measured from 200-1100 nm for 10^{-3} M solutions in DMSO at room temperature with (UV-Vis) spectrophotometer type Shimadzu 1800, using quartz cell of 1.0 cm length. The measurements were obtained at Ibn Sina Company, Ministry of Industry, Baghdad, Iraq. Mass spectra were obtained as Electrospray (ES) using an LTQ-FT mass spectrometer (Thermo Fisher Scientific). The spectra were recorded at the University of Manchester Metropolitan, UK. The spectral data were recorded in the positive mode. NMR spectra (^1H, ^{13}C-NMR) were recorded in DMSO-d_6 solutions using a Brucker-400 MHz and a JEOL-400 MHz for ^{1}HNMR and 100.61 MHz for ^{13}C-NMR, respectively, and TMS was used as an internal standard for ^{1}HNMR measurement. The samples were recorded at the University of Manchester Metropolitan, UK and Isfahan University, Islamic Republic of Iran. Metals were determined using a Shimadzu atomic absorption spectrophotometer (F.A.A) 680G. Chloride was determined using a 686-titro processor-665 Dosimat-Metrohm Swiss. in Ibn Sina Company, Ministry of Industry Baghdad, Iraq. Conductivity measurements were made with DMSO solutions using a Eutech Instruments Co, 150 digital conductivity meter, and magnetic moments were determined at 298 k with a Sherwood Scientific magnetic susceptibility balance. Thermal analyses were performed under an argon atmosphere on an STA PT-1000 Linseis company /Germany with a heating rate of 10 ºC/min. at College of Education for Pure Science (Ibn Al-Haitham), University of Baghdad. The evaluation of ligands and their metal complexes against four bacterial strains *(Escherichia coli, Pseudomonas aeruginosa, Staphylococcus aureus and Bacillus stubtilis)* and four fungi species (*Candida albican*s, *Candida glabrat*a, *Candida tropicali*s and *Candida parapsilsis*) were performed using agar-well diffusion. The results were recorded at College of Science, Baghdad University and at College of Education for Pure Science (Ibn Al-Haitham), University of Baghdad.

2.3. Synthesis

2.3.1. Preparation of precursors (M_1, M_2, A_1 and A_2)

The preparation of M_1 and M_2 was performed according to a published method [10,11] and the preparation of A_1 and A_2 was achieved using a reported method [12].

2.3.1.1. Preparation of (1R,2R,4R,5S)-2,4-diphenyl-3-azabicyclo[3.3.1]nonan-9-one (M_1)

A solution of benzaldehyde (1.33ml, 13mmol), ammonium acetate (0.5g, 6.500mmol) and cyclohexanone (0.674ml, 6.500mmol) [2:1:1] in ethanol (20ml) was mixed together. The reaction mixture was allowed heating between 30-40 ºC for 6h, during which time a yellow solid was formed. However, upon using MeOH medium for 4h reflux the reaction yielded an identical compound. The solid was collected by filtration, washed with ethanol (5ml), and diethylether (10ml) and then dried under vacuum. Yield: 1.26g (93%), m.p = 108-110 ºC. FT-IR data (cm^{-1}), 3313 ν(N–H), 3032 $\nu(C–H)_{arom}$, 2920 and 2850 $\nu(C–H)_{alip}$, 1716 ν(C=O), 1581 and 1558 ν(C=C), 1492 ν(N–H). NMR data (ppm), ^{1}H (400 MHz, DMSO-d_6): δ_H = 1.60 (2H, m, C_{10}-H); 1.76 (4H, quar, 3.6 Hz, J_{HH} = 9.6 Hz, $C_{9,9}$`-*H*); 2.60 (2H, dd, $J_{HH}$ = 6 Hz, $C_{8,8}$`-*H*); 2.80 (2H, t, J_{HH} = 4.8 Hz, $C_{7,7}$`-*H*); 7.80 ppm (1H, s, *N*-*H*); 7.02 and 7.11 ($C_{1,1}$`-*H*; 2H, t, J_{HH} = 5.2 Hz) and ($C_{2,2}$`, $_{6,6}$`-*H*; 4H, t, J_{HH} = 5.2 Hz), respectively; 7.43 ppm (4H, d, J_{HH} = 6 Hz) was assigned to (C3,3`, 5,5`-H); ^{13}C NMR (100.63 MHz, DMSO-d_6): δ_c = 22.89 (C_{10}), 25.61 ($C_{9,9}$`), 55.69 ($C_{7,7}$`), 58.93 ($C_{8,8}$`), 124.09 ($C_{1,1}$`), 131.08 ($C_{2,2}$`, $_{6,6}$`) and ($C_{3,3}$`, $_{5,5}$`), 139.37 ($C_{4,4}$`), 203.40 (C=O). The electrospray (+) mass spectrum of M_1 shows no molecular ion peak for M_1. Peak detected at m/z = 266.2844 amu assigned to $[M-(C_2H_2)+H)]^+$ for $C_{18}H_{20}NO$, requires = 266.1539. The other peaks detected at m/z = 240.2844, 174.1106 and 107.0409 were assigned to $[(M-C_2H2+C_2)]^+$, $[(M-C_2H+C_2+C_6H)]^+$ and $[(M-C_2H+C_2+C_6H+C_4H_{14})]^+$.

2.3.1.2. Preparation of (1R,2R,4R,5S)-2,4-di-p-tolyl-3-azabicyclo[3.3.1]nonan-9-one (M_2)

The method used to prepare M_2 was analogous to the starting material M_1, but with the used of 4-methylbenzaldehyde instead of benzaldehyde. The amounts of other reagents used were adjusted accordingly, and a similar workup procedure was used to give compound M_2 as a pale-yellow solid. Yield: 1.53g (54 %) , m.p. = 168-170 ºC. FT-IR data (cm^{-1}), 3298 ν(N–H), 3020 $\nu(C–H)_{arom}$, 2858 and 2927 $\nu(C–H)_{alip}$, 1705 ν(C=O), 1577 and 1550 ν(C=C), 1512 ν(N–H). NMR data (ppm), ^{1}H (400 MHz, DMSO-d_6): δ_H = 1.57 (2H, m, C_{10}-H); 1.67 (4H, m, $C_{9,9}$`-*H*); 1.77 and 1.79 (2H, d, $J_{HH}$ = 6 Hz, $C_{8,8}$`-*H*); 2. 71 (2H, t, J_{HH} = 5.6 Hz, $C_{7,7}$`-*H*); 2.91 ppm (6H, s, *2CH$_3$*); 4.36 (1H, s, *N*-*H*); 7.38 (4H, d, $J_{HH}$ = 7.2 Hz, ($C_{2,2}$`, $_{6,6}$`-*H*); and 7.43 ppm (4H, d, $J_{HH}$ = 7.2 Hz ($C_{3,3}$`, $_{5,5}$`-*H*). $^{13}$C NMR (100.63 MHz, DMSO-$d_6$): $\delta_c$ = 23.75 ($C_{10}$); 25.98 ($C_{9,9}$`); 44.61 (C methyl); 56.19 ($C_{8,8}$`); 58.79 ($C_{7,7}$`); 124.93 ($C_{3,3}$`, $_{5,5}$`); 126.71 ($C_{2,2}$`, $_{6,6}$`); 135.61($C_{1,1}$`); 138.93 ($C_{4,4}$`) and 209.69 (C=O). The electrospray (+) mass spectrum of M_2 shows the molecular ion peak for M_2 at m/z = 319.0421 amu for $C_{22}H_{25}NO$, requires = 319.1936. Peaks recorded at m/z = 275.1434 and 151.4732 amu attributed to $[M-(CH_3CH_2CH_3)]^+$ and $[M-(CH_3CH_2CH_3)+(C_{10}H_4)]^+$.

2.3.1.3. Preparation of 2-(((1R,2S,4R,5S,E)-2,4-diphenyl-3-azabicyclo[3.3.1]nonan-9-ylidene)amino)ethan-1-amine (A_1)

A solution of ethylenediamine (0.160g, 2.663mmol) dissolved in ethanol (20ml) was added to a mixture of M_1 (0.8g, 2.747mmol) in ethanol (20ml). The reaction mixture was treated with 2ml of concentration hydrochloride acid, and then allowed to reflux for 6h. The reaction mixture was left for a slow evaporation and yellow crystals were obtained that isolated by filtration, washed with cold ethanol (5ml) and diethylether (10ml) and then dried under vacuum. Yield: 0.104g (65%), m.p = 194-196 ºC. FT-IR data (cm^{-1}), 3309 and 3248 ν(N–H), 1639 ν(C=N), 1504 δ(N–H), 119 ν(C–N). NMR data (ppm), ^{1}H NMR (400 MHz, DMSO-d_6): δ_H = 1.24 (6H, m, $C_{9,9}$` and $C_{10}$-*H*); 1.75 (2H, m, $C_{12}$-*H*); 2.28-2.41 (5H, m, $C_{8,8}$`,C_{11}-*H* and N-*H*); 3.16 (2H, d, J_{HH} = 7.6 Hz, $C_{7,7}$`-*H*); 7.25 ($C_{1,1}$`-*H*; 2H, t, J_{HH} = 4.4 Hz); 7.35 ($C_{2,2}$`, $_{6,6}$`-*H*; 4H, t, J_{HH} = 4.4 Hz); 7.46 (4H, dd, J_{HH} = 3.6 and 7.3 Hz) ($C_{3,3}$`, $_{5,5}$`-*H*). ^{13}C NMR (100.63 MHz, DMSO-d_6): δ_c = 23.80 ($C_{9,9}$`); 27.83 ($C_{10}$); 28.80 ($C_{8,8}$`); 35.39($C_{7,7}$`); 46.82 ($C_{12}$); 49.44($C_{11}$); 122.35 ($C_{1,1}$`); 127.08 ($C_{3,3}$`, $C_{2,2}$`); 127.24 ($C_{6,6}$`); 142.49 ($C_{4,4}$`);152.49 (C=N). The electrospray (+) mass spectrum of A_1 revealed a peak at m/z = 333.1042 amu assigned to $(M)^+$ for $C_{22}H_{27}N_3$, requires = 333.2205 and the following fragments at 304.1548 and 264.1742 amu were related to $[M-CH_3N]^+$ and $[M-(CH_3N+C_3H_4)]^+$, respectively.

2.3.1.4 Preparation of 2-(((1R,2S,4R,5S,E)-2,4-di-p-tolyl-3-azabicyclo[3.3.1]nonan-9-ylidene)amino)ethan-1-amine (A_2)

An analogues method for the isolation of precursor A_1 was used to prepare A_2, but M_2 was used in place of M_1 and other reagents were adjusted accordingly. A yellow solid was obtained, yield = 0.2155g (75 %), m.p. = 113-115 ºC. FT-IR data (cm^{-1}), 3421 ν(N–H), 1658 ν(C=N), 1508 δ(N–H), 1311 ν(C–N). NMR data (ppm), ^{1}H NMR (400 MHz, DMSO-d_6): δ_H = 1.18 (6H, m, $C_{9,9`}$, $C_{10}$ -H); 1.55 (2H, m, $C_{12}$-H); 2.20-2.25 (5H, m, $C_{8,8`}$, C_{11}-H) and N-H; 3.10 (2H, d, J_{HH} = 5.2 Hz $C_{7,7`}$-H); 3.76 (6H, s, 2 x $CH_3$); = 7.02 (4H, d, $J_{HH}$ = 7.6 Hz, $C_{2,2`}$, $_{6,6`}$-H); 7.70 (4H, d, $J_{HH}$ = 7.6 Hz, $C_{3,3`}$, $_{5,5`}$-H). $^{13}$C NMR (100.63 MHz, DMSO-$d_6$): $\delta_c$ = 21.82 ($C_{methyl}$); 22.02 ($C_{9,\ 9`}$); 24.50 (C_{10}); 29.84 ($C_{8,\ 8`}$); 39.28 ($C_{7,7`}$); 43.41 (C_{12}); 51.36 (C_{11}); 124.58 ($C_{2,2`}$,$C_{6,6`}$); 126.43 ($C_{3,3`}$, $C_{5,5`}$); 134.34 ($C_{1,1`}$); 137.75 ($C_{4,4`}$); 153.39 (C=N). The electrospray (+) mass spectrum of A_2 showed the mass ion peak at m/z = 347.0251 amu assigned to $(M-(CH_3)+H)^+$ for $C_{23}H_{29}N_3$. Peaks detected at m/z = 303.1755 and 169.1104 were correlated to $[(M-(CH_3)+(CH_4N_2)]^+$ and $[(M-(CH_3)+(CH_4N_2)]+(C_{12}H_{14})]^+$.

2.3.2. Synthesis of ligands (H_2L^1 and H_2L^2)

2.3.2.1. Synthesis of N-(2-(((1R,2R,4R,5S,Z)-2,4-diphenyl-3-azabicyclo[3.3.1]nonan-9-ylidene)amino)ethyl)-2-((2-mercaptoethyl)thio)acetamide (H_2L^1)

A mixture of 1,4-dithian-2-one (0.080g, 0.597mmol) in $CHCl_3$ (10ml) was added dropwise, under N_2 atmosphere, to a mixture of precursor A_1 (0.233g, 0.699mmol) in $CHCl_3$ (10ml). The reaction mixture was stirred under nitrogen atmosphere for 3h. A white solid that formed was collected by filtration, washed with diethylether (10ml) and then allowed to dry under vacuum. Yield: 0.056 g (70 %), m.p. = 312-315 ºC. Ft-IR data (cm^1), 3417 $\nu(N-H)_{amide}$, 1662 $\nu(C=O)_{amide}$, 1604 ν(C=N), 2555 ν(S-H), 1531 and 1492 $\nu(C=C)_{arom}$, 1346 ν(C-N), 1056 and 914 ν(C-S). NMR spectra (ppm), ^{1}H (400 MHz, DMSO-d_6), see Figure 1; δ_H = 1.23 (3H, m, H_{10}, S-H); 1.60 (2H, t, J_{HH} = 8.8 Hz, H_{14}); 1.81 (9H, m, $H_{8,8`}$, $H_{9,9`}$, H_{11} and N-H); 2.61 (2H, t, H_{15}, J_{HH} = 6.4 Hz); 2.87(2H, d, $H_{7,7`}$ , $J_{HH}$ = 5.2 Hz); 3.16 (2H, t, $H_{12}$, $J_{HH}$ = 6.4 Hz); 3.63(2H, s, $H_{13}$); 7.44 (2H, t, $J_{HH}$ = 5.2 Hz, $H_{1,1`}$); 7.57 (4H, t, J_{HH} = 5.2 Hz, H $_{2,2`;\ 6,6`}$); 7.77 (4H, d, J_{HH} = 4.8 Hz, $H_{3,3`;\ 5,5`}$); 8.09 (1H, s, N-*H*)$_{amide}$.), ^{13}C (100 MHz, DMSO-d_6), Figure 2; δc= 24.49 (C_{10}); 25.52 ($C_{9,9`}$); 28.80 ($C_{8,8`}$); 32.56 (C_{15}); 41.18 (C_{14}); 46.42 (C_{13}); 48.13 (C_{12}); 56.79 (C_{11}); 60.97 ($C_{7,7`}$) 125.10($C_{1,1`}$); 126.95($C_{2,2`}$, $_{6,6`}$);127.11 ($C_{3,3`}$, $_{5,5`}$); 138.28 ($C_{4,4`}$); 157.79 (C=N); 175.86 (C=O). The electrospray (+) mass spectrum of H_2L^1 showed the parent ion peak at m/z = 467.3040 amu corresponding to $(M)^+$, requires; 467.2065 and the following fragments at 374.2201, 261.1360 and 160.8401 amu were assigned to $[M-(C_2H_6S_2)+H]^+$, $[M-(C_2H_6S_2+C_9H_5)]^+$ and $[M-(C_2H_6S_2+C_9H_5+C_5H_{11}NO)]^+$, respectively.

2.3.2.2. Synthesis of N-(2-(((1R,2R,4R,5S,Z)-2,4-di-p-tolyl-3-azabicyclo[3.3.1]nonan-9-ylidene)amino)ethyl)-2-((2-mercaptoethyl)thio)acetamide(H_2L^2)

The method adopted to prepare H_2L^2 was similar to that for H_2L^1, but with precursor A_2 instead of A_1. Other reaction reagents were adjusted accordingly and an analogues workup procedure that implemented resulted in the isolation of the required ligand. Yield: 0.2155g (75 %), m.p. = 320-322ºC. IR data (cm^1), 3398 $\nu(N-H)_{amide}$, 1674 $\nu(C=O)_{amide}$, 1616 ν(C=N), 2619 ν(S-H), 1577and 1523 $\nu(C=C)_{arom}$, 1323 ν(C-N), 1033 and 9254 ν(C-S). NMR data (ppm), Figure 1; ^{1}H (400 MHz, DMSO-d_6), see Figure 1; δ_H = 1.02 (3H, m, H_{10}, S-H);1.582 (2H, t, J_{HH} = 8.8 Hz, H_{14}); 1.44 (9H, m, $H_{8,8`}$, $H_{9,9`}$, H_{11} and N-H); 1.71 (2H, t, H_{15}, J_{HH} = 6.4 Hz); 2.73(2H, d, $H_{7,7`}$ , $J_{HH}$ = 5.2 Hz); 2.86 (2H, t, $H_{12}$, $J_{HH}$ = 6.4 Hz); 3.09(2H, s, $H_{13}$); 3.59 (2H, t, $J_{HH}$ = 5.2 Hz, 2x $CH_3$); 3.70 (4H, t, $J_{HH}$ = 5.2 Hz, H $_{2,2`;\ 6,6`}$); 7.15 (4H, d, $J_{HH}$ = 4.8 Hz, $H_{3,3`;\ 5,5`}$); 7.45 (1H, s, N-*H*)$_{amide}$. ): 8.12. $^{13}$C (100 MHz, DMSO-$d_6$), Figure 2; $\delta$c= 20.40 ($C_{methyl}$); 23.19 ($C_{9,9`}$); 26.35 ($C_{10}$); 28.75 ($C_{8,8`}$); 32.26 ($C_{15}$); 35.46 ($C_{7,7`}$); 41.15 ($C_{14}$); 44.79 ($C_{13}$); 46.14 ($C_{12}$); 54.37 ($C_{11}$); 126.35 ($C_{2,2`}$, $_{6,6`}$);128.26 ($C_{3,3`}$, $_{5,5`}$); 134.69 ($C_{4,4`}$); 136.69 ($C_{1,1`}$); 146.84 (C=N); 177.69 (C=O). The electrospray (+) mass spectrum of H_2L^1 recorded a peak at m/z = 495.2304 amu related to $(M)^+$, requires; 495.2378. Fragments at 403.3873, 374.2201 and 261.1360 amu correspond to $[M-(SCH_2SCH_2)]^+$, $[M-(SCH_2SCH_2)+(CH_2NH)]^+$ and $[M-(SCH_2SCH_2)+ (CH_3NH_2)+(NHCCOCHCHCHCH)]^+$, respectively. Elemental microanalyses of precursors and ligands, colours, yields and melting points are placed in Table 1.

2.3.3. Synthesis of the complexes with H_2L^1 and H_2L^2

A mixture of the title ligand (0.1g, 0.180mmol) in 20ml of a mixture solution of ethanol:chloroform 1:1 and potassium hydroxide (0.03g, 0.541mmol) in ethanol (5ml) was stirred for 10 min. To the above mixture was added dropwise an ethanolic solution (10ml) of the metal chloride (0.043g, 0.180mmol). The resulting mixture was refluxed under N_2 atmosphere for 3h. A solid that formed was filtered, washed by ethanol and diethyl ether, and dried under vacuum. Elemental analysis data, colours, and yields for the ligands and their complexes are given in Table (2).

2.4. Determination of biological activity

The evaluation of compounds (ligands and complexes) against four bacterial strains *(Escherichia coli, Pseudomonas aeruginosa, Staphylococcus aureus and Bacillus)* and four fungi species (*Candida albican*s, *Candida glabrat*a, *Candida tropicali*s and *Candida parapsilsis*) were performed using agar-well diffusion. In this method, the wells were dug in the media with the help of a sterile metallic borer with centres at least 6 mm. A 100 μL concentration of the title specimen 1 mg/mL in DMSO was placed in the individual wells [13]. The Petri dishes were incubated in the incubator for 24h at 37 ºC. The biological activity was observed by measuring the diameter of inhibition zones (mm).

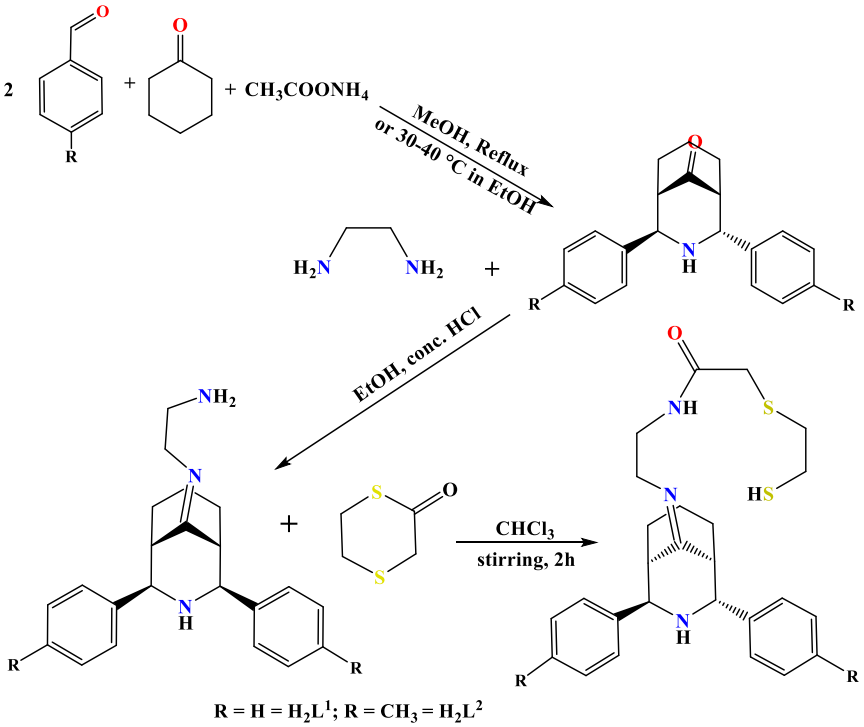
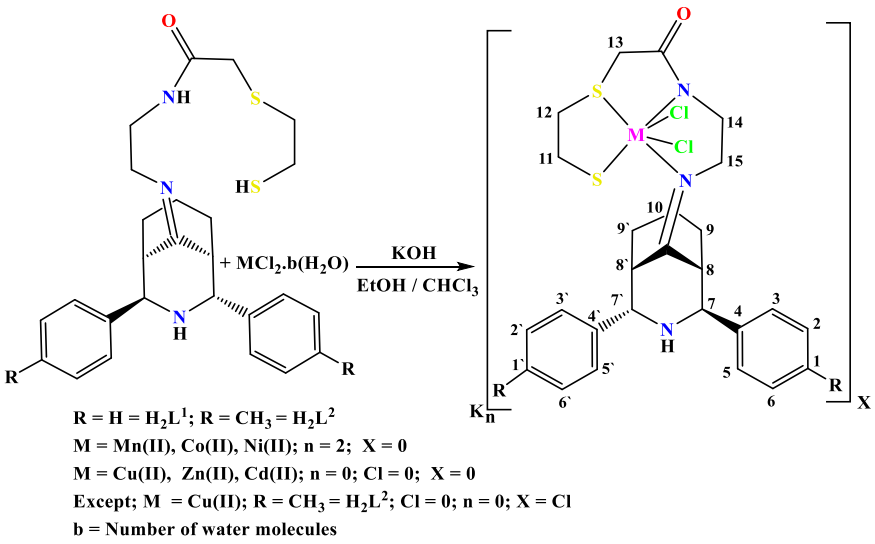
3. Results and discussion

Ligands were prepared from the reaction of amine precursors with 1,4-dithian-2-one. The preparation of the precursors was achieved into two steps; the first step includes Mannich-reaction of benzaldehyde or its derivative with ammonium acetate and cyclohexanone in the presence of ethanol to isolate precursors M_1 and M_2. The second step focused on the reaction of precursors with ethylenediamine to obtain amine compounds A_1 and A_2. The ligands were synthesised from the reaction of 1,4-dithian-2-one and amine precursors in the presence of triethylamine as a base in $CHCl_3$ medium, which gave the title ligands (H_2L^1 and H_2L^2), see Scheme (1). Elemental analysis Table 1, FT-IR (Table 3), NMR (^{1}H- and ^{13}C-NMR) and mass spectra were implemented to determine the entity of compounds (precursors and ligands).



Scheme 1. Synthetic route for precursors and ligands H_2L^1 and H_2L^2.

Complexes of the ligands with Mn(II), Co(II), Ni(II), Cu(II), Zn(II) and Cd(II) ions were synthesised by heating 1 mmole of each ligand with 1 mmole of metal chloride using a mixture of ethanol/chloroform medium at reflux using KOH as a base. In the ethanol/chloroform solution of KOH, the deprotonation of the ligands is occurred that facilitated the formation of $K_2[Co(HL^n)Cl_2]$, $K_2[Mn(HL^n)Cl_2]$, $K_2[Ni(HL^n)Cl_2]$, $[Cu(HL^n)]$, $[Zn(HL^n)]$ and $[Cd(HL^n)]$ **(**M = Mn(II), Co(II), Ni(II), Cu(II), Zn(II), and Cd(II), $L^n = L^1$ or L^2), Scheme 2. The complexes are air-stable and soluble in DMSO (bar other organic solvents). Elemental analysis and other physical properties of the complexes are placed in Table 4. Physico-chemical data agree well with the proposed formulas. The prominent infrared peaks and their assignments for the ligands and complexes are included in Table 3. The electronic data (UV-Vis) with their assignments for ligands and complexes are placed in Table 4.



Scheme 2. General synthetic route of ($H_2L^1$and H_2L^2) complexes.

3.1. FT-IR and NMR spectra

The FT-IR spectra of free ligands display bands due to $\nu(C=O)_{amide}$, $\nu(C=N)_{imine}$ and ν(C-N) groups. The distinct frequency around 2555-2619 cm^1 related to ν(S–H), confirms the presence of the ligands in the thiol form [14]. The FT-IR spectra of the complexes exhibited H_2L^1 and H_2L^2 bands with the proper shifts due to complex formation (Table 3). Band assigned to ν(S-H) in the free ligands was disappeared in the spectra of complexes, due to the involvement of sulfur atom, as a thiolate moiety, in complex formation. The $\nu(C=O)_{amide}$ and $\nu(C=N)_{imine}$ at ca. 1662,1674 cm^1 and at ca. 1604-1616 cm^1 in the free ligands were recorded at lower frequencies, indicated a reduced bond order, and observed around 1631-1651; 1600 and 1639-1651; 1600 cm^1 for H_2L^1 and H_2L^2 complexes, respectively. This shift confirmed the involvement of the N atoms of these moieties in the coordination to the metal centre. Bands detected around 1056-1029; 898-855 cm^{-1} and 1083-1033; 898-855 cm^{-1} were attributed to ν(C-S) for complexes of H_2L^1 and H_2L^2, respectively indicating the involvement of sulfur atoms upon coordination to metal centre [15]. At lower frequency, the complexes exhibited bands around 416-493 and 333-383 cm^1 attributed to ν(M-N) and ν(M-S), respectively. Bands observed around 244-262 and 243-277 cm^1 in the spectra of $K_2[Mn(L^1)Cl_2]$, $K_2[Co(L^1)Cl_2]$, $K_2[Mn(L^2)Cl_2]$ and $K_2[Ni(L^2)Cl_2]$ are related to ν(M-Cl) [16]. The appearance of two bands indicated the coordination of the Cl atoms in the *cis* conformation.

The ^{1}H and ^{13}C NMR spectra of ligands revealed peaks related to the various proton and carbon nuclei consistent with the proposed structural formula. The ^{1}HNMR spectrum of $[Cd(L^1)]$ Figure 3; in DMSO-d_6 solution indicated two characteristic sets of chemical shifts in the aliphatic and aromatic regions. In the aromatic region, the spectrum indicated signals at; 7.57 ppm (4H, d, J_{HH} = 4 Hz, $H_{3,3`;\ 5,5`}$); 7.17 (4H, t, J_{HH} = 8 Hz, $H_{2,2`;6,6`}$); 7.02 ppm (2H, t, J_{HH} = 8 Hz, $H_{1,1`}$). The aliphatic region shows chemical shifts at 3.99 (2H, s, $H_{13}$); 3.41 (2H, t, $H_{12}$, $J_{HH}$ = 8 Hz); 2.68 (2H, s, $H_{7,7}$); 2.34 (2H, t, $H_{15}$); 1.60 (9H, m, $H_{8,8`}$, $H_{9,9`}$, H_{11} and N-*H*); 1.14 (2H, t, H_{14}, J_{HH} = 8 Hz); 1.01 (2H, m, H_{10}). The spectrum indicated no signals may attribute to N-H of the amide groups and S-H of thiol, confirming the involvement of these moieties in complexation, and making the ligand behaves as -2 species upon complexation. 22.61 (C_{10}); 23.50 ($C_{9,9`}$); 28.36 ($C_{8,8`}$) 29.61 (C_{15}); 38.07(C_{14}); 39.81(C_{13}); 41.10(C_{12}) 44.27 (C_{11}); 67.52 ($C_{7,7`}$); 128.27($C_{1,1`}$); 128.60 ($C_{2,2`}$, $_{6,6`}$); 131.63 ($C_{3,3`}$, $_{5,5`}$); 137.43 ($C_{4,4`}$); 167.06 (C=N); 188.12 (C=O). The $^{13}$C-NMR spectrum of $[Cd(L^2)]$ displayed signals at; 22.30 ($C_{methyl}$); 23.80 ($C_{9,9`}$); 28.24 (C_{10}); 28.55 ($C_{8,8`}$); 34.49 ($C_{15}$); 43.95 ($C_{7,7`}$); 50.28 (C_{14}); 55.42 (C_{13}) and (C_{12}); 55.76 (C_{11}); 128.21($C_{2,2`}$, $_{6,6`}$); ($C_{3,3`}$, $_{5,5`}$) 132.55; 134.45 ($C_{4,4`}$); 135.17 ($C_{1,1`}$); 159.76 (C=N); (C=O) 188.87 ppm. The chemical shift for the imine and amide groups by ca. 10-13 and 11-13 ppm, respectively in comparison with that in the free ligand confirmed the involvement of the nitrogen atoms of the imine and amide groups in complexation. This shift is related to the deshielding occurred to these moieties by the Cd(II) centre upon complexation.

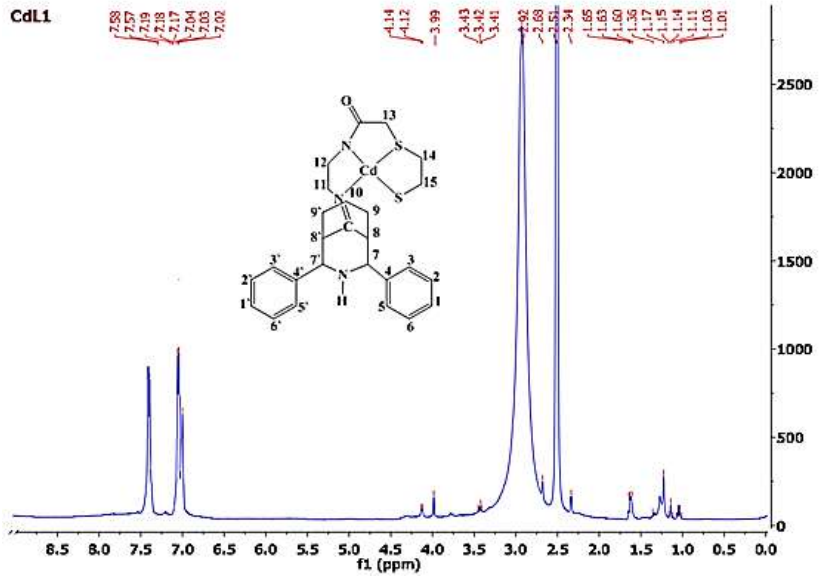

Figure 3. ^{1}HNMR spectrum of [Cd(L^{1})] complex in DMSO-d_6.

3.2. Mass spectra

The obtained mass spectra of the ligands agreed with the suggested structural formula (see experimental section and 'Figure 4'.

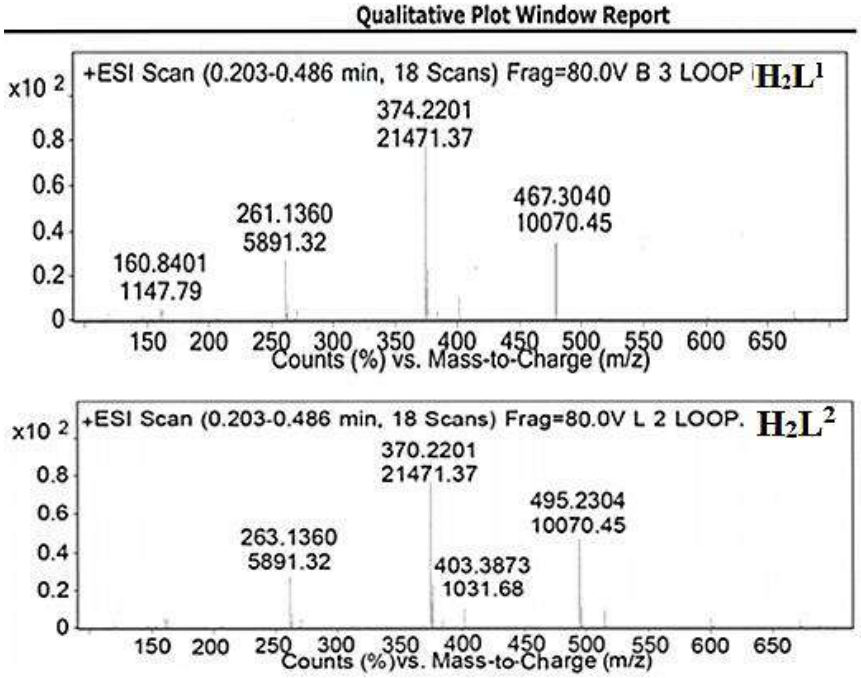

Figure 4 . ESI (+) mass spectra of H_2L^1 and H_2L^2

The accurate electrospray (+) mass spectrum of $K_2[Ni(L^1)Cl_2]$ Figure 5; indicated a peak at m/z = 671.4532 amu, requires = 670.9913 corresponding to $(M)^+$. The successive fragments at 487.3041, 374.2202, 261.1360 and 160.8402 were assigned to $[M-(C_5H_6S)+(C_4H_2S)]^+$,$[M-(C_5H_6S)+(C_4H_2S)+(CHCl_2NO)]^+$, $[M-(HCN)+(2HCl)+(C_4H_8S_2)+(HCN)+(C_6H_4O)+(C_5H_2C_5H_6S)+(C_4H_2S)+(CHCl_2NO)+(HCN)+(C_7H_2)]^+$ and $[M-(C_5H_6S)+(C_4H_2S)+(CHCl_2NO)+(HCN)+(C_8H_3N)+(C_6H_{13}N)]^+$, respectively.

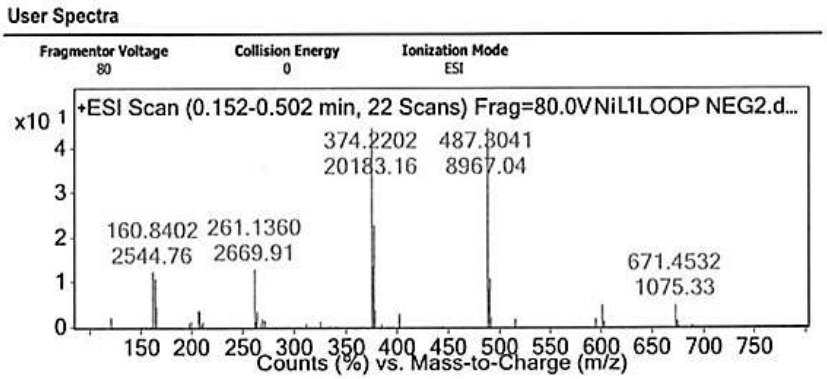

Figure 5. ESI (+) mass spectrum of $K_2[Ni(L^1)Cl_2]$.

3.3. Electronic spectra, magnetic moments, and conductivity measurements

The electronic data of H_2L^1 and H_2L^2 display absorption peak at 260, 265 and 345, 360 nm, respectively related to overlaps of $\pi \rightarrow \pi^*$ and $n \rightarrow \pi^*$ transitions. The spectra of H_2L^1 complexes showed hypsochromic shift peaks correlated to the ligand field transitions ($\pi \rightarrow \pi^*$ and $n \rightarrow \pi^*$) [17-19], bar Cu(II) complex that exhibited a bathochromic shift. The electronic spectrum of Mn(II) complex revealed peaks in the d-d region at 441 and 762 nm assigned to $^6A_1g^{(F)} \rightarrow {}^4T_2g^{(G)}$ and $^6A_1g \rightarrow {}^4T_1g^{(G)}$ transitions, respectively indicating a distorted octahedral geometry about Mn(II) ion [20-21]. These data with the magnetic moment value confirmed an octahedral geometry around the Mn(II) atom. The Co(II) complex displays more peaks in the d-d region at 413, 537 and 674 nm due to $^2Eg \rightarrow {}^2T_1g$ or ^2T_2g, $^2Eg \rightarrow {}^4T_1g^{(F)}$ and $^4T_1g^{(F)} \rightarrow {}^4A_2g^{(F)}$, respectively. This spectrum is characteristic for Co(II) complexes with distorted octahedral geometries around Co atom [22-24]. The μ_{eff} value for this complex is included at the range of octahedral confirming octahedral geometry about metal centre. The Ni(II) complex showed peaks at 417, 610 and 681 nm related to $^3A_2g \rightarrow {}^1T_1g^{(P)}$, $^3A_2g \rightarrow {}^3T_1g^{(p)}$ and $^3A_2g \rightarrow {}^3T_1g^{(F)}$ transitions, respectively confirmed a distorted octahedral geometry around Ni atom [16]. The paramagnetic behaviour of the Ni(II) complex suggested a distorted octahedral geometry. The Cu(II) complex displayed a peak in the d-d region at 828 nm attributed to d-d transition attributed to $^2B_1g \rightarrow {}^2A_2g$, confirming a distorted square planar arrangement about Cu atom [25-27]. The proposed distorted square planar arrangement for the pale-green Cu(II) complex is supported by its magnetic measurement value and other analytical data. The spectra of the Zn(II) and Cd(II) complexes revealed peaks related to ligand field ($\pi \rightarrow \pi^*$ and $n \rightarrow \pi^*$). These diamagnetic complexes (d^{10} system) normally prefer tetrahedral structures. The conductance values of the Mn(II), Co(II), Ni(II), Cu(II), Zn(II) and Cd(II) complexes were in the range of 13.1-76.99 $\Omega^{-1}cm^2mol^{-1}$ indicating 2:1 electrolytic behaviour of the Mn(II), Co(II) and Ni(II), while those of the Cu(II), Zn(II) and Cd(II) complexes were indicating nonelectrolytes [27-28]. The electronic spectra of H_2L^2 complexes revealed peaks that attributed to the ligand field ($\pi \rightarrow \pi^*$ and $n \rightarrow \pi^*$ transitions) [16-18]. The electronic spectrum of Mn(II) complex displayed peaks at 434 and 639 nm correlated to $^6A_1g^{(F)} \rightarrow {}^4T_2g^{(G)}$ and $^6A_1g \rightarrow {}^4T_2g^{(G)}$ transitions, respectively confirming a distorted octahedral structure around Mn atom [23]. These data with the value of magnetic moment support an octahedral geometry around the Mn atom. The Co(II) complex displays additional peaks in the d-d area at 438 and 680 nm due to $^4T_1g^{(F)} \rightarrow {}^4A_2g^{(F)}$ and $^4T_1g \rightarrow {}^4T_2g^{(F)}$ transitions, respectively. This spectrum is characteristic for Co(II) complexes that adopt distorted octahedral structures [23]. The magnetic moment value of the Co(II) complex is in the agreement of octahedral structure with a high spin configuration around Co(II) ion. The Ni(II) complex displayed a peak at 641 nm related to $^3A_2g \rightarrow {}^3T_1g$ transition, confirming a distorted octahedral sphere about Ni atom [23]. The Ni(II) complex is paramagnetic with a value consists of the distorted octahedral geometry. The electronic spectrum of this complex was in agreement with this assignment. Cu(II) complex showed a peak in the d-d region at 794 nm attributed to d-d transition $^2B_1g \rightarrow {}^2B_2g$ demonstrating a distorted square planar geometry about Cu atom [14]. The suggested distorted square planar geometry of the blue Cu(II) complex is supported by magnetic moment value

and other analytical data. The spectra of the Zn(II) and Cd(II) compounds indicated peaks attributed to ligand field ($\pi\rightarrow\pi^*$ and $n\rightarrow\pi^*$). These diamagnetic complexes (d^{10} system) normally prefer tetrahedral structures. The molar conductance values of the Mn(II), Co(II), Ni(II), Cu(II), Zn(II) and Cd(II) complexes were in the range of 7.07-78.21 $\Omega^{-1}cm^2mol^{-1}$ indicating 2:1 electrolytic behaviour of the Mn(II), Co(II) and Ni(II), while those of the Cu(II), Zn(II) and Cd(II) complexes were indicating nonelectrolytes, except Cu(II) complex that indicated a 1:1 electrolytic behaviour [27-28].

Table 4. Electronic spectral data of (H_2L^1- H_2L^2) complexes in DMSO solutions.

3.4. Thermal gravimetric analysis

This technique was implemented to study the thermal properties of compounds (stability and chemical composition of ligands and some complexes). TGA analysis supported the determination of the melting points of compounds and identifying their decomposition steps, see Table (5). The TGA peak of the ligand Figure 6; observed at 399.9 ºC indicated the loss of ($C_{20}H_{22}N_2$) fragment, (det. = 12.364 mg, 60.904 %; calc. = 12.357 mg). The other step occurred at 521.8 ºC revealed the loss of (CH_3NO) portion, (det. = 1.941 mg, 9.562 %; calc. = 1.921 mg). The third step of the decomposition of the compound at 593.3 ºC is linked to the evolving of (CH_2S) segment, (obs. = 1.956 mg, 9.633 %; calc. = 1.958 mg). The remaining deposit of the compound above 598.0 ºC is associated with the loss of (C_4H_6S), (obs. = 4.040 mg, 19.901%; calc. = 3.668 mg). The differences in the weight may be related to a sublimation process that occurred at high temperature. The DSC curve recorded peaks at 317.1, 337.0, 524.1 and 593.3 ºC, which refer to an endothermic decomposition process. While the peak at 344.0 ºC was referred to an exothermic decomposition process. The exothermic and endothermic peaks may specify combustion of the organic ligand in an argon environment [29-30]. The thermogram for $K_2[Co(L^1)Cl_2]$ Figure 7; which confirmed the Co(II) complex is stable up to 285.0 ºC. In the TGA curve, peak detected at 408.6 ºC is related to the loss of (C_7H_4, C_7H_7NO and 2HCl) segments, (det. = 9.954 mg, 54.997 %; calc. = 9.941 mg). The second step at 594.0 ºC that indicated the loss of (2C) fragment, (obs. = 0.619 mg, 3.429%; calc. = 0.646 mg). The final residue of the compound that recorded above 598.0 ºC is correlated to the (Co, 2K, N_2, $2H_2S$, CH_4 and C_2H_6), (det. = 7.534 41.573 %; calc. = 7.512 mg). The DSC curve indicated peaks at 283.0, 325.4, 353.6, 419.2 and 594.0 ºC correlated to an endothermic decomposition process. The endothermic peaks may show combustion of the organic ligand in the inert atmosphere [29-30]. The last endothermic peak may indicate the braking of the metal-ligand bond. The thermogram for $[Cu(L^1)]$ Figure 8; which shows the Cu(II) complex is stable up to 220.0 ºC. The TGA peak at 259.9 ºC attributed to the loss of (C_2H_2) group, (det. = 0.835 mg, 4.347 %; calc. = 0.946 mg). The differences between the observed and calculated weight may be related to the sublimation process. The second step occurred at 391.9 ºC account for the loss of ($C_4H_6S_2$, C_6H_6 and NH_3) portions, (det. = 7.698 mg, 40.092 %; calc. = 7.711 mg). The third step of the decomposition of the compound is observed at 515.5 ºC, which attributed to the loss of ($2H_2$ and NH_3) fragments, (obs. = 0.771 mg, 4.016 %; calc. = 0.765 mg). The final residue of the compound recorded above 598.0 ºC is assigned to the (Cu, HCN and $C_{12}H_5NO$), (obs. = 9.896 mg, 51.543 %; calc. = 9.778 mg). The DSC curve indicated endothermic decomposition processes at temperatures 220.4, 280.4, 334.6 and 515.5 ºC. Peaks at 436.1 and 459.4 ºC attributed to exothermic decomposition steps. The exothermic and endothermic curves may relate to the combustion of the organic ligand in the inert atmosphere [29-30]. The last endothermic peak may signify the metal-ligand bond breaking. While the thermogram for H_2L^2 is shown in Figure 9; The analysis chart indicated the ligand is intact up to 325.0 ºC. The TGA curve measured at 336.9 ºC attributed to the mass loss of (C_5H_7NO) segment, (obs. = 3.845 mg, 19.612 %; calc. = 3.844 mg). The second step took place at 399.3 ºC confirmed the loss of ($C_5H_6S_2$, C_5H_5N and C_3H_4) portions, (obs. = 12.979 mg, 66.217 %; calc. = 12.985 mg). The third decomposition step of the compound at 577.5 ºC is assigned to the mass loss of (C_2H_4) fragment, (obs. = 1.146 mg, 5.8471 %; calc. = 1.110 mg). The final residue that observed above 598.0 ºC is attributed to the elimination of (C_3H_6) portion, (obs. = 1.631 mg, 8.322 %; calc. = 1.664 mg). In the DSC curve, peaks at 331.3, 363.1 and 577.5 ºC indicate endothermic decomposition processes. Peaks at 535.0 and 568.8 refer to exothermic decomposition processes. The exothermic and endothermic curves may relate to the pyrolysis of the organic ligand in the inert atmosphere [29-30]. The thermogram for $K_2[Mn(L^2)CL_2]$ Figure 10; that revealed the Mn(II) complex is steady up to 272.0 ºC. The TGA curve observed at 399.3 ºC related to the loss of (C_5H_6, 2HCl, NH_3, H_2S, $C_5H_{10}S$ and C_7H_8) portions, (obs. = 11.014 mg, 55.0305 %; calc. = 11.010 mg). The second and third steps occurred at 485.3 and 580.28 ºC indicated the evolving of (HCN) compound, (obs. = 0.779 mg, 3.894 %; calc. = 0.779 mg). The final residue of the compound at 598.0 ºC is related to the loss of (Mn, 2K, N_2, and C_9O), (obs. = 8.215 mg, 41.0755 %; calc. = 8.186 mg). The DSC curve displayed peaks at 272.0, 351.8, 418.3, 449.2, 504.3 and 580.2 ºC refer to endothermic decomposition processes. The endothermic peaks may relate to the combustion of the organic ligand in an argon environment [29-30]. The last endothermic peak may signify the metal-ligand bond breaking. The thermogram for $K_2[Ni(L^2)Cl_2]$, Figure 11; which revealed the Ni(II) complex is stable up to 288.8 ºC. The TGA peak observed at 411.9 ºC

confirmed the loss of ($C_7H_{11}N$, $C_4H_8S_2$ and C_8H_{10}) segments, (obs. = 10.070 mg, 47.952 %; calc. = 10.069 mg). The second and third step occurred at 443.9 and 594.8 ºC indicated the loss of (C_2H_4 and HCN) fragments, (det. = 1.663 mg, 7.919 %; calc. = 1.655 mg). The remaining residue above 598.0 ºC related to the (NiO, 2K, Cl_2, HCN and 4C), (det. = 9.267 mg, 44.128 %; calc. = 8.978 mg). The DSC analysis shows peaks at 288.8, 347.7, 502.7 and 594.8 ºC refer to endothermic decomposition processes. The peak at 477.0 ºC refers to an exothermic decomposition step. The exothermic and endothermic peaks may conclude combustion of the organic compound in the inert atmosphere [29-30]. The final endothermic peak attributed to the metal-ligand bond breaking.

4. Antimicrobial activity

The compounds (ligands and complexes) were screened against four bacterial strains *(Escherichia coli, Pseudomonas aeruginosa, Staphylococcus aureus and Bacillus)* and four fungi species (*Candida albican*s, *Candida glabrat*a, *Candida tropicali*s and *Candida parapsilsis*). The measured areas of inhibition against the growth of different microorganisms were listed in Tables (6 and 7). These data show the inhibition capacity of the prepared compounds on the tested bacteria and fungi species. It is found that metal complexes have antimicrobial activity against bacterial strains and fungi species. This attributed to the complexation influence that allows the participation of the inherent positive charge of the metal ion in complexes with the negative charge provided by the donor atoms of the ligand. Subsequently, the π-electron will distribute over the entire chelate ring resulting in the increases of the lipophilic character of the metal chelate system. This shall help its mobility through the cell membranes [31-32].

5. Conclusions

In the present publication, we have investigated the synthesis, structural characterisation and coordination bonding mode of metal complexes isolated from the reaction of multidentate N_2S_2 heterocyclic ligands (H_2L^1 and H_2L^2) with a range of metal ions. The coordination chemistry and overall structure of the complexes were concluded using a range of analytical and spectroscopic techniques. Further, thermal properties of the ligands and some complexes were established using TGA, DTA and DSC analyses. Biological activities revealed that the ligands and their metal complexes showed different

activity effect on both types of the Gram-positive (G+) and Gram-negative (G-) of the tested bacteria and four species of fungi.

Abstract. In this paper; the modern method was used to remove the congo red dye (CR) from its aqueous solutions by chemometric separation. The nano charcoal activated (NCA) was used to remove the CR and the factors affecting the adsorption process were studied simultaneously to reduce the number of experiments followed and to rely on central composite design and the method of response surface by used statistica 12 program. This gives the relationship between all the variables simultaneously. It was found that the removal efficiency reached to 98.371%.

Keyword: Chemometric Method, Congo Red Dye, Nano Charcoal Activated, Adsorption, and Simultaneously.

1.Introduction:

Environmental pollution in general and water pollution in particular is a problem of significant importance in many countries [1]. Water pollution hurts human health [2] as liquid pollutants such as heavy metal ions and dyes are among most critical diseases [3]. These dyes are used in many vital industries such as paper, fabric, tanning and painting [4]. Congo red dye (CR) is one of the known industrial dyes and it is one of the oldest dyes used, Figure (1) [5]. The molecular formula for this dye is ($C_{32}H_{22}N_6Na_2O_6S_2$) [6]. Despite the benefits of its use in the medical field and the food field, but when discharged into water it causes pollution [7]. There are many techniques to remove the dyes from water including the adsorption method as one of the most crucial methods [8]. Adsorption is used to remove dyes from water because it is simple to operate, cheap, and highly efficient [9]. Nano charcoal activated (NCA) is widely used as an adsorbent in separation processes due to its large surface area, low price and painless preparation [10].

(NCA) had stimulated research society to solve the problems of the environment [11]. This nano is very useful for removing by adsorption of various water, air and soil contaminants [12]. Moreover, the decline in water quality has led researchers to use new adsorbents to treat water with charcoal activated [13]. NCA is an excellent adsorbent as its surface that can be adjusted with the addition of other materials and has a high ratio of the volume to the surface area. In addition, it is relatively low cost of production and it is able to reuse [14]. Using coating, stabilizing, and functionalization (NCA) can be modified surface [15]. In the (NCA) surface coating process, clusters are not formed due to the particle dispersion when water molecules containing contaminants (hydrophilicity) are attracted [16]. Therefore, the surface modification of (NCA) will improve its ability to adsorb many pollutants such as dyes and ions of heavy metals [17]. The coating of surface phenomenon helps convert the geometry of closely-packed cubic to nanoparticles in compacts and robust [18].

In this study, the nano charcoal activated (NCA) was used to remove congo red dye (CR) from its aqueous solutions by chemometric separation, making the process less expensive, more productive and environmentally friendly after determining the optimum adsorption conditions.

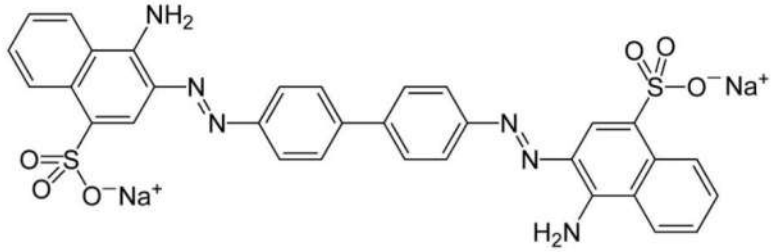

Figure 1. Chemical Structure of Congo Red Dye (CR)

2.The experimental part:

2.1.Chemicals and instruments:

Throughout this study, a high pure and analytical grade was used for all chemical substances and reagents, including nano charcoal activated (NCA) from (BDH), positive congo red dye (CR) from Sigma-Aldrich with purity 99.5%. During the experiments, ultra-pure water was used. Shimadzu UV-Vis Spectrophotometer 1650Pc was used for specifying the residual (CR) in the experiments. Adjusted pH by adding 0.01 M NaOH or 0.01 M HCl and measured by WTW pH meter InoLab 730. A shaker water bath from Amerexa was used to maintain a steady mixing temperature, and it was set to 150 rpm throughout the experiments.

The stock solution of 100 mg/L of (CR) was prepared by dissolving 0.01000 g in a small volume of ultra-pure water and transferred to a 100 mL volumetric flask, diluted with water to a mark. Every day freshly prepares in the range of 30-0.05 mg/L solutions to create a calibration curve. The dye concentration in the aqueous solution was measured via the absorbance (Abs.) at λ_{max} equal to 522 nm by the Least-squares method.

$$[CR]_{mg/L} = \frac{\text{Abs.} - Intercept}{\text{Slope}} \quad (1)$$

2.2.The methodology of experiments:

In this study, all experiments were performed after an added amount of (CR) with nano charcoal activated in the Erlenmeyer flask, placed in the shaker water bath. In order to obtain the optimum conditions for the process of removing (CR) from its aqueous solutions, the effect of five different factors was studied simultaneously and at three levels as shown in table (1); the initial concentration of (CR), the amount of nano charcoal activated, pH, shaking time, and the temperature depended on central composite design [19] and the method of response surface [20] by used STATISTICA 12 program.

Table 1. Factors, Symbol and Coded level to Natural Level by Chemometric Separation

Factors	Symbol	-1	0	+1	Coded level to natural level
The initial concentration of (CR) (mg/L)	X1	10	20	30	10
Amount of Nano charcoal activated(g)	X2	0.2	0.4	0.6	0.2
pH	X3	2	6	10	4
Shaking time (min)	X4	15	25	35	10
Temperature (K)	X5	290	310	330	20

For the passage from coded variable level to natural variable level, the following equations were used: X1 = $([CR]_{mg/L}$ - 20)/10; X2 = (NCA - 0.4/0.2); X3 = (pH−6)/4; X4 = (Time - 25/10) and X5 = (Temperature - 310)/20.

The adsorption process behaviour can be explained based on the empirical second-order polynomial model below [21]:

$$Response = \beta_0 + \sum_{i=1}^{n} \beta_i X_i + \sum_{i=1}^{n} \beta_{ii} X_i^2 + \sum_{i=1}^{n-1} \sum_{j=i+1}^{n} \beta_{ij} X_i X_j \quad (2)$$

Where β_0 is a constant, β_i is the linear coefficient, β_{ii} is the quadratic coefficient, and β_{ij} is the interaction effect coefficient. X_i and X_j are the symbolic values of the factors.
The amount of residual dye was measured at λ_{max}. The quantity (CR) adsorbed onto nano charcoal activated q_e (mg/g) and the removal efficiency R%, which were determined by the following equations:

$$q_e = (C_0 - C_e) \times \frac{V_L}{m_g} \quad (3)$$

$$R\% = \frac{C_0 - C_e}{C_0} \times 100 \quad (4)$$

If the initial concentration (CR) is C_0 (mg/L), the equilibrium concentration C_e (mg/L) of (CR), the Nano charcoal activated mass is m (g), and the solution volume is V(L).

3.Result and Discussion:

3.1.Calibration curve for (CR):

Concentrations of (CR) ranged between (30.0-0.05) mg/L in their aqueous solutions were measured at λ_{max} = 522 nm for creating the calibration curve, as in 'Figure 2' by the Least-squares method.

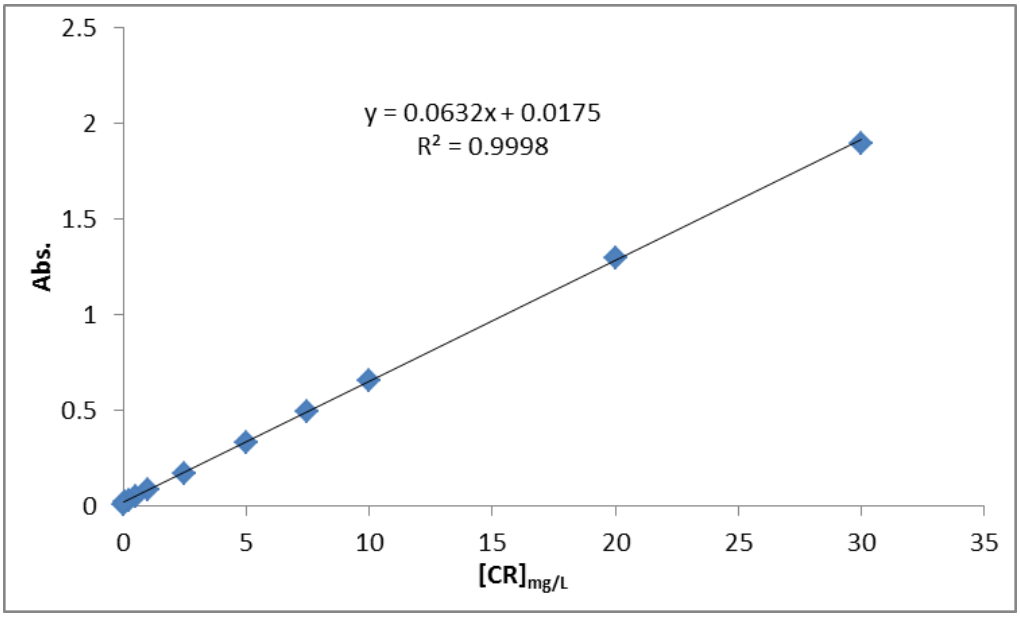

Figure 2. Calibration Curve for Congo Red Dye (CR)

3.2.The optimum conditions:

After studying simultaneously for Nano charcoal activated (NCA) to remove Congo Red dye (CR) from its aqueous solutions by chemometric separation in different conditions [22]; The following results were obtained in 'Figures 3-12' .

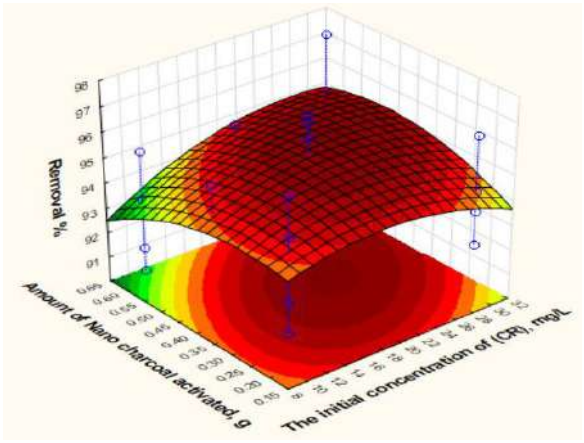

Figure 3. The relationship between the initial concentration of (CR) and amount of nano charcoal activated

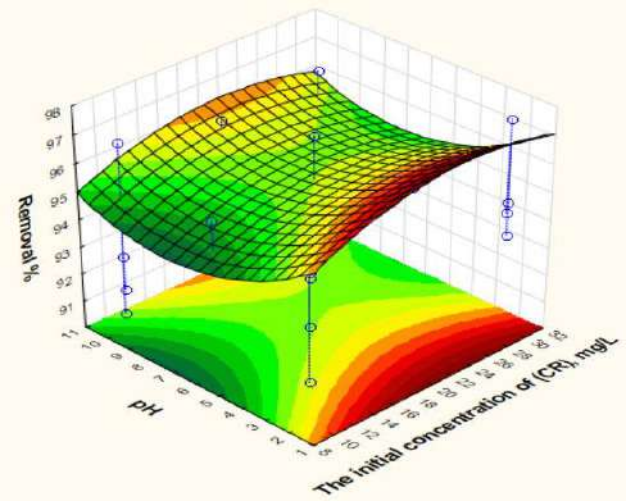

Figure 4. The relationship between the initial concentration of (CR) and pH

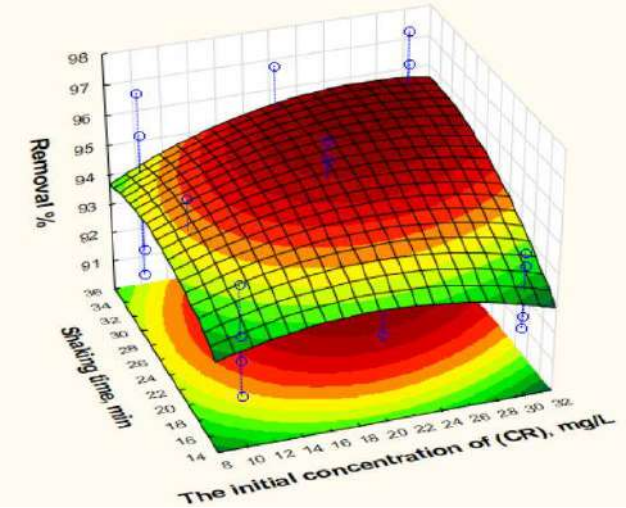

Figure 5. The relationship between the initial concentration of (CR) and Time

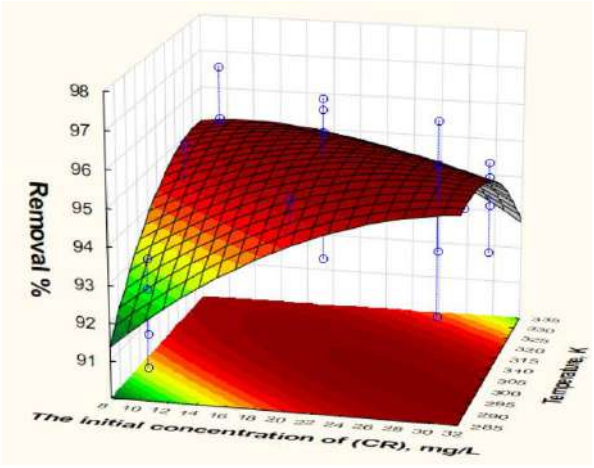

Figure 6. The relationship between the initial concentration of (CR) and temperature

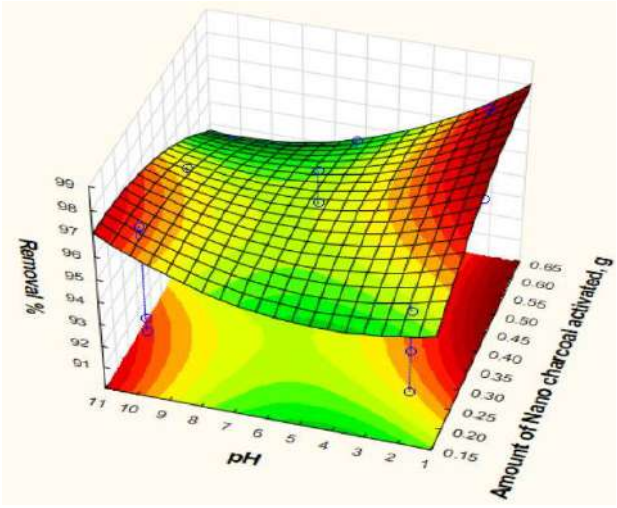

Figure 7. The relationship between amount of nano charcoal activated and pH

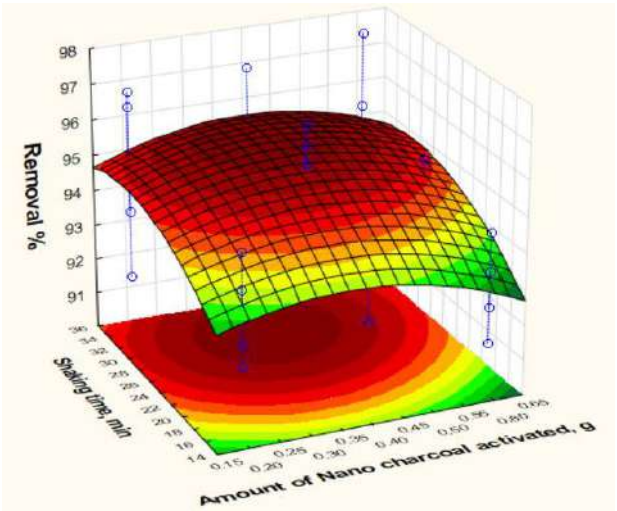

Figure 8. The relationship between amount of nano charcoal activated and Time

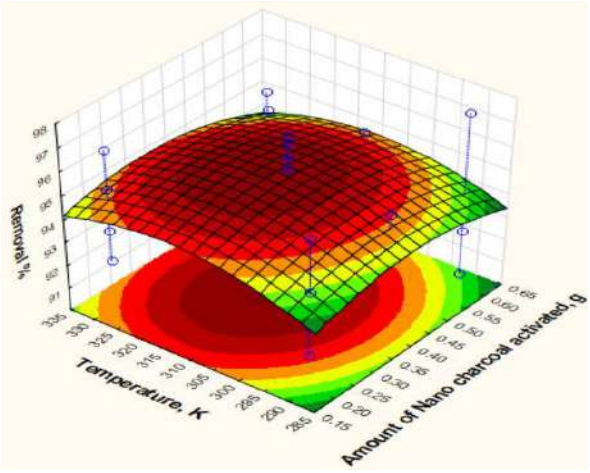

Figure 9. The relationship between amount of nano charcoal activated and temperature

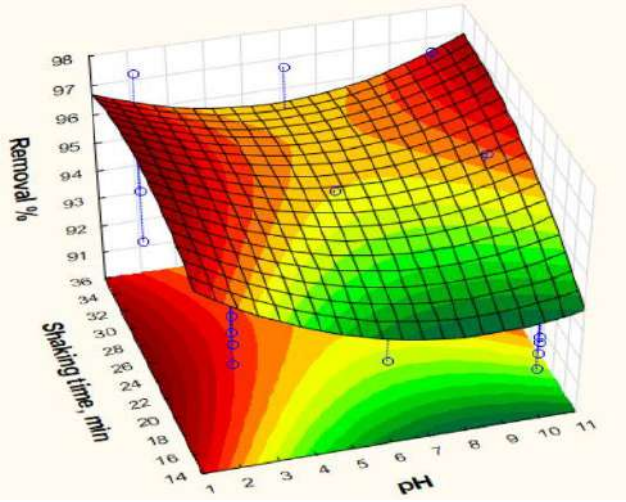

Figure 10. The relationship between pH and time

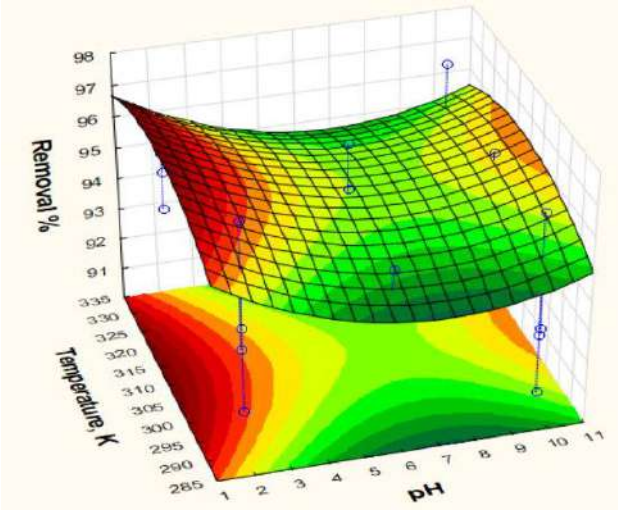

Figure 11. The relationship between pH and temperature

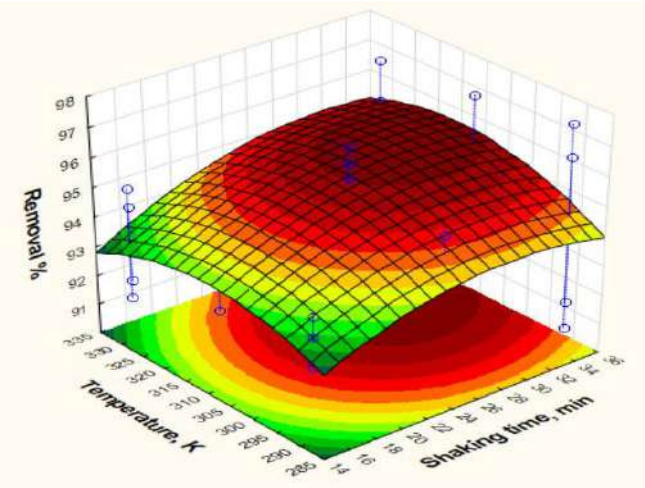

Figure 12. The relationship between time and temperature

By studying the relationship between the five variables with each other and using the statistica 12 program, optimal conditions were found for each factor [23] as shown in Table 2.

Table 2. Optimal conditions by chemometric separation for (CR)

Factors	Symbol	Optimal Conditions
The initial concentration of (CR) (mg/L)	X1	15.341
Amount of Nano charcoal activated (g)	X2	0.258
pH	X3	4.671
Shaking time (min)	X4	20.470
Temperature (K)	X5	309.455

When applying this model to the (CR) dye, it was found that the removal efficiency R% reached 98.371%, as shown in ‘ Figure 13 ’.

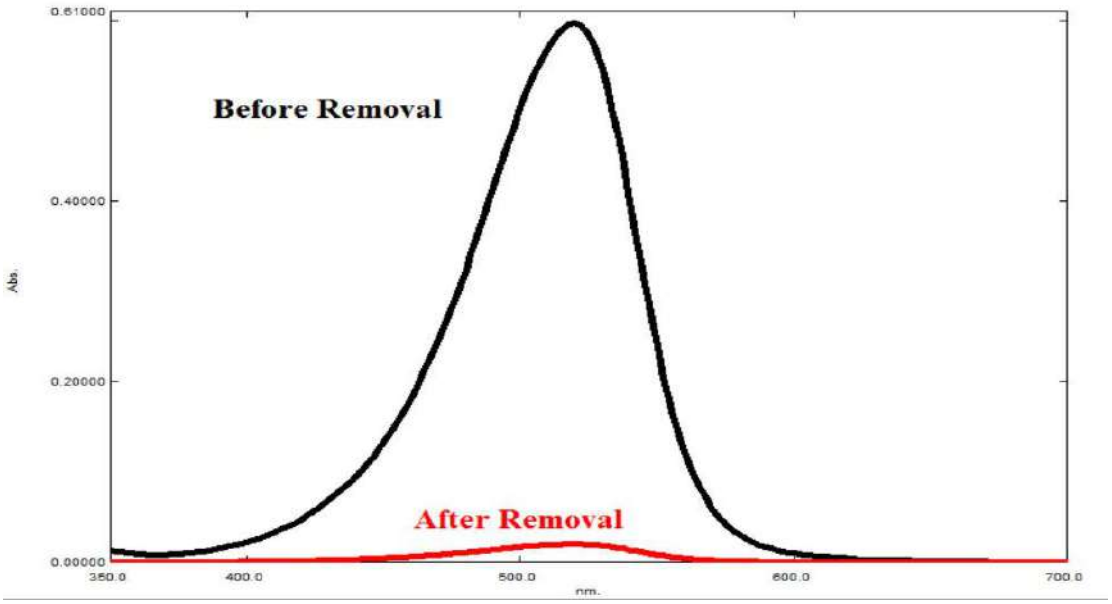

Figure 13. The removal efficiency of congo red dye (CR)

4.Conclusions:

The chemometric separation method is one of the modern, easy and inexpensive methods as it depends on reducing the number of experiments and thus reducing pollution inside the laboratory. The method relied on the use of nano charcoal activated to remove the congo red dye (CR) from its aqueous solutions based on five factors which are the initial concentration of (CR), the amount of nano charcoal activated, pH, shaking time and the temperature depended on Box-Behnken design and the method of response surface by used statistica 12 program and to study the effect of these factors on each other at the same time. The obtained results are satisfactory and compared to the classic methods used in the process of removing dyes.

Abstract. this paper contains preparation of Active carbon surface (AC) from pro so millet grain husks and Loading and activating by Iron oxide and hydrogen peroxide sequentially to obtain surface (ACIPE). The changes of previous processes on Active carbon surface were diagnosed by Fourier transform infrared spectroscopy (FTIR) and Scanning electron microscopy (SEM) . These surfaces (AC and ACIPE) were using as adsorbent for removing of congo red dye from aqueous solutions under certain conditions through batch system .More than one kinetic model was applied to congo red dye adsorption process and it was found that the most kinetic model applied to it is a model (pseudo second order model). In addition to the adsorption efficiency of the surface after activation and loading, it was much better than the main surface where the adsorption efficiency of the first and second surface was equal (27% , 85%) sequentially at higher temperatures .

1.Introduction

Industrial waste dumped in water is a serious environmental issue in the world, especially developing countries. [1-3]. The presence of many organic and inorganic pollutants in water areas by different industries stimulated the world's attention because of its harmful effects on the environment and human health [4,5].

Dyes are one of the most dangerous pollutants, which are produced in large quantities in the form of liquid waste from several different industries such as textiles, paper, rubber, leather, cosmetics and food industries. The unacceptable treatment of these colored wastes of water has negative effects on living organisms in nature in addition to harmful health effects on humans [6,7]. Therefore, it is important to remove the dyes from the waste before releasing it into the environment [8]. Among these dyes is the Congo red dye (CR) , an anion dye, (4-aminonaphthalene-1-sulphonic acid) is a benzidine-based anionic diazo dye, which is generated by some industries, They are toxic to many organisms and suspect they are carcinogenic and mutagenic [6]. Several physical, chemical and microbial methods have been used to remove CR from colored water [7,9]. Adsorption technology is preferred among several techniques, as it is simple, easy and efficient, and it uses environmental friendly adsorbents— such as activated carbon [10], montmorillonite [11], rice husk [12], bentonite [13],

Activated carbon has a high surface area and this qualifies it to adsorb many pollutants, including organic pollutants, but it is also characterized by its high cost and inability to recover it [2,10]. Use Aloe Vera leaf shells as a cheap absorbent material to produce activated

carbon to absorb the CR dye from industrial wastewater. Particle sizes of 300 to 500 micrometer were carbonized in an oven at 550 ° C [14].
One of the recent studies included the synthesis of activated carbon by collecting leaves and trunks of the Bambusa plant. Then they were thermally and chemically treated with nitric and phosphoric acids. The properties of the resulting carbon surface have been diagnosed with several techniques (FTIR, EDX, SEM and BET). The adsorption of the methylene blue dye on the activated carbon surface has been studied due to its relatively large surface area and a high degree of porosity.[15] The aim of this study was to prepare new surface (activated carbon) from Millet crusts, loaded with oxidized iron particles and use as adsorbent surfaces of Congo red dye.

2.Experiments part

2.1.Materials and methods

2.1.1. Congo red dye

Congo red dye the sodium salt of 3,3'-(biphenyl-4,4'-diyldidiazene-2,1-diyl)bis(4-aminonaphthalene-1-sulfonate) (chemical formula :$C_{32}H_{22}N_6Na_2O_6S_2$,M.wt: 696.66 g/mol) was obtained from Merck (Darmstadt, Germany) ,
Used in this study as an adsorbent material without any purification. Use distilled water twice to prepare all required solutions and reagents.. chemical structure of Congo red dye was shown as 'Figure 1' , Congo red [3, 9- bis dimethylaminophenazo thionium chloride], λ_{max} = 498 nm.

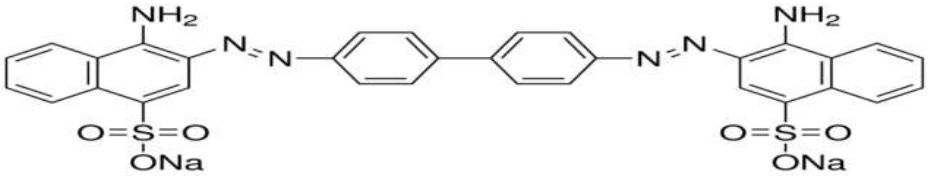

Figure 1. chemical structure of Dye

2.2. Preparation of activated carbon

2.2a. Iron loading on carbon surface

Millet husks were collected from a famous Iraqi market for birds (algazel market) in Baghdad, Iraq, where the crusts were washed several times from the liquefied water and distilled water to remove the dust and foreign bodies, then the crusts were burned after being wrapped with silicon sheets in a burning oven (Furnaces oven Vindon Scientific LTD, OLDHAM, England) at a temperature (500ºC) for an (3) hour, Then the grinding process was done with a home mill,A certain amount of the resulting carbon surface was suspended in (400) ml of water under the influence of ultrasound and continuous stirring for a period of (90) minutes interspersed with the gradual addition of (0.5) gram of iron oxide, and then the filtering and drying process was completed in an oven (Daihan Labtech Oven , LDO-60e,south korea**)** at a temperature (80ºC) Then grinding., the result was a carbon surface with the symbol (AC).

2.2b. Activation of loaded crbon surface

Amount of the modified carbon surface was taken with iron particales and added to (300) ml of hydrogen peroxide with constant stirring and dispersion by ultrasound for one hour and then the carbon surface It was washed with distilled water many times and then filtered and dried at a temperature (80ºC) after grinding and sieving at size of 150 µm to produce the modified carbon surface, symbol (ACIPE).

2.3. Sorption Experiment of Congo red (CR)

Adsorption of the Congo red dye was carried out with an initial concentration (55 mg/L) and its factors were studied in terms of the adsorbent dose, contact time and the temperature in the batch system, which includes direct contact between the dye solution with the weight of the

surfaces(AC,ACIPE) studied in round flask (50 ml) placed in shaker water bath (Labtech ,South korea) at a thermal range (288 , 298 , 308 , 318) K and at A period of time (5-120)min , then separated of adsorbent surface for the dye solution by a centrifuge (Hettich EBA-20,Germany) and then the absorbance of the dye solution was measured by the UV-vis spectrophotometer (Shimadzu 1800,Japan) the amount of adsorbed dye (mg/g) is calculated through the following equation:[16]

$$q_t=V(C_0-C_t)/m \quad (1)$$

where q_t = the amount of solute adsorbed from the solution at time. V = Volume of the adsorbate (L), C_0= the concentration before congo red adsorption, C_t= the concentration after Congo red adsorption and m = the weight of the adsorbent(g).

3.Result and discussion

3.1.Characterization of AC and ACIPE surfaces

3.1.1.FTIR analysis

'Figures 2 , 3' shown the FTIR spectra of (AC) and (ACIPE) surfaces respectively ,We noticed from the 'Figures 2,3 ' the presence of peaks for (ACIPE) surface after the loading and activation process more than the (AC) surface before loading and activation, which indicates the reorganization of surface oxides after being exposed to heat in high temperatures in addition to its treatment with iron oxides and hydrogen peroxide, and this leads to changes in the peaks locations, intensity and shape in addition to disappearance And the emergence of new peaks, which indicates the success of the process of loading and activation to cause changes in the carbon surfaces studied.Where we note the presence of a weak and wide peak that is within the range (3300-3000) cm^{-1} stretch vibration returns to the (OH) group in addition to the vibration of aliphatic compounds already present in the cellulosic tissue of the carbon surface (AC),Also found at (1699 cm^{-1}) return to the (C=O) group and also the presence of a peak at (1576 cm^{-1}) returns to the bend vibration of the (NH) group for primary amine compounds with a peak at (1367cm^{-1}) returns to the vibration of the(C-O)group For alcoholic and carboxylic compounds as well, these compounds contain a peak at(1211cm^{-1}) which is due to the bend vibration of (OH) group in addition to the vibration of the group CH at frequencies within the area of (1100-550cm^{-1}) as well as the presence of weak peaks at frequencies less than(500cm^{-1}) which are due to the bend patterns of the aromatic compounds in the cellulosic tissue. These peaks give a less sharp and more homogeneous spectrum, which gives a less active characteristic in terms of functional groups,While we observe a spectrum 'Figure 2' that includes sharper and more pronounced peaks, especially those that appear at (3160 cm^{-1}) and which are due to the vibration of (OH) group of the carbon surface (ACIPE) after treatment with hydrogen peroxide and iron oxide this gives a less homogeneous spectrum which gives a more effective characteristic in terms of totals Effective functionality compared to the first surface.[17,18]

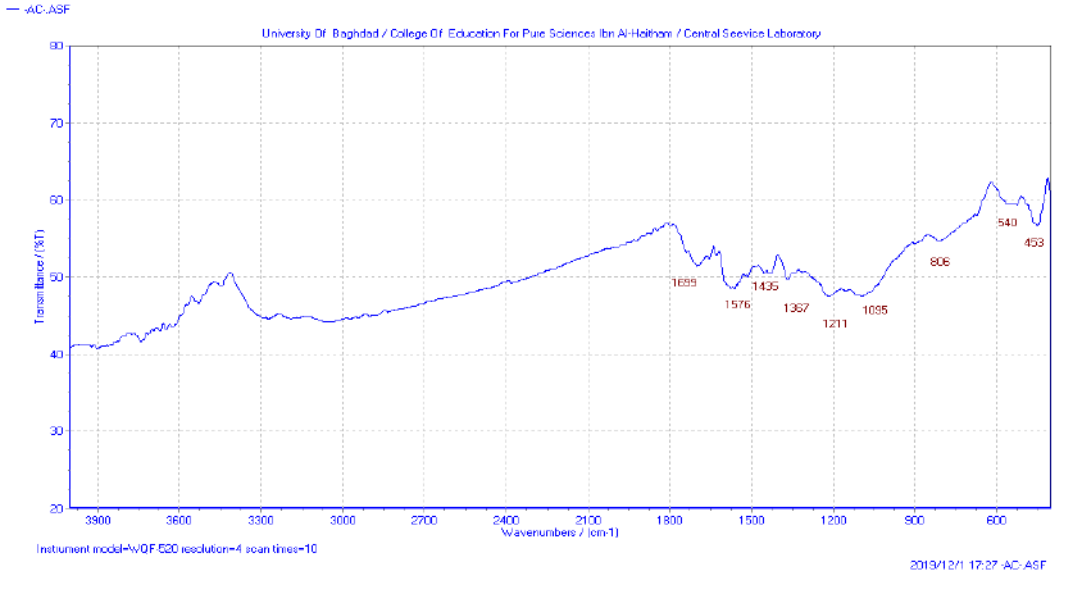

Figure 2. FTIR spectrum of AC surface

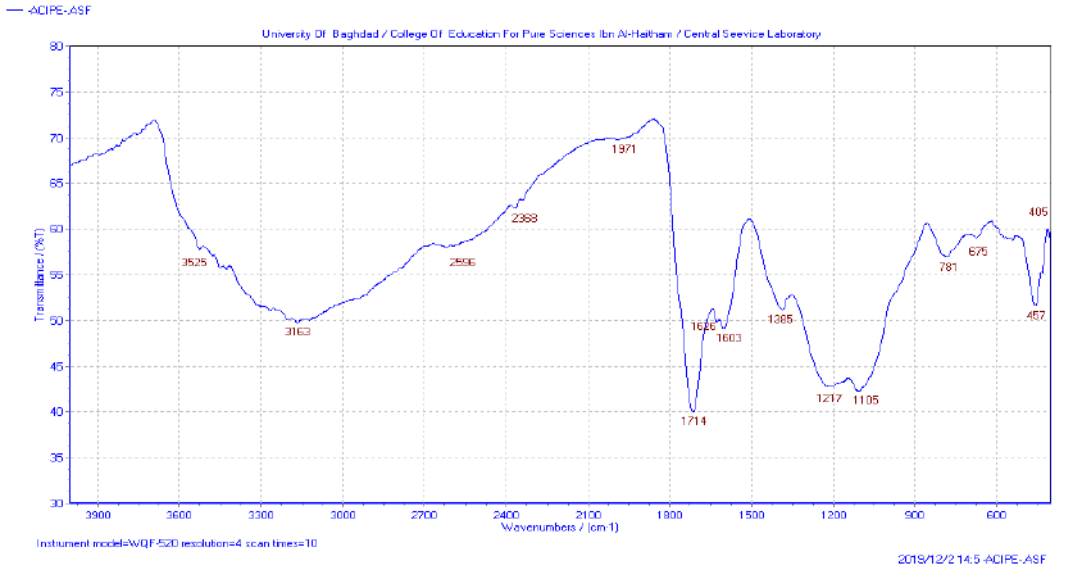

Figure 3. FTIR spectra of ACIPE surface

3.1.2.FESEM analysis

The FESEM images exhibited a description of the morphology of the surfaces of the studied materials with specific enlarging dimensions and forces (100 nm) from the figure. The surface morphologies of (AC) and (ACIPE) surfaces were observed, the FESEM image 'Figure 4 ' of the first surface shown surface particles in the form of individual longitudinal particles that are more than (200nm) intermittently interfering with each other to give Irregular clusters, this in the end gives heterogeneous surfaces, not at the level of their surfaces or at the end, which may cause a kind of obstruction in the reception of any of the materials to be loaded to it, and thus this affects his efficiency when using it in a specific field, as the 'Figure 5' (FESEM) includes On the second surface, surfaces are more flat, in addition to large cavities

On the whole, it given more uniform, homogenous and porous scarves, which greatly improves its surface properties.[19]

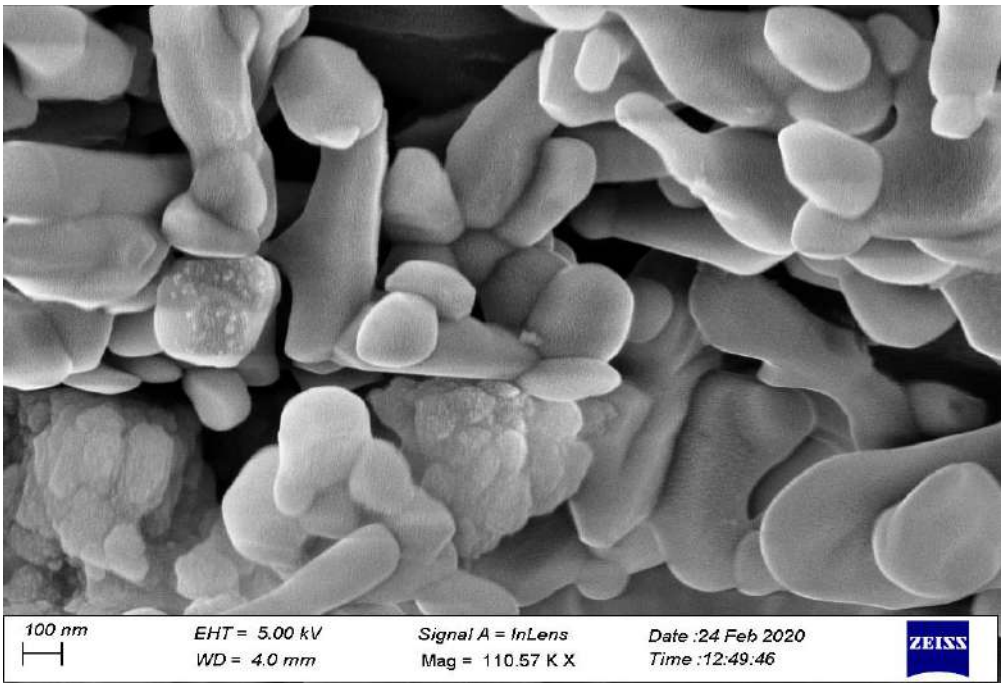

Figure 4. SEM micrographs of (AC)surface

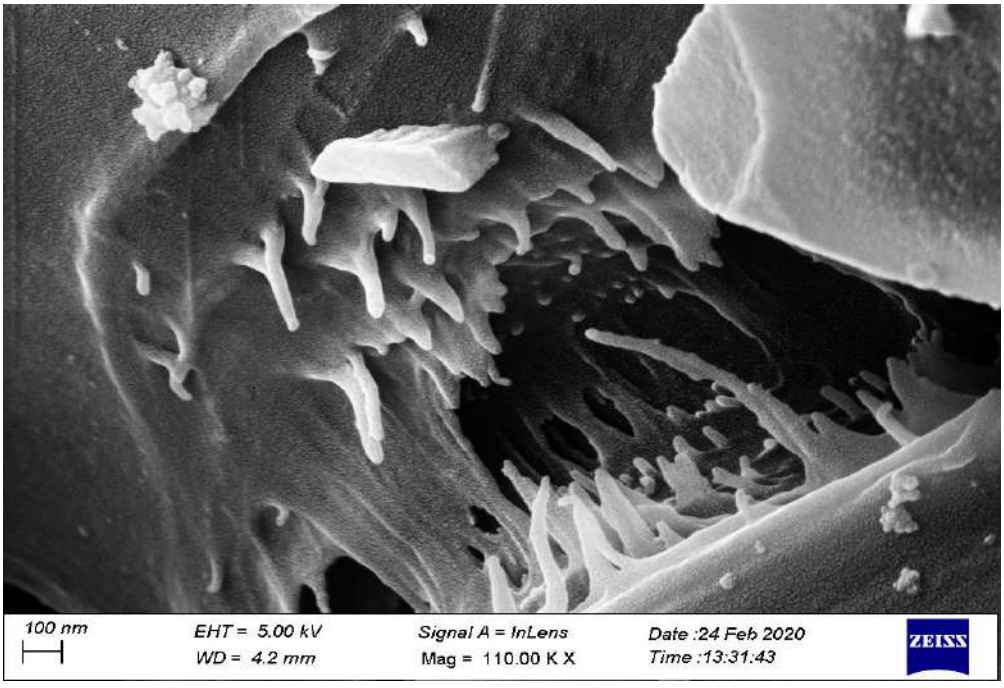

Figure 5. SEM micrographs of (ACIPE)surface

3.2.Study of (CR) adsorption

3.2.1.Effect of adsorbent dose

Absorption dose is an important parameter that strongly influences the adsorption process by affecting the adsorption capacity. Therefore, the influence of adsorbent dose on (CR) dye adsorption by (AC,ACIPE) surfaces were investigated in the range of (0.01-0.05) g . We noticed from the 'Figure 6' that the greatest adsorbing amount of dye for both surfaces was at weight (0.01 g) and then after that either they are relatively stable or decrease with the increase in the weight of the adsorbed surface and this was due to more than the reason that the surfaces may have reached the level of saturation and there are no places for more adsorbed dye particles, which pushes the escape from surface to solution [20]

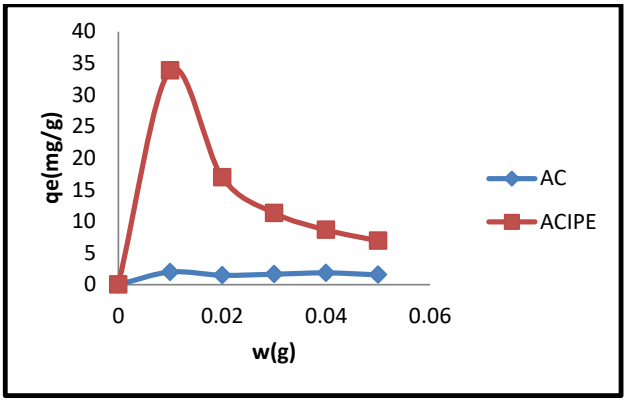

Figure 6. Effect of adsorbents dose on adsorption of (CR) dye

3.2.2.Effect of contact time on (CR) dye adsorption

'Figure 7 ' shown the time effect on initial concentration (55 mg/L) adsorption of (CR) dye by adsorbents (AC,ACIPE) . 'Figure 7 ' shown an increase in the amount of adsorbed dye with increasing time. This increase was rapid during (10), and then the adsorption speed of the dye on both surfaces slows down to a constant amount of adsorption at the time (45 min) and (60 min) of the surfaces (AC) and (ACIPE) sequentially. This time represents The equilibriminum time for adsorption of the dye on both surfaces. This time and beyond represents the saturation area of the two surfaces with this dye. [21,22]

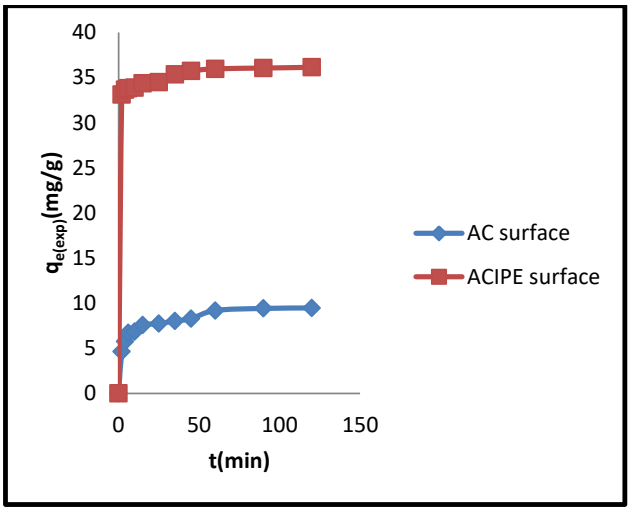

Figure 7. Effect of contact time on the adsorption of (CR) dye on both adsorbents

3.2.3.Effect of temperature on (CR) dye adsorption

'Figures 8 , 9 ' Explained the effect of temperature on the dye adsorption rate (CR) on adsorbents (AC, ACIPE), researched at four different temperatures (288, 298,308 and 318) K , using the initial concentration of (55 mg/L) . It was observed that the removal percentage of (CR) increases with increasing temperature for both adsorbents studied. An increase in temperature increases the rate of diffusion of the adsorbate molecules across the external boundabotry layer and within the internal pores of the adsorbent particles, due to a decrease in the viscosity of the solution. The obtained results revealed that an increase in temperature from 288 to 318 K increased the (AC) surface adsorption efficiency from 16%.1 to 27% while at same range temperatures K increased the (ACIPE) surface adsorption efficiency from 65%. to 85% . This phenomenon indicates that the adsorption process was of a endothermic nature. This may be due to the movement of the particles, which generally increases with increasing temperature, which facilitates the formation of mono layers.[23,24]

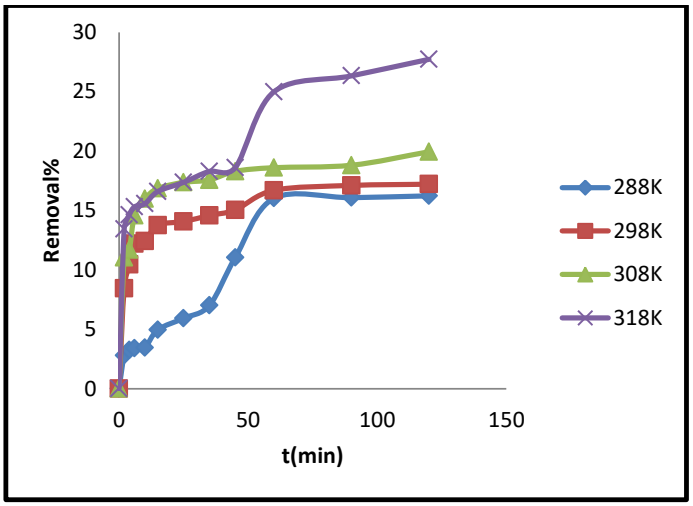

Figure 8. Effect of temperature on the adsorption efficiency of (CR) dye on (AC) surface

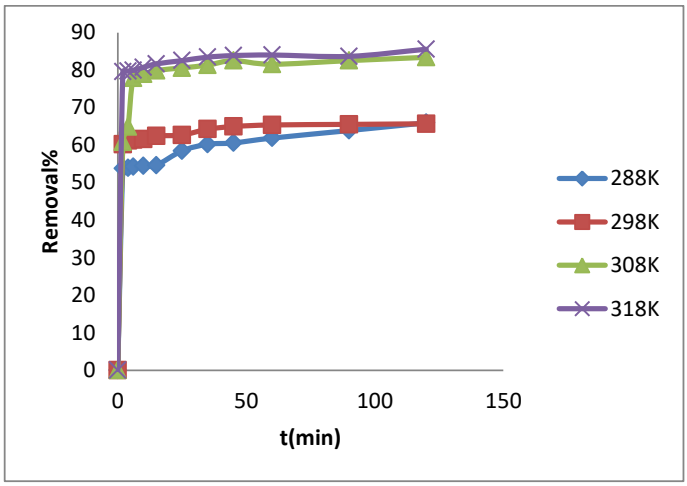

Figure 9. Effect of temperature on the adsorption efficiency of (CR) dye on (ACIPE) surface

3.2.4.Kinetic study

A study was conducted Kinetics of the (CR) dye adsorption process on both surfaces (AC,ACIPE) from the application of the most famous kinetic models (pseudo first order [25] and pseudo second order [26]) which were recorded in Tables 1,2 where they were represented graphically to obtain ' Figures 10a,b ' for the pseudo first order for (AC ,ACIPE) surfaces and 'Figures 11a,b ' for the pseudo second order for (AC ,ACIPE) surfaces and from these figures are calculated coefficients of the two orders and included in the Tables 1,2.

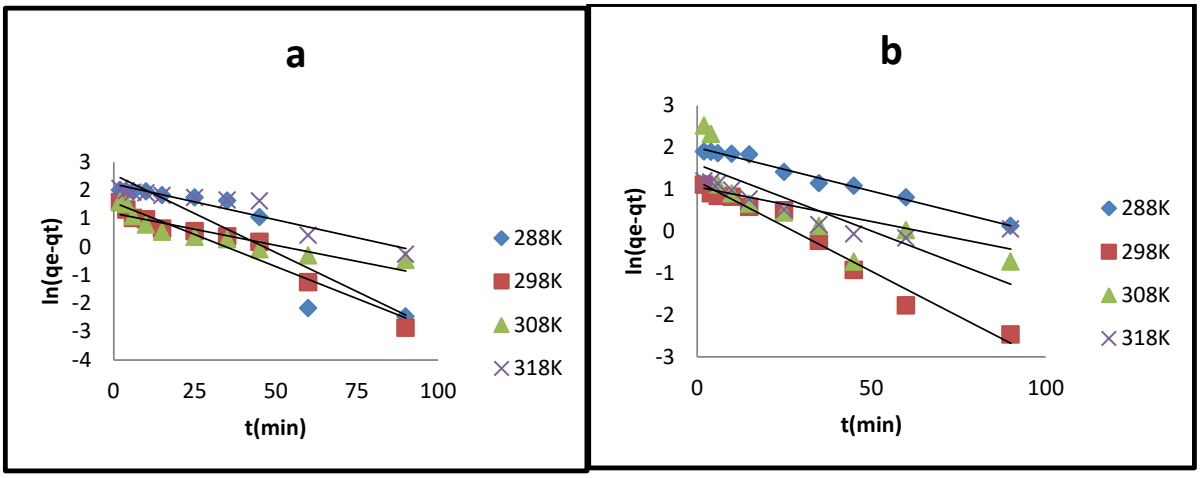

Figure 10.the graphical representation of first order of (CR) dye adsorption on a)AC ,b) ACIPE surfaces at different temperatures

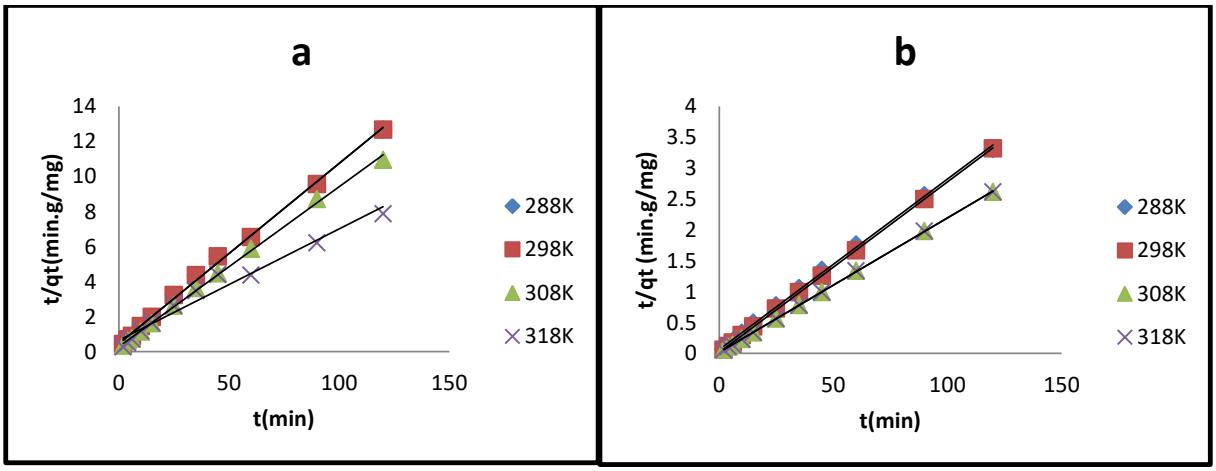

Figure 11. the graphical representation of second order of (CR) dye adsorption on a) AC ,b) ACIPE surfaces at different temperatures

Table 1 . Kinetic parameters for adsorption of (CR) dye onto AC surface based on Pseudo (first and second) order equations

Model kinetic		Parameter	Temperature / K

		q_e(mg/g)	36.231	36.231	46.082	46.948
		R^2	0.998	0.999	0.999	0.999

Where $q_{t(exp)}$ ($mg.g^{-1}$) and $q_{e(theo)}$ ($mg.g^{-1}$) were the adsorption capacity of dye at time t and at equilibrium, k_1 (min^{-1}) and k_2 ($g.mg^{-1}.min^{-1}$) are the rate constants of pseudo-first order and pseudo-second order models respectively.

From the Tables 1,2 shown the applicability of the pseudo second order equation more than the pseudo first order to the (CR) dye adsorption process for both adsorbents because the values of (R^2) for the second order were higher than their values for the first order and on the other hand the values of (q_e) (practical and theoretical) for the second rank are closer more than the The first order.[27]

4.Conclusion

In this study we concluded that the process of activating and modifying the carbon surface (AC) with iron particles and hydrogen peroxide was introduced through diagnostic tools (FESEM,FTIR) in addition to this process led to improving the adsorption efficiency of the ACIPE surface and was (85 %) while it was for the (AC) surface (27 %) and the nature of both processes was endothermic. adsorption (CR) dye follows a pseudo-second kinetics, which follows the mechanism of monolayer chemical adsorption.

Audio source separation using supervised deep neural network

Audio source separation using supervised deep neural network

E-mail: rihamjassim11@gmail.com

Abstract. The speech signals inserted in the computer may be mixed as a result of interference with signals from other sources. These signals may be speech signals or noise. One of the most famous examples of this problem when a group of people speaking in the same time is the "Cocktail Party". This problem produces a mixture of different speech signals, called the mixed signal. To solve this problem, the audio signals that make up the mixed-signal must be restored to their sources. This task is called separating audio sources. In this paper, supervised Deep Recurrent Neural Networks with Bi-directional Long Short Term Memory (Supervised DRNN-BLSTM) were used. To achieve a monaural source separation, we build a model to separate audio signals from a monaural mixed signal. This mixed signal consists of two different audio signals (male-female). We predict two types of time-frequency masks (Ideal Ratio Mask (IRM), and Optimal Ratio Mask (ORM). They are used to achieve the separation of the target audio sources from the mixed signal. We test the model on a dataset with (500) mixed signals. Each mixed signal three seconds in length and consists of two speaker signals (Female-Male). They are recorded in a stereo format at 8192kHz, our approach achieves Signal-to-Distortion ratio (SDR) (0.183.db), Source-to-interference Ratio (SIR) (0.198.db), and Source-to-Artifacts Ratio (SAR) (0.13.db) gain using (ORM) mask compared to the existing model using (IRM) mask.

Keywords: Monaural source separation, Ideal ratio mask (IRM), Optimal Ratio Mask (ORM), Deep Neural Network, Cocktail party problem.

1.Introduction

In the field of sound processing, separation methods are used to extract the interfering sounds of speakers in a mixture of different audio signals. The term (Source) is used on the signals forming the mixture, while the task is called Blind Source Separation (BSS)[1]. The process of separating single-channel audio sources is a special case of separating audio sources because the separation is done using a single mixed-signal. This adds another challenge as the different signals overlap in time and frequency, making the separation process more difficult [2]. Recent researches on supervised single-channel source separation as in [3,4,5], have enhanced the (BSS) techniques by merging the sources training to generate linear and nonlinear models. These models achieve an efficient source separation. The development of deep learning techniques in recent years has a significant impact on the evolution of the performance of source separation algorithms, where deep learning techniques have been used to separate different types of audio

signals, including mixed musical signals, speech signals from noise, separating interfering and synchronous speech signals[6]. The models based on Deep Neural Networks(DNN) have improved the source separation tasks because their learning capacity allows effective modeling of the interaction between the source signal and the acoustic environment in a nonlinear manner as well as the dynamic structure of speech. Discriminative features are also important[6,14].(DNNs) are usually used to predict time-frequency mask that contributes to determining the contribution of each source in the mixed signal. The Ideal mask estimation shouldn't be hard to estimate by learning machine and should obtain good separation results[10]. Separation task carried out in the time-frequency domain(TF-domain) as recovering the Short-Time Discrete Fourier Transformation (STFT) of the source signals $X_n(t,f)$ for each time frame t and frequency f , as follow[11]:

$$X(t,f) = \sum_{n=1}^{N} x[n+tL]w[n] \exp\left(-\frac{j2\pi nf}{N}\right) \quad (1)$$

The input to the network is the magnitude spectrogram of the mixed-signal assigned to training ($x_{n,f}$), and the original signals for each source ($S_{1(n,f)}$) and($S_{2(n,f)}$)[5]. After training the output prediction of the network are ($\hat{S}_{1(n,f)}$) and ($\hat{S}_{2(n.f)}$) [12].

To reconstruct estimated time-domain frames, an inverse Discrete Fourier Transform (DFT) can be used from the estimated STFT ($\hat{S}_{(n,f)}$) of each source signal. The overlap-add operation with the synthesis window v[n] is used to reconstruct the estimate ($\hat{S}_{(n,f)}$) of the target signal[11]

$$\hat{S}_{(n,f)}[n] = \frac{1}{N}\sum_{f=1}^{N} \hat{S}_s(t,f) \exp\left(\frac{j2\pi nf}{N}\right) \quad (2)$$

$$\hat{S}_{(s)}[n] = \sum_{t=1}^{T} v(n-tL)\, \hat{S}_{(s,t)}(n-tL) \quad (3)$$

2. Methodology of the Problem

The process of separating the audio source signals from single-channel mixed signal requires an estimation of (S) sources from the mixed-signal, as in equation (4).

$$x(t) = \sum_{i=1}^{S} y_i(t) \quad (4)$$

Where $y_i(t), i = 1 \ldots S$, is i^{th} of sources to be estimated, while $x(t)$ is the observed mixture[7]. For simplicity, we assume that the mixed signal is consisting of two different signals $s_1(t), s_2(t)$ as in Equation (5)

$$x(t) = s_1(t) + s_2(t) \quad (5)$$

This problem can be solved in the (STFT) Domain. Let $X(n,f)$ be the corresponding (STFT) of the mixed-signal $x(t)$, where t denotes the time domain, n represents the frames index and f is the frequency-index of the STFT domain of the signal. This problem can be formulated as follows:

$$X(n,f) = S_1(n,f) + S_2(n,f) \quad (6)$$

Where $S_1(n,f)$ and $S_2(n,f)$ are the unknown (STFTs) of the sources in the mixed signal. Given $X(n,f)$ the aim of monaural source separation is to recover one or more desired signals from the mixed signal[8]. The typical setup assumed that only (STFT) magnitude spectra is available and differences between the phase angles of the (STFT) of the sources are ignored during the separation task. This is used only when reconstruct the time domain waveforms of the sources. [9]. The magnitude spectrogram of the measured audio signal can be written as the sum of source signals magnitude spectrograms as follows:

$$|X_n| \approx |S_1(n,f)| + |S_2(n,f)| \quad (7)$$

We use the matrix form to represent the magnitude spectrograms where n and f denote the spectral frame and frequency index respectively, as follows:

$$X(n,f) \approx S_1(n,f) + S_2(n,f) \quad (8)$$

Where $S_1(n,f)$ and $S_2(n,f)$ are the unknown magnitude spectrograms of the sources that need to be estimated[8]. The magnitude spectrogram of the mixture signal $|X(n,f)|$, together with spectral features are fed into (DNN) to predict time-frequency mask for each speaker. The masks are multiplied by the mixture using (element-wise multiplication operation) to estimate the magnitude STFT of the desired speaker. The separated waveforms of the estimated speaker are resynthesized using inverse(STFT), the estimated magnitude of the speaker, and noisy phase information.[10]

3. Bi-directional Long Short Term Memory (BLSTM)

The (BLSTM) combines long short-term memory (LSTM) and bi-directional iterative recurrent neural network (BI-RNN**).** The recurrent neural network (RNN) is a special development of artificial neural networks to process continuous data. Due to the problem of gradient vanishing or explosion, the (LSTM) was created, which consists of three gates (input - forget - output). Both (RNN) and (LSTM) can obtain information from the previous context only. To solve this problem(BLSTM) was used [10]. The (BLSTM) consists of two hidden recurrent layers, receive the input string separately in two opposite directions, one in the forward direction, and the other in the backward direction. Both layers are connected to the same output layer. Thus enabling access to long contexts in two different directions [12]. In a single cell (LSTM), the hidden serial vector is calculated by calculating the output of each gate as in the following equations:

$$f_t = \sigma\left(W_f x_t + R_f h_{t-1} + b_f\right) \quad (9)$$
$$i_t = \sigma(W_i x_t + R_i h_{t-1} + b_i) \quad (10)$$
$$o_t = \sigma(W_o x_t + R_o h_{t-1} + b_o) \quad (11)$$
$$j_t = tanh\left(W_j h_t + R_j h_{t-1} + b_j\right) \quad (12)$$
$$c_t = c_{t-1} \odot f_t + j_t \odot i_t \quad (13)$$
$$h_t = \tanh(c_t) \odot o_t \quad (14)$$

Where x_t is cell's input, c_t and h_t the state and output respectively, at time t. f_t, i_t and o_t are forget gate, input gate and output gate, respectively. W, R denote the trainable weight matrices, b the bias vectors and σ the activation function of the hidden layer. In (BLSTM) the equation (14) cannot be used directly, instead, the forward hidden sequence h1 and backward hidden sequence h2 is computed as shown in equation(15) and (16) respectively[13].

$$\overrightarrow{h_1} = f(W_{x\vec{h}} x_t + W_{\vec{h}\vec{h}} \vec{h}_{t+1} + b_{\vec{h}} \quad (15)$$

$$\overleftarrow{h_2} = f(W_{x\overleftarrow{h}} x_t + W_{\overleftarrow{h}\overleftarrow{h}} \overleftarrow{h}_{t+1} + b_{\overleftarrow{h}} \quad (16)$$

4. Mask Estimation Using Deep Neural Network(DNN)

Deep neural networks are usually used to predict a mask. This mask is used to determine the contribution of each source in the training mixed signal. The input to the network is the magnitude spectrogram of the training mixed-signal (X_{tr}), the original signals for each source (S_{tr1}) and(S_{tr2})[7]. After training, the output prediction of the network are ($\hat{S}_{tr1}$) and ($\hat{S}_{tr2}$) [13]. To smooth the spectra results, two types of masks are estimated separately by the model, the first mask is the ideal ratio mask (IRM) which is a smooth form of an ideal binary mask (IBM),(IRM) mask represented in equation (17)

$$IRM_s = \left(\frac{S_1(t,f)^2}{S_1(t,f)^2 + S_2(t,f)^2}\right)^{\beta} \qquad (17)$$

Where $S_1(t,f)^2$ and $S_2(t,f)^2$ are the energy of each speech signal in mixed-signal, in each (TF Unit). (β) is the square root value used as a tunable parameter, which is usually set to (0.5). (IRM) the mask used to conserve the speech energy of each (TF unit), assuming $S_1$and S_2 are uncorrelated[14]. The second mask is the optimal ratio mask (ORM) which can be derived by minimizing mean square error(MSE) between the clean speech signal and the target speech signal that has been estimated and can be defined by equation (18).

$$M(t,f) = \frac{|S_1(t,f)^2 + R(S_1(t,f)S_2{}^*(t,f))}{|S_1(t,f)|^2 + |S_2(t,f)|^2 + 2R(S_1(t,f)S_2{}^*(t,f))} \qquad (18)$$

Where S_1 and S_2represent the spectrum of the two speech signals in the mixed-signal at frame (t) and frequency(f). The symbol (*) indicates the conjugate operation, while R (°) represents the real component of the spectrum. The ORM differs from the IRM in the presence of the coherent part by $R(S(t,f)N^*(t,f))$, whose value is equal to zero in the IRM. The (ORM) achieves high efficiency in the separation process in the case of a high correlation between the speech signal and the noise signal. The mask ORM values range from (-∞, + ∞), which makes the estimation process more difficult. So the values of the ORM mask are determined using the hyperbolic tangent function as in equation (19).

$$ORM(t,f) = K\frac{1 - e^{-cy(t,f)}}{1 + e^{-cy(t,f)}} \qquad (19)$$

Where c=0.1 is the steepness, while K is equal to 10, it restricts the values of the ORM between (-10, + 10). Equation (18) is the basic equation of the ORM mask[14].

5. Network architecture

The (DRNN_BLSTM) architecture based on monaural speech separation was used in this paper. To estimate the mask that can determine the contribution of each source in the mixed signal. We adopt the magnitude spectrogram of the mixed-signal, using (STFT) with Hann window the size is set to (512)), and the reference masks of the clean sources (male-female). The network trained to predict the mask closest to the reference masks by minimizing the mean squared error between the predicted and the reference mask, the predicted mask is then used for separation. The (DRNN-BLISTM) model consists of two sub-networks, the first network is used to estimate masks for the male signal, while the other is used to estimate masks for the female signal. Each sub-network consists of three hidden layers (BLSTM) (128cell),followed by (dense layer) (64cell),and

(BLSTM) layer with (512cell). The activation function is used to train the model type (Tanh). The architecture of the proposed model is shown in figure (1).

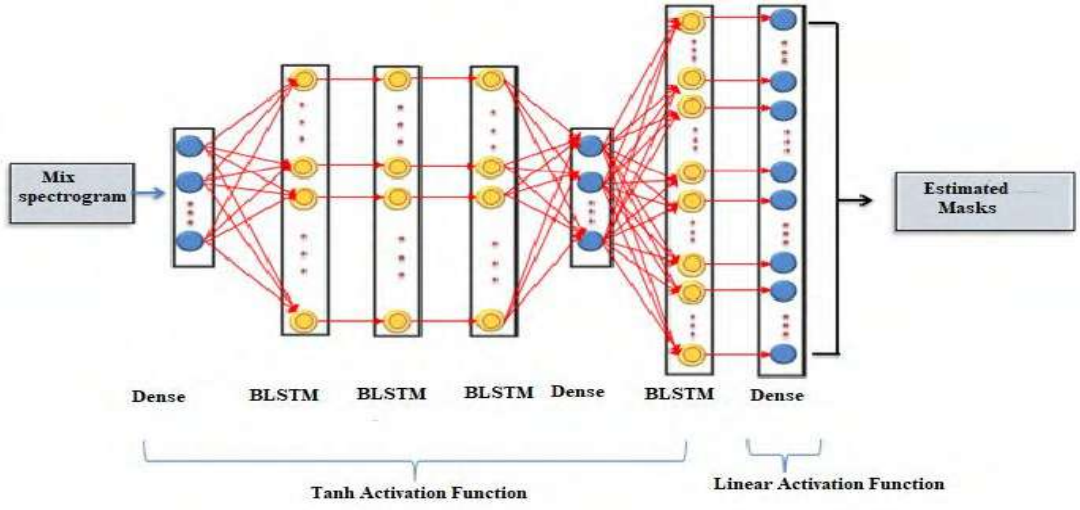

Figure (1) DRNN-BLSTM Model

6. Dataset and Results

The dataset used to train the network consists of (500) preprocessed mixed-signal consists of two different signals (female-male) with (3) seconds length and frequency (8192Hz). These audio files are collected from the internet and combined to form the mixed signals. The trained model was tested on (10) mixed signals for each mask and the results of the separation process differ according to the used mask. So the efficiency of the network performance was measured using three types of metrics: signal to distortion ratio (SDR), the signal to interference ratio (SIR) addition to signal to artifact ratio (SAR) in the signal generated by the separation process. Figure (2) shows the combined signal and the source signal, as well as the separated signal using the (IRM) mask, and Figure (2) shows the separation process for the same signal using the (ORM) mask. The performance of the separation model is evaluated based on SDR, SIR and SAR calculated using the BSS evaluation toolbox, Table(1), show the results of these three metrics when use (IRM) and (ORM) in separation task. The separating results show that the signal separation process using the (ORM) mask achieved (SDR) slightly higher (0.183.db) than it is when using the (IRM). As well as for (SIR) by (0.198 .db) is higher when using the (IRM). While (SAR) in both (IRM) and (ORM), its percentage is high, but the difference between the two masks is (0.13 .db). The efficiency of separation using (ORM) is high in the case of a high correlation between the combined signals, and the loss function represented by the learning curve of the neural network using the root mean square. Propagation (RMSprop) optimizer reduces the value of the error function to reach the best value in which the error function is lower. As in Figure (3), which shows the loss function when training the network to predict each of the filters (IRM) and (ORM) using the hyperbolic tangent function as activation function with a range of [1, -1]. We achieved the best results for both masks

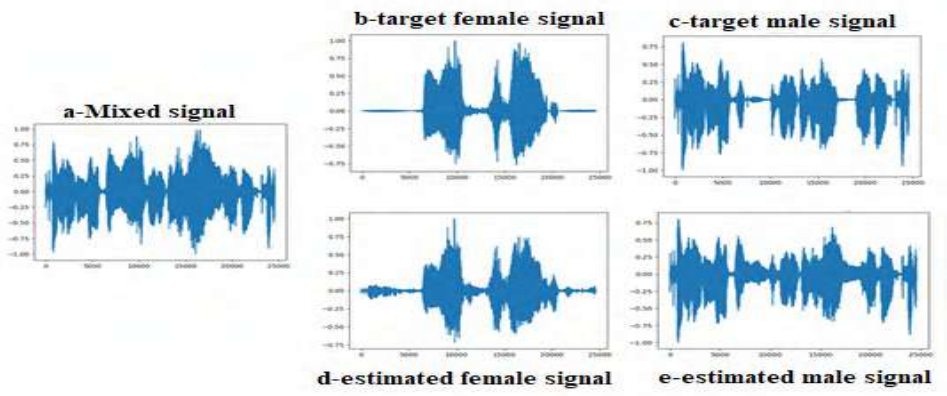

Figure (2) the original source signal and the estimated signal Using IRM Mask

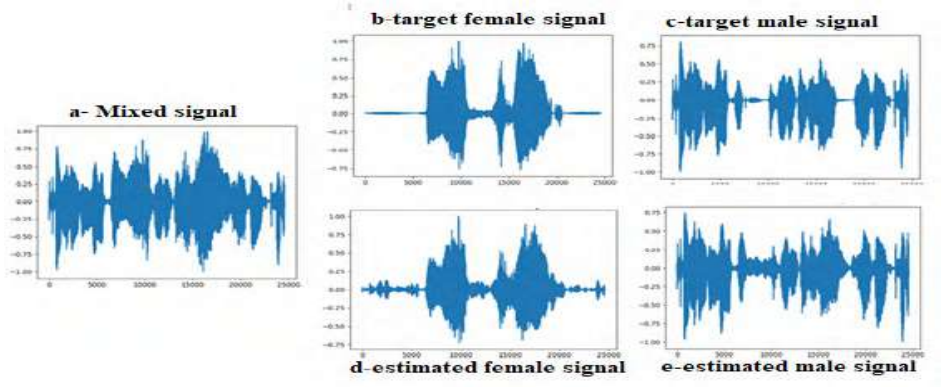

Figure (3) the original source signal and the estimated signal Using ORM Mask

Table(1) performance comparison of two masks measures

Masks	SDR	SIR	SAR
(IRM)	6.164	7.189	14.020
(ORM)	6.347	7.387	14.150

.

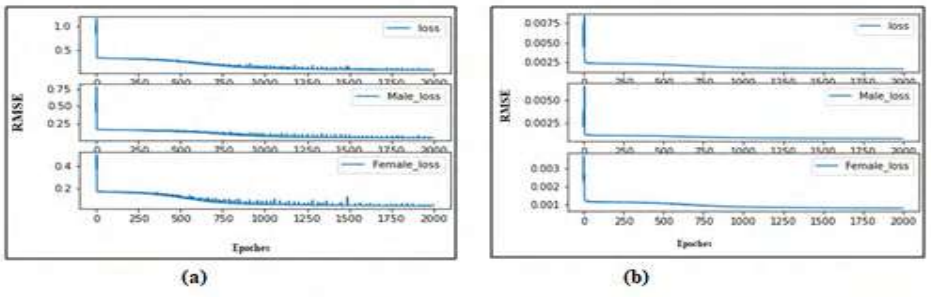

Figure (4) loss function (a) (IRM) (b) (ORM) using (Tanh)

7. Conclusions

The use of Supervised (DNN) in monaural source separation has effectively contributed to achieving separation results, especially in the case of separating large data such as audio signals. As the network extracts the characteristics from the data automatically the (TF masks) showed improvement in separation results better than the use of direct mapping, where the resulted mask was directly used to perform the separation. The (IRM) mask depend on the information of the magnitude spectrogram for both mix and source signal, the results of separation using (IRM) mask has improved good performance and the estimated signal improves high quality and intelligibility, but less than the efficiency when using (ORM) mask due to the correlation between the source signal and signals in the mixed signal.

Abstract. In order to enhance the production efficiency, scheduling problem of job-shop has used that thought of complex problem with complicated constraints and structure . This problem is characterized as NP-hard. In most cases, the excessive complexity of the problem makes it difficult to discover the best solution within affordable time. Hence, searching for estimated solutions in polynomial time rather than precise solutions at excessive cost is favored for challenging situations of the problem. In this paper, a parallel genetic algorithm with proposed adaptive genetic operators and migration operation is applied for job-shop scheduling problem . Through tests on numerous different experimental cases, the adaptive operator of genetic algorithm and the parallelism strategy are considerably improving the results effectively while decreasing the computation time. Also, the migration operation gives a greater effect on the performance of the algorithms.

Keywords: Job-Shop, Scheduling, Genetic Algorithm, Adaptive Genetic Operators, Migration Operation, Parallel Algorithm

1. Introduction

Job-Shop Scheduling Problem is a conventional combinational optimization problem. It is common in present day production industries in which numerous processing machines need to be allocated fairly and operation orders of the jobs order need to be sorted well to enhance manufacturing efficiency. Its most important characteristic includes numerous machines with same function but distinct operation time [1].Efficient methods of solving scheduling problems can have major effects on profitability product quality. The big matter is the minimization of the whole elapsed time between the start of the first operation and the completion of the last operation (the makespan). The shortest makespan is the simplest and most extensively used criterion among any other measures of scheduling quality. In general, the difficulty of the Job-Shop Scheduling problem makes it very difficult for conventional search-based approaches to find near-optima in reasonable time. This has led to recent interest to adopt genetic algorithms to deal with these problems [2].Genetic algorithm (GA) is a flexible in dealing with complicated problems and normal attribute of parallel processing, that randomly and successfully pattern and search at big state space, and rapidly converge to the optimal or near-optimal solution, so it gets extensively interest in the discipline of scheduling. Experimental tests showed GAs' scheduling performances in a several different criterions are better than heuristic and stochastic hill-climbing approaches. All these illustrate that GAs are so appropriate to solve scheduling problem [3].The remainder of this paper is organized as follows: the job-shop scheduling problem, the design of the

system of solving job-shop scheduling problem using parallel genetic algorithm, and finally, the results of the system and some concluding remarks are given.

2. Job-Shop Scheduling Problem Description

Scheduling for the adaptable activity shop is essential in the two fields of creation administration and combinatorial improvement. Be that as it may, it is very hard to accomplish an ideal answer to this issue in medium and genuine size issue with conventional improvement approaches inferable from the high computational unpredictability [4].

2.1. Problem Description

The JSSP is a scheduling problem that assumes M various machines and N various jobs. Each job consists of Q operations and each operation needs a different machine. The jobs' operations are handled in a fixed processing order which specifies the precedence restrictions. The job's operations are completely ordered so that no job's operation can begin earlier than the completion of its predecessor [5]. The operation sequence of every job is predetermined whereas each operation will be processed on any a machine from a group of candidate machines [6]. To achieve optimal performance, the system should satisfy the scheduling goals, which include: selection of the most appropriate machine for every process, and approve the optimal sequence of processing and time of every work process on every machine [3].

2.2. Problem Formulation

The JSSP is defined by:

- J = {J1 , J2, … , Jn } the set of n independent jobs,
- O = {(O11 , O12 , ...), (O21 ,O22 , ...) ... (On1 On2, ...)} the set of operations, where Oji is operation i of job j.
- M = {m1, m2 ,... mk } a set of machines.

The goal is to find a schedule of operations that minimizes the completion times of all jobs (MakeSpan of the schedule):

$$\text{Makespan} = \text{Min}(\text{Max}(T1, T2, \ldots, Tn)) \quad \ldots\ldots\ldots (1)$$

where, Tj is the completion time of job J.

2.3. Parallel Genetic Algorithm for JSSP

The following sections illustrate the application of parallel GA for solving JSSP:

2.4. Parallel GA

GA is a powerful approach used in many various areas to search for a near-optimal solution when searching for the optimal solution is too expensive[7]. Though, parallelization is also an appropriate way to enhance the process time and the efficiency in the exploration of the search space. Certainly, GAs are 'naturally parallelizable', for example, their population-based features enable us to assess in a parallel manner the fitness of each individual [7]. To exploit parallelism in GAs, various ways exist; these include: master–slave models, fine-grained models, island models, and hybrid models. Island models are the foremost known to consider on parallel GAs. Populations on islands are free to converge toward totally different sub-optima with a quicker improvement of the average fitness and a migration operator will facilitate combine good features that emerge from different local islands [8]. The advantages of the parallel design are as follows:

• Since more than GA work together, GA get new search points in exploring space via various techniques, this strategy increases the searching process range and decreases the probability of premature convergence.
• Because of the independent evolution, individuals from heterogeneous islands gain different characters from a range of different solutions. Thus, the migration performance is improved [9].
In this paper, three Genetic Algorithms are used in parallel mode. Each GA consists of two main keys: choosing an encoding representation of the problem; and defining the genetic operators [7].

2.5. Encoding and Fitness Evaluation for JSSP

• Encoding Representation of a schedule
As a schedule consists of a sequence of total operations *OP*, it can be represented as follows:

$$OP = \{op\ ij \mid i = 1, 2, \ldots, N \text{ and } j = 1, 2, \ldots, M \quad \ldots (2)$$

Where: *op* is the operation, *i* is the job number, *j* indicates the operation number of job *i*, *N* is the set of jobs, and *M* is the set of available machines. The *ij* indices of the operation *op* are encoded as a sequence number (*index*) of a chromosome's gene which can be represented by two fields: the first field consists of the machine's number and the second field of a gene is the completion time of the operation [2].
The chromosome length is equal to the product of the number of jobs and the total number of machines in a given problem [10].

• Evaluation of Fitness Function
The fitness value can be evaluated by summing the total completion time of the operations on each machine (TCT). The total completion time with maximum value is the chromosome's fitness value [2], as follows:

$$\text{Fitness Value} = \text{Maximum of (TCTx)} = \text{Max (TCTx)} \quad \ldots (3)$$

Where:
x : is the machine number, $1 \leq x \leq M$,
M: is the no. of machines.

2.6. The Operators and the Proposed Adaptive Operators of GA
The three genetic algorithms adopted in this paper use several types of GA operators. Some of them are the same as original GA operators and the other are improved and adapted to give best results.

• Original GA Operators
For selection operator, the system uses tournament selection technique with tournament of two and three. For crossover operator, one-point crossover and two-point crossover operator are used. For mutation operator, random selection of chromosome and randomly replace a position in it with random value [11].

• The Proposed Adaptive Operators of GA
i. Adaptive Selection Operator:

Because of the size of the population of every generation is constant ,each time one individual chosen, there is an excessive possibility that individuals with high fitness are selected over

and over whereas individuals with low fitness aren't selected at all. However, when the generation number increased, the population will contain many good but identical individuals.

The proposed selection operator is as follows: in each tournament selection, the individual having the greater fitness is added to the new population and removed from the parent population. Such that, every individual can be chosen solely as soon as such that the population's diversity is ensured.

ii. Adaptive Crossover Operator

In this paper, a special crossover operator is adopted which randomly selects two individuals, and then checks whether they have common points (i.e., common machine number within a schedule). If not, then the crossover will not be performed and the two parents from the population are copied to the population of the next generation. If they have only one common point, then that point is the crossover point. If there are more than one common points, then the crossover point is randomly selected.

iii. Adaptive Mutation Operator

The mutation operator is improved as follows: after a random selection of an operation within a schedule, this operation is reassigned to a machine away from the original machine in two locations in circular style. That is, if the machine number is x, then reassign to machine number x+2, and if the original machine is the last machine then reassign to machine 2.

2.7. The Migration Operation

The migration operation is the process of swapping individuals amongst the subpopulations of the GA. The operation of migration improves the population's genes and consequently will increase the diversity and speed up the convergence of the algorithm.

The essential migration's parameters are the interval of migration, rate of migration, the technique for choosing migrating individuals, the technique for changing an individual by the new one in the receiving subpopulation, and the type of topology.

The migration topology adopted in this paper is based on the unidirectional ring topology by which the communications between islands are done on a unidirectional ring, and hence an island can send migrants to its next neighbors and receive migrants only from its previous neighbors.

Each sub-population sends and receives the best individual from the neighbor sub-population, and exchanges the worst one in its pool by the received individual. The rate of migration was determined as a fixed number of the best individuals in the population in each interval. The interval in terms of generations in GA [12].

3. The Implementation of The System

The system uses three genetic algorithms (GA1, GA2, and AGA which stands for Adaptive Genetic Algorithm) work in parallel mode. It starts by dividing the initial population into three parts. GA1 is applied on the first part, GA2 is applied on the second part, and AGA is applied on the third part.

The types of genetic operators used in each genetic algorithm are shown in Table (1).

Table (1): GA Operators Used in GAs

GA Operators	GA1	GA2	AGA
Selection	Tournament (Size= 2)	Tournament (Size= 3)	Adaptive selection
Crossover	One-point	Two-point	Adaptive Crossover
Mutation	Classical (random change)	Classical (random change)	Adaptive Mutation

The detailed steps of the system are shown in Figure (1).

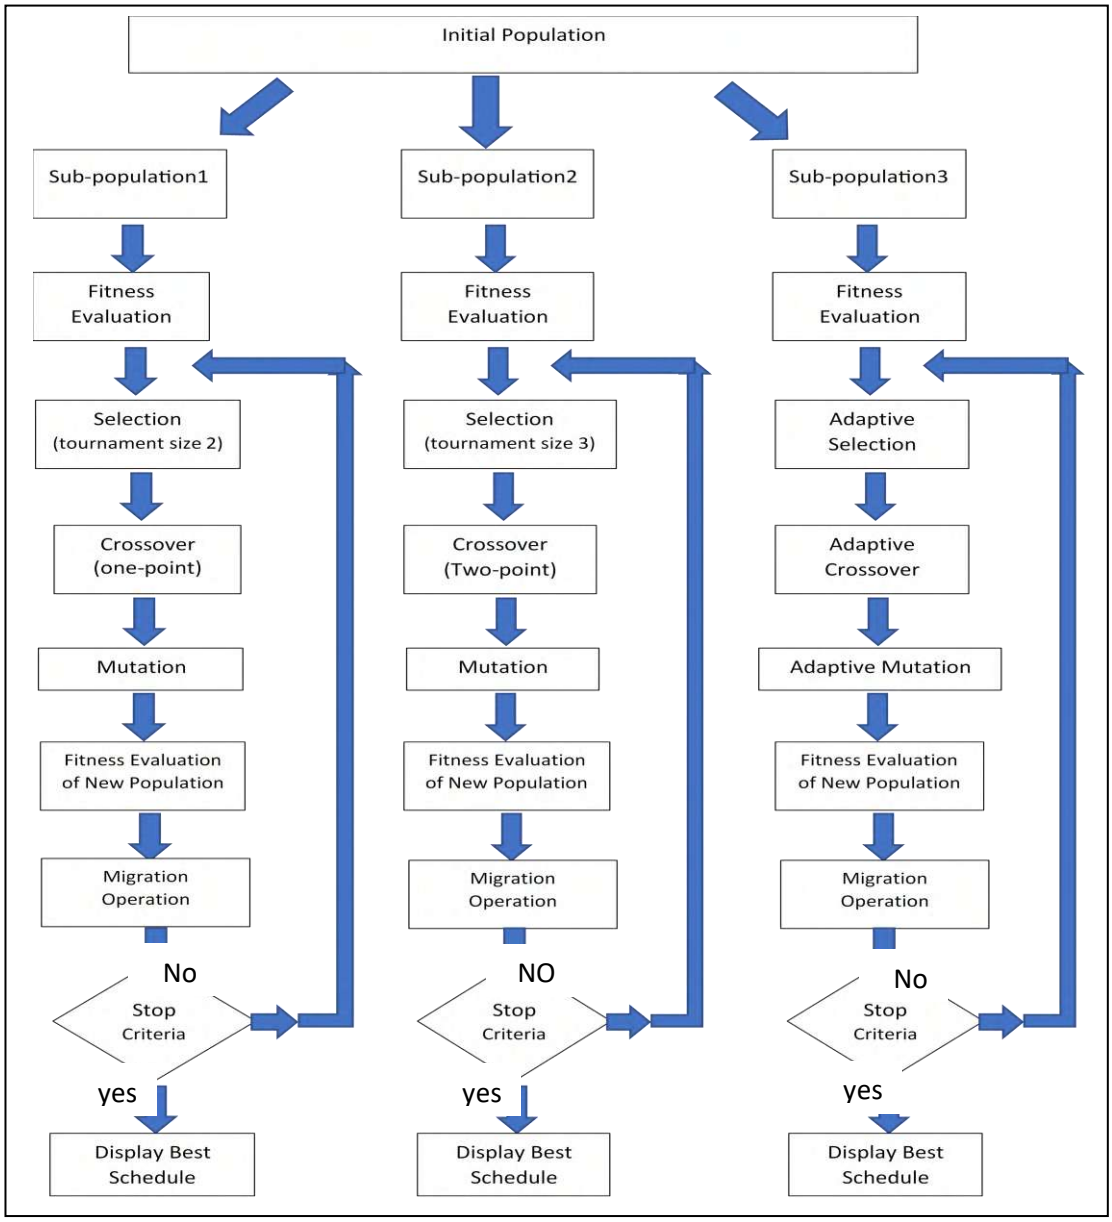

Figure (1): The Steps of The System of The Parallel GA.

4. Experimental Settings and Results

Various cases of different job-shop problem are taken. However, All the three genetic algorithms use the same case instances in order to compare the implementation results among them.

Firstly, Table (2) shows various problem instances. These instances are different in the number of machines in the system and the number of jobs.

Table (2): The Problem Instances Used by The System

Instance number	No. of Machines	No. of jobs
1	6	6
2	10	10
3	8	8
4	10	4
5	10	5

The system specifications and the parameters used with their assigned values are described in Table (3).

Table (3): The System's Parameters Settings

Parameter Name	Value
Sub-population size	50 individuals
Max No. of Generations	500
Crossover Rate (pc)	0.7
Mutation Rate (pm)	0.1
No. of Migrant Individuals	4

The adopted migration policy is done by the selection of the best individuals from the sending island and the replacement of the worst individuals in the destination island.
The result of applying each genetic algorithm on any of the problem instances is a schedule having a minimum *makespan* of a schedule. The Table (4) and Figure (2) show the makespans from GA1, GA2, and AGA.

Table (4): The resultant makespan from GA1, GA2, and AGA

Instance Number	Makespan of GA1		Makespan of GA2		Makespan of AGA	
	Without Migration	With Migration	Without Migration	With Migration	Without Migration	With Migration
1	68	54	70	50	62	48
2	196	112	185	88	86	75
3	107	89	101	84	84	61
4	240	205	232	194	190	172
5	181	167	177	155	154	128

From Table (4) and Figure (2), it is obvious that the best makespan is from the schedule resulted from AGA with migration operation, while the worst makespan resulted from GA1.

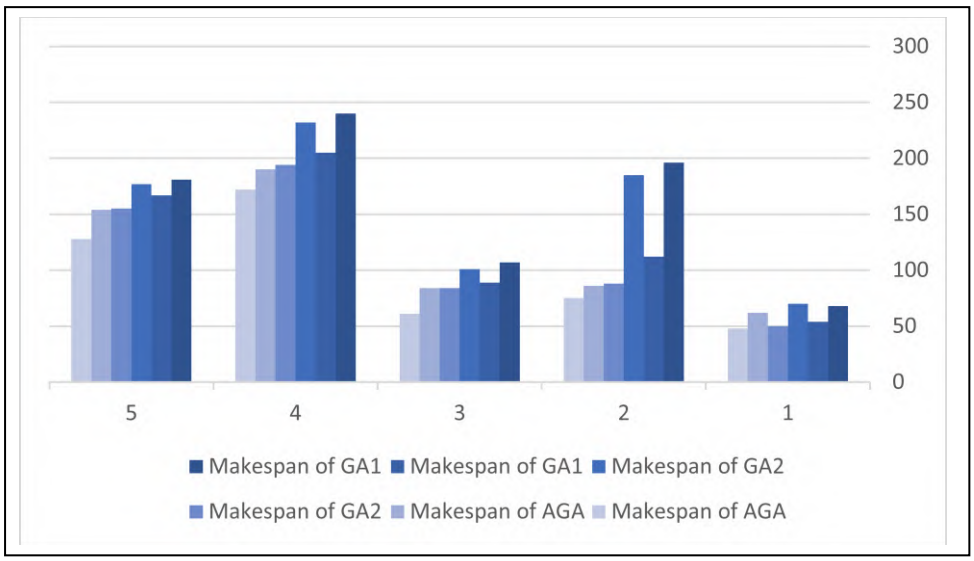

Figure (2): The makespans from GA1, GA2, and AGA.

The converged generation numbers for GA1, GA2, and AGA at which the algorithms reach the best schedule are shown in Table (5). Table (5) and Figure (3) show the converged generation number with and without applying the migration operation.

Table (5): The Converged Generation Number from GA1, GA2, and AGA

Instance Number	Gen. No. of GA1		Gen. No. of GA2		Gen. No. of AGA	
	Without Migration	With Migration	Without Migration	With Migration	Without Migration	With Migration
1	165	144	146	142	90	77
2	254	219	202	197	132	101
3	137	130	129	111	107	85
4	277	215	238	221	134	120
5	116	103	108	106	98	95

The results displayed in Table (4) and Table (5) showed that the GA2 gives better makespan and better converged generation number than the GA1. This is due to: (i) the larger tournament size of selection operator adopted in GA2 than that in GA1, (ii) the two-point crossover operator used in GA2 that provides more diversity than one-point crossover in GA1.

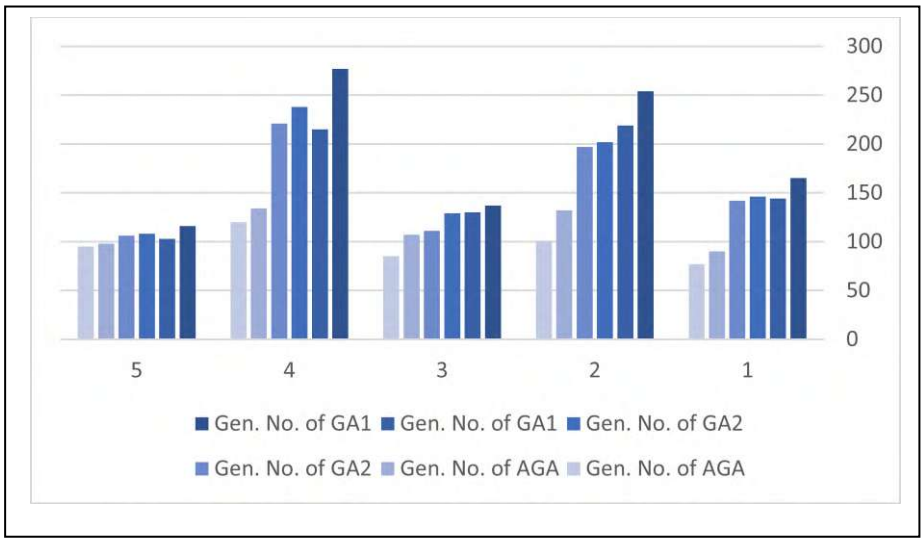

Figure (3): The Converged Generation Number from GA1, GA2, and AGA

Also, the applying of the migration operation significantly enhanced the performance (makespan and converged generation number) in GA1, GA2, and AGA.
However, Table (4) and Table (5) show that the AGA gives a better performance than GA1 and GA2 in all problems' instances.

5. Conclusions

In this paper, we present a system of implementation of a parallel genetic algorithm to find the best schedule of a job-shop scheduling problem. The system proposes adaptations for the three GA operators. It demonstrates that by dividing the initial population and uses adaptive GA operators in parallel mode give best schedule, and less computation time.
The system uses three genetic algorithms each with different type of genetic operators. The use of adaptive selection operator, adaptive crossover operator, and adaptive mutation operator in the third algorithm has significantly improves the system performance in terms of the resulted schedule and time it takes to find the best solution. The application of migration operation among the three genetic algorithms greatly enhanced the system performance.

Human Activity Diagnosis System Based on the Internet of Things

Human Activity Diagnosis System Based on the Internet of Things

Mohammed Khammas Jabar and Ali Kadhum M. Al-Qurabat

Department of Computer Science, College of Science for Women, University of Babylon, Babylon, Iraq.

E-mail: alik.m.alqurabat@uobabylon.edu.iq

Abstract. The Cognitive Internet of Things (CIoT) is the next step in enhancing the accuracy and reliability of the Internet of Things (IoT) technology used for Cognitive Computing, which plays a main role in health and disease diagnosis. The study was suggested a diagnosis method to sound sensitivity by developing a framework with IoT and cloud based on a facial expression recognition system. It was achieved through the creation of a cognitive IoT hardware-based environment and the elements of the programs that are implemented to test the behaviour of people suffering from sound sensitivity, this operation is done by using a camera and image processing and it used Convolutional Neural Network (CNN) as a facial recognition software to track human facial emotions through live video. The sentiment values were analysed that they were collected and stored in a cloud using Transmission Control Protocol (TCP) protocol. These emotions were categorized as abnormal or normal. Normal states represented by happy or natural feelings that give the impression that the environment is suitable for people's senses and that they do not suffer from discomfort towards this environment, therefore; the system operates on a mechanism to increase the volume in this environment by using an Arduino microcontroller. Although the device operates automatically in the event of hypersensitivity detection, it reduces this severity. The obtained results showed the efficiency of the proposed system in recognizing facial emotions with 80% accuracy.

1. Introduction

The Significant advancements in telecommunications networks and the advent of the Internet of Things (IoT) paradigm have resulted in remarkable improvements in the everyday usage of computer resources and applications. The IoT is an evolving model of communication in which computers, cameras and sensors act as objects or 'things' capable of sensing their environment, communicating with each other, and sharing knowledge over the Internet [1, 2]. IoT key purpose is to allow us to define, signify, navigate and monitor items individually at any time and everywhere by the use of the Internet. A large number of intelligent and autonomous applications and resources will result from interconnected system networks, bringing substantial personal, technical and economic benefits [3, 4].

More recently, the Internet of Things paradigm has been used to build information ecosystems such as smart communities and diagnostic networks for human operation, with various functional fields and similar facilities in the medical industry, for example. The aim of creating such smart environments is to make human life more prosperous and convenient by resolving the problems of living conditions, energy use and industrial needs [5]. This purpose is clear, and is reflected in the significant increase in

applications for open and IoT-based services across various networks. IoT technology can be used in order to create a human behaviour diagnostic system. In order to provide the medical personnel with information, good medical diagnosis and control, proper care and comfort. The use of IoT technology puts together doctors and patients in new health care applications for real-time tracking and hospital management. One of the core technologies of IoT improvements in the healthcare monitoring system is the emotions recognition system based on the Internet of Things [6].

In this paper, a Human Activity Diagnosis System is proposed. The system consists of three essential entities: first, physical elements, smart sensors and actuators; secondly, a communication network (wired/wireless) typically interconnecting the physical compounds; third, intelligent processing of information, for the management and control of the human activity diagnostic system, using the Artificial Intelligence algorithms (e.g. CNN).

The contributions made by this paper are as follows:

- Cognitive IoT for smart diagnosis systems: this paper provides prototyping of smart diagnosis systems (hardware and software) for measuring sound sensitivity.
- Designing a face and emotion recognition system: the paper using Convolution neural network (CNN) as a software to detect faces and emotions signs.
- TCP protocol-based sound management system: the paper includes a control system that uses Arduino to publish and subscribe to cloud server features using the TCP protocol.

2. Related Works

The Human Activity Diagnosis System Based on the Internet of Things has become a highly developed research in the field of healthy intelligence, various approaches were proposed for designing such systems.

Söhsten and Murilo, in 2013, proposed performance evaluations on a neighboring Emgu CV multi-facial detection system and versions communicating with Windows Azure, calculating in real time the amount of facial information processed and the classification element. The greater the number of faces processed is better in terms of reliability [5].

Diego Castro et al., in 2017, presented a new method for Human Activity Recognition (HAR) based on the Internet of Things (IoT) by remotely tracking vital signs. To assess the activities conducted within four pre-established categories (lie, sit, walk, and jog), they use machine learning algorithms. Meanwhile, using a remote monitoring component with remote visualization and programmable alarms, it is able to provide input during and after the operation is completed [6].

Martin Magdin, et al., in 2019, presented the study of reactions recorded by the face analysis method. The experiment was performed on a group of 50 students from universities. 100 random images were presented to each student and the student's response to the image was registered. The reactions reported were subsequently compared to the predicted image response. Several imperfections in the face recognition method have been illustrated by the findings of the experiment. The machine has trouble classifying gestures and is unable to identify and understand inner emotions that an individual may experience when the picture is seen. Only feelings conveyed externally on a face through hormonal changes in some areas of the face can be identified through facial recognition systems [7].

Stefan Oniga and József Sütő in 2012, discussed studies using IoT technology for autonomous everyday life support for aged people or people with disabilities. The aim is to build a system that makes it possible to remain in a familiar atmosphere for as long as possible. The larger spread of assistive devices and the Internet of Things (IoT) would make this possible. In order to build a dynamic assistive device with functional capabilities and learning behavior, the authors plan to bring

together the current achievements in the area of the Internet of Things and Assistive Technology. In order to be eventually evaluated for a medical diagnosis, they used IoT technology to track the status of a patient in real-time or to get critical details [8].

Fadhil and Mandeel, in 2018, a remote tracking system for children with autism has been developed to help experts track the success of their patients and interpret the analysis of data. This method monitors the cases' reactions to different emotions such as sorrow, enthusiasm, nervousness, appetite, trepidation and relaxation, and then logs this detail [9].

3. Proposed System

In this paper, a diagnosis method to sound sensitivity by developing a framework using IoT and cloud computing for a facial expression recognition system is suggested. In the following subsections the face recognition and emotion detection algorithms are discussed in detail.

3.1. *System Parameters*

The proposed system depends on many parameters:

- **Emotion:** It is a case of mindfulness link with the nervous system. The emotions can be categorized as normal (i.e. happy) and abnormal (i.e. sad). Emotions parameter is represented by e_i, where $(i = 1,2)$.
- **Sound Intensity:** It is the power that sound waves hold per unit area in a direction vertical to that area, International System of Units defined intensity of sound - as watts per square meter $(watts/m^2)$, s_i represents the parameter of sound intensity where $(i = 1,2, \dots m)$, and s_0 and s_m denote the initial and maximal sound intensity respectively.
- **Levels of Sensitivity**: Experience many levels to find a human sensitivity to sound. The sensitivity level is placed through the symbol n_i where $(i = 1,2, \dots m)$, n_0 is the first sensitivity level and n_m is the highest sensitivity level.

3.2. *System Model*

The mechanism of the system can be specifically created based on the diagnostic process performed at multiple sensitivity levels. Figure 1 shows the diagram of the diagnostic system. The sentiment detection system can interpret the captured data that represent the video frames and produce the emotions to describe the person's reaction to the sound. Sentiment collected from the previous stage, which was processed in the patient's computer to determine if the person is in a normal state or abnormal and choose the appropriate volume level for each condition. The results are then sent to the cloud that uses Internet protocols. Objects Encapsulated in a TCP Datagram. The results uploaded in the cloud can be accessed by the other party for checking if the emotions values are normal or not.

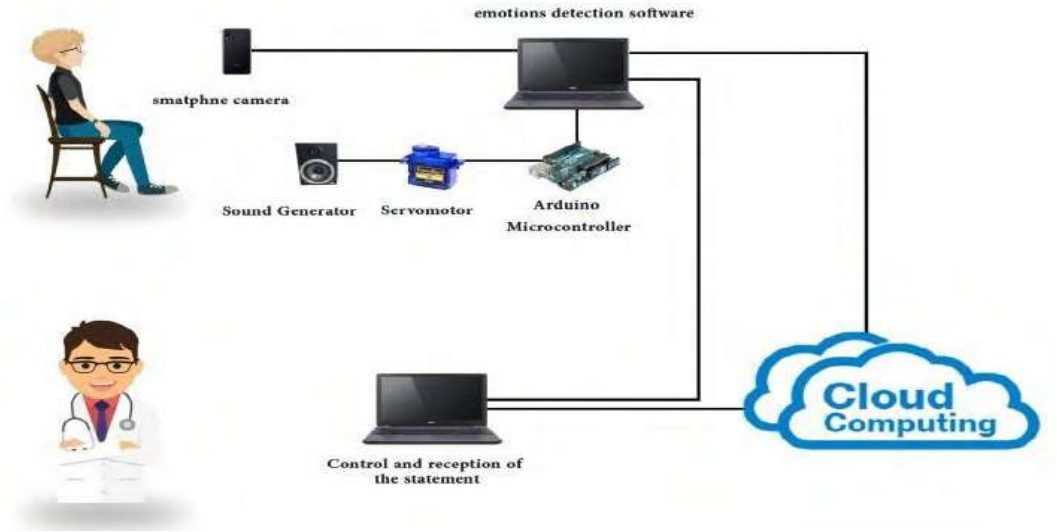

Figure 1. The diagram of proposed diagnosis system.

3.3. *System Work*

The value of sound intensity s_i, which decreases or increases depending on the equations and conditions described below, is calculated by the control system of the diagnostic system for acoustic sensitivities as follows:

1. The system of diagnosis determines the range of the levels of sensitivity ni.
2. The maximal intensity of sound s_m is set by the diagnostic system and the test begins with s_0, the initial intensity of sound.
3. The intensity of sound difference value Δs which increases/decreases at each stage can be determined from the following equation:

$$\Delta s = \frac{s_m - s_0}{n_m} \quad \text{..... (1)}$$

4. Diagnosis system regulates the ei at each level.
5. e_i normality is an indicator to raise the intensity of sound and vice versa.
    1. The intensity of sound is determined from the following equation for normal emotions:

$$s_i = s_{i-1} + \Delta s \quad \text{..... (2)}$$

    2. The intensity of sound is determined from the following equation for abnormal emotions:

$$s_i = s_{i-1} - \Delta s \quad \text{..... (3)}$$

6. When it notices abnormal feelings or when n_i equals n_m, the system stops.

The flowchart for the diagnostic sound sensitivity method displayed in Figure 2.

3.4. *Facial Emotion Detection*

In human life, emotions play a significant role. Human face represents at different times or moments how he feels or in what mood he is. Emotional factors have an enormous effect on social intelligence,

such as understanding interaction, making decisions, and helping to understand human behavioural aspects. The processing of facial emotion recognition passes through three stages [10]:

1. Facial Detection: Face position in any photo can be identified, offline video or live video.
2. Facial Recognition: Comparing various faces to define which faces belonging to the same individual. This is achieved by comparing the embedding vectors of the face.
3. Emotion Detection: Classifying the emotion as being on the forehead happy, angry, sad, neutral, surprise, disgust or fear.as shown in Figure 3.

In this paper, facial emotions recognition will be used to support the faces and emotions detection of autism people and patients with sensitivity to sound.

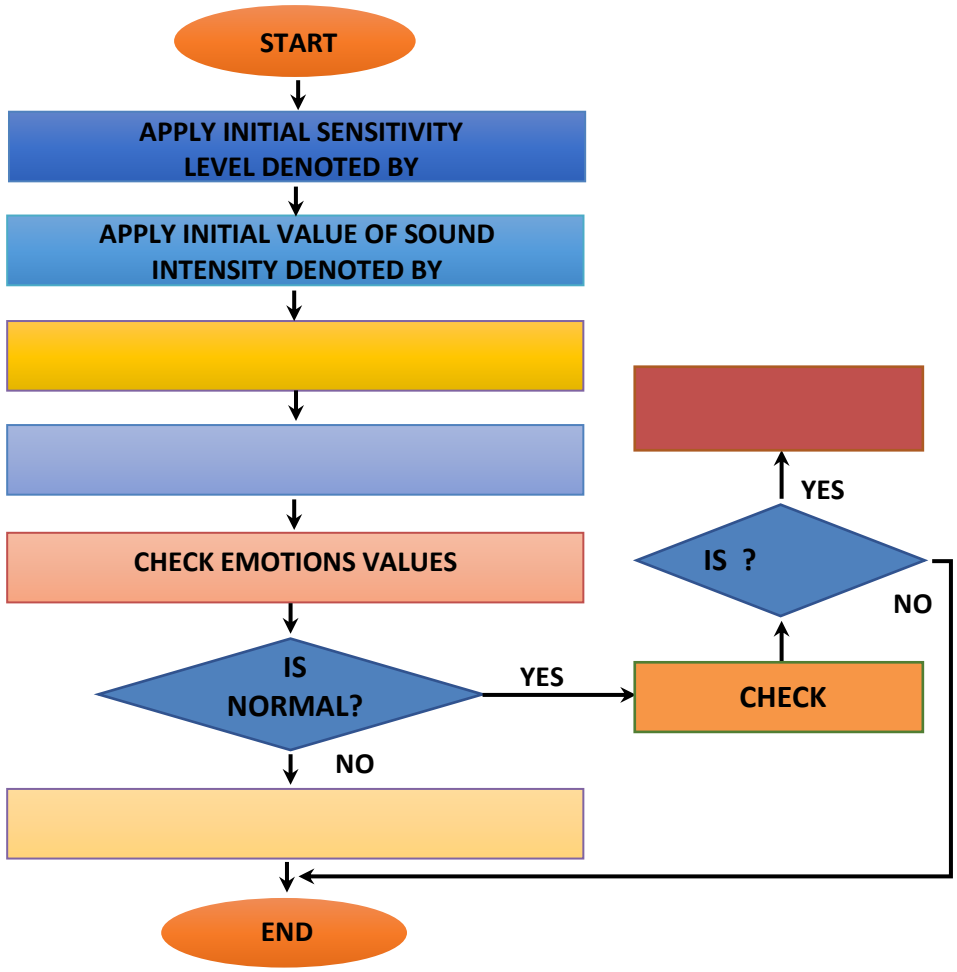

Figure 2. Sound Sensitivity Diagnostic Flowchart.

Figure 3. Example for Emotions Detection.

The mechanism used for emotion detection in this project is based on Deep learning. Convolutional Neural Networks (CNN) is one of the deep learning algorithms specialized in the images that have the best high resolution. The CNN, as well as other hidden layers, it consists of an input and output node. These layers are usually categorized into four forms: convolution, max pooling, flattening and full connection (short for fully-connected) [11] as shown in Figure 4.

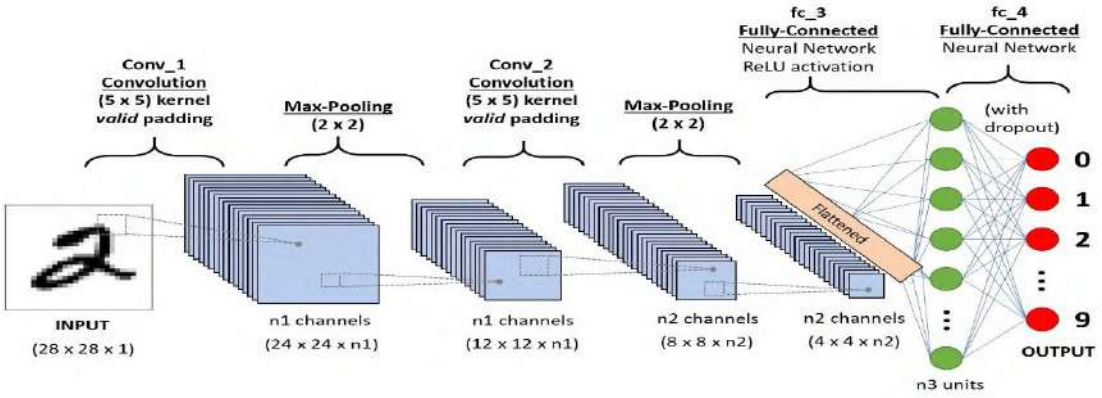

Figure 4. CNN sequence to classify handwritten digits [11].

4. Design and Implementation

The software/hardware components of the system and the detailed description of its implementation is given in this section. The components that need to build the proposed system are Arduino Uno, Arduino WiFi Shield, Servomotor, Micro USB cable, breadboard, jumper wires, Smartphone, two laptops and sound generator. Figure 5 illustrates the system components.

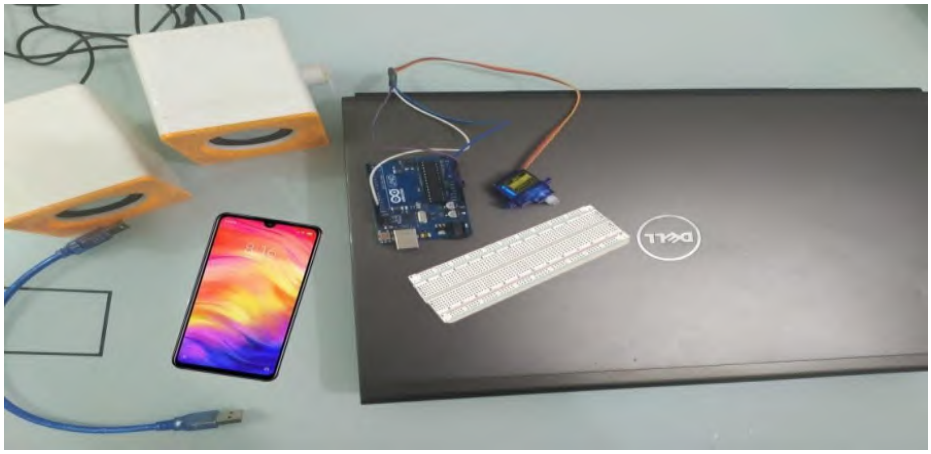

Figure 5. Components needed for Human Activity Diagnosis System.

4.1. *Live Video Processing System*

A smartphone (Redmi note 7) was utilized to recognize the patient's face during live video capturing mode for the purpose of detecting and examining his emotions. DroidCam software was used for both interfaces of emotion detection system (smartphone and laptop) that are connected via Wi-Fi using Wi-Fi IP and DroidCam port 4747 4.3. DroidCam software was connected to reprogrammed software written by python 2.7 language using. PyCharm Community Edition 2020.2 x64 for face and emotion detection in laptop.

4.2. *Emotions Detection*

After taking the picture through the smartphone the image enters the analysis algorithm (as shown in Figure 6) which is as we mentioned in the third section convolutional neural network in which the patient's condition is (happy, angry, sad, neutral, surprise, disgust or fear). Currently, only these cases are taken into account due to limited time.

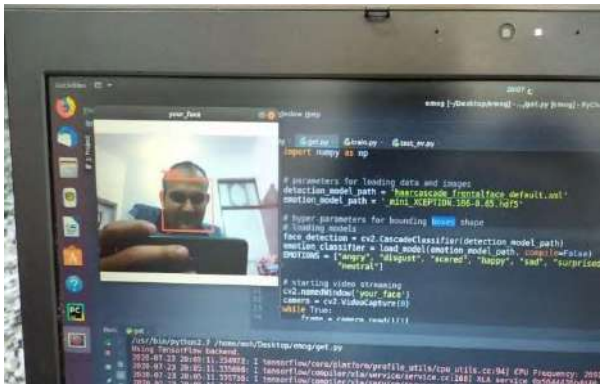

Figure 6. Emotions detection

This algorithm relies on training the network by entering more than 1792 emotional images for training and nearly 20 emotional images to test the neural network, the dimensions of the input image are 48 * 48, it is implemented using Kiras Library, which is a Python compiler used in TensorFlow library including machine learning tools and algorithms.

Inserting images into the convolution layer, whose size is the size of the input image, which creates very important features and by applying the filter that determines the edges of the image where the

images wanted for training were entered into the convolution layer four times to find the desired, then enter the Max pooling layer which is 24 * 24 in the first layer and continues to decrease each time, this layer is repeated four times as well. Then enter the Max pooling layer.
The size is 24 * 24 in the first layer then continues to decrease each time and repeat this layer four times also, after that flattening layer which flattens the matrices emerging from the previous two layers. We have repeated this layer three times then the image or arrays enter the neural network for training.
The emotions results are extracted from the input image as follows:

1. If the percentage of normal features inside the output matrix increases, the output value is normal
2. If a decrease in the percentage of normal features and an increase in abnormal features is observed within the trained network, the output will be abnormal. As shown in Figure 7.

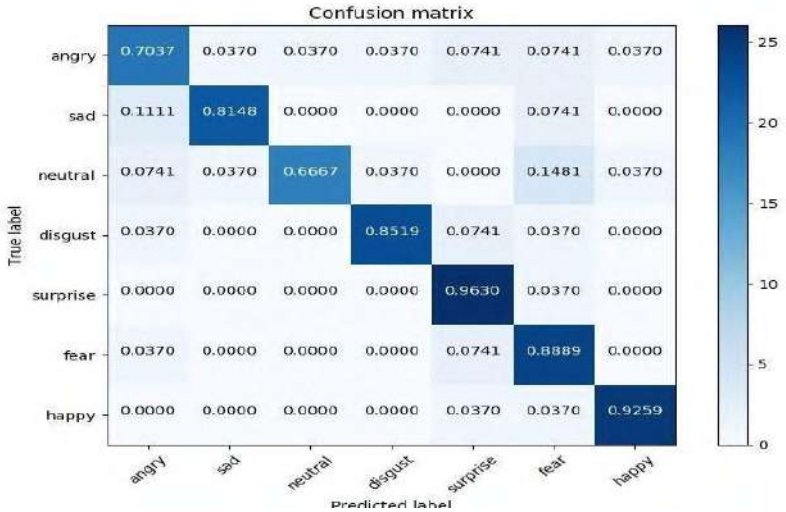

Figure 7. Output matrix of the CNN.

4.3. Cloud Implementation

After completing the processing on the patient's computer, the edge node (i.e. PC) sends the complete results to the cloud, which can be accessed from anywhere. The results and patient photos are displayed on the cloud as shown in Figure 8.

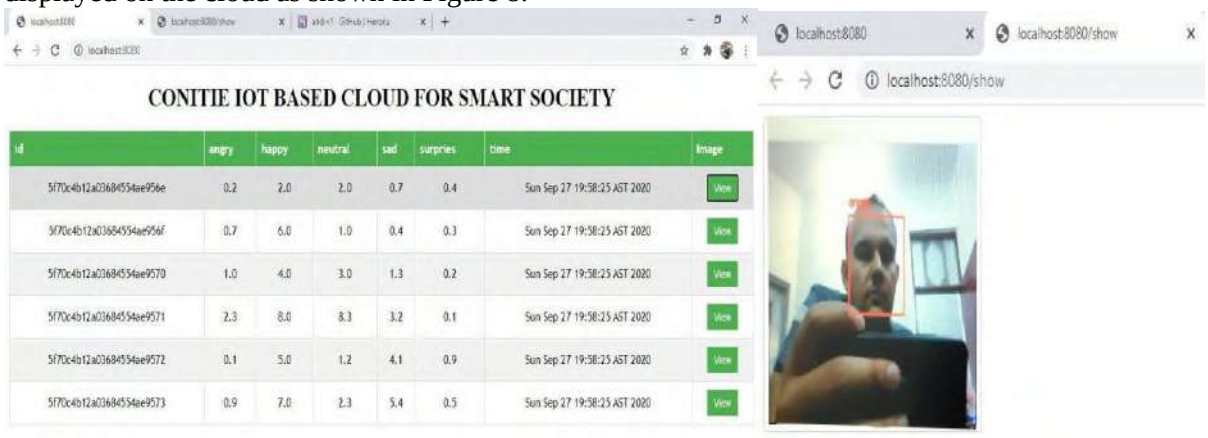

Figure 8. Uploaded results on Cloud.

4.4. Devices of Sound Control

The sound control system contains the sound control knob (micro kigdom Q280) Arduino, servo engine, board and wires integrating to control the rotation of the sound volume control knob. The sound frequency of the sound generator should be between 0 dB and 70 dB. The control knob of sound volume is connected to the servomotor in order to increase or decrease the volume of sound through rotating it clockwise or counter-clockwise. To connect the Arduino Uno (low-level language) with Python (high-level language) we need to use the Firmata firmware from Arduino Uno.

4.5. System Implementation

After the completion of the configuration and installation of the software/hardware components of the system will look as shown in Figure 9. The practical implementation of the system will be as follows:

Figure 9. Circuit Connections for the proposed system.

1. The patient sits in front of the mobile camera that connected to the first computer through the Wi-Fi network.
2. Providing internet service to ensure that the results are sent to the cloud, which in turn reaches the doctor in any place.
3. When clicking from the controller's computer, an instruction is sent to the patient's computer on the second party via the TCP protocol to take a picture of the patient.
4. The facial recognition algorithm determines the patient's condition.
5. And then the computer sends the results to the cloud, at the same time the computer sends an instruction to the motor to move according to the results.

5. Results

Each case was examined to determine his/her sensitivity to sound using Nostalgia music for Yanni (it is adjusted in terms of duration to be appropriate for examination) for sensitivity ranging from 1 to 5 levels system works to increase this intensity within certain periods ranging from 106 sec to 636 sec depending on the patient sensitivity and examination situation. At each sensitivity level the case was examined to detect his/her emotions to find out if he is in a normal situation or suffers from sensitivity toward this sound intensity. This intensity was automatically increased when the case was confirmed to be normal and stable and vice versa if he turns out to be disturbed.

In figure 10 four cases are examined. Case 1 in Figure 10-A displays a normal emotional reaction for all levels of the heard sound. While the other cases in Figure 10 (B, C and D) illustrate a

hypersensitivity to a specific level of sound intensity. After the patient suffers from hypersensitivity, the sound intensity is reduced automatically to the previous level.

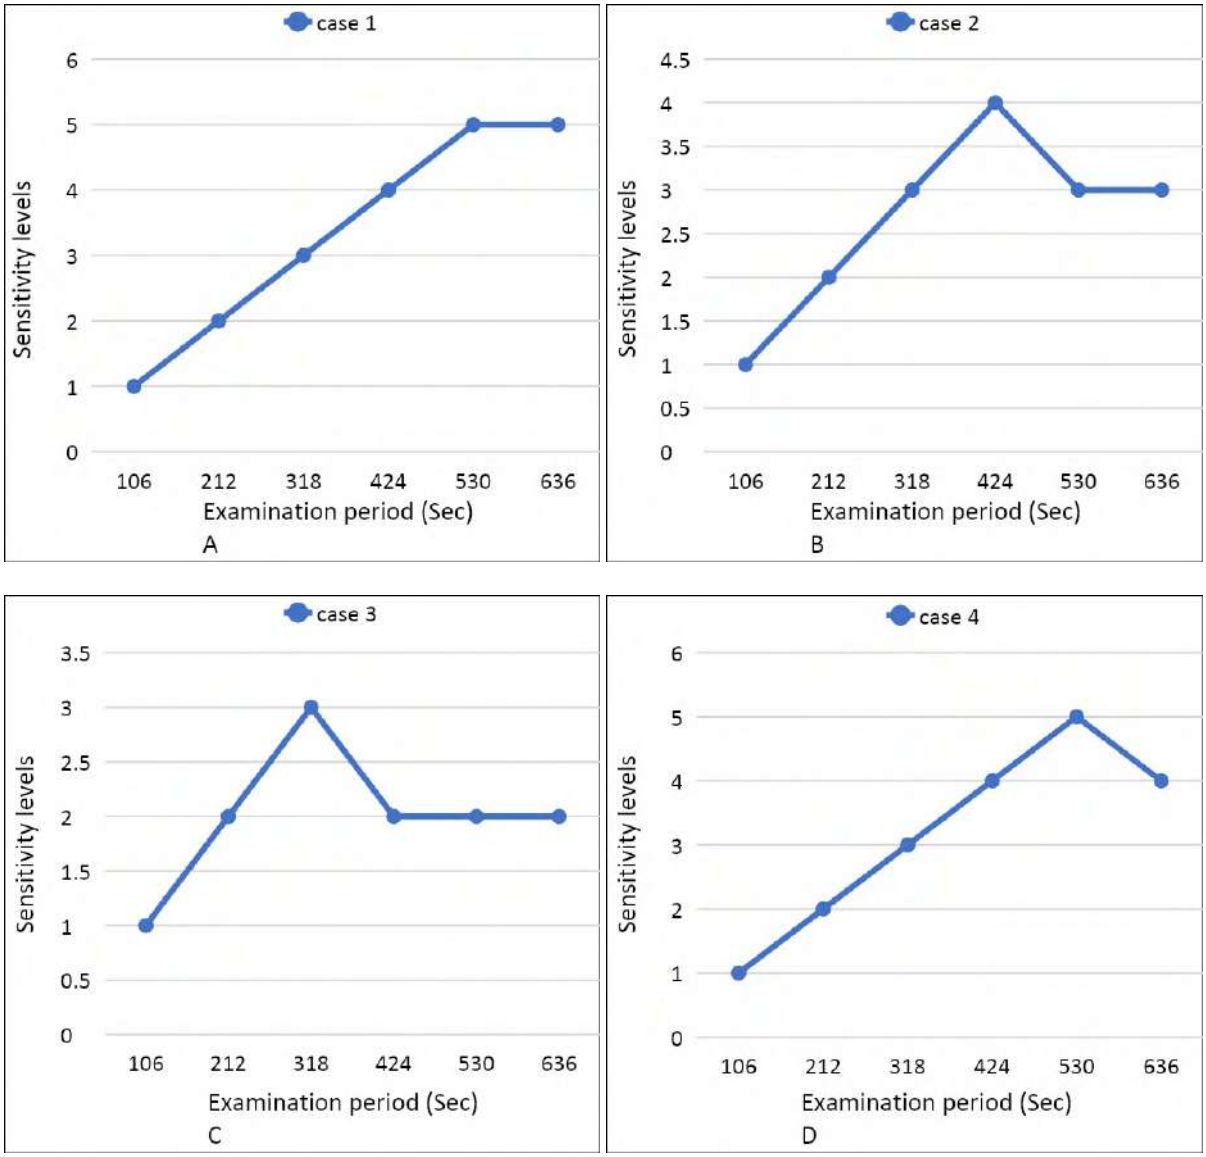

Figure 10. The sound sensitivity examination.

6. Conclusion

This paper introduced a smart diagnostic device to detect sound sensitivity to the effects of the surrounding atmosphere using cloud computing and cognitive IoT. The system prototype can be adopted as an effective system in medical centres dealing with the diagnosis of hypersensitivity toward environmental parameters. Several experiments have been conducted using different algorithms as fuzzy algorithm. These experiments showed that a convolutional neural network is 80% more accurate than as fuzzy algorithm but requires more time in training. Also, this system applies the idea of social spacing, especially in the context of the spread of the new Coronavirus. The proposed system is effective in diagnosing and responding to autistic patients with sound sensitivity.

As a suggestion for future works, hands and head motion detection can be added to the proposed system to support emotion detection. Also, with the training of many networks and the introduction of

all aspects of body language, can be converted into a polygraph system in criminal cases, with many factors such as light and sound and manipulation of guilty room temperature and other factors.

Personal identification system based on multi biometric depending on cuckoo search algorithm

Personal identification system based on multi biometric depending on cuckoo search algorithm

Ansam Nazar Younis

E-mail: anyma8@uomosul.edu.iq

Abstract. In modern devices, many personal identification systems are used using various biometrics to confirm the identity of an individual and identify him for several purposes. Some of these essential biometrics are used in this paper to help identify a person while attaining social distance because of the widespread epidemics. The features of the face, eyes, nose, and finally, the features of the mouth are used in this article. The work begins by detecting the parts of multibiometric from the input images using Viola-Jones face detection algorithm with a modification to it then segment them. After that, various initial treatment processes begin which helps clarify them to facilitate subsequent operations. Also, a Histogram of oriented gradient method(HOG) is used to extract the significant features of those image segments. The extracted features from these segments are entered into the developed cuckoo search algorithm(DCSA), the best image segment within the used dataset is searched for similar in terms of characteristics to the entered image segment. The work has also been developed so that the system is executed on two cores using parallel processing technology to utilize the processor as much as possible and reduce the time it takes to implement the system and identify the person concerned. A high identification rate has been reached, reaching 99.25%, and overall speed up 1.40323 sec relative to serial execution
.

Keywords: Multi biometric, Cuckoo Search Optimization Algorithm, Preprocessing, Viola-Jones Face Detection Algorithm, HOG, DCSA, Parallel Processing.

1. **Introduction**.

The emergence of some epidemic diseases such as the recently introduced Corona disease, which is transmitted rapidly through contact, has led to a reduction in the use of systems and techniques that are used to confirm the identity and which require touching the associated devices. Such as the use of fingerprints, palm prints, or even the use of live signatures, as these techniques were rapid methods of spreading diseases among people. Also, the needing for social distancing has led most people to carry out their activities, work, and lessons through computer services and the Internet, which has increased the needing for institutions and official departments to confirm the identity of the people who communicate with them. Therefore, experts have recently resorted to advocating the development and use of personal identification techniques that reduce contact between people by focusing on safer biometrics that have strong characteristics to distinguish people at the same time.

Multibiometric Systems mean systems that rely on multiple biometric characteristics are systems that use more than one physiological or behavioral characteristic for the same person[1], and the most striking biometric solution is facial identification[2].

In [3] the authors suggested a mapping technique for Using deep convolutional neural recognition(DCNNs) networks consists of the proposed architecture for two branches of DCNNs to map the high and low-resolution face images, [4] build a deep neural network for deeply encoding the face regions, also [5],[6]built an application for facial recognition for a Convolutional Neural Networks Biometric Network-Based, While [2]A facial classification strategy was proposed using the support vector machine algorithm,[7] Propose a multi-biometric face recognition technique to extract deep features from various facial regions using multiple convolutional neural networks (CNNs). A system that uses KELM to identify normalized face images is proposed in [8] to compensate for the effects of light variations.

In this paper, the clearest multibiometric for digital camera capture, the simplest availability and the most accurate and recognizable for individuals were adopted, Where the work relied on using the characteristics of the face, eyes, nose, and mouth separately using modified Viola-Jones face detection algorithm, as these characteristics express the person clearly. Where the algorithm (Histogram of oriented gradient algorithm) is used in the process of extracting important characteristics, reducing the dimensions, and developing an algorithm(Cuckoo Search Algorithm CSA) one of the metaheuristic algorithms, to make the algorithm better in the process of searching for the ideal solution and reaching the desired goal. Also proposed an algorithm for the execution of work on 2 cores to achieve optimum utilization of the processor inside the computer and achieve a high speed of execution. So that the work aims to achieve the identification of people by using multiple biometric features with a high recognition rate and short execution time.

2. Traditional cuckoo search optimization algorithm:

It is an intelligent algorithm that is considered one of the metaheuristic algorithms for optimization and random searching, first introduced in 2009[9] that simulates the behavior of one of the cuckoo bird family types in finding the nest and raising the young. Where this bird searches for a suitable nest randomly from the nests of other birds to lay its eggs in it so that the owner of the nest does not suspect the host, and each egg from the original nest represents a solution, while the cuckoo's egg represents a new solution[10].

3. Proposed work:

3.1. Creating dataset :

In the first stage of the system's work, the original dataset is created, which consists of 180 diverse natural images for a large group of people. The number of models varies for each person, as some people have some changes in taking pictures, for example changing the state of the mouth (silence, laughing, taking out the tongue, changing movement The mouth is in a different direction.) Also, some changes may occur to the type and shape of the covering over the head. It may also change at times from the shape of the eyes by adding different medical glasses, as well as other changes such as the background and the distance from the camera. For this purpose, a smartphone camera is used, Also some standard datasets are used, some pictures can be seen in Figure 1.

Figure 1. Examples of the dataset of the proposed system.

3.2.Preprocessing:

To facilitate smooth implementation of the algorithm steps, the input images are preprocessed at this stage, These preprocessed include unifying the input image sizes for all images into a single size, then converting it from (RGB) color space images to gray-level color space images.

3.3. Detect the segments of the multibiometric for each facial image:

Here at this stage, the multibiometric segments are identified and cut from the original image separately and stored in a special matrix, which is done by using a detection algorithm based on the Viola-Jones face detection algorithm[11]. Besides, a special programmatic section was used to modify the algorithm, whereby the nose area is used to obtain the mouth area easily. After the nose is determined, the square of dimensions by which the nose was defined is shifted downwards to easily identify the mouth without making mistakes with a small amount of enlargement of those dimensions, this is because the nose area is stronger in the detection process with this algorithm, that will help to get the segments correctly while not allowing false possibilities or segments that are out of place. Whenever the square of the nose contour is shifted by the length of the nose of the person (the length of the vertical side of the square) while expanding the square by the width of the nose of the person (the length of the horizontal side of the square) to show us the square that correctly defines the mouth area of the person. The mechanism of action is thus shown in Figure 2. The method of detecting and segmenting an image from the images entered into the device is shown in figure 3.

Figure 2. Defining the mouth area by shifting and enlarging the square that determines the nose

Figure3. Detecting and segmenting Multibiometric(Face, Eye, Mouth, Noise) of an image

3.4. Feature extraction:

The Feature extraction process was carried out using the Histogram of oriented gradient (HOG) method to obtain the best characteristics and features of each segment of multibiometric that belong to one of the images in the dataset. In most systems for recognizing objects or people, a strong set of extracted properties is relied upon. This method relies on studying edge descriptors based on gradation[12]. It uses a gradient of local intensity or distribution in the direction of the edge to describe an object's appearance. So effectively, HOG features will be resolving the issues of classification and identification systems[13], First of all, HOG is calculated, usually by convolution, by finding the horizontal gradients and vertical gradients in the image. For both the horizontal direction and vertical direction, use the (One_Dimention)point discrete derivative mask for, which is(-1,0,1) in the horizontal direction and(-1,0,1) in the vertical direction, The value of the gradient can be calculated according to the value of each pixel in the image using the equation:

$$G = \sqrt{g_y^2 + g_x^2} \quad (1)$$

It is also possible to measure the angle of the gradient for each pixel of the image by using the equation:

$$\theta = \arctan(\frac{g_y}{g_x}) \quad (2)$$

Where g_y represents the result of the convolution in the vertical direction, while g_x represents the result of the convolution in the horizontal direction[14].

3.5. Developing Cuckoo search Algorithm (DCSA):

The process of extracting the previously mentioned traits was applied to each of the biometric segments that were segmented from all the images, whether in the dataset or entered into the system, which were later used as inputs to the cuckoo search algorithm, and this represents a hybridization of the algorithm so that it deals with the extracted properties and not with the images and segments directly.

The goal of the basic search optimized cuckoo algorithm is to replace the bad (solution) individuals with the good individuals in the nest. This is done by using the fitness function [10],[15]. Therefore, the algorithm has been developed to suit the work in searching for the optimal solution, which represents the best match of the properties of the biometric segments with the corresponding segments in the dataset. Therefore, the Euclidean distance equation was used as a function of fitness for all individuals or solutions available in each generation which is can be defined as the following equation:[16][17]

$$D(x,y) = \sqrt{(x_1 - y_1)^2 + (x_2 - y_2)^2} \quad (3)$$

Where D is the distance between x which has(x1,x2)coordinates, and y which has(y1,y2) point. Thus, the pseudo-code of the DCSA algorithm can be written as follows in figure 4[18][19], where:s is the solution(egg), m is the nests, pr the probability of egg laid by a cuckoo is discovered by host bird with pr ∈[0, 1], D is the fitness value which calculated by equation 3.

Input: host nests m**,** cuckoo egg s.
Output: best nest.
Begin
1. Objective function : $f(s), s = (s_1, s_2, \dots\dots, s_d)^t$
2. Initial population created of m host nests $s_i = (i = 1,2, \dots\dots, m)$
3. **while** (t <Max number of Generation)
4. Randomly get a cuckoo
5. Evaluate cuckoo fitness (D_i)
6. Choosing a nest randomly among m(say, j)
7. if ($[D_i > D_j$)
8. Replace the solution j with the current new solution i;
9. **end**
10. A fraction (pr) are left worse nests and new ones are created;
11. Hold the best solution
12. Rank all the solutions then find the current best
13. **end while**
14. Post-process results and visualization

end

Figure 4. DCSA Algorithm Pseudo Code

3.6. Parallel Processing Method:

Parallel processing implies faster execution of the program by breaking the main program into several components and running simultaneously as each component operates on a separate processor or kernel[20][21]. The program is divided into two separate parts, so that each part is executed on a different core in the processor, to implement this method I used : (Intel ® Core TM i5-7200U, CPU @ 2.50GHZ 2.70GHZ) computer, Windows10 Processor OS. figure 5 represents a system execution by using two cores(kernels) which are called workers in MATLAB programming language.

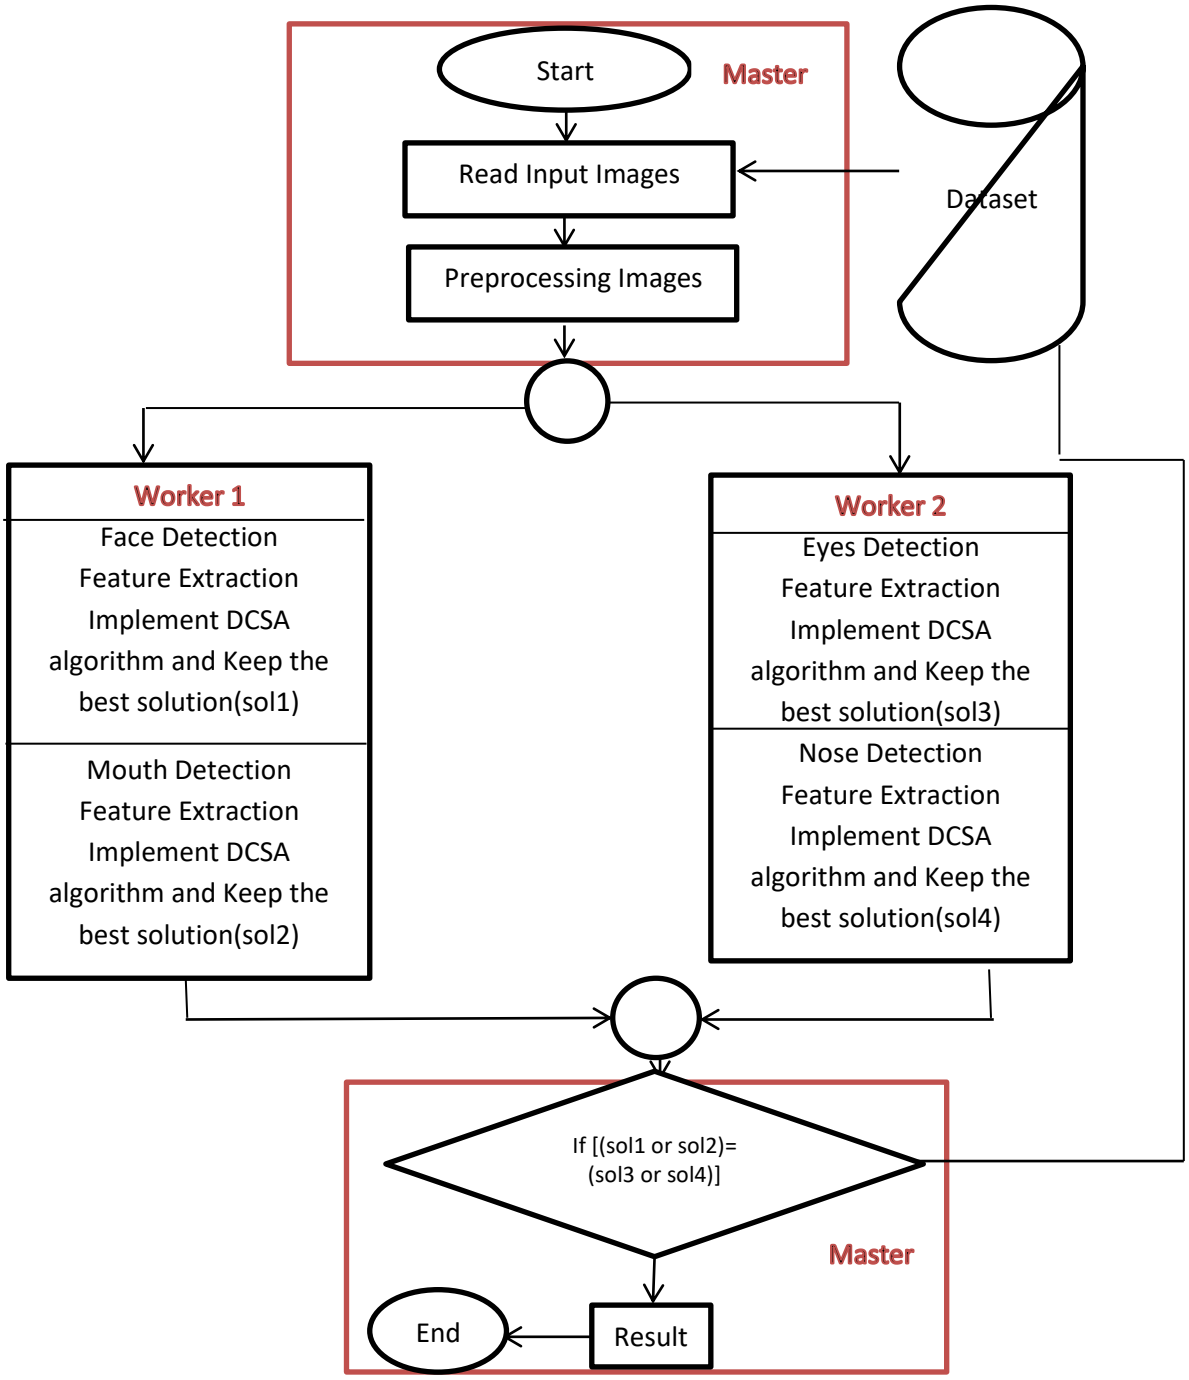

Figure 5. Flowchart of the Parallel Processing Method

Where the Master responsible for:

a. It provides the possibility of choosing the method used in the implementation and works to prepare the work environment as a whole in the case of parallel implementation.
b. Calling the necessary functions for parallel execution.
c. Process the input image as preliminary processing and then pass it on to the workers later.
d. Open parallel environment.
e. Preparing the workers and giving each worker his data and functions that it will work on.
f. Close the parallel environment.
g. Collecting and arranging the results and examining the solutions obtained to find the best.
h. Output results.

While the worker will responsible for:

a. Receive the data the worker needs from the master, including the target image that he wants to identify.
b. Implementation of the feature extracting method and developed cuckoo algorithm and searching for the best solution for two types of the biometric segment.
c. Return the best solutions to the master.

4. Measures Used To Calculate System Results:

To calculate the results obtained after implementing the developed algorithm and applying the aforementioned work steps, a set of important measures are used. These measures are divided into two main types, one that calculates the results of the system's accuracy in identifying people through its biometric characteristics and the success of the proposed algorithm for that purpose. As for the second type, it is concerned with measuring the speed and efficiency obtained from the implementation of the proposed algorithm in identifying people after implementing it in a parallel manner. The first type includes two measures, so The following measures can be used to calculate the identification results[21][22]:

1) $$\text{Identification Rate IR} = \frac{\text{Number of sample correctly identified}}{\text{Total number of images}} * 100 \quad (4)$$

Which represents the percentage of the number of people who have been identified in the system successfully, and the higher the value of this scale, the stronger the system will be in identifying people.

2) $$\text{Wrong Identification Rate(WIR)} = \frac{\text{Number of images identified error}}{\text{Total number of images}} * 100 \quad (5)$$

Which represents the percentage of the number of people who have been not identified in the system, and the lower value of this scale, the stronger the system will be in identifying people.

As for the second type, as seen in the following two equations, the measure of the increasing speed and the measure of the increase in the efficiency was used to prove the efficiency and performance of the system.

1) $$\text{Speed Up} = \frac{\text{The execution time of serial execution(one core)}in\ second}{\text{The execution time on n cores(in second)}} \quad (6)$$

This scale represents the acceleration factor of the system when we use parallel processing, which helps increase the execution speed of the intelligent system and depends on the execution time spent. Whenever the output value of this equation is greater than 1, the system is considered to be better in terms of execution speed.

2) Speed up Efficiency $= \frac{\textbf{Speed Up}}{c}$ (7)

The measure of increased efficiency depends on the scale of the acceleration factor, and that c represents the number of cores used in the execution. In terms of speed-up efficiency, the greater value of the output for this equation, the system is considered better.

5. Results and Analysis.

Practical experiments were conducted and the system was tested in identifying images of people in two ways (parallel execution and sequential execution). The input images were identified by finding the best solutions in recognizing the face, eyes, nose, and mouth, which represent the multibiometric for each image of a person. The result is calculated in favor of the image of the optimal solution that emerged from the implementation of the algorithm of cuckoos developed four times each time for a specific type of multibiometric and the detection of the solution closest to it. if the solutions returned from the four algorithms(DCSA algorithm for face identification, DCSA algorithm for mouth identification, DCSA algorithm for nose identification, DCSA algorithm for eyes identification) do not match, then the facial recognition solution with the mouth recognition solution is considered and must match with the nose recognition solution with the eye recognition dependent solution. This is because the biometric characteristics of the face and the nose are stronger than the biometric characteristics of the eyes and mouth. This is due to the possibility that the person will wear eyeglasses, use colored lenses, or make some striking movements of the mouth that cause the inability to recognize them.
Table 1 shows the most important results obtained from implementing the system on 180 images. We note from the results of the table that the strongest biometric characteristics are the facial and nose characteristics due to the lack of their changes even with changing the headcover sometimes, where the face and nose biometric identification ratio was 100%. It also appears that the IR of biometric for the eyes is 98.6% which is stronger than the biometric for the mouth that the IR of it is 98.4%, that is because the addition of glass glasses does not affect the results to a large extent as it affects moving the mouth or opening and closing it. Also, notice that the use of two cores to implement the system is much faster 1.40323 times compares to serial execution, as well as the efficiency of the system has achieved high efficiency estimated at 0.701615, which is considered to be very good even though the parallel execution needs to do a lot of additional executive operations that are not needed by the sequential execution. Figure 5 shows the implementation of the system as an example and the results with the data information of the person. Table 2. demonstrates a comparison of the recognition results using previously used algorithms with the proposed algorithm DCSA.

Table 1. Results of the system execution

No.	Type of Multibiometric	Type of Execution		IR	WIR	Speed Up times(in seconds)	Speed Up Efficiency
1	Face	Serial Execution		100	0.0	1	1
2	Nose	Serial Execution		100	0.0	1	1
3	Eyes	Serial Execution		98.6	1.4	1	1
4	Mouth	Serial Execution		98.4	1.6	1	1
5	Face	Parallel Execution Using 2 cores		100	0.0	1.40323	0.701615
6	Nose	Parallel Execution Using 2 cores		100	0.0	1.40323	0.701615
7	Eyes	Parallel Execution Using 2 cores		98.6	1.4	1.40323	0.701615
8	Mouth	Parallel Execution Using 2 cores		98.4	1.6	1.40323	0.701615
Total				99.25	0.75	1.40323	0.701615

Figure 6. Example of system execution

Table 2. A comparison between Algorithms(among works)

No.	Algorithm	Biometric Type	Recognition Rate
1	Two-Branch Deep Convolutional Neural Network Architecture[3]	Face	80.8% to 98.8%
2	deep neural networks [4]	Face	98.52%
3	Convolutional Neural Networks [5]	Face	98.75%
4	Convolutional Neural Network (CNN)[6]	Face	98.75
5	support vector machine[2]	Face	94% to 99 %
6	deep learning[7]	Face, Nose, Eyes, Mouth	93.77% to 97.94
7	light variations [8]	Face	98.89%
8	Proposed Algorithm(DCSA)	Face, Nose, Eyes, Mouth	99.25

6. Conclusion and future work.

The adoption of the developed cuckoo search algorithm along with the trait extraction algorithm used in the Persons identification system has proven its worth in reducing the possible solutions and reaching the optimal solution at a high speed. Also, the adoption of multiple biometrics has given power in identifying people while achieving social distancing, so a person who relies on this type of system does not need to touch devices for this purpose. Although the camera used to take pictures is a non-fixed camera, so the total IR reached 99.25, which is an excellent value in personal identification ratio, This can be seen by observing the outcome of identification obtained in Table 1, and the comparison made with other algorithms shown in Table 2. The great results that have been achieved give high confidence in using the system with established verification systems in institutions and official departments. Also, the use of parallel execution has given importance to this kind of exploitation of available computer capabilities, which helps in developing systems specialized in identifying people quickly where the speed up reached 1.40323 times compares to serial execution and the Speed Up Efficiency 0.701615 which is high.

As future work, we can develop the work to include another type of biometric in addition to the one used in the research. Also, additional other algorithms can be used in the trait extraction process to reduce the possibility of error such as PCA, LDA,.. etc. Also, with the increase in the number of dataset images, more than two cores can be used in the execution of the system to increase the utilization of the processor and ensure the utilization of the time spent.

Some limitations may appear in this algorithm, which is not identifying a specific area of the biometric areas used by the method, and this may be due to the lack of clarity of the taken image or to the rapid movement of the person during the capture, which distorts the image completely, or to some external environmental influences that affect the clarity of the image such as the presence of blur On the lens or taking the photo in a relatively dark place, etc., which negatively affects the identification results.

ACKNOWLEDGEMENTS
The author is very thankful for the facilities provided by the Mosul University / College of Computer Science and Mathematics, which helped to enhance the quality of this work.

Abstract. In the wake of the outbreak of the new coronavirus, the countries in the world have fought to combat the spread of infection and imposed preventive measures to compel the population to social distancing, which led to a global crisis. Important strategies must be studied and identified to prevent and control the spread of coronavirus COVID-19 disease 2019. In this paper, the effect of preventive strategies on COVID-19 spread was studied, a model based on supervised data mining algorithms was presented and the best algorithm was suggested on the basis of accuracy. In this model, three classifiers (Naive Bayes, Multilayer Perceptron and J48) depended on the questionnaires filled out by Basra City respondents. The questionnaires consisted of 25 questions that covered fields most related to and that affect the prevention of COVID-19 spread, including demographic, psychological, health management, cognitive, awareness and preventive factors. A total of 1017 respondents were collected. This model was developed using Weka 3.8 tool. Results showed that quarantine played an important role in controlling the spread of the disease. By comparing the accuracy of the algorithms used, the best algorithm was found to be J48.

Key words: Supervised Data Mining, COVID-19, Predictions, Accuracy, NB, MLP, J48.

1. Introduction

A new type of coronavirus has been discovered recently after it has been identified as the cause of the spread of one of the diseases that started in China from December 2019. The resulting disease is called coronavirus 2019 (COVID-19). In March 2020, the World Health Organization declared COVID-19 as a pandemic [1]. Evidence that men are more likely to die from COVID-19 than women is growing. People who suffer from aging diseases, weak immunity and lung-related diseases are the most affected [2]. The signs and symptoms of the disease may appear 2–14 days after exposure and may include the following: fever, coughing, shortness of breath, runny nose, headache, diarrhoea, vomiting and loss of sense of smell and taste. For protection from this epidemic, people must avoid contact with others and surfaces; avoid touching eyes, nose or mouth; wash hands frequently with soap and water; and maintain social distancing by 1–3 m [3]. The two important stages of COVID-19 are stages 2 and 3. Stage 2 involves infection from one person to another, whilst stage 3 involves infection from society. In accordance with COVID-19 stages,

the action plan could be determined by different countries. In Basra, the first case of COVID-19 was documented on 24 February 2020, originating from Najaf-Iraq. After 3 months, this disease spread in almost all areas of the city. A total of 22,926 cases have been recorded thus far. Among them, 16,817 recovered and 630 died. In this research, the following questions were answered: first, what are the most important factors that reduce the spread of COVID-19? Second, among the supervised data mining (DM) algorithms used, which could best predict the prevention of the spread of the disease? These questions were answered using DM techniques.

2. DM Technique

DM is a computational process applied in many areas; it aims to obtain useful and hidden predictive knowledge. DM techniques are used to construct a model where new information could be identified by unknown information [4]. One popular feature of all DM techniques is automated learning that recognises new patterns in the observed datasets [5]. DM specialists have devoted their careers to enhance the understanding on how to process and draw conclusions from huge quantities of knowledge depending on the techniques from the intersection of database management, machine learning and statistics. Thus, they divided the algorithms into two simple groups: supervised and unsupervised algorithms [6] [7]. Supervised DM is used to build models by using training data with a familiar class to which the data belong. The training data are composed of a series of training examples. Each example is a pair consisting of a vector of attribute value and a desired output class. A supervised learning algorithm analyses the training data and generates a feature inferred, which could be used to map new examples. This algorithm allows to determine the classes labels correctly for unseen instances. Classification methods belong to this group. The most popular classification methods are decision trees, classification rules, Bayesian networks and neural networks [8] [9]. The role of unsupervised learning is more complex than that of supervised learning because its only aims at searching the data for interesting connections and attempts to group elements by postulating class descriptions for sufficient numbers of classes to cover all objects in the database [10]. These tasks range from the identification of potentially useful regularities among the data couched in the language of description given to the discovery of concepts by conceptual clustering and constructive inference and further discovery of empirical laws relating to concepts developed by the method. Clustering and association rule methods belong to this group [8] [11]. Several different classifier models are available in the literature and determining the best method is not possible as they vary from each other in several aspects, such as learning rate, amount of training data, speed of classification and accuracy. In this paper, the effect of three algorithms, namely, Naive Bayes (NB), Multilayer Perceptron (MLP) and J48, on data analysis was discussed. These three classifier algorithms were used to predict the final class (prevention of COVID-19 spread) that some new unlabelled attributes belong to. The selected algorithms were also used to find the most convenient method to predict the final class.

2.1 Naive Bayes

NB algorithm is one of the most popular machine learning methods, specifically data analysis and classification. This method relies on the statistical concept of Bayes' theorem, which calculates the probability of a specific result by using available information [12]. This classifier is called naive because it relies on the principle of independence assumptions, that is, the relationship among all attributes and features is considered independent of one another [13]. The NB classifier model is characterised by the ease of construction and development and the ability to process large data, outperforming a number of sophisticated and sophisticated algorithms. The model is trained with the data and its available properties in databases, determines the type of new records and then classifies them on the basis of data and statistics previously available [14]. It is used in many systems, such as for identifying harmful messages; classifying documents, such as in news sites, to anticipate the type of document (e.g. politics, sports and technology);

recognising the views and feelings in the text content (negative, positive or optimistic) and in face recognition in pictures [15].

2.2 Multilayer Perceptron

MLP algorithm is one of the most popular neural networks algorithms. It consists of a perceptron, an input layer for receiving the signal, an output layer for making a decision or prediction about the data and an infinite number of hidden layers, which are MLP's true computational engine between the two layers [16]. MLP is also applied to supervised machine learning problems; they train on a collection of pairs of input–output and learn to model the correlation between those pairs. Network training requires adjusting the model's parameters (weights) to reduce error [17] [18]. This network could also be used for unsupervised machine learning by using auto-associative structure, where similar values are set for the network inputs and outputs. This method is intensive in computational terms. For any fair representation, the MLP network must have at least three hidden layers, thus requiring a long time [19] [20].

2.3 J48

J48 algorithm is an extension of ID3 algorithm. It was developed by Ross Quinlan in 1993 to generate a tree-like hierarchy and construct classification trees that represent a flowchart structure, in which the non-terminal nodes indicate the attribute tests and the terminal nodes represent the decision outcomes [21] [22]. This classifier is one of the most widely used machine learning language processing domains. The main advantages of this algorithm are easy construction of graphical classification and low-cost formal generation. However, this algorithm does not generate multiple redundant attributes and modules and it is quite susceptible to noise in the data [23].

3. Model

3.1 Data Discerption

Quantitative method relies on the use of questionnaire survey. In this work, questionnaires were built on Google Docs to collect data online. These questionnaires were used to collect data of the real direction and challenges of the respondents in Basra City on the basis of on their different experiences, allowing for collection of more accurate coded data. The research data, a total of 1017 samples, were collected in March of 2020. The six main parts of the questionnaire were demographic, psychological, health management, cognitive, awareness and preventive factors. Table 1 shows the questionnaire parts, question number and question description and the respondents' answers. These answers were shortened and converted from nominal to numeric type for ease of use and understanding. The answers were classified on the basis of Likert scale as follows: 1 for strongly agree, 2 for agree, 3 for not applicable, 4 for disagree and 5 strongly disagree. The initial step in data pre-processing involved preparing the data and converting them for evaluation and processing using MS Excel. In the second step, the collected responses were converted carefully using Weka 3.8 tool.

Table 1. Questionnaire Description

Part	No.	Distribution	Rank
Demographic Data	Q1	Gender	Male
			Female
	Q2	Age (years)	15–24
			25–34
			35–44
			45–54
			> 54
	Q3	Job	Healthcare field
			Engineering field
			Teaching field
			Student
			Earner
			Unemployed
	Q4	Address	City centre
			City outskirts
	Q5	Level of Education	Ph. D.
			MS. C.
			BS. C.
			Diploma
			Secondary
			Middle
			Primary
Psychological Factors	Q6	Social media is the most influencing factor of my psychological state.	1, 2, 3, 4, 5
	Q7	I suffer from nervous tension and anxiety during this period.	1, 2, 3, 4, 5
	Q8	I consider storing goods and food items a necessity in this period.	1, 2, 3, 4, 5
	Q9	Seeking help from psychologists is necessary during this period.	1, 2, 3, 4, 5
Health Management Factors	Q10	Basra is one of the healthiest cities to fight COVID-19.	1, 2, 3, 4, 5
	Q11	The medical personnel from the province are ready to deal with the virus.	1, 2, 3, 4, 5
	Q12	The crisis could be overcome by connecting health institutions with international scientific research centres.	1, 2, 3, 4, 5
	Q13	I support receiving medical personnel from outside Iraq, such as China.	1, 2, 3, 4, 5
Cognitive Factors	Q14	One of the most important transmission routes of infection is inhalation of the droplets produced when an infected person sneezes or coughs.	1, 2, 3, 4, 5
	Q15	Contact with surfaces contaminated with droplets from an infected person is a typical way to catch the disease.	1, 2, 3, 4, 5
	Q16	COVID-19 one of the most dangerous infectious viruses in recent times.	1, 2, 3, 4, 5
	Q17	Taking nonsteroidal anti-inflammatory drugs, such as Provin and Punestan, reduce the severity of symptoms.	1, 2, 3, 4, 5
Awareness Factors	Q18	Staying away from markets, restaurants and gatherings is a good way to prevent the spread of the virus.	1, 2, 3, 4, 5-
	Q19	I support the compulsory quarantine of all expats from abroad.	1, 2, 3, 4, 5
	Q20	I support curfews and disruption of circuits and schools and I encourage e-learning.	1, 2, 3, 4, 5
	Q21	I support isolating infected people in hospitals far from residential areas.	1, 2, 3, 4, 5
Preventive Factors	Q22	Meat and eggs should be cooked well.	1, 2, 3, 4, 5
	Q23	It is necessary to wear masks and paws when leaving the house.	1, 2, 3, 4, 5
	Q24	The immune system is strengthened by taking high doses of zinc and vitamin C.	1, 2, 3, 4, 5
	Q25	Washing hands with soap and water for at least 20 seconds and using sterilisers containing 70% alcohol are the basic information that I know.	1, 2, 3, 4, 5
Total of all items			25

3.2 Questionnaire Reliability

Reliability is the extent to which an instrument would produce the same results, whether the measurement under the same conditions was to be taken again. For example, measuring people's height and weight is also extremely reliable [24]. Cronbach's alpha is statistically one of most effective methods to measure internal consistency and reliability; it is used to calculate the extent to which the questions in the survey all measure the same underlying construct. When Cronbach's alpha > 0.7, its internal reliability performance is satisfactory [25]. Table 2 shows that the Cronbach's alpha was 0.8 for the scaled variables, which consisted of 21 items (parts 2–5) and 1017 respondents.

Table 2. Questionnaire Reliability

Reliability Statistics			
Cronbach's alpha	***No. of items***	***No. of respondents***	***% of respondents***
0.8	21	1017	100%

4. Results and Discussions

A Weka software package developed at Waikato University in New Zealand was used to implement this study. This package is run on Java, and it stands out as perhaps the most professional and extensive package of machine learning algorithms [26]. Analysing the effect of attributes is necessary to obtain an enhanced insight into the importance of the attributes. Thus, the effect of certain attributes of the model on the final class was analysed in the present study. This analysis discussed the most correlated attributes (respondents) to the final class (prevention of COVID-19 spread) and how they may affect the final class. This stage revealed the average correlation of the attributes with the final class. The respondents with high correlation could be regarded as points of advice for interested parties in this field. Weka provides several filters that could be used to clean up the data before invoking a classifier. In this stage, a filter (CorrelationAttributeEval) was used to find the correlation between attributes and the final class. This filter evaluated the value of an attribute by calculating the correlation (Pearson's) between it and the final class.

Table 3. Correlation Rate of Responses

Sequence	**Respondent**	**Average**	**Sequence**	**Respondent**	**Average**
1	Q19	0.15624	13	Q3	0.04214
2	Q16	0.14841	14	Q6	0.03534
3	Q24	0.13699	15	Q8	0.03149
4	Q22	0.10039	16	Q5	0.03136
5	Q25	0.0961	17	Q17	0.02950
6	Q15	0.09046	18	Q14	0.01748
7	Q20	0.08735	19	Q1	0.0159
8	Q11	0.07532	20	Q2	0.01316
9	Q4	0.0587	21	Q9	0.00743
10	Q10	0.05505	22	Q7	0.00483
11	Q23	0.04537	23	Q12	0.00414
12	Q18	0.04358	24	Q13	0.00352

Table 3 displays the correlation rate with the evaluation mode between the attributes and the final class (10-fold cross validation) to ensure accuracy. This analysis aimed to determine the importance of each attribute

individually. The responses were ranked from the highest to the lowest correlation rate with the final class. Those with the highest correlation rates represent the value most correlated with the final class. The results showed that Q19 affected the final class the most, followed by Q16, Q24, Q22 and Q25, whereas Q9, Q7, Q12 and Q13 had the smallest output effect. Some experiments were also conducted to evaluate the performance and usefulness of the different classification models of the prevention of COVID-19 spread. The results are summarized in Tables 4–6.

Table 4. Predictive Results of Classifier Models

Evaluation Criteria	Classifier Models		
	NB	***MLP***	***J48***
Timing to Build Model (in seconds)	0.05	25.49	0.05
Correctly Classified Instances	906	934	953
Incorrectly Classified Instances	110	82	64
Prediction Accuracy	89.17%	91.92%	93.79%

Table 5. Comparison of Performance

Evaluation Criteria	Classifier Models		
	NB	***MLP***	***J48***
Kappa Statistics	0.2017	0.1542	0.1368
Mean Absolute Error	0.122	0.0835	0.099
Root Mean Squared Error	0.2975	0.2676	0.2412
Relative Absolute Error	114.27%	78.23%	92.73%
Root Relative Squared Error	192.29%	116.26%	104.80%

Table 6. Comparison of Evaluation Measures

Classifier Model	TP	FP	Precision	Recall
NB	0.925	0.667	0.959	0.925
MLP	0.964	0.825	0.952	0.175
J48	0.987	0.895	0.0.949	0.987

The performance of the three models was measured on the basis of three criteria: prediction accuracy, building time and error average, as shown in Figures 1–3, respectively.

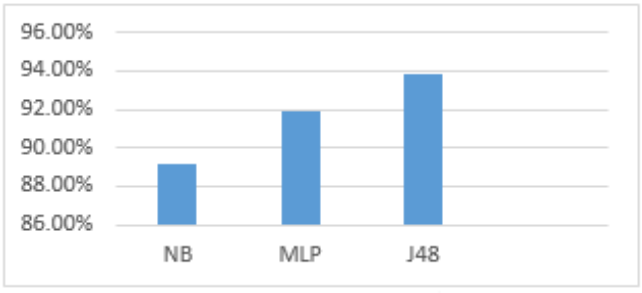

Figure 1. Prediction Accuracy

Figure 1 illustrates the classifier models used in the experiment; the accuracy average of NB algorithm was the lowest.

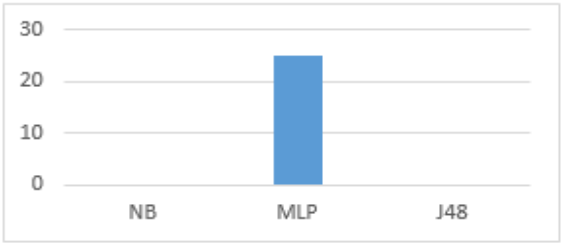

Figure 2. Building Time of Classifier Models

Figure 2 illustrates the building time of the three models under consideration. Amongst them, the MLP classifier took the longest time to build a model, whereas the NB and J48 classifiers learned to construct a model quickly for the given data. Figure 3 displays the correctly and incorrectly classified instances.

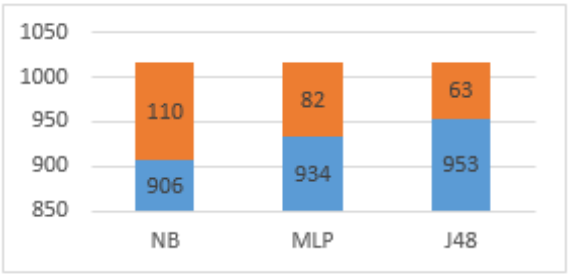

Figure 3. Error average

The performance of machine learning techniques is highly dependent upon the quality of the training data. Confusion matrices are extremely useful for evaluating the classifier models. A confusion matrix is a table used to define a classification model's output on a collection of training data for which the true values are known. In table 7 there are two possible predicted classes: "A" and "B". "A = yes" would mean they predicating the prevention of COVID-19 spread, and "B = no" would mean they do not . For example, The classifier made a total of 1017 predictions . Out of those 1017 cases, the classifier "NB" predicted "A" 981 times, and "B" 36 times. In reality, 998 respondents in the sample have the prevention, and 19 respondents do not. Briefly, the columns in table7 represent the predictions, whilst the rows indicate the final class.

.

Table 7. Confusion Matrices

Classifier Model	A	B	
NB	969	29	A
	12	7	B
MLP	992	6	A
	14	5	B
J48	983	15	A
	10	9	B

In general, the experiments proved that cross validation was statistically good in the classifier performance. Good results lead to large numbers and small down the main diagonal, perfectly zero off-diagonal elements. As shown in Table 7, the classifier algorithms (MLP, NB and J48) demonstrated good results, indicating that DM methods could effectively help in the prevention of COVID-19 spread.

Figure 4 demonstrates the tree of the J48 classifier algorithm, which was the best method to show the most connected questions to the final class. Each node represent a question and its branches are drawn in accordance with the answers.

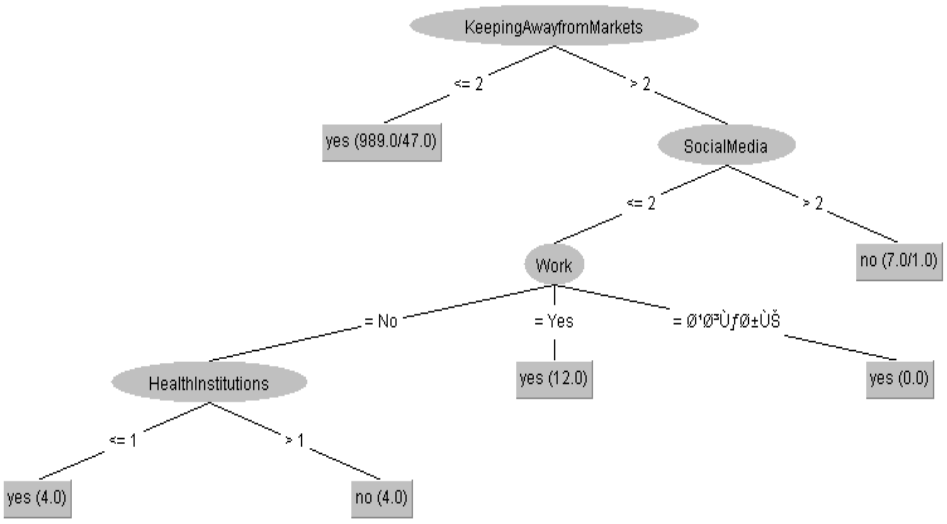

Figure 4. J48 Classifier Algorithm

5. Conclusion

In this paper, the problem of COVID-19 spread in Basra City was studied by applying three supervised DM algorithms to predict the prevention of COVID-19 spread. The performance of the learning methods was evaluated on the basis of their prediction accuracy. The results indicated that the J48 classifier outperformed the NB and MLP methods. A good classifier model must be accurate and comprehensible. This study was based on the questionnaires filled out by respondents from Basra City and the DM techniques were applied after the data were collected. This method could help medical departments by limiting the spread of the disease and reducing infection by taking necessary precautions in a timely manner and improve the quality of health institutions. For future works, the experiment could be expanded with more special attributes to obtain more accurate results. Many specific technologies could also be used when using different factors.

Abstract. The global economy is constantly evolving and corporate technology and business are an important factor in this development and because of the accompanying negative impact on the environment and society, the role of sustainability and sustainable development highlights. To further investigate the scope of the green software development process and its integration with information systems such as the Enterprise Resource Planning (ERP) system, we presented this study due to its importance in minimizing the negative effects of information technology on our natural environment. In this connection, there is a have to combine sustainability and information technology allow organizations to behave in a manner to going greener. Comprehending that the Enterprise Resource Planning (ERP) system is one of the very effective commercial enterprise solutions for organizations, it is necessary to align its use with sustainability factors through the utilization of green IT practices, the objective of this research study is to provide a design model to enhance ERP system in green software development process. So every company must look into the impact of the utilization of Information and communications technology (ICT) on our natural environment and take care to adopt methods to decrease the effects negative on its. Therefore, knowledge management (KM) can be used as the facilitation tool. This research paper presents the results of qualitative research, which proposes a model that to the possibility of enhancing the implementation of the ERP system in the Green Software Development Process by using green IT practices and knowledge management as facilitation tools.

1. Introduction
